FOREWORD

The Faculty of Organizational Sciences, University of Belgrade, traditionally organizes SymOrg to promote the theory and practice of management and management-related disciplines. We are very pleased to present the Proceedings of the XV International Symposium of Organizational Sciences – SymOrg 2016. As in the previous years, the Symposium has given an opportunity for the participants to share and exchange both academic and practical knowledge and experience in a pleasant and creative atmosphere.

The topic of SymOrg 2016 was "Reshaping the Future through Sustainable Business Development and Entrepreneurship". We are pleased that this topic attracted researchers from different institutions, both from Serbia and abroad. The Business forum and the panel discussion which was a part of the StartUp Day competition gave added value to the Symposium and helped narrow the gap between science and practice.

Sustainable business development and entrepreneurship are relevant topics of interest for researchers in different fields. In line with their competences, they conduct analyses and research, and make new discoveries. New technologies and new business models are changing the present business environment with significant impact on the future. Numerous opportunities for business development imply incremental improvement or breakthrough changes of products, services and processes.

Innovation and entrepreneurship are seen as key drivers for the creation of more sustainable economies and societies. The management of today should facilitate business development to be more sustainable economically, socially and environmentally. This poses many questions and challenges for researchers and practitioners. We hope that some answers given by the authors at SymOrg 2016 will help in (re)shaping the future for the wellbeing of all generations.

The authors have contributed with around 200 papers. Around 500 authors and co-authors, scholars and practitioners are represented with their contributions in the Proceedings. The broad themes of the Symposium have allowed for exploration of different aspects of these areas:

- Business Analytics and Optimization
- Communication Management
- Corporate restructuring
- Data Science and Business Intelligence
- Electronic Business
- Entrepreneurship
- Environmental Management
- Financial Management
- Human Resource Management
- ICT and Management
- International Management
- Knowledge Management
- Marketing Management
- Operations Management
- Project Management
- Public Administration Management
- Quality Management
- Software Engineering
- Strategic Management
- Sustainable Business Development
- Technology and Innovation Management

Proceedings contain full papers accepted for presentation at the Symposium. It also includes extended abstracts of invited keynote speakers, to whom we express appreciation for taking part in this year's SymOrg.

We want to thank the contributors and the reviewers who made this issue possible. The Faculty of Organizational Sciences expresses gratitude to institutions, associations and individuals who have given support and contributed to the realization of the Symposium: the Ministry of Education, Science and Technological Development, sponsors, participants and volunteers.

(RE)SHAPING OR ESCAPING THE FUTURE? ATRANSDISCIPLINARY PERSPECTIVE ON SUSTAINABLE DEVELOPMENT AND THE ROLE OF BUSINESS

Adriana Budeanu
Department of International Economics and Management (INT)
Center for Leisure and Culture Studies (CLCS)
Copenhagen Business School, Denmark

Abstract: *Examining and discussing the role of business and entrepreneurship in the context of sustainable development is an ambitious task. This expose takes a starting point in acknowledging that business development is essential to any goal associated to the future of humanity, while at the same time, sustainable development has given way to a veritable market transition. In fact, it is suggested thatsustainable consumption and social equity are becoming key goals for business strategy (Porter & Kramer, 2011) next to profitability and competitiveness. The emergence of social entrepreneurship, socially responsible investments and philantro-capitalism are illustrative examples of an acclaimed paradigm shift in business philosophy, where profitability is embedded and aligned with society's well-being.*

In his book "From heresy to Dogma", Andrew Hoffmann makes a historical analysis of corporate reactions and positions towards sustainability-relevant matters, such as environmental goals, to conclude that businesses have become an equal partner in the negotiations that aim to definesuch goals(Hoffman, 2001). So much so, that businesses involvement is often comparable with the role of states in shaping society's path towards the future(Halme, Park, & Chiu, 2002).This is also illustrated by the constant preoccupation of political, cultural and (recently) spiritual leaders who speak of the role, interest and responsibility of businesses for the well-being of humanity. The subject of business involvement in sustainable development enters other spheres of everyday lifealso. As individuals, we are now citizen-consumers and have the option of 'voting with our wallets'to encourage businesses that make significant and genuine efforts to offer sustainable products and services, such as organic food or renewable energy. To make our choice easier, specialized organizations develop ranking systems that inform and educate while convincing us that businesses have – to different degrees – a genuine interest in encouraging sustainable consumption. At the same time, the trustworthiness of sustainable businessactions is a frequent subject in mass media, albeit mostly when is highly controversial, as for example in the recent case of Volkswagen(Milne, 2015). But while a few (mostly the same) companies make headlines, the majority remains silent and only occasionally engages in the field of sustainable development. In Hoffman's perspective, businesses' active (sometimes aggressive) interest in shaping political and social debates about sustainable development is a natural way for preserving their future relevance. Then it is reasonable to ask – and rightly so - why is progress so slow, and insufficient in practice?

In his argument, (Hoffman, 2001) brings up a keyparadox embedded in the definition given by the World Commission of Economic and Development to sustainable development as "the development that meets the needs of the present without compromising the ability of future generations to meet their own needs"(UNWCED, 1987). This definition is extremely important for introducing a new moral obligation for social responsivenessto nations and individuals alike (Solow, 1991). But at the same time, this definition posits the assessment of success into the future, a time and space for which we lack unbiased evaluations. The absence of objective proof enables the emergence of multiple representations of a future for humanity, of which many gravitate around utopian or dystopian views.Utopian descriptions of the future assume that humanity will prevail in achieving sustainability, primarily by eliminating un-sustainable practices known today (e.g. distributional inequity, intensive resource consumption, etc). The focus in such views is primarily on integrating desirable objectives from all groups involved,with little concern of their (sometimes) contradictorygoals. The resulting integrated models are accompanied by intricate sets of conditions that often inhibit

chances for implementation. In contrast, dystopian views describe a doomed hellish future, with an apocalyptic environment (severe climate, insufficient resources, horrifying natural disasters and profound social turbulence) adverse to human survival. Faced with an apparent choice, actors can, and seem entitled to,act to avoid apocalyptic futures at all costs, under a high sense of urgency enhanced sometimes by scientifically calculated 'deadlines'. Obedient in many respects, we aim to tame the unknown future by defining, measuring and designing measures to avoid it. Butas long asestimations of future needs remain uncertain, visions for a sustainable humanity result in actions thatreduce un-sustainability aspectsbut lead only to occasional true progress (Ehrenfeld, 2004).

Referencingvisions of humanity's future, in all its complex and dynamic socio-technical, cultural and economical dimensions, gives way to multiple interpretations of meanings, symbols and imaginaries that shape social reality (Baptista, 2012) and arguments for prioritization often end with no prospects for progress. At the same time, uncertainties embedded in operating (or trying to) the notion of 'the future' open up possibilities for opportunistic behavior by individual actors. And many concepts emerging from the definition of sustainable development seem to converge towards institutional and group prerogatives at the expense of traditional beliefs and practices (Mebratu, 1998). Perhaps, instead of taking a starting point in defining 'what' is sustainable development, we could start by asking 'how' to make progress by ensuring that all social groups concerned with the future are involved in negotiations and the decisions that construct it. In this scenario, focus on delineating the parameters of the future is replaced by the intent to create possibilities for humans and all forms of life on Earth to 'flourish' (Ehrenfeld, 2004).This alternative allows for the creation of a new intellectual space where new questions about 'what' sustainable development could be, and 'who' would be the actors building it, can emerge and be addressed. Using examples of urban sustainability projects (involving but not restricted to tourism initiatives), this presentation aims to formulate such questions and starting discussing the conditions under which sustainable futures may be (re)shaped or maybe escaped? By inquiring 'who' can participate in imagining a sustainable development, the presentation will also reflect on the role for business and entrepreneurship in designing our future.

DESIGN THINKING APPROACH TO ETHICAL (RESPONSIBLE) TECHNOLOGICAL INNOVATION

Ganesh Nathan
University of Applied Sciences and Arts Northwestern Switzerland, Business School Lausanne (BSL), Switzerland

Abstract: *There is growing interest and importance for responsible research and innovation (RRI) among academic scholars and policy makers, especially, in relation to emerging technologies such as nanotechnology. It is also to be noted, although design thinking approach has been around since 1960s, there is renewed interest in this approach to innovation with increasing number of related publications over the last couple of decades. It is also currently introduced in a number of schools and community projects. This paper attempts to show that design thinking approach is potentially conducive to ethical (responsible) innovation due to its emphasis on human centred design.*

This paper first introduces why we should be concerned about ethical aspects of technological innovation. Then it shows why these problems pose challenges and constraints to address them. Following this section, it discusses about the shortcomings of linear innovation process models and introduces an improved circular innovation process model to embed ethical decision-making taking into consideration both internal and external stakeholders and networks at organizational level. However, many emerging technologies may introduce ethical issues at machine level; for example: autonomous vehicles, drones and next generation robotics. These concerns have been increasingly addressed by the emerging new field of machine ethics. However, it is important to integrate both ethical-decision making at organizational level on innovation process and machine ethics. From this perspective, this paper introduces design thinking approach to innovation and attempts to demonstrate that it is potentially conducive to ethical (responsible) technological innovation. It concludes with potential benefits and challenges with some directions for further research.

'Technologies can be not only contentious – overthrowing existing ways of doing things – but also morally contentious – forcing deep reflection on personal values and societal norms' (Cole & Banerjee, 2013; quoted in Nathan, 2014). Technological innovations can have undesirable consequences for society and environment. Just to give some examples: DDT as pesticide; the pharmaceutical thalidomide, prescribed as morning sickness treatment for pregnant women; chlorofluorocarbons (CFCs) used as refrigerants and propellants; etc. (Bessant, 2013; Nathan, 2014). These examples illustrate that organizational level decision-making during innovation process can have impacts on the linkages at macro level towards the market within socio-cultural-political-ecological context (see Hanekamp, 2010; Nathan, 2014). Furthermore, it is plausible to argue that many innovation decision-making processes have been blind to ethical impacts and concerns – 'innovation ethical blindness' (Nathan, 2014) and these can have economic impacts as well. For example, the Dutch government had to cancel the EPRS (Electronic Patient Record System) due to unresolved privacy issues after the investment of 300 million Euros over a 15-year period and the initiative to introduce smart electricity meters in every household within the Netherlands was also rejected by the upper house of the Dutch parliament due to privacy concerns after some years of R&D efforts (Van den Hoven, 2013; also Nathan, 2015). From social constructivism perspective, reality is socially constructed and technological innovations shapes this reality; however, this reality raises many ethical concerns and dilemmas Nathan, 2014). For example, social media raises ethical issues of cyber bullying and infringement on privacy and installation of surveillance cameras in public places introduces ethical dilemma of public safety versus privacy concerns. Technological innovations can be supportive to new constructive possibilities or can be exploitative for destructive purposes by actors within the technological field; for example, 3D printer can be used for reconstructive surgery and to make prototypes for architectural designs; however, 3D printer could also be used to print hand guns. Therefore, it is also important to consider moral contestation through exploitation that can have impacts on other intersecting fields (Cole & Banerjee, 2013; Nathan, 2014). Emerging technologies in many forms can introduce ethical concerns and dilemmas that are predictable as well as most critically less predictable ones (Matter, 2011; Nathan, 2014 & 2015). These emerging

technologies such as ICT and nanotechnology can converge into new forms of converging technologies such as nanomedicine and nanopharmacy that may introduce ethical dilemmas and concerns; these may be hard to predict at the early stages of innovation and to resolve them at later stages (Nathan, 2015). These new forms of technologies may raise some fundamental ethical questions such as how we should understand human identity and dignity. The above examples lead us to ask: what are the challenges and constraints in addressing these ethical concerns?

Some of the problems may be considered as wicked problems. These are ill-formulated or ill-structured with confusing information along with contradicting or conflicting values among those stakeholders such as decision-makers and customers or end users; moreover, requirements may be changing and dynamic and therefore ramifications can be confusing (Buchannan, 1992). Furthermore, it is also complicated with Collingridge dilemma; as already briefly mentioned, some of the ethical concerns and dilemmas may not be obvious and predictable at the early stages of innovation process and by the time they become clearer, it may be too late to remedy them due to technological lock-in (Collingridge, 1980; Nathan, 2015). Another challenge that one may face is moral overload; even if one identifies those ethical dilemmas it may be difficult to resolve those conflicting moral obligations or values or to implement them at the same time (Van den Hoven, 2013; also Nathan, 2015). So the next question is what sort of innovation process models may be suitable to address the above mentioned challenges and constraints?

There are variety of innovation process models such as traditional –stage-gate and funnel phased approach– as well as open innovation model; however, these are all linear innovation process models (Nathan, 2015). These models simplify complex innovation processes in order to emphasize critical innovation elements and stages. A simplified innovation process model consists of critical stages: searching for innovation opportunities, selecting the most suitable or viable ones and then implementing them for capturing the benefits in the market (Tidd and Bessant, 2009 & 2013). However, it is a linear progressive stage model that may not be suitable for wicked problems that require iterations with progressive and regressive processes. Furthermore, these models do not explicitly integrate ethical-decision making at each stage to identify potential ethical concerns and dilemmas among various stakeholders. Most importantly, as it is a linear open ended model, there is no explicit feedback loop to capture any unpredictable ethical concerns as early as possible following the launch of products and services in order to re-evaluate and take back these issues through the innovation process stages to rectify and to re-launch or to terminate those products or services (see Nathan, 2015). However, this simplified model could be modified as a circular innovation process model embedding ethical decision-making incorporating internal and external stakeholders at the organizational level (Nathan, 2015). A stakeholder map identifying all stakeholders, their interests along with ethical concerns and dilemmas as well as their rights and responsibilities may enable us to embed ethical decision-making within the innovation process at the organizational level; this framework could also integrate multiple perspectives and systems thinking approach (Nathan, 2015).

However, new forms of emerging and converging technologies may be problematic to embed moral code into intelligent autonomous machines such as drones, next generation robots and autonomous transport vehicles. These problems have fostered growing interest in the emerging field of machine ethics over the last decade (Anderson & Anderson, 2006). Building ethical robots is a challenge; embedding rule based ethical decision-making in predictable situations may not be effective in unpredictable situations and enabling machine-learning to make ethical decisions in new situations may create a problem of trust (Deng, 2015).

Against the above background, this paper attempts to explore the potential application of design thinking approach. Design thinking has been around since 1960s. However, design movement evolution can be traced back to 1980s with cognitive reflections towards user centred design to service design towards human centred design in 2000; from 2010 onwards, the movement has evolved to design thinking with approaches to experience design and creative class (Curedale, 2013). Design thinking may be understood in many different ways with some core attributes; there is no single definition for design thinking and in fact defining design thinking may defeat the very essence of it. The core elements of design thinking approach to innovation are technology, business and most importantly human. It is not about consumer or customer centred; rather it is about human centred and from this perspective it is not about existing or target customers. Therefore, it can also take into consideration potential new customers. However, I would add that

these need to be contextualized within the social and ecological environment as these elements invariably interact with the environment and ethical concerns may arise due to these interactions. IDEO has popularized design thinking to innovation with a simplified model consisting of six critical elements: understand, observe, point of view, ideate, prototype and test with iterative feedback processes. The core attributes of design thinking approach are: ambiguity, collaborative, constructive, curiosity, empathy, holistic, iterative, non-judgemental and open mindset (Curedale, 2013). It appears that some of these core attributes may be conducive to address the ethical problematic context. These core attributes are integrated with certain design thinking principles such as: action oriented, comfortable with change, human centric, integrates foresight, a dynamic constructive process, promotes empathy, reduces risks and creates meaning (Mootee, 2013). Again, we can see that these principles appear to be conducive to address ethical challenges to technological innovation.

Design thinking approach could be integrated with multiple perspectives and system thinking approach to embed ethical decision-making. This paper attempts to show that this path could potentially address ethical challenges in technological innovation and provides some directions for further research.

A NEW ENVIRONMENT FOR ENTREPRENEURSHIP AS A LEVER OF SUSTAINABLE BUSINESS DEVELOPMENT

Joaquim Ramos Silva
University of Lisbon, CSG/Socius, Lisbon School of Economics and Management, Portugal

Abstract: *When more than a century ago (Schumpeter, 1908), the entrepreneur emerged, in a context of increasing influence of neoclassical approaches, as a key player in the economic development process and the vehicle of innovation, the concept had a long and winding road to affirm itself on a theoretical ground. For a long period, has had happened before with precursors like Cantillon and Say during the classical age, the mainstream economic thinking of the first decades of the 20th century succeeded in putting aside this disturbing element to equilibrium explanations (Kirzner, 1973), and only in recent decades it gained enough scope by its own right, not necessarily through the best ways (for example, as it is something that can be easily learned or created ab nihilo). Anyway, the shift of emphasis towards a more assertive view of entrepreneurship as a pillar of economic theory is a very promising turn, insofar the economists' views became more realist and operational filling a gap that lasted to long time (Casson, 2003). As stated for example by Foss and Klein (2012), the theory of entrepreneurship is closely connected with the theory of firm what turns economists' concerns more oriented to the study "of the ordinary business of life". Therefore, in the search for solutions to economic problems, such as sustainable growth, productivity improvement, competitiveness, the introduction and spread of innovations, unemployment, among others, the entrepreneurship function also began to be compared with other instruments of the economists' toolkit, particularly at the macro level. The analysis of these different perceptions of the concept and its potential is our main objective insofar they are highly influential and must be closely followed.*

Regarding this new context for entrepreneurship, there are two perspectives that must be taken into account. On the one hand, the knowledge economy and the increasing key role of innovation in the modern economic process, where it became a routine according to Baumol (2002), reinforce more the relevance of the entrepreneur's contribution to the extent he has a higher capacity to use knowledge and to introduce into market activities in a competitive manner. On the other hand, many factors have contributed to the creation of a new economic rationale that emphasizes the contexts of uncertainty and risk (not only caused by the acceleration of change in the transformation of economic structures but also as a result of more recent events such as the financial crisis that erupted in 2007-2008 and its aftermath that weakened the belief that economists know well how to deal with these situations). All this led to a stronger valuation of the role of the entrepreneur, considered particularly apt to manage its businesses within such contexts. Indeed, it is in his behavior, in the sense of interacting with economic opportunities (arising from globalization or from the new technologies of information and communication and through other ways, novel or not), where lies the overtaking of the deadlock in which we are living. Hence, there are fundamental dimensions of the modern economy, clearly demanding more entrepreneurial commitment in the management of the economy, such as in synthesis: knowledge/innovation, and uncertainty/risk.

Despite the relevance of the historical background, the newly accepted role of the entrepreneur, and that of entrepreneurship in economic theory with its diverse linkages, must be put in the frame of reference of the 21st century. It must be recalled that in these circumstances, if we look at historical patterns, the state and its public policies are very much influential in economic life. This trend was perhaps slowed down in some respects in the last decades of the 20th century, but undoubtedly remains, either in advanced or in developing economies. Simultaneously, due to innovation and globalization there is a vast array of entrepreneurship initiatives as showed in the case of emergent economies, particularly when not depending on natural resources. So, beyond its recognition as a very important domain in economic theory, one point should be underlined: entrepreneurship must also have much more attention in the field of economic policy, at all levels of government, as a way of overcoming critical situations, and likely much less through traditional measures of public spending such as subsidies and others. However, it must be fairly recognized that much of the outcome of entrepreneurship is not easily discernible in the short term. From this point of view, it is relevant to compare, for example, with the new financial theories ("modern finance") that were promoted, particularly since the 1980s (Dowd and Hutchinson, 2010). Indeed, much of them showed their inability to bring sustained and sound solutions to economic and business problems, and created a bloated financial system that caused new and huge difficulties that were at the basis of the 2007-2008 crisis and the Great Recession that followed.

Now we will focus in more detail the new trends that characterize the entrepreneurial process. Rules and policy environment became often more friendly of entrepreneurial activities in large areas across the world. It became easier to create firms, but the burden of regulations and taxation remain important, and if they have been reduced in some domains, they rose in others, not always well founded. At a broader scale, the strong increase of foreign direct investment since the middle of the 1980s, with the correlated creation of global value chains, is a good sign of this process, particularly if we take into account that the entry of a firm in a new and foreign market, implies a higher degree of risk due to a lack of local knowledge. It is clear however that appropriate policies may improve the entrepreneur's capability in this field.

The emergence of entrepreneurship in the last decades significantly changed the theoretical landscape of economics and business. Although the process is far from being consolidated, we focused on some of its main aspects. Looking at the future, we hardly deny that entrepreneurship and entrepreneurs have a major role to play towards the improvement of economic structures, particularly when responsive to the true needs of the populations, and not only of particular groups. As referred to before there is a clear contrast with the relevance of what was called "modern finance". And the problem is not confined to the situation prior to 2008, as an author put it later as far as Quantitative Easing is concerned: "QE in some ways resembles the artificial seeding of clouds after a period of drought. Rain has fallen, catastrophe has been averted but much of the water lies in stagnant pools on the baked ground …" (Taylor, 2012). Thus, entrepreneurship has a great contribution to give in breaking out of these situations but often lacks the best environment (including at the level of public policies) to display its full capacity. All the issues that have been raised, show how important and necessary is to deepen the study of this subject in order to open routes for the affirmation of entrepreneurship in all its potential.

RSLINGO4PRIVACY: AN INTEGRATED APPROACH TO IMPROVE THE SPECIFICATION AND ANALYSIS OF PRIVACY POLICIES

Alberto Rodrigues Da Silva
University of Lisbon, INESC-ID, Instituto Superior Técnico, Portugal

Abstract: *Popular web and mobile applications attract and manage a huge number of users. They collect data from their users without ensuring traceability between privacy policies and application design decisions. A particular challenge for policy authors and application developers is the need to use a common language and companion tools that supports translating important privacy policy statements into actionable requirements. For example, European Union and United States employ privacy policies as "notices" to end users and, in the U.S., these policies are often the sole means to enforce accountability. Given the pressure to post privacy policies and the pressure to keep policies honest, companies must do more to align their policies and practices. In this respect, more should be accomplished by enabling developers with new tools to better specify their data needs while policy authors, who are typically legal professionals, can work with those specifications to create more accurate policies or to enforce those policies in the context of developer data needs.*

In general, a privacy policy is a technical document that states multiple privacy-related requirements that a system should satisfy. These requirements are usually defined as ad-hoc natural language (NL) statements. Natural language is an ideal medium to express these policies because it is flexible, universal, and humans are proficient at using NL to communicate. Moreover, natural language has minimal adoption resistance as a requirements documentation technique (Ferreira & Silva, 2012) (Ferreira & Silva, 2013). However, NL has intrinsic characteristics that become the root cause of quality problems, such as incorrectness, inconsistency or incompleteness (Ferreira & Silva, 2012) (Pohl, 2010).

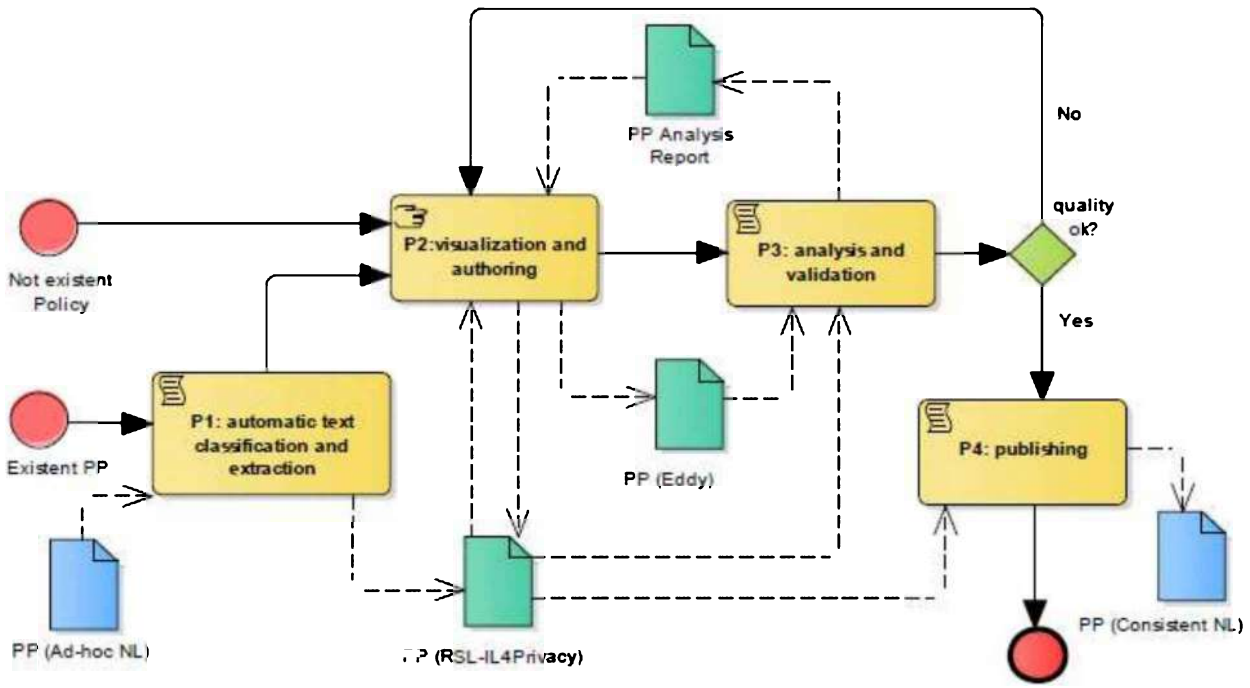

Figure 1: RSLingo4Privacy approach (defined with a BPMN business process diagram).

Recently we proposed the definition of a domain-specific language (DSL) for the specification of privacy-aware requirements, called RSL-IL4Privacy (Caramujo & Silva, 2015) . The RSL-IL4Privacy allows specify privacy policies by providing several constructs, such as statements, private data, recipients and

enforcement mechanisms, which are necessary to specify and document privacy-related requirements. The goal of the proposed approach is to use the RSL-IL4Privacy formalization as the necessary mechanism for the specification of policies while providing features for better analyzing and validating the corresponding privacy requirements.

RSLingo4Privacy is a multi-language approach that uses the following privacy-aware languages: RSL-IL4Privacy and Eddy. Figure 1 overviews RSLingo4Privacy approach as a top-level BPMN business process diagram. If a given (ad-hoc natural language) policy exists, the process P1 applies complex text classification and text extraction techniques to automatically produce the equivalent specification in RSL-IL4Privacy. In addition or otherwise, if that policy does not exist, the RSLingo4Privacy approach starts directly with process P2 to allow visualizing and authoring the policy in a rigorous and consistent way based on the RSL-IL4Privacy language. Process P3 takes as input both RSL-IL4Privacy and Eddy specifications, and provides analysis and validation features, producing, for example an analysis report with errors and warnings that can be taken into consideration during these authoring and validation processes. Finally, when the quality of the policy specified in RSL-IL4Privacy is appropriated, the process P4 is responsible for producing an improved version of the policy, specified again in natural language but in a more consistent and high-quality manner.

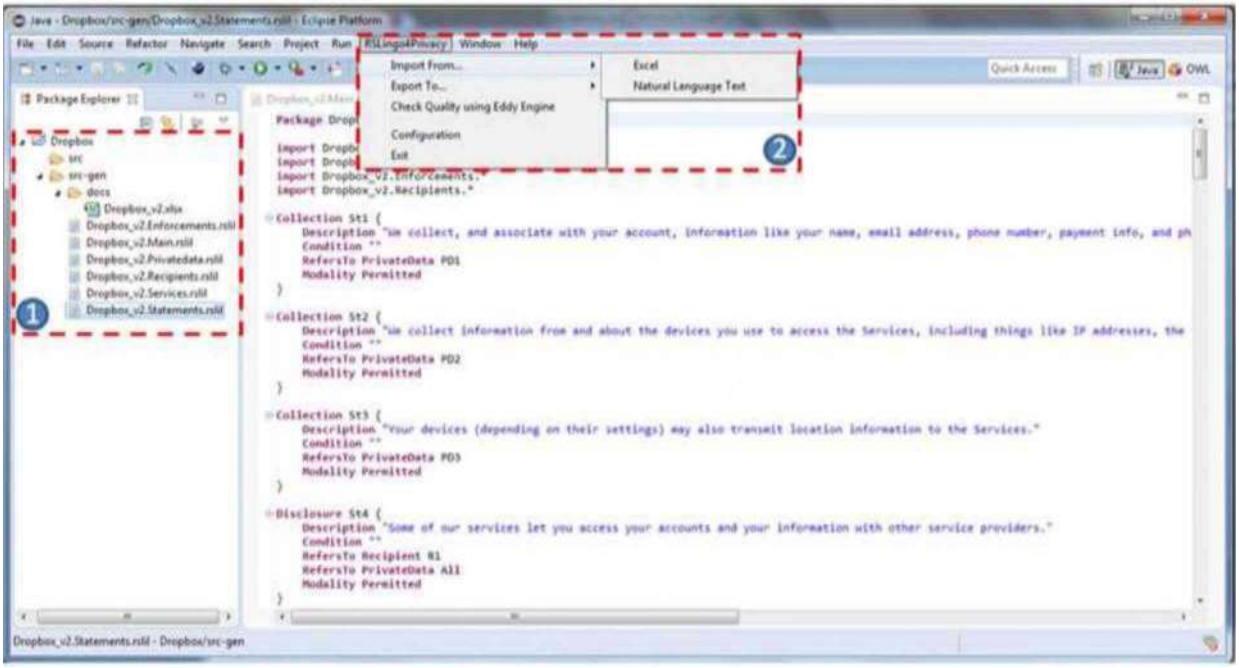

Figure 2. Structure of RSLingo project (1) and RSLingo4Privacy Main Menu bar (2).

This talk presents both the RSLingo4Privacy approach (Figure 1) and its companion tool, the RSLingo4Privacy-Studio,(Figure 2) which is particularly designed for better supporting the specification, analysis and documentation of privacy-aware requirements in the scope of privacy policies.

This work complements the current state-of-the-art by providing a versatile tool designed around the RSL-IL4Privacy domain specific language, with multiple representations while taking into account the importance of having requirements documented in a format as close to natural language as possible. This tool is built on top of the Eclipse IDE, and particularly leveraging and integrating technologies such as: Xtext, Xtend, Eclipse Modeling Framework (EMF), RapidMiner, Eddy engine and Apache POI library.

The explanation and validation with several case studies shows the potential of RSL-IL4Privacy as a rigorous language for expressing privacy requirements and, in addition, shows the relevance of the provided interoperability features. These features are classified by different classes of transformations, all of them founded on that common and intermediate format: RSL-IL4Privacy (defined with the respective Xtext grammar). First, T2M transformations intend to automatically classify NL statements and extract from them text snippets using text mining and text extraction algorithms. The implementation of such transformations is a complex task that involves the integration and tuning of tools like RapidMiner, and is still a working in progress research. Second, M2T transformations produce a consistent and easy-to-read version of a privacy policy. These versions can be produced in multiple formats, such as structured NL in Word, plain text or even HTML. Third, M2M transformations may include two variants: M2M transformations that support multiple representations of the RSL-IL4Privacy; for example, from plain text format (defined with Xtext) into tabular

format in Excel, and vice-versa; and finally, M2M transformations between RSL-IL4Privacy with other languages and formats, such as JSON or Eddy (which can be itself latter mapped in OWL or equivalent formats).

The major merit of the proposed approach is that it allows both technical and non-technical users to easily author and analyze policies using a language close to NL, but that is simultaneously readable by machines and so providing automatic validation at both syntactic and semantic levels. This fact permits RSL-IL4Privacy to act as an intermediate language and be supported by an environment that integrates multiple representations of a privacy policy addressing concerns of multiple stakeholders.

The concrete artifacts of the RSL-IL4Privacy representations for Dropbox, Facebook, LinkedIn and Twitter privacy policies, as well as the analysis of other case studies under the scope of RSLingo4Privacy are available and can be found on its GitHub repository (https://github.com/RSLingo/RSLingo4Privacy).

MEASURING SOCIAL PREFERENCES USING EXPERIMENTAL GAMES: LITERATURE REVIEW

Marija Kuzmanović*[1], Tijana Blažić[1]
[1]University of Belgrade, Faculty of Organizational Sciences
*Corresponding author, e-mail: marija.kuzmanovic@fon.bg.ac.rs

Abstract: *In the last few decades, there is an increased interest in social preferences. They point to the fact that individuals are not rational all the time, although it may be desirable. For measuring the social preferences a variety of experimental games can be used. This paper points to the possibility of measuring the social preferences using the experimental games and focuses on two experimental games: ultimatum and dictator game. The results of experiments which use the ultimatum game, have shown that social preferences influence on decision making, as well as factors such as cultural norms, gender have effect to the social preferences. As far as the dictator game, the results indicates on the fact that factors (altruism, social pressure, empathy and others) have influence on the giving in this game.*

Keywords*: social preferences, behavioral game theory, experimental games, ultimatum game, dictator game*

1. INTRODUCTION

One of the standard assumptions in economics is that individuals are motivated by only their material self – interest (Baran et al, 2010). Although Adam Smith in his *Theory of Moral Sentiments* (1759) recognized the possibility that some individuals exhibit other types of interests, it is only in the last few decades have seen a strong course of interest in what are now widely known in economics as "social preferences". Social preferences refer to the phenomena that people seem to care about certain ~~-s~~ocial" goals, such as well-beings of other individuals, or a ~~-f~~air" allocation among members in society, in addition to their own material benefits (Li, 2008).

In their seminal paper, Fehr and Schmidt (1999) suggested that while many people might be motivated only by pure self-interest, this need not be the case for all people. They theorized that some people may be basically motivated by fairness concerns, reciprocity (reward kindness and punish unkindness) and even pure (unmotivated) altruism (Baran et al, 2010) but also they sometimes act in the entire group's interest, even if it hurts some individuals in the group (Li, 2008).

While the study of social behaviors has a long tradition in economics, psychology and sociology, recently, the term social preferences has come to be associated with a more specific program of research originated mainly in experimental and behavioral economics (Galizzi, & Navarro Martinez, 2015).

A considerable body of experiments has examined the effects of various demographic variables on the social preferences (see Wilkinson, & Klaes, 2012). The variable most frequently studied are gender (Heinz et al, 2011), age (Gummeru et al, 2010; Wittig et al, 2013), academic major (Kahneman et al, 1986; Kuzmanovic et al, 2012), culture (Henrich et al, 2005), social distance (Charness & Gneezy, 2008) and religious identity (Brañas-Garza et al, 2014; Gomes & McCullough, 2015).

Other factors whose effects on social preferences experimentally examined are: anonymity (Dufwenberg, & Muren, 2006; List, 2007; Bardsley, 2008; Franzen & Pointer, 2012; Winking & Mizer, 2013); the context and framing (Branas-Garza, 2007; Stoop, 2014) the size of the stakes (Carpenter et al., 2005; List and Cherry, 2008); the subject pool (Cleave et al, 2013; Exadaktylos et al, 2013; Stoop, 2014). One of the recent studies (Arfer et al, 2015) suggests that people may behave prosocially not only because they value the welfare of others, but also to protect their own reputation.

In this paper will be shown some of the experimental games which can be used for measuring the social preferences. It will also be shown an overview of the results of experiments in which have been used the experimental games.

2. SOCIAL PREFERENCE MODELS

There are essentially two types of social preferences: distributive and reciprocal. Distributive preferences assume that individuals have preferences over final payoff allocations (Li, 2008), while reciprocal preferences mean that individuals desire to reward or punish others beyond mere consequences. Accordingly, the existing literature on social preferences distinguishes three main classes of models (Schmidt, 2011): (1) outcome-based social preferences, (2) intention-based social preferences, and (3) type dependent social preferences.

In models of *outcome-based social preferences,* the utility of each player depends directly on the material payoff of other players in his reference group. For example, the theories of unconditional altruism (Andreoni & Miller, 2002) assume that the utility of a player not only depends on his own material payoff but it is also monotonically increasing in the monetary payoff of other players. Charness and Rabin (2002) show that subjects are more concerned with increasing social welfare (sacrificing to increase the payoffs for all recipients, especially low-payoff recipients) than with reducing differences in payoffs. The Fehr-Schmidt model is consistent with observed behavior in many experimental games but it assumes that people care only about outcomes and not about intentions.

Models of *intention-based social preferences* try to capture intention effects and incorporate the idea that players benefit from reciprocating (or punishing) acts to which they attribute good (or bad) intentions (Netzer, & Schmutzler, 2014). In these models, preferences are defined not only over outcomes but also over beliefs about why a player has chosen certain actions. Namely, players reward kind and punish unkind intentions. Rabin (1993) assumes that the social preferences are driven by players' kindness towards each other: if a player believes the opponent's action is motivated by kindness toward him, then he prefers to react kindly; and vice versa. According Falk et al. (2003) players are punishing much more in case that can be inferred that exist a greedy intention or personality. The *intention-based* model successfully accounts for retaliatory and altruistic behavior (Li, 2008) and requires the use of psychological game theory (Dufwenberg and Kirchsteiger 2004, Falk and Fischbacher 2006).

Finally, in type-based models, the level of the payoff to another player depends on one's own (distributional) basic attitude as well as the perceived basic attitude of the other player (Kerschbamer, 2015). In other words, in type-based social preferences models (Rotemberg, 2008), a player behaves kindly to a ~~"g~~good" person and hostile towards a ~~"b~~ad" person. For instance, in Levine (1998) people are altruistic (or spiteful) to various degrees and – given their own basic altruism – they place more positive (negative) weight on the money received by an opponent who is believed to be more altruistic (spiteful). Andreoni and Bernheim (2009) have a similar model in which others' other-regarding concerns are evaluated in the terms of inequality aversion (and not in the terms of altruism).

3. BEHAVIORAL GAME THEORY

Game theory is the study of mathematical models of conflict and cooperation between intelligent rational decision-makers (Myerson, 1991). It is multiplayer decision theory where the choices of each player affect the payoffs to other players, and the players take this into account in their choice behavior (Gintis, 2009). Game theory provides the conceptual and procedural tools for studying the social interaction, including the characteristics of the players, the rules of the game, the informational structure, and the payoffs associated with particular strategic interactions.

Game theory is designed to be flexible enough to be used at many levels of detail in a broad range of sciences. Players may be people, groups, companies or nations. Strategies may be either an action taken by a player at some point during the play of a game or a complete plan of actions i.e. algorithm for playing the game. Outcomes can be anything players value – money, prestige, corporate profits or captured territory (Camerer, & Fehr, 2002).

The most central concept in game theory is a solution concept of non-cooperative games, known as Nash equilibrium. A set of strategies (one for each player) form an equilibrium if each player is choosing the strategy which is a best response to the other players' strategies. A common assumption underlies an equilibrium is that players act rationally. However, in practice (in the real world situations), human behavior often deviates from this model.

Behavioral game theory is about what players *actually* do (Camerer, 2003). It expands analytical theory by adding emotion, mistakes, limited foresight, doubts about how smart others are. Actually, behavioral game theory analyzes interactive strategic decisions and behavior using the methods of game theory, experimental economics, and experimental psychology. It attempts to explain decision making using experimental data,

and allows for rational and irrational decisions because both are examined using real-life experiments. Specifically, behavioral game theory attempts to explain factors that influence real world decisions (Colman, 2003).

Several experimental games, particularly the ultimatum game, dictator game, trust game, gift exchange game, and public goods game, are widely used to measure the impact and magnitude of the social preferences. In this paper will be shown two types of experimental games, the ultimatum and dictator game.

3.1. Ultimatum game

Using results of experiments with Ultimatum game, some studies confirmed that the social preferences certainly influence the decision-making process as well as the interactions that people have with each other (Ciampaglia et al, 2014). Also, some authors used the Ultimatum game to examine whether social norms and beliefs affect the distribution of money (Camerer & Fehr, 2002). It is certainly of great importance because social norms determine the type of social preferences, specifically directed individual towards pro-social type of social preferences. If it turns out the fact that the individuals affected by social norms, individuals will be less selfish or completely unselfless during the resource allocation (Azar et al, 2015).

Ultimatum games represent a form of take-it-or-leave-it bargaining (Güth et al, 1982). The first player (proposer) receives a sum of money (S) proposes how to divide the sum between the proposer and the other player. The second player (responder) chooses to either accept offer x, or reject it, in which case neither player receives any money. If the Responder accepts he earns x and the Proposer earns $S - x$. The game is typically played only once (see Figure 1).

In theory, rational (self-interested) responders will accept any positive offer, and proposers who anticipate this should offer the smallest possible positive amount because for the responder something is better than nothing at all. The ultimatum game measures whether responders will negatively reciprocate, sacrificing their own money to punish a proposer who has been unfair.

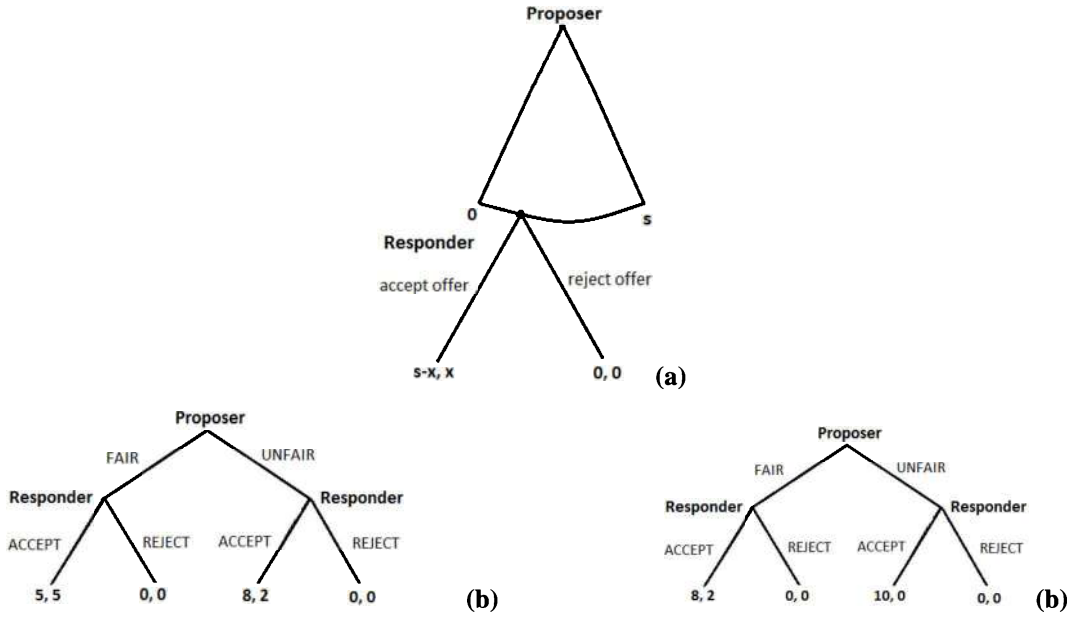

Figure 1: (a) Classic ultimatum game, (b) mini ultimatum games

The experimental results are in stark contrast to the rational solution. On average, proposers offer about 40% of the initial amount (S) to the responder, while Responders reject offers less than 20% of S about half the time (Camerer, 2003). It has also been found that delaying the responder's decision makes people accept "unfair" offers more often (Oechssler et al, 2015).

As Falk and Fischbacher (2006) pointed out, two types of fairness considerations are at work when playing the ultimatum game: outcome-based fairness, in which one compares one‘s own gains and losses relative to those of others, and intention-based fairness, in which one also takes into account the motives lying behind the outcomes (Wittig et al, 2013). Falk et al. (2003) consider a mini-ultimatum game which directly addresses these two possibilities. In this form of game, the proposer is restricted to choose between two different

allocations. In one treatment he can choose between (8,2) and (5,5), in another treatment he can choose between (8,2) and (10,0). In the first treatment the choice of (8,2) may be considered greedy, because he could have offered the equal split (5,5). In the second treatment the choice of (8,2) may be considered generous, because the only alternative would have been (10,0). (see Fugure 1, Schmidt, 2011).

Wittig et al, 2013 used mini-ultimatum game to determine the nature of fairness sensitivity at a period before formal schooling begins (five years olds). They found that preschool children seem to understand „fair = equal" in this task, but not much more, and they are not yet skillful at anticipating what others will find fair beyond 50/50 splits.

The responders took into account the options the proposer had available when he proposed a particular division of resources, including ones that were not equal (Falk et al., 2003). On the other hand, proposers take responder's perspective into account in that they tend to choose the fairest possible alternative and never make offers of zero. For example, when the proposer chooses between offering 20% or 75%, an offer of 20% is rejected 33% of the time. On the other hand, when the proposer's choice set is changed to (20%, 87.5%), the rejection rate for an offer of 20% drops to 16% (Charness and Rabin 2002; Li, 2008).

Some authors suggest that making an fair offer is indeed a rational behavior on the part of proposers because they should take responders' perspective into account (assuming responders are not rational in the standard economic sense) and make an "optimal" offers, that is, those that have a high probability of being accepted while still giving a high payoff to the proposer (Wittig et al, 2013). Harbaugh et al. (2007) suggested that in the practice, people make "optimal" offers, that is, those that have a high probability of being accepted while still giving a high payoff to the proposer.

Many studies have shown that both the proposer's and responder's behavior relies on what they consider to be a fair distribution, sometimes is influenced by general cultural norms (Henrich et al., 2005). The first detailed study in 1991 by Roth et al. examined subjects in four countries: the USA, Japan, Israel and Yugoslavia. They find out that the highest offers are made in the USA and Yugoslavia, and the lowest offers are made in Israel, with Japan in the middle. The main finding was that offers were on average about 10% in Japan and Israel. Interestingly, countries with lower offers did not have higher rates of disagreement. Instead, somewhat lower offers were accepted in countries where low offers were made. Henrich (2000) reports differences between 18 - 30 olds Machiguenga men of the Peruvian Amazon and students at UCLA.

Wilkinson and Klaes (2012) emphasize that although there are a number of significant differences between the genders in terms of fairness and social preferences, there is no simple pattern. Eckel and Grossman, (2001) experimentally demonstrated that in ultimatum game both sexes make similar offers, while woman reject less often. In addition, some authors are using the Ultimatum game pointed to the preferences of people towards the so-called "round" amounts of money, namely that people are choosing a specific amount, for example, half, quarter, and so on (Azar et al, 2015).

3.2. Dictator Game

The dictator game is similar to the ultimatum game. In this game, the first player, (dictator), determines how to split an endowment (such as a cash prize) between himself and the second player (recipient). The recipient simply receives the remainder of the endowment left by the dictator and his role is entirely passive and has no input into the outcome of the game.

Since the dictator's outcome depends only on his own actions, Dictator game is considered as degenerate game and has been used to test the "*Homo economicus*" model of individual behavior. Model "*Homo economicus*" means that individual is concerned with their own economic well being, and dictators would allocate the entire good to themselves and give nothing to the recipient. However, experimental results offer evidence against the rationally self-interested individual concept (Bardsley, 2008).

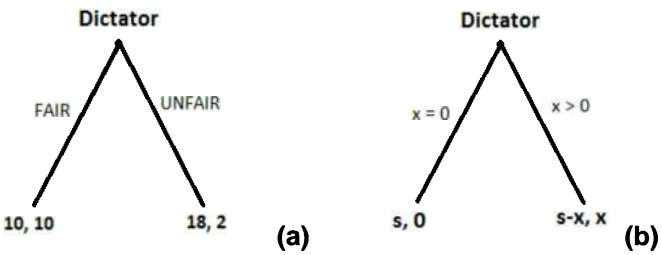

Figure 2: a) Dictator game (Kahneman et al. 1986), b) general form of the Dictator game

The first dictator game experiment was conducted by Kahneman et al, (1986). Authors gave subjects a choice either to split of $20 ($10 each) with another student or an uneven split ($18, $2), favoring themselves. Majority of the students (75%) chooses the equal split. Forsythe et al. (1994) later carried out the dictator game with real stakes and obtained similar results. They find that 70% of the dictators actually do not choose to leave entire endowment for themselves, leaving the recipient with on average 24% of the total amount. Similar patterns have been found in many different dictator game settings. As Camerer (2003) points out, a plenty of subsequent dictator experimental studies replicate these results, finding that usually more than 60 percent of subjects give away a positive amount of money, with the mean transfer roughly 20 percent of the endowment. This has induced numerous researchers to investigate the motivation for such behavior.

The most common explanations for giving in experimental dictator game are altruism and social pressure (Akerlof & Kranton, 2000). Eckel and Grossman (1996) proposed a variant of the dictator game in which a subject decides how to allocate a sum of money between herself and a charity. Moreover, Fong (2007) has shown that an empathy is a more important motivation for dictator game giving when recipients are perceived to be in great need. Additional experiments have shown that subjects maintain a high degree of consistency across multiple versions of the dictator game in which the cost of giving varies (Andreoni, & Miller, 2002).

Most dictator game studies involve only an anonymous recipient. In a few studies, the participants are informed about one or two characteristics of the recipients like the gender (Dufwenberg and Muren 2006) or the name of the organization (DellaVigna et al, 2012). Some studies suggest that Dictator giving tends to increase when weakening anonymity across subjects (Burnham, 2003; Engel, 2011) or when adding an additional observer (Cason and Mui, 1997). However, Bolton et. al (1998) find no significant experimenter anonymity effect.

It has been also argued that giving in dictator games might arise from a desire of subjects to appear acting in a socially appropriate way because their individual behavior is observed by others (Hoffman et al. 1994). Since dictators‘ behavior might also be influenced by expectations about the experimenter‘s judgement, Frequency of positive offers and average donations drop significantly relative to Forsythe et al. (1994). On the other hand, Koch & Normann (2008) suggest that when strategic considerations are eliminated it does not matter to an individual how his or her actions are perceived by others.

Razzaque (2009) experimentally demonstrated that receiver's gender is an important factor of influence on the decision on giving. Some researcher suggests that women are more generous than men (Aguiar et al, 2009) even when recipients have to expert effort to earn rewards as opposed to receiving them as gifts (Heinz et al, 2011). In modified versions of the dictator game, children also tend to allocate some of a resource to a recipient and most five-year-olds share at least half of their goods (Gummerum et al, 2010).

Shariff and Norenzayan (2007) investigated the effect of religious identity on generosity in a dictator game. They found a significant positive effect of religious identity on generosity; the religiously primed participants allocated more money to anonymous strangers than did participants who were not primed. Ahmed and Salas (2011) provide more evidence for religious identity being positively related to generosity in a dictator game.
Brañas-Garza et al, (2014) also explored the relationship between several personal religion-related variables and social behavior, using dictator and ultimatum games. They found that individuals with ~~-n~~o religion” made decisions closer to rational selfish behavior compared to those who affiliate with a ~~-s~~tandard” religious denomination. However, some studies suggest that the effect of religious priming on generosity in the dictator game may be more limited than previously thought (Gomes & McCullough, 2015).

Forsythe et al. (1994) were the first to compare offers in the ultimatum game to offers in the dictator game. They find out that offers in the dictator game are considerably less generous. A significant fraction of dictators give nothing. This shows that many proposers are generous only for strategic reasons in the ultimatum game.

4. CONCLUSION

Economics argues that each individual is rational, or whether it is really so. Even when it is desirable to be rational does not mean that this is actually happening, and that all people are motivated by self-interests (Fehr and Schmidt, 1999). The experimental results offer evidence against the rationally self-interested individual concept. In recent decades, it appears increased interest in social preferences. The reason is that

they help to understand the behavior of individuals and to discover the factors of influence on the decision-making process.

The review literature suggests ways of measuring the social preferences using the experimental games. As reported throughout the current review, using the ultimatum game, has been discovered that social preferences influence on decision-making. It have been also discovered factors which have influence such as social norms, beliefs (Camerer & Fehr, 2002), cultural norms and gender. It has also been found that delaying the responder's decision makes people accept "unfair" offers more often. According to some authors, people are choosing a specific amount, so-called "round" amounts of money.

Observing the review, using the dictator game, as results in experiments appear different factors for giving: altruism, social pressure, gender, religious identity, and empathy. It has been also argued that giving might arise from a desire of subjects to appear acting in a socially appropriate way because their individual behavior is observed by others.

This paper presents the results of experiments where the experimental games are used for measuring the social preferences. However, researchers should not be limited to the measurement of social preferences using the experimental games only. The direction of future experiments, in this area, can relate to new methods of measurement of the social preferences. Also, some subsequent experiments may relate to new factors and examine their impact on social preferences.

AHP GROUP DECISION MAKING: EXAMPLE OF SELECTING EVALUATORS FOR EVALUATION OF PERFORMANCE OF MILITARY MOTOR VEHICLES DRIVERS

Vesko Lukovac*[1], Dragan Pamučar[1], Ljubomir Gigović[1]
[1] University of Defense, Military Academy
*Corresponding author, e-mail: lukovacvesko@yahoo.com

Abstract: *This paper deals with group decision making based on complete information. Known method for decision support, Analytical Hierarchy Process (AHP), was used individually by twenty participants in the task: selecting evaluators for evaluation of performance of military motor vehicles drivers. The deciding group consisted of twenty officers of the traffic department of the Army of Serbia (VS). Synthesis of individual evaluations was carried out afterwards using geometric averaging method. Additional analysis of the individual performance of decision makers was performed using the conformity index and Spirman's rank correlation coefficient.*

Keywords: AHP, group decision-making, evaluators, drivers, military vehicles

1. INTRODUCTION

The final score of evaluating the performance of driver of military motor vehicles (m/v) in VS according to the current approach is the result of the evaluation of a person – his direct superior. However, from the standpoint of successful human resource management, one of the measures recommended for the reduction of errors of evaluators in the process of evaluating the performance of employees is the inclusion of several evaluators in the evaluation process! Accordingly, there is the question: To whom the role of evaluators in the process of evaluating the performance of drivers of military m/v would be given? For the selection of persons who may be given the role of evaluators in the process of evaluating the performance of employees there are several options at disposal. Evaluator, in principle, can be any person who knows and follows the work process. Five primary sources that are recommended for the selection of persons who may be involved in the process of evaluation of the performance of employees (Noe, Hollenbeck, Gerhart & Wright, 2006):

1) managers, and direct supervisors;
2) co-workers;
3) subordinates;
4) employees (self-evaluation);
5) customers-consumers;

Starting from one of the five primary sources, which are recommended for the selection of evaluators in the process of evaluating the performance of employees, the final score of evaluating the performance of drivers of military m/v may be the result of the evaluation by direct superior (superior officer), by those who are on the same organizational level (co-worker), by personal evaluation (self-evaluation), as well as by clients (service user). Performance evaluation of drivers of military m/v can not only be the result of the evaluation by a direct subordinate, considering that drivers of military m/v represent the lowest - executive level in the organizational structure of the transportation service of VS. On the other hand again, based on the assumptions evaluation of 360 degrees, this process could include dispatchers. Therefore, pursuant to the recommendation for inclusion of more evaluators in the process of evaluating the performance of employees, the final score of evaluating the performance of drivers of military m/v may be the result of evaluation: direct his supervisor, dispatchers, colleagues, service users and their own evaluation.

However, the question of whether final score of evaluating the performance of drivers of military m/v should be the result of these evaluations, and which criteria should be taken into account when selecting persons as evaluators who can get involved in the process of evaluating the performance of military driver m/v? In order to define the criteria that should be considered in the selection of these persons, a group of experts, which consisted of twenty officers of the traffic service, hereinafter EKSG, was interviewed. The survey was conducted in two rounds. In the first round of the survey a

questionnaire, by which they are supposed to provide proposal criteria for selection of evaluator, was sent to the experts. Analysis of the results obtained by examination of the questionnaires showed that proposals of EKSG members regarding the criteria for the selection of persons who can, as evaluators, be involved in process of evaluating the performance of drivers of military m/v mainly relate to:

- Knowing the work that driver carryout;
- Better insight into chores drivers perform;
- Objectivity (impartiality) during the evaluation process;

In accordance with these proposals three so-called "selection criteria" were defined:

- K1 - Knowing the work;
- K2 - Insight into the work;
- K3 - Objectivity of the evaluation;

To validate the proposed selection criteria, in the second round of the survey, the members of EKSG received questionnaire where they were supposed to give their opinion on the validity of the proposed criteria for the selection of evaluators. The results of the survey by this questionnaire fully confirmed (100%) consistency of members of EKSG that persons who participate in the role of evaluator in the process of evaluating the performance of drivers of military m/v should be selected on the based on these 3 criteria.

As the decision on the selection of persons who should be involved, as evaluator, in the process of evaluating the performance of drivers of military m/v, should be made taking into account the multiple (three) criteria, in this paper decision implemented methodology for multi-criteria analysis and ranking known as the AHP-Analytical Hierarchy process (Analytic Hierarchy process) is used and at group level.

2. METHODOLOGY AHP GROUP DECISION MAKING

Analytic Hierarchy Process (Saaty, 1980) is the worlds most used multi-criteria analysis method for assistance in individual and group decision making (Subramanian & Ramanathan, 2012; Bernasconi, Choirat & Sherry, 2014). The method is "analytical" and "hierarchical "because the decision-maker breaks down a complex decision making problem into the several elements establishes a hierarchy between them. Popularity AHP method in the world originates primarily from its fundamental quality: "Always compare two elements of decision-making in pairs and use a simple semantic scale with only five basic graduation degrees of importance (equal, little more important, more important, much more important, absolutely important)". In this way, the method is approximated to person who basically does not have to have an interest in "mathematics" on which the AHP scientifically based on and recognized.

Example below applies Saaty's group decision making principles in AHP method:

- Number of group members is $K \geq 2$;
- The problem hierarchy is pre-defined with the global aim of the top level, the criteria on the lower level and a set of alternatives at the bottom level;
- Standard Saaty's scale given in Table 1 is used;
- Individually obtained weight values of alternatives are geometrically synthesized into the group value according to the consistency demonstrated by the group members in the individual AHP evaluation hierarchy. Consistency is calculated according to the Saaty's methodology, and a weight of the group members is determined by the normalization of individual reciprocal coefficients of consistency.

Table1: Saaty's scale of relative importance

Definition	**Numerical equivalent (a_{ij})**
The absolute dominance of the element i over the element j	9
Very strong dominance of the element i over the element j	7
Strong dominance of the element i over the element j	5
Poor dominance of the element i over the element j	3
The same importance of the element i and the element j	1
Poor dominance of the element j over the element i	1/3
Strong dominance of the element j over of the element i	1/5
Very strong dominance of the element j over the element i	1/7
The absolute dominance of the element j over the element i	1/9
(Intermediate values)	(2,4,6,8)

Since all decision makers (DM) made their evaluation, information base is complete, and a group synthesis was performed by consolidating individual priorities (Aggregation of Individual Priorities - AIP) using geometric averaging method (Geometric Mean Method - GMM):

(1)

where:

- weighted value of alternative to A_i awarded by k^{th} member of the group (k = 1,2, ..., m)
- overall composite weight of alternative Ai
- t - weight of k^{th}

Single weigh of $\alpha_k -$ t group members needed to be previously additively normalized, where supplementary analysis of the performance of individual decision makers, was conducted by using conformity index and Spirman's rank correlation coefficient. When calculating conformity index (C^k) group weight of alternatives obtained by synthesis from individual weights, is adopted as a reference, and then conformity index is calculated for each group member as follows:

... (2)

In the equation (2) k is index group member, K is the number of group members, a superscript ref represents a group weight.

When calculating Spirman's rank correlation coefficient (S) so-called reference list of ranks is used, and any other list is compared with it according to the equation:

———— ... (3)

is the difference between U_a i V_a and where U_a i V_a are ranges for an alternative a according to the reference list and according to the list that compares to the reference list, and n is the number of alternatives. In a group context, the equation (3) is applied to each of the combinations (group list, a list of the k^{th} group member) i.e. one need to calculate as many Spirman's coefficients as there are members of the group, same as with conformity index. Value of Spirman's coefficient can vary between theoretical values -1 and 1. When the value is closer to 1, the indication is that the ranks are similar or the same, and when the value is less than zero and closing - 1 ranks are reversed, i.e. negatively correlated.

3. PROBLEM SETTING AND THE INDIVIDUAL AHP EVALUATION

Problem decided by EKSG consists of three hierarchical levels. Five persons who participate in the role of evaluators in the process of evaluating the performance of drivers of military m/v were assessed according to 3 criteria, Figure 1.

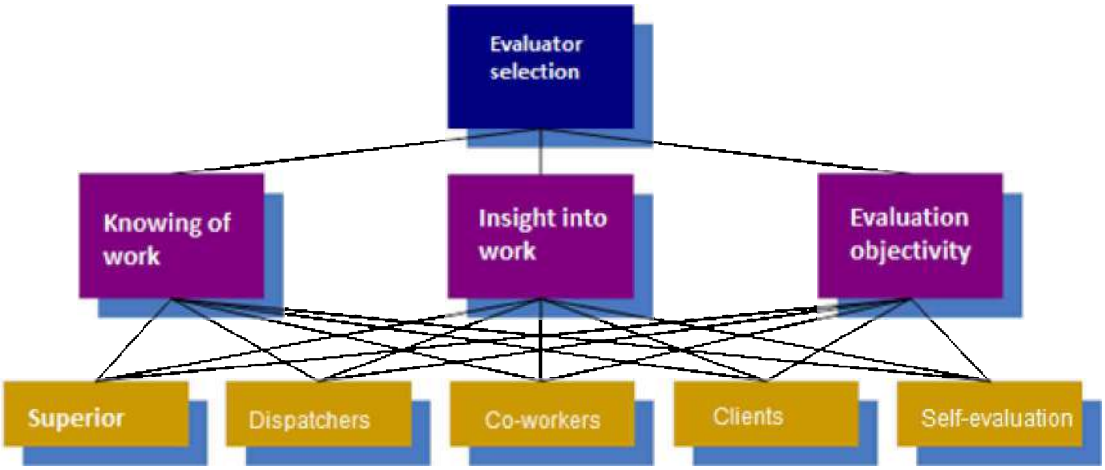

Figure 1: The hierarchy of decision problems

The aim is to "select the evaluator," and it is on top of the hierarchy. Selection criteria are the following - the middle level, and alternative (persons who participate in the role of evaluators), which is subject to selection are at the lowest level of the hierarchy:

- A1 - superior
- A2 - Dispatchers;
- A3 - Colleagues;
- A4 - Clients;
- A5 - Self-evaluation;

With each DM a complete personalized AHP stage consisting of the following steps (Lukovac, 2010) was conducted:

1. The hierarchy in Figure 1 was shown in a short interview and the elements of the hierarchy were explained;
2. The procedure of AHP evaluating was explained i.e. instructions on how to evaluate elements of the hierarchy using Saaty 's Scale in Table 1, were given;
3. The form with comparison matrix for AHP comparison of hierarchy elements in pairs using Saaty 's Scale was delivered;
4. Participants were informed that the results from the comparison matrixes would be processed by the software Expert Choice 2000 (EC 2000), which automatically calculates reciprocal value, and consequently in the comparison matrixes only elements in so-called upper triangles of the comparison matrixes should be evaluated;
5. It was also announced that after the completion of the AHP evaluation, DM would be informed on the final result of decision he made on the problem and about the degree of consistency that he demonstrated, which was also automatically calculated by the software EC 2000.

Final results of the individual evaluations of decision makers are shown in Table 2. Results are obtained by processing data from the comparing matrix by the EC in 2000. In the far right column overall degree of consistency (CR) is given, by which, in an indirect way, according to established methodology AHP (Saaty, 1980), the consistency of decision-making in respect of transitive rules such as "If A has strong dominance over B (numerical preference equal to 5; see Table 1), and B is of

equal importance as the C (numerical preference is 1; see Table 1) then A has strong dominance over C (numerical preference equal to 5)", was presented. Mathematically, complete consistency is achieved if a_{AB}=5 and a_{BC}=1 than a_{AC}=$a_{AB}a_{BC}$=5x1=5. If this rule is violated in any way, it results inconsistency. If anywhere in AHP within the entire hierarchy the smallest inconsistency occurs, the level of CR is greater than zero. According to (Saaty, 1980), it is considered that for the CR less than 0.10 consistency is satisfactory.

4. SYNTHESIS OF INDIVIDUAL AHP EVALUATION

Group synthesis of individual weight vectors listed in Table 2 was performed AIP GMM method according to the form (1). DM weights were obtained by normalizing the reciprocals of the individual degrees of consistency (CR) (Srđević, 2008), and are shown in table 4.

Table 4: Weights decision makers

EKSG	CR	Weights (α_k)
	0.02	0.0508
	0.05	0.0203
	0.05	0.0203
	0.03	0.0338
	0.03	0.0338
	0.04	0.0254
	0.05	0.0203
	0.03	0.0338
	0.02	0.0508
	0.02	0.0508
	0.02	0.0508
	0.02	0.0508
	0.01	0.1015
	0.01	0.1015
	0.02	0.0508
	0.02	0.0508
	0.01	0.1015
	0.02	0.0508
	0.02	0.0508
	0.02	0.0508

When the weights listed in Table 4 are used for the group synthesis of individual vectors DM from Table 2, by using AIP GMM method according to the equation (1), a group decision is obtained as shown in Table 5.

Table 5: Weights alternatives and ranks according to the AIP GMM

AIP GMM	Alternatives				
Weight	0.336	0.305	0.194	0.065	0.100
Rank	1	2	3	5	4

In order to analyze the individual performance of DM, values of the conformity index (C^k) and Spirman's rank correlation coefficient (S) were calculated. Conformity index was calculated according to equation (2) and Spirman's rank correlation coefficient by the software IBM SPSS Statistics 22. The values of conformity index and Spirman's DM correlation coefficient are shown in Table 6.

The values of conformity index of (0.026-0.195) show a small deviation of individual decisions from group decisions. The lowest level of conformity (0.026) was at which means that his deviation of weight values of alternative from their group weight value is slightest. , DM_{16}, DM_{15} follow and so on up to with the highest conformity index (0.195). Based on the values Spirman's rank correlation coefficient (0.900-1.000), it can be concluded that the individual decisions are in correlation with the group decision. Even eleven DM has equally ranked all alternatives (comparing to a group decision) ($S = 1.000$).

5. CONCLUSION

Each possible choice of those who should be assigned the role of evaluator in the process of evaluating the performance of employees has its advantages and disadvantages with regard to evaluation quality. For whom would the organization decide, depends on a number of factors: organizational design, management style, goals set and information that are desired. This paper shows how known method of multi-criteria analysis- AHP could be used for this purpose. The method is interesting because in addition to individual analysis it allows easy expansion to the group context.

This paper considers situation where the problem of selection of persons who should be, as evaluators, involved in the process of evaluating the performance of drivers of military m/v, was decided by 20 individuals. Identified as DM_1–DM_{20} decision makers individually used AHP, and then the context of decision-making was extended to the group. Since the group decision making allows numerous variants of handling the process, one of the most important is that the individual DM was assigned relative weight and thus possibly favoring one over the others in forming a group decision. It should be noted the difference between the terms "common" and "group" decision. In the first case consensus is implied, but it is not necessarily in another. Group context that is considered in this paper entirely corresponds to the second case, i.e. there was no harmonization or consultations among the participants, and the results of individual evaluations were summarized later. In order to maximally objectify group context in the synthesis of individual decision, decision makers were assigned weights that were corresponded with manifested levels of the individual consistency.

The results of the process of aggregation of the individual to the group decision and measurement in each case of conformity and rank – distance according to Spirman in relation to the derived group decision, shows that AHP methods produce logical results in a multi-criteria tasks directly expressed or hidden conflicts. Additional analysis would allow, for example, drawing of conclusions about the effects of classification of DM into subgroups according to the consistency and then the subsequent synthesis sub-group decisions in a group decision, or the elimination of some DM (DMs) from the decision-making process because of the reported inconsistencies, etc.

MULTICRITERIA DECISION MAKING - PRACTICAL EXAMPLE OF AHP BASED APPROACH FOR SUPPLIER SELECTION

Jovana Mihailovic*[1]
[1]Vip mobile d.o.o.
*Corresponding author, e-mail: j.mihailovic@vipmobile.rs

Abstract: *Paper presents multi-criteria decision making problem of supplier selection. When evaluating and choosing the best supplier, decision maker faces complex task that usually consists of analysing many qualitative and quantitative conflicting performance measures. On practical example applied in one company from Belgrade, this paper describes how decision maker can chose best supplier by using Analytical Hierarchical Process and software Expert Choice. This study identifies criteria used for decision making, alternatives, and presents Expert Choice calculation and sensitivity analysis of solution.*

Keywords*: multi-criteria decision making, AHP method, supplier selection, Expert Choice*

1. INTRODUCTION

The goal of multi-criteria decision making (MCDM) techniques is to help decision maker choose the best option among set of alternatives, by analysing them from different angles or attributes. Ideal situation would be if one had alternative best by all criteria. However, almost every real life example consists of intangible and conflicting criteria and evaluating alternatives is rather complex task.

Since 1970s, MCDM has undergone rapid development and has become a hot research topic. Today there are more than hundred different MCDM techniques and their variations, and this lead to conclusion that choosing right MCDM method has become a decision problem itself (Saaty & Ergu, 2015). Some of the most popular MCDM techniques are the Analytic Hierarchy Process (AHP), the Analytic Network Process (ANP), Technique for Order Preference by Similarity to ideal Situation (TOPSIS), ELimination Et Choix Traduisant la REalité (ELECTRE), Preference Ranking Organization METHod for Enrichment Evaluations (PROMETHEE), VIKOR method, Simple Multiattribute Rating Technique (SMART) and Decision-Making Trial and Evaluation Laboratory (DEMATEL).

Different authors have presented comparisons of different decision making techniques in their researches (Velasquez & Hester, 2013, Chai, Liu & Ngai, 2013, Hodgett. 2015). It is hard to estimate which MCDM technique is the best since many methods can lead to different results when dealing with identical problem. It is difficult to classify, evaluate, and compare different MCDM methods because they are based on a variety of assumptions about the decision maker's preferences and use different types of preference information (Saaty & Ergu, 2015).

AHP appeared to be one of the most prominent methodologies used to address the problem of multi-criteria decision making (Bruno et al, 2012, Chai Liu & Ngai, 2013, Hodgett. 2015, Bentes et al, 2012). Literature review has showed wide use and numerous applications of AHP method. AHP was used to solve problems in: business planning, resource allocation, organisation priority setting, and selection (Bhushan & Rai, 2004), total quality management, business process reengineering, quality function deployment. The Ford Motor Company used the AHP (1999) to establish priorities for criteria that improve customer satisfaction. IBM used AHP in the design and marketing of its successful midrange AS 400 computer (1991). AHP had significant role in creating agreement called the Pittsburgh Principles in Israeli-Palestinian conflict (2011). Some of the reasons AHP method has wide use are its simplicity (decision maker compare only two objects at the time), it is adaptable (this is possible because of hierarchical structure) and it is supported by user friendly software package commercially available. Additionally, it can be used in combination with many other approaches: Data Envelopment Analysis- DEA (Liu & Hai, 2005), fuzzy set theory (was investigated by Chan & Kumar, 2007), genetic algorithms (Rao, 2007), Balanced Scorecard - BSC (nice example of applying AHP and BSC in measuring organisational performance was presented in Bentes et al, 2012).

1.1. Supplier selection- multi-criteria decision making problem

Supplier selection is process that includes acquisition of required material, services and equipment for all types of businesses. Evaluating vendors is complex procedure that requires analysis of multiple tangible and intangible criteria and many alternatives. Almost every company deals with supplier selection problem and criteria used for evaluation are usually based on cost, quality and vendor ability to meet the deadline and keep up with schedule. MCDM techniques can be used to support decision makers in supplier evaluation and their final judgment of choosing the best alternative. AHP method was evaluated as the most used methodology in supplied selection problem (Bruno et al, 2012, Chai Liu & Ngai, 2013). This can be explained by observing some of the strengths of AHP: it has ability to structure problem hierarchically which facilitates decision maker analysis since he investigates each level of hierarchy separately, AHP can handle both tangible and intangible attributes and characteristics, it is possible to monitor consistency decision maker has when making judgement and it can be used in combination with many other approaches.

This paper should highlight the need to use MCDM techniques in corporate environment. The goal is to solve supplier selection problem by using AHP method and software package Expert Choice. This is shown on practical example applied in one company in Belgrade. Paper is organised in four sections. Following introduction, section 2 describes theoretical framework of AHP method. Section 3 presents application of AHP on supplier selection problem: criteria for supplier evaluation and alternatives are defined and structured hierarchically (3), attributes and alternatives are evaluated in 3.1 and 3.2, results, sensitivity analysis and discussion is shown in 3.3.

2. ANALYTICAL HIERARHICAL PROCESS

AHP is decision making approach that helps decision maker solve complex problem consisting of multiple conflicting criteria both quantitative and qualitative and multiple alternatives. Modeling process consists of following steps:

- Problem structuring
- Comparative judgements and weights evaluation
- Calculation of global score
- Sensitivity analysis

Like in all MCDM processes, first challenge is to structure the problem, which means to define goal, criteria and alternatives. One of the advantages of AHP method is the fact that it structures attributes in hierarchy. This provides decision maker better focus on specific criteria and sub criteria and simplifies allocating the weights.

Second phase begins with data collection and measurement. Decision maker does pairwise comparisons at each node of hierarchy. Psychologist argue that it is easier and more accurate to express one's opinion on only two alternatives than simultaneously on all alternatives (Ishizaka & Labib, 2009). To compare two attributes and characteristics *i* and *j* the ratio scale illustrated in Table 1 is used.

Table 1: Ratio scale of comparative judgements (Saaty, 1977)

Intensity of importance	Definition	Explanation
1	Equal importance	*i* and *j* are equally important
3	Weak importance of one over another	*i* is slightly more important than *j*
5	Strong importance	*i* is much more important than *j*
7	Very strong importance	*i* is by far much more important than *j*
9	Absolute or extreme importance	*i* is definitely much more important than *j*
2, 4, 6, 8	Intermediate values between 2 adjacent judgements	
Reciprocals of above nonzero	If activity *i* has one of the above nonzero numbers assigned to it when compared to activity *j,* then *j* has the reciprocal value when compared to *i*	

Next step is determining relative weights of attributes. Assume *n* attributes $A_1, A_2 \dots A_n$ with known worth $w_1, w_2 \dots w_n$. Matrix of ratios is shown on Table 2. To recover the scale *w* from the matrix of ratios *A*, one must solve the eigenvalue problem shown in Equation 1:

$$Aw = nw \text{ or } (A - nI)w = 0 \tag{1}$$

Table 2: Matrix of ratios

$$\begin{array}{c} \\ A_1 \\ A_2 \\ \\ A_n \end{array} \begin{array}{c} \begin{array}{cccc} A_1 & A_2 & & A_n \end{array} \\ \begin{bmatrix} \frac{w_1}{w_1} & \frac{w_1}{w_2} & \cdots & \frac{w_1}{w_n} \\ \frac{w_2}{w_1} & & \ddots & \vdots \\ \vdots & & & \\ \frac{w_n}{w_1} & \frac{w_n}{w_2} & \cdots & \frac{w_n}{w_n} \end{bmatrix} \end{array}$$

Table 3: Equation to get back the scale

$$\begin{bmatrix} \frac{w_1}{w_1} & \frac{w_1}{w_2} & \cdots & \frac{w_1}{w_n} \\ \frac{w_2}{w_1} & & \ddots & \vdots \\ \vdots & & & \\ \frac{w_n}{w_1} & \frac{w_n}{w_2} & \cdots & \frac{w_n}{w_n} \end{bmatrix} \begin{bmatrix} w_1 \\ w_2 \\ \vdots \\ w_n \end{bmatrix} = n \begin{bmatrix} w_1 \\ w_2 \\ \vdots \\ w_n \end{bmatrix}$$

In general case when only judgements but not the numbers are available, precise value of $\frac{w_i}{w_j}$ is not known, instead only an estimate of it can be given as a numerical judgement from the scale in Table 1 (Saaty, 2013). The maximum eigenvalue is no longer equal to *n* but is replaced by the maximum eigen value of matrix of judgements, λ_{max} (Table 4 and Table 5). The solution is obtained from the Equation 2:

$$A' w' = \lambda_{max} w' \tag{2}$$

Table 4: Matrix of ratios

$$A' = \begin{bmatrix} 1 & a_{12} & \cdots & a_{1n} \\ \frac{1}{a_{12}} & & & \\ \vdots & & \ddots & \vdots \\ \frac{1}{a_{1n}} & \frac{1}{a_{2n}} & \cdots & 1 \end{bmatrix}$$

Table 5: Equation to get the scale of priorities

$$\begin{bmatrix} 1 & a_{12} & \cdots & a_{1n} \\ \frac{1}{a_{12}} & & & \\ \vdots & & \ddots & \vdots \\ \frac{1}{a_{1n}} & \frac{1}{a_{2n}} & \cdots & 1 \end{bmatrix} \begin{bmatrix} w_1 \\ w_2 \\ \vdots \\ w_n \end{bmatrix} = \lambda_{max} \begin{bmatrix} w_1 \\ w_2 \\ \vdots \\ w_n \end{bmatrix}$$

The consistency index (CI) and the consistency ratio (CR) measure the degree to which judgements of decision maker are not coherent. Saaty (1977) has proposed a CI which is related to eigenvalue method:

$$CI = \frac{\lambda_{max} - n}{n-1} \tag{3}$$

$$CR = \frac{CI}{RI} \tag{4}$$

RI stands for random index (average CI of 500 randomly filled matrices (Saaty, 1977)). Satisfactory degree of consistency is when CR is less than 10%.

Once local priorities are calculated they should be synthetized across all criteria to determine the global priority. This is done by additive aggregation.

The last step in this model is the sensitivity analysis. The aim of it is to observe the results when input data are slightly modified. If the ranking does not change, the results are said to be robust.

3. SUPPLIER SELECTION – PRACTICAL USE OF AHP METHOD

Practical use of AHP method is demonstrated on example in company MBT Concept. Best supplier was chosen with the help of software Expert Choice. Problem solving steps follow the steps of AHP method: defining goal, defining criteria and sub-criteria, defining alternatives, pairwise comparison of attributes, and pairwise comparison of alternatives according to each criteria, aggregation of local results and sensitivity analysis.

Company is the consultant for procurement of FF&E (furniture, fixtures and equipment) and at the time of study company had big project going on which included choosing vendors for hotel furniture. Choosing best supplier is challenging task that requires observation and evaluation of many qualitative and quantitative criteria, so commercial management team was proposed to use AHP method in order to help them in selection process. Several meetings were organised with commercial management team. In the beginning they were familiarised with AHP method, how it can be applied and all the parts they have to participate in. First challenge was to define criteria and arrange them in hierarchical structure. Some authors have proposed set of attributes that can be chosen for supplier selection (Sung & Ramayya, 2008). This paper was used as starting point for identifying criteria, however the final set of attributes was defined according to the needs of the company. Most important criteria this company values when choosing supplier were recognized together with commercial director and procurement manager. In this study agreement based approach was used, since only two representatives from the company were participating in analysis. Constructive dialogue conducted during the meetings lead to common understanding and decisions. Criteria used for evaluation were divided in three groups: Service level, Quality, Financial conditions. Indicators for Service level were: delivery time (time supplier needs to produce, transport and install furniture), job knowledge (how well informed and professional are vendor representatives), flexibility (how fast can supplier respond to changes in specifications), previous experience (if company cooperated with vendor in the past how satisfied they were). Quality child attributes were: design (similarity between offered and designed furniture), warranties (duration of guarantee period), quality of material (quality of fabrics, woods and other material used in construction of furniture), references (big projects company worked on, especially hotels). Financial conditions were divided into: product price (fee of offered furniture), advance payment (the required amount of advanced payment), other conditions (at which point supplier required full payment). Hierarchical structure of supplier selection problem is presented on figure 1.

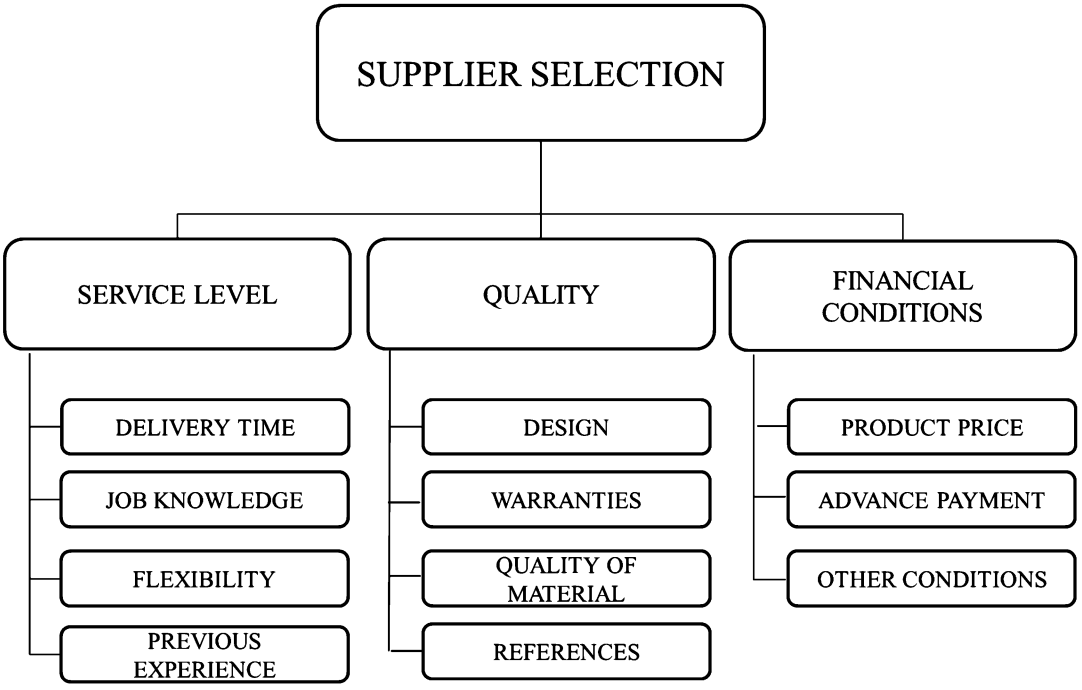

Figure 1: Hierarchical structure of supplier selection problem

In this case study three suppliers were evaluated. Due to data privacy vendors are defined as: Supplier A, Supplier B, Supplier C. Authors are familiar with companies names as well as with their proposals.

3.1. Supplier selection criteria evaluation

After attributes are defined and placed in hierarchical structure pairwise attribute comparison is performed on each level of hierarchy. Ratio scale from table 1 was used as shown on figure 2

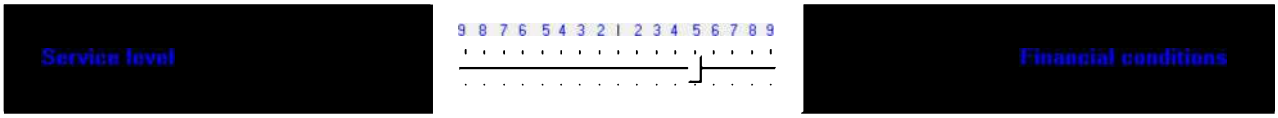

Figure 2: Numerical scale in Expert Choice

Decision makers were advised to use scales: 1, 3, 5, 7, 9, and in the case they were hesitating between two to pick number in the middle. Comparison values and derived local and global priorities are shown on table 6. Consistency ratio was checked in each comparison matrix, and its level was always less or equal to 0.1.

Table 6: Criteria evaluation

SUPPLIER SELECTION	Service level	Quality	Financial conditions	Priority
Service level	1	1/4	1/5	0.093
Quality	4	1	1/3	0.280
Fin. conditions	5	3	1	0.627

IC=0.08

SERVICE LEVEL	Delivery time	Job knowledge	Flexibility	Previous experience	Local priority	Global priority
Delivery time	1	4	5	1/2	0.354	0.033
Job knowledge	1/4	1	1/2	1/3	0.091	0.008
Flexibility	1/5	2	1	1/4	0.112	0.011
Prev.experience	2	3	4	1	0.443	0.041

IC=0.09

QUALITY	Design	Warranties	Quality of material	References	Local priority	Global priority
Design	1	1	1	1	0.250	0.070
Warranties	1	1	1	1	0.250	0.070
Quality of m.	1	1	1	1	0.250	0.070
References	1	1	1	1	0.250	0.070

IC=0

FINANCIAL CONDITIONS	Product price	Advance payment	Other conditions	Local priority	Global priority
Product price	1	8	7	0.777	0.487
Advance pay.	1/8	1	1/3	0.070	0.044
Other condition	1/7	3	1	0.153	0.096

IC=0.1

One can notice that financial conditions are by far most important evaluation criteria, influencing the final decision by 62.7%. As expected most important second level attribute is product price and it influences 48.7% total ranking.

3.2. Supplier evaluation

Supplier evaluation is performed after pairwise comparison of criteria is finished and their local and global priorities are calculated. Comparison is done by each criteria (Figure 3). Results are shown in table 7.

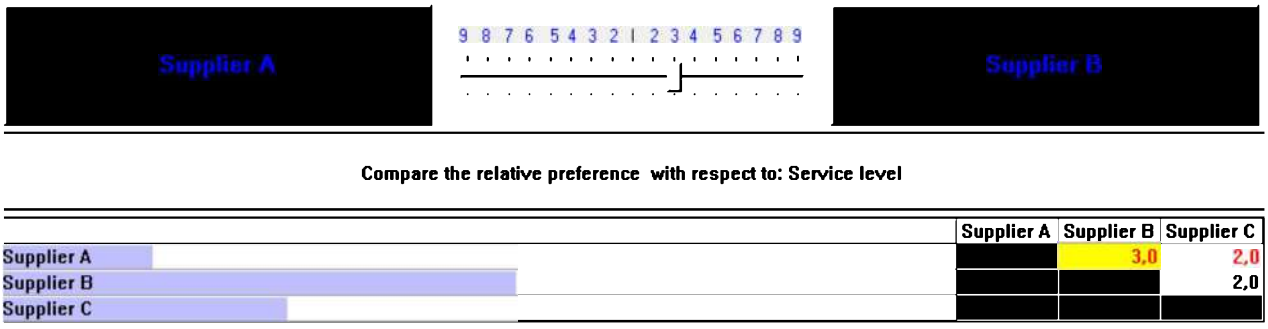

Figure 3: Supplier comparison in Expert Choice

3.3. Results and discussion

In previous chapter one can observe supplier order by each examined attribute. However it is very hard to tell which supplier is the best in total. Overall best supplier, or final result of evaluation is presented on Figure 4.

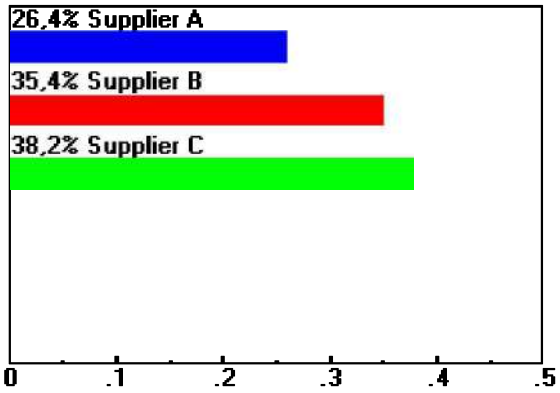

Figure 4: Supplier evaluation results

Supplier with the best total grade is Supplier C with 0.382, second is Supplier B with 0.354 and last is Supplier A with 0.264. Figure 5 demonstrates supplier ranking in more detail and one can observe supplier order by service level, quality and financial conditions. Supplier C is by far better than any other supplier

regarding financial conditions. On the other hand regarding quality and service level its results are rather poor. As previously mentioned, financial conditions were identified as most influential criteria (62.7%) and only thanks to good price offer they defeated their competition. Supplier B on the contrary was evaluated as best regarding service level, and second regarding quality and financial conditions. The difference between Supplier C and B is only 0.028 or 2.8%.

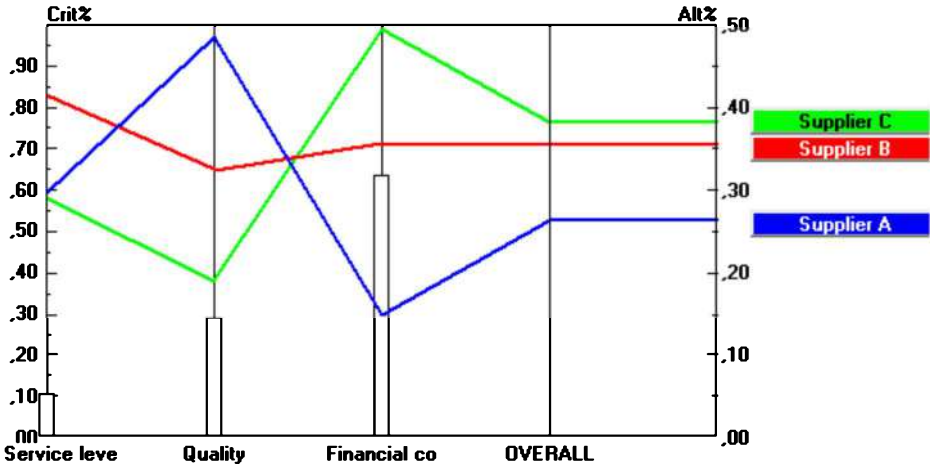

Figure 5: Supplier order by each group of criteria

It is always recommended to perform sensitivity analysis and check if overall ranking changes when the input data changes. Supplier B is better than C by both service level and quality. Expert Choice is very convenient for sensitivity analysis. One can generate Gradient sensitivity graph and observe how supplier ranking can change when priority of criteria changes. Vertical line represents current state and by moving it, variation in alternative order can be observed. It is logical to check result in the case financial priority decreases since financial conditions have highest impact. If the impact of financial conditions drops by 0.1, or by 10%, ranking changes and supplier B is ranked as first (Figure 6). When one criteria ponder drops, some others must be increased, in this case impact of quality and service level increase equally, 5% each.

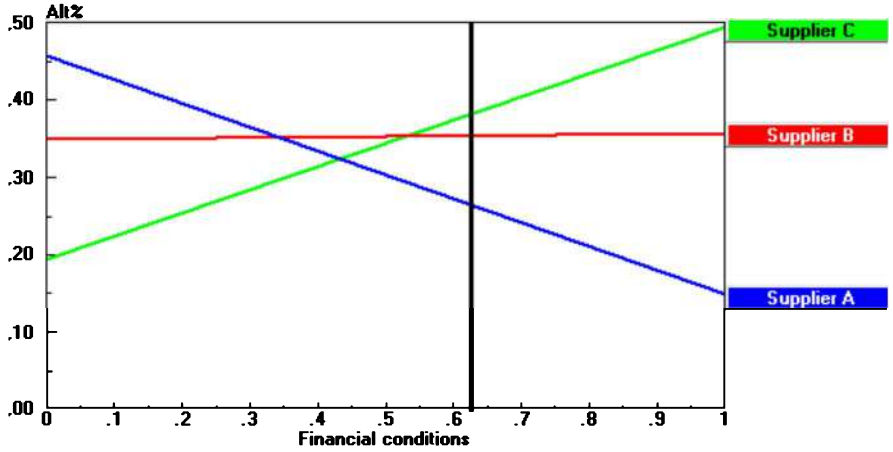

Figure 6: Supplier ranking according to financial conditions ponder

Previous analysis have showed that even though Supplier C was ranked first in overall result, Supplier B seemed to have better performance by more criteria and was serious candidate for winning the job especially after sensitivity analysis. Before showing results, Commercial director was asked to present his feeling about which vendor should be chosen just based on his experience and by analysing offers. He had chosen Supplier B. After seeing results he was more certain in his decision.

Expert Choice was proven to be very useful tool to support judgements when evaluating suppliers. It is very intuitive and easy to use. On the other hand some imperfections were noted. Hierarchical structure in many ways simplifies problem, however when forming it one must be very careful since different structure may lead to different result. Pairwise comparison even though is simple, can be tiring, because one must make a lot of judgements. Additionally it is not easy to choose numbers from Saaty scale. In order to be sure which grade

to grant one must precise criteria for evaluation for each attribute. If compared values are numerical, Expert Choice offers possibility to calculate priority based on their value. In the case of minimization (for example attribute price), priority is calculated based on reciprocal value. In supplier selection example, when Expert Choice was calculating with exact prices, supplier final order was different, Supplier B was first with 35.9%, Supplier C had 34.4%.

4. CONCLUSION

Supplier selection is complex task almost every company faces, and solving it requires analysis of many qualitative and quantitative criteria, usually conflicting, and many alternatives. Companies require finding solution in a quick and simple way. Literature review has showed big interest for supplier selection problem and AHP method appeared to be mostly used and investigated. Due to that fact, in this paper AHP method for supplier evaluation was suggested and applied on practical example in company MBT Concept. First, important criteria were identified and were organised in hierarchical structure. Criteria were divided in three groups: Service level, Quality and Financial conditions. Three suppliers and their offers were analysed and evaluated. Expert Choice proved to be very intuitive and simple to use and was convenient for sensitivity analysis. Final result proved that AHP method can be easily applied and be very helpful in corporate environment to support manages in their decisions. In the last years researchers are trying to combine AHP with other mathematical programming methods such as DEA, genetic algorithm, fuzzy sets, as well as with strategic framework such as SWOT and BSC analysis, so it is assumed that the number of applications of AHP method in different areas in corporate world will grow in the future.

EFFICIENCY EVALUATION OF ABA LEAGUE TEAMS FOR THE SEASON 2012-13 THROUGH DMU CLUSTERING AND DEA

Maja Mitrović*[1]
[1]University of Belgrade, Faculty of Organizational Sciences, Serbia
* Corresponding author: mitrovicmaja4@gmail.com

Abstract: *In this work, Data Envelopment Analysis (DEA) approach measures the efficiency of basketball teams, which played the 2012–13 Adriatic (ABA) League regular season. To apply such methodology, 14 teams were considered as Decision Making Units (DMU), and the algorithm K-means Clustering is used to group teams into homogenous clusters. Then, DEA is applied separately to evaluate efficiency of each team in a specific cluster. The proposed model in the paper is basic BCC DEA model, oriented to outputs, which considered a single input and two outputs. The advantages of the work rest on the fact that presented methodology should help ensuring a greater efficiency of each team, and getting more precise prognoses of sports results.*

Keywords*: DEA methodology, K-Means clustering, efficiency, basketball, ABA-league*

1. INTRODUCTION

As one of the well-known sports in the United States (ReadingTree, 2016), basketball provides a great portfolio for a business platform, which contributes to the great result in finance (Labonté, 2016). Looking at National Basketball Association (NBA), or at the most famous one from Spain - ACB league (ENBR, 2016), sports statistic is of great importance for different groups of people, since it allows many types of analyses. From those matches, as well as from other less popular leagues, available data enhance the chance of better results in the next season if it"s used in a right way.

Using Data Envelopment Analyse (DEA) methodology becomes very popular in recent years. DEA is widely used to measure the efficiency of decision-making units (DMUs). It is possible to find many works which describe how the methodology has been used for performance evaluation in widespread areas in the last decades, from non-profit sector like education and hospitals evaluation (Jeremic *et al.* 2011, Jeremic *et al.* 2012, Savic *et al.* 2012) to profit sector like banks evaluation (Bulajic *et. al*, 2011; Savic *et al.* 2013; Radojicic *et. al*, 2015). Variety DEA studies are also done for different sports, such as football (Tiedemann *et. al.* 2011, Petrovic *et al.* 2015), baseball (Lewis, 2014), and tennis (Ramón & Sirvent, 2012; Ruiz & Pastor, 2013). Many authors used the benchmark methodology with the DEA to show improvements in productivity in sports (Anderson, 2004; Barros & Santos, 2014). For the sake of this work, the most important is efficiency assessment in sports, in particular to basketball.

De Mello (Angulo-Meza & Da Silva, 2009) used basketball as official Olympic discipline, to rank clusters by aggregation of the partial sports. Cooper *et al.* (2009) demonstrate how multiplier values are used to identify major characteristics of individual players. For one of the most popular competitions – NBA, DEA approach is used by Radovanović, Radojičić & Savić (2014). Furthermore, Moreno and Lozano (2014) used DEA to assess the efficiency of NBA teams for the regular season 2009-2010, with the results which show the differences between network DEA and conventional DEA approach. Aizemberg *et al.* (2014) present an analysis of the NBA team for period of five years, using a multi-objective approach, while Alves, et al. (2013) show the efficiency of teams just for one season and ranks them according to composed efficiency score of each DMU, using the inverted frontier method.

For the purpose of this work, the author will analyze a regional professional basketball league, commonly known as the **Adriatic League**. In the recent years, the basic countries which took part were: Serbia, Croatia, Montenegro, Bosnia and Herzegovina and Slovenia. The body that organizes the league is **Adriatic Basketball Association** and the league is also considered as a local version of the Europe-wide Euro league (Aba-league, 2016).

The organization of the league is next: in the regular part of the season, 14 teams are playing. Each team plays against every other team once at home and once away. After 26 played rounds, the best placed 4 teams (also known as „Final Four") are qualified to the playoffs.

The semi-finals are played in the best of three games format (1-1-1), where the first placed team after regular part of the season will face the fourth-placed team in the first semi-final pair and the second placed team after regular part of the season will face the third placed team. The first and the second placed team will have the home court advantage in the semi-finals.

Winners of both semi-final pairs will advance to the finals, which will be played in the best of five games format (2-2-1). There will be no games for the third place played. The finalist, that is the better placed after the regular season, will have the home court advantage (Aba-league, 2016).

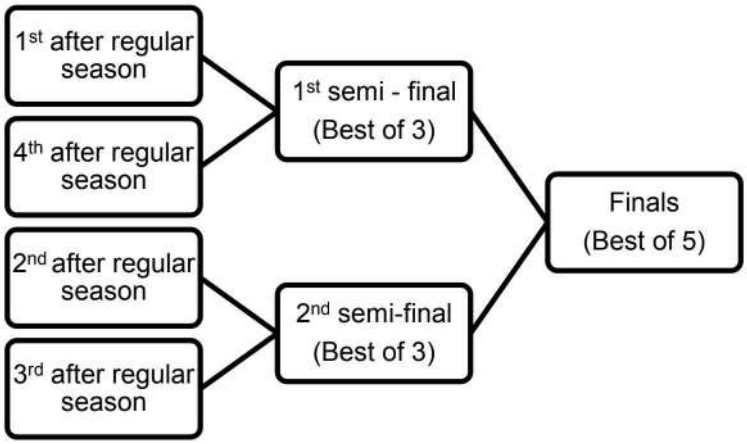

Figure 1: Competition system

This study proposes an efficiency analysis of 14 teams that played the 2012-13 regular season. Moreover, it will be shown clustering via K-Means Clustering algorithm and evaluation of the teams in each cluster using DEA methodology. The concept of clustering consists of grouping the DMUs with similar characteristics. Various authors have used different clustering methods in order to obtain homogeneous clusters (Alves *et al.,* 2013; Ma, Wang & Wang, 2014) and then, apply DEA for assessing efficiency index (Yu & Lee, 2013; Alves *et al.*, 2013; Moreno & Lozano, 2014). In order to improve the efficiency of each team, the author applied DEA methodology, observing the classic efficiency of teams in each cluster using the BCC DEA model (Banker *et al.*, 1984) oriented to output. The goal is to grade DMUs. The obtained results can act as indicators for management, players, but also for civil society to realize what to improve, and to predict the future results in coming seasons in order to get a higher rank of selected team.

The paper is organized as follows. First, the basic concept of the data used is described. Then, in **Section 2** proposed methodology, including the K-means Clustering and fundamental concept of DEA model is given. In **Section 3** the result of the study is shown, as well as its analysis. Finally, concluding remarks of this work are presented.

2. METHODOLOGY

2.1. K-means Clustering

At the beginning of this paper, the author introduces that the matches took place in different Balkan cities, which can intensify the home advantage. Anderson *et al.* (2012) suggest that this factor could significantly affect the performance of teams in different sports. In order to set a homogeneous assessment, the DMUs were grouped in clusters based on circumstances of the cities that hosted their matches.

One of the most widely used algorithm for grouping units is K-means clustering. Tan, Steinbach and Kumar (2013) gave the definition: *"Cluster analysis groups data objects based only on information found in the data that describes the objects and their relationships"(p.490)*. They also argue that, if the similarity within a group is greater, as well as the difference between groups, the clustering is better *(p.490)*.

This work uses the K-means Clustering algorithm for the purpose of grouping teams in homogenous clusters. As a partitioning clustering technique, it uses centroids to specify the number of clusters (K). Centroids are usually the mean of a group of points (Tan, Steinbach, & Kumar, 2013) while K is the user specified number. Each point is assigned to the closest centroid, and the collection of points assigned to a centroid is a cluster. The basic algorithm is given in the following:

- Select K points as initial centroids

- Repeat
    - Form K clusters by assigning each point to its closest centroid
    - Recompute the centroid of each cluster
- Until centroids do not change

In the first iterations, the conversation is the fastest. A measure used to assign a point to the closest centroid is Euclidean (L_2) distance:

$$dist(p,q) = \sqrt{\sum_{i=1}^{n}(p_i - q_i)^2}\,, \tag{1}$$

where *p* and *q* are points and the distance represents the length of their line segment connecting them (Deza & Deza, 2009). In order to minimize the squared distance of each point to its centroid, it's necessary to express objective function. The sum of squared error is a measure of the quality of clustering. The goal is next: to get the smallest total sum of squared errors of each data point:

$$SSE = \sum_{i=1}^{K}\sum_{x \in C_i} dist^2(m_i, x)\,, \tag{2}$$

where *x* is the point from the specific cluster C_i, while m_i is the most representative point for the cluster *C* (Vazirgiannis, Halkidi, & Gunopulos, 2012). It's also possible to use other measures as Proximity function Manhattan (L_1), where Centroid is the median of the points and also minimize the sum of the L_1 distance between an object and its median. Squared Euclidean use means as centroids and minimizes the sum of the squared L_2 distance (Deza & Deza, 2009).

The most followed issues for the previously described measure are Handling Empty Clusters and Outliers (Tan, Steinbach, & Kumar, 2013). Empty clusters can be obtained if no points are allocated to a cluster. Improving the methods allows overcoming the issues (Delibasic *et. al*, 2009; Delibasic *et. al*, 2012). Wang *et. al* (2015) described a new K-Means algorithm to reduce the computational complexity in the assignment step, using multiple random spatial partition trees. An adaptive initialization method (IM) can be used to initialize other partitional clustering algorithms such as fuzzy c-means and its variants (Celebi, Kingravi & Vela, 2013).

2.2. DEA – BCC model

DEA was first developed by Farrel (1957) and improved by Charnes, Cooper & Rhodes (1978) as a non-parametric method that compares a decision making-units directed to frontiers rather than central tendencies, using performance indicators. This tool allows identifying which units are efficient, besides defining benchmarks between such units. DEA has two classical models, which are the CRS (Charnes et al, 1978) and BCC (Banker et al, 1984). The CRS model works with constant returns to scale while the BCC assumes that the DMUs can exhibit variable returns to scale. Both models can work with input orientation, where inputs are minimized while outputs remain unchanged, or can work with output orientation when the objective is to maximize the outputs while inputs do not change.
In this paper, the DEA BCC model was chosen due to the fact that increasing input variable – in this study *Total budget* won't increase the same quantity of output variable. Therefore, the variables do not vary proportionally. The output orientation is preferred since the main purpose of the basketball teams is to have high scores and to win the matches.

Let x_{ij} - denote the observed magnitude of *i* - type input for entity *j* ($x_{ij} > 0$, $i = 1, 2, ..., m$, $j = 1, 2, ..., n$) and y_{rj} - the observed magnitude of *r*-type output for entity *j* ($y_{rj} > 0$, $r = 1, 2, ..., s$, $j = 1, 2, ..., n$). Then, the basic DEA model is formulated in the following form for the selected entity k:

$$(\max)\, h_k = \sum_{r=1}^{s} u_r\, y_{rk} \tag{3}$$

$$\sum_{i=1}^{m} v_i\, x_{ik} = 1 \tag{4}$$

$$\sum_{r=1}^{s} u_r y_{rj} - \sum_{i=1}^{m} v_i x_{ij} \leq 0, (j = 1,...,n) \quad (5)$$

$$u_r \geq \varepsilon, r = 1,2,..., s$$
$$v_i \geq \varepsilon, i = 1,..., m) \quad (6)$$

Where:

- v_i is the weights to be determined for input *i*;
- *m* is the number of inputs;
- u_r is the weights to be determined for output *r*;
- *s* is the number of outputs;
- h_k is the relative efficiency of DMU_k;
- *n* is the number of entities;
- ε is a small positive value.

The relative efficiency h_k, of one decision-making unit *k*, is defined as a ratio of the weighted sums of their outputs (virtual output) and the weighted sums of their inputs (virtual input). As for the decision-making unit *k*, for which a maximum in the objective function (3) is sought, the condition (4) is true, meaning that it is obviously $0 < h_k \leq 1$, for each DMU_k. The weights v_i and u_r show the importance of each input and output and are determined in the model so that each DMU is efficient as much as possible. Given that the condition (6) is true for every DMU, it means that each of them lies on the efficiency frontier or beyond it. If Max $h_k = h_k^* = 1$, it means that efficiency is being achieved, so we can tell that DMUk is efficient. Efficiency is not achieved for $hk^* < 1$ and DMUk is not efficient in that case. The mathematical model given above is linear and can be solved using any of the familiar programs packages for LP (Martic et al., 2009).

Variable Description

Table 1: ABA league 2012-13 Teams and Variables used for analyses

Team information		***K-Means Clustering***			***DEA***		
		Inputs			*Inputs*	*Outputs*	
Home country	**Team**	**Average home attendance**	**Total kilometres travelled**	**GDP per capita (€)**	**Total budget (mil €)**	**Victories**	**Average score**
Bosnia and Herzegovina	Igokea	2160,00	18072	11,1	2,5	20	46
Bosnia and Herzegovina	Siroki WWin	2807,69	22944	7,963	2,5	9	35
Croatia	Cedevita	1076,92	19160	13,493	7	15	41
Croatia	Zadar	4076,92	24456	17,8	2,5	9	35
Croatia	Cibona	1916,67	19160	13,493	3,7	9	35
Croatia	Split	1861,54	23976	10,47	1,9	8	34
Hungary	Szolnoki Olaj	1600,00	30264	12,39	3	9	35
Macedonia	MZT Skopje	3080,00	35068	3,688	2,5	14	40
Montenegro	Aerodrom Buducnost VOLI	1960,00	26896	5,211	2,8	16	42
Serbia	Crvena Zvezda	5097,07	20896	7,136	4	18	44
Serbia	Telekom Partizan mt:s	5178,57	20896	7,136	4,5	16	42
Serbia	Radnicki	3040,00	24232	7,4	3,25	17	43
Slovenia	Union Olympic	2100,00	24264	10,1	4	13	39
Slovenia	Krka	980,00	21244	17,379	3,7	9	35

ABA league teams are grouped based on the following set of inputs: *Average attendance* at home matches, *Total kilometres* travelled by the team during the regular season and *Average GDP per capita* of host cities. For the purpose of DEA analyses, the author had used *Total budget* (in million euros), as an input variable, and *Number of Victories* followed by obtained *Average Score* as output variables. All of the mentioned variables are shown in **Table 1.**

Average home attendance – defines the level of public participation in the games that occurred in the own city. Higher *home attendance* is correlated with higher *home advantage*; teams with a relatively high *home advantage* perform better in front of larger crowds, while teams with a relatively low *home advantage* perform better in front of smaller crowds (Willoughby, 2014). As a half of the matches were played in team's hall, that increased *home advantage* attendance.

Total kilometres travelled – expresses the distance travelled by each team during the regular season. This variable can also be interpreted as the effort that fans of a team would make in order to attend the match; it should be lower the participation of its fans at the games, as farther the game is played. Scheduling tournament is also important for this point of view because it's directly connected with the team budget (Ribeiro, 2012).

The last variable chosen for clustering – *Average GDP per capita* – is the average GDP per capita of all cities that hosted the games that each team participated. This variable reflects the economic situation of the city's public – how much people would pay for the tickets for the games occurred in their town. Also, it has the direct impact on future participation in sport (Humphreys, Maresova, & Ruseski, 2012).

Total budget - represents the amount of money that each team had for organizing tournament during the season. The budget expresses in which condition is team – if the team has better results, players will be desired by another team, the performance of the team will increase (Lera-López *et. al*, 2013).

The number of victories - shows the main purpose of a team, which is winning the game. Also, another variable which has almost the same meaning is the score reached. Observing this, the author used DEA BSS model oriented to output, in order to maximize score with the minimum of available input.

3. RESULTS AND DISCUSSION

This section presents the results obtained from the application of the proposed approach described in the previous section of this paper. **Table 2** presents the clusters found and the efficiency scores assessed for teams in each cluster.

Table 2: Team country, main cluster, and team efficiency

Home country	City	Team	Cluster	Efficiency
Bosnia and Herzegovina	Široki Brijeg	Siroki WWin	C1	1
Slovenia	Ljubljana	Union Olimpija	C1	0,932
Slovenia	Novo Mesto	Krka	C1	1
Croatia	Zagreb	Cedevita	C2	0,848
Croatia	Zadar	Zadar	C2	0,784
Croatia	Zagreb	Cibona	C2	0,913
Croatia	Split	Split	C2	1
Hungary	Szolnok	Szolnoki Olaj	C2	1
Macedonia	Skopje	MZT Skopje Aerodrom	C2	0,784
Montenegro	Podgorica	Buducnost VOLI	C2	0,77
Bosnia and Herzegovina	Aleksandrovac	Igokea	C3	1
Serbia	Beograd	Crvena Zvezda Telekom	C3	0,875
Serbia	Beograd	Partizan mt:s	C3	0,875
Serbia	Kragujevac	Radnicki	C3	0,85

The methodology of clustering enabled the author to makes groups of units which have some similar characteristics. That provides fair analyses of efficiency since the teams were compared with other teams that played in similar circumstances.

From Cluster 1 teams it can be seen that Krka has the smallest *home attendance*, as well as *total kilometres travelled* during the season, but has the biggest *GDP per capita* in front of other countries. These opposite values put it next to the teams Union Olympia and Siroki WWIn. Interesting is that even Krka has the highest GDP per capita, home matches are not enough known. Higher GDP means better health and education outcomes, better sporting infrastructure and more resources spent for sports (Economictimes, 2016). Siroki WWin has more fans than Union Olympic, but they were less active.

Most of the Cluster 2 teams present low values for the *Average home attendance* and high values related to the average *GDP per capita* of home cities. Climate can play a significant role in home advantage. All Croatian cities have Mediterranean climate with a lot of rain during the year. That involves people to watch the match at home. Skopje had the lowest *GDP per capita* for the year 2013, but urbanization of that city influenced *home attendance*.

On the other hand, Cluster 3 teams played under favourable conditions, since they mostly played in cities with a high average *GDP per capita*, and had a high home advantage. Furthermore, these teams present a middle value looking at *total kilometres travelled*. Played matches between teams in this Cluster were in top 10 attendance (Wikipedia, 2013), since Belgrade is an attractive turist destination.

The second part of the methodology is to calculate the efficiency indexes. The obtained results have shown interesting values about the performance of the teams. The author got in two clusters pairs of teams which have efficiency equal to 1. As the efficient teams from Cluster 1 author can observe Siroki WWin and Krka from Slovenia. Union Olympic considers as an inefficient team because of the amount of budget (4 million Euros) and just 4 matches more victories, as well as 4 points greater average score than Krka. For the season 2012-13 players didn't make game very well, they bypass the top 10 players.

In the Cluster 2, Split and Szolnoki have the efficiency equal to 1. Split had the minimum budget for the season, even 3 times smaller than the highest one, but also had just eight victories more and 4 points more than others. Split and Szolnoki round by round became at the top of the best player. That ends with high scores.

Figure 2 shows Final rank of the teams, as well as achieved points in the final games. It can be seen that all "Final Four" teams are grouped in the same cluster.

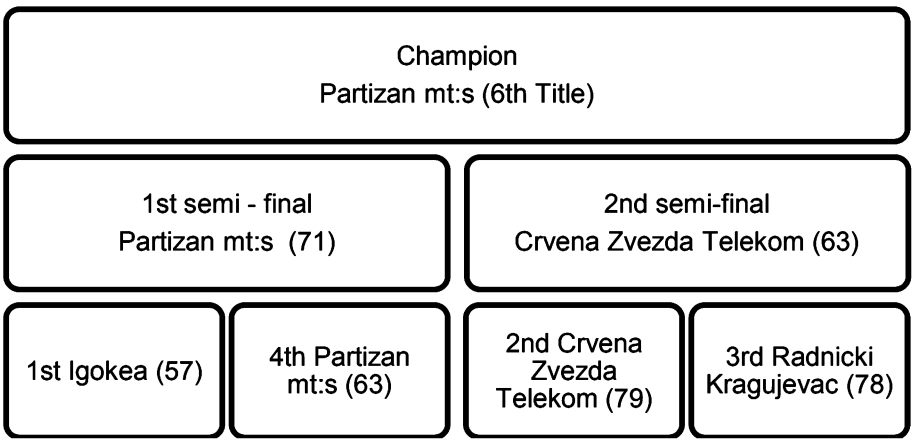

Figure 2: Results and Final rank

From the strongest teams, only Igokea was ranked 1st in its cluster. It's pretty surprisingly because Igokea ranked 2nd in value for variable *Total budget* (in a group with Siroki WWinn, Zadar and MZT Skopje), and ranked 1st based on the *Number of victories* and *Average score*. Even Igokea had the greatest efficiency, that wasn't enough for the victory. Going further, two other teams in the same cluster (Crvena Zvezda Telekom and Partizan mt:s) had almost 2 times the greater budget for the season, but a smaller number of victories and scores. With the same efficiency, the both of teams played in Semi-Final and the champion of the season (Partizan mt:s) was neither first in its cluster. The study also found that Radnicki Kragujevac, the team with the smallest efficiency in it's cluster ranked 3rd looking at the *Number of victories* and *Average scores*.

4. CONCLUSION

In this paper, the author shows through DEA methodology efficiency measures of 14 basketball teams belonging to the ABA league 2012/13 regular season. Since the approach has never been applied on the ABA league before, the author has developed a framework for teams analyses, by clustering the teams into effective DMUs. Another main feature of the proposed approach is to consider the importance of obtained results – how to plan and allocate the budget, or how to enforce the public to support their teams on the upcoming matches.

Regarding teams analysis, the author can observe the performance of teams in each group - Cluster 2 presents the greater difference between maximum and minimum values for each efficiency score, while Cluster 1 presents the lowest difference. All of the teams in Cluster 1 are efficient, and teams with the highest and lowest composed efficiency were grouped in Cluster 2. In this context, the recommendation for the Team management is to consider greater budget for the next regular season, in order to allow better conditions, as well as better performances of the team players.

For the future research work, the author suggests additional analyses of team players, considering the fact that each team belongs to a specific cluster. Another topic of further research can be to evaluate the change in efficiency for every team in a specific period of time. Than, the application of statistical methods could be significant, in order to reduce the number of related problems, such as a high degree of correlation between proposed variables; or to show the most important variables, applying the I-distance methodology.

APPLICATION OF GENETIC ALGORITHM IN AUTOMATED TRADING

Pavle Jovanović*[1], Aleksandar Rakićević[1], Bratislav Petrović[1]
[1]University of Belgrade, Faculty of organizational sciences
*Corresponding author, e-mail: pavlej93@gmail.com

Abstract: *This paper describes the use of genetic algorithm in the automated trading. Automated trading makes up a high percentage of the total trading volume which makes it very promising for future research. The proposed trading system is based on genetic algorithm which is here used to optimize parameters of a trading strategy in order to obtain the most profitable combination. The proposed trading strategy uses technical indicators to extract trading signals from market prices. Further, we use several performance measures to evaluate trading successfulness. The proposed trading system is tested in US stock market data.*

Keywords: *automated trading, genetic algorithm, optimization, stock market, technical indicators, trading strategy.*

1. INTRODUCTION

Automated trading (AT), also known as algorithmic trading, represents electronic trading in computerized manner, using computer programs and algorithms. Following development of information-communication technologies, AT raised as the new area of modern finance. In order to speed-up their reactions to new information and profit opportunities, market players started introducing algorithms in market trading at the end od 1980s and during 1990s. At the first time, these algorithms were meant to accelerate trading order execution, but with time the algorithms became more complex and intelligent. During the 2000s, AT has experienced extensive expansion in use and popularity. Kissel (2013) states that the total market volume made by automated trading systems raised from 25% in 2005 to almost 75% in 2009.

The main advantage of an automated trading system, if its trading algorithm is well written, is its speed. Today's market is very dynamic and unpredictable. Due to increasingly rapid changes in the market, it often happens that a man is not able to react to new information or profit opportunity in a timely manner, even if those are foreseen in advance. In order “to compete the market”, one needs to use some kind of computerized support. Computer algorithms have ability to react to a rapidly changing market conditions and execute transactions before another change occurs.

There are two main approaches to financial market analysis. Fundamental analysis (FA) relies on financial statement data, analyze company"s business performances. On the other side, technical analysis (TA) uses historical market data such as price, volume, bid, ask etc. to build technical indicators – models that attempt to mathematically and graphically describe the movement on the market. Many traders and other market participants use these indicators for trading and for building automated trading systems.

The first work in which the genetic algorithm (GA) was used to optimize a trading strategy was done by Allen and Karjalainen (1999). They used GA to learn technical trading rules for the S&P 500 index using daily prices from 1928 to 1995. Outside of training data (out-of-sample) their algorithm was not giving much of a good results, but it was very simple and its parameters were not necessarily optimized. Their work represented the basis for further research of many authors.

Deng *et al.* (2012) reported that trading profit is a discrete and multimodal function with many parameters and that therefore genetic algorithms and genetic programming may be used to optimize the trading rules in order to obtain profitable trading strategy. Their trading environment was currency market (FOREX). Their trading strategy was based on technical indicators, while the GA was used to optimize parameters of the strategy. Cheung and Kaymak (2007) were among those who tried to optimize fuzzy-rule-based trading strategy. They used GA to set the membership functions of fuzzy sets within the if-then rules in fuzzy inference system.

In this study a stock market trading strategy based on TA was created. We use three technical indicators to obtain buy/sell signals. Further, we apply GA to optimize input parameters for these indicators in order to discover set of parameters that will ensure the profitable outcome of stock market trading. We use profit factor as a performance measure of strategy successfulness. Profit factor is also used as a fitness function

for genetic algorithm. To test our model, we create virtual trading engine to simulate stock market trading. We use real data from American stock market.

The remainder of this paper is organized in four sections. In Section 2 we will give a theoretical basis of genetic algorithm. The proposed model is presented in Section 3. It gives necessary details about trading strategy and technical indicators being used to build it. In this section, we also explain the proposed mechanism for GA which is used to optimize trading strategy. In Section 4 we explain stock market data, experimental settings and performance measures used for testing the proposed model. Further, we present results and briefly discuss them. Finally, the paper is concluded with Section 5.

2. GENETIC ALGORITHM

Genetic algorithms (GAs) were invented by John Holland in the 1960s. Mitchell (1999) report that „ Holland's 1975 book *Adaptation in Natural and Artificial Systems* presented the genetic algorithm as an abstraction of biological evolution and gave a theoretical framework for adaptation under the GA. Holland's GA is a method for moving from one population of „chromosomes" (e.g., strings of ones and zeros, or „bits") to a new population by using a kind of „natural selection" together with the genetics−inspired operators of crossover, mutation, and inversion. Each chromosome consists of „genes" (e.g., bits), each gene being an instance of a particular „allele" (e.g., 0 or 1)." Accordingly we can say that GAs mimic the process of natural selection. Each individual in a population is characterized by a chromosome that represents its genetic code. Those individuals showing better adaptation (better fitness) in problem environment get the greater opportunity to reproduce themselves. This is the mechanism that allows "better genes" to spread across the population. For this reason, the new generation of individuals is better adapted from the previous one.

One of the main strengths of the GAs lie in the fact that they are able to determine the position of the global optimum in the area with several local extremes, in the so-called multimodal space. This is the reason why they are widely and extensively practiced for optimization purpose. However, as with other heuristics, there is no guarantee for optimal solution (global optimum).

There are three most important features, also known as genetic operators, which largely determine the success of a genetic algorithm. Those features are:

- reproduction (multiplication, crossover)
- mutations and
- selection.

The reproduction starts when two parents are selected to participate in the process. The most important characteristic of reproduction process is that the children inherit the properties of their parents. If the parents possess good genetic material then it is most likely that the child will posses good, if not better genetic material than the parents. Reproduction operator is binary and it can be defined as: uniform reproduction, reproduction with one breakpoint and reproduction with multiple breakpoints.

The mutation represents a random change of one or more alleles in a gene sequence. It is an unary operator, since it acts on one unit. The result of mutations is a changed unit. Mutation operator is very important since it helps GA to avoid local extremes and to restore lost genetic material.

The purpose of the selection process is the preservation and transfer of good traits to the next generation of units. It imitates the famous mechanism of "natural selection". The selection is used to choose best fitted units in a current population to enable them to participate in reproduction process. In this way the good genetic material is given opportunity to spread in next generation, while the bad material is rejected. However, continuous selection of the most fitted units and discarding others (so called elitism strategy) will lead to premature convergence of genes in a population. This effect usually ends with GA stucked in local optimum.

3. THE PROPOSED MODEL

The proposed model is consisted of input parameters, trading strategy and GA. In the following parts of this section we will give detail explanation of these components.

3.1. Technical indicators

In the following Table 1 we give details about technical indicators used for our trading strategy. These indicators are used to explain underlying model of a market and to signal trading opportunities for our trading system.

Table 1: Technical indicators

Indicator	Formula	Description
MACD line	$MACD(N,M) = EMA(N) - EMA(M)$	Moving Average Convergence/Divergence line tracks a difference between longer and shorter trend of the price
ROC	$ROC(N) = \frac{Price_t - Price_{(t-N)}}{Price_{(t-N)}} \cdot 100$	Rate of Change is designed to show the relative difference between today's closing price and the close N days ago
PSAR	$SAR_{(i)} = SAR_{(i-1)} + \alpha \cdot (ExtrimePrice - SAR_{(i-1)})$	Parabolic stop and reversal try to determine the end of current trend.

3.2. Strategy

Input parameters for the strategy are as follows:

- Input data are daily data consisted of opening, highest, lowest and closing prices.
- The initial trading account value
- Stop-loss and take-profit parameters
- Input parameters of previously explained technical indicators

When strategy is activated it first calculates indicator values for input price data using parameters provided with GA. Further, the strategy monitors indicators" values in order to check whether the trading conditions are met. If conditions are met, the strategy further checks if the position is already opened by the system or not. The strategy is written so that at one point it cannot manage more than one opened position. When position is finally opened, than the stop-loss and take-profit orders are set as closing conditions. Take-profit order is a trading order type that allows one to close out a profitable trade at a pre-determined price. On the other side, a stop-loss order is a protective order that closes out a losing position at some pre-determined price. When position is opened, the system monitors market price and if the price hits level of either one of these two orders, system closes position. When position is closed system recalculates account balance along with performance measures.

3.3. Model of genetic algorithm

The goal of this study is to apply GA to optimize trading strategy for automated trading. To optimize trading strategy we use profit factor as criteria function. Profit factor is a ratio of trading profits and losses. It is a discrete and multimodal but unknown function of many parameters. For this reason, GA represents an adequate tool for solving this problem. Since our trading model is based on technical indicators, the profit factor will be a function of indicators parameters.

The model of GA is probably the most important piece of work. Figure 1 shows the proposed model of GA used to optimize the proposed trading strategy.

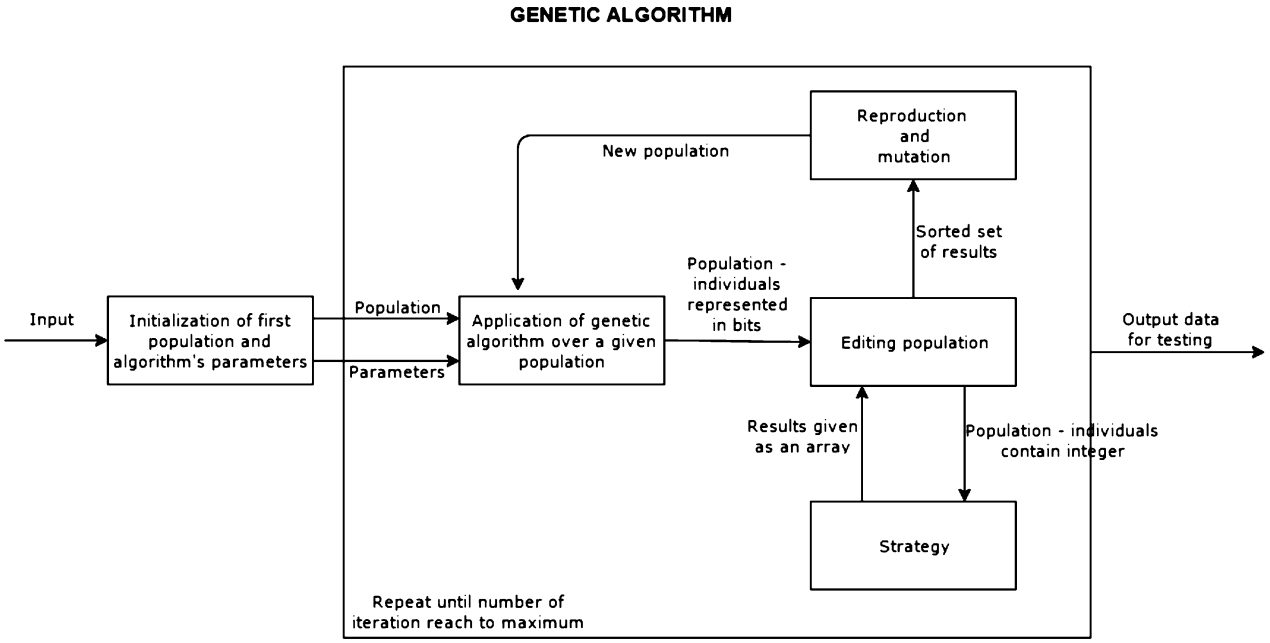

Figure 1: Model of the described genetic algorithm

In this study, we use binary representation to code genes in our GA. Consequently, genetic operators are also binary. One individual is represented with genetic sequence consisted of 5 genes and total of 27 alleles. Population is consisted of 64 individuals. Initial population is created randomly. Further, the selection procedure is such to retain certain percentage of the best individuals in population. The rest of population enters the reproduction process and creates children that will replace their parents in a new population. It is important to be noted that the better individual is fitted the greater chance for reproduction is assigned to it. In order to achieve this, we rank the rest of population by fitness and then split it in three parts. The first third of individuals is then duplicated before entering the reproduction pool. In that way we increase probability for their selection. We use multiple breakpoints as reproduction operator, which takes alleles alternately from both parents. The mutation is performed by random selection of alleles to be mutated. The number od alleles to be mutated (from 1 to 9) and their position in gene sequence (from 1 to 27) are determined randomly. Therefore, the mutation rate is not fixed but it changes through generations.

Our genetic code is consisted of 27 alleles which are used to represent 5 genes. Each gene represents one parameter in one of the three selected indicators. Parameters are coded in the following way:

- The first gene represents time window parameter of fast exponential moving average (EMA) within MACD indicator. It is coded as binary sequence consisted of 4 alleles which represent, when converted to integers, values between 0 and 15.
- The second gene is time window parameter of slow EMA within MACD indicator. It is coded with binary sequence of 5 alleles representing integer values between 0 and 31.
- The third gene is a binary sequence consisted of 5 alleles, representing time window in ROC indicator with values between 0 and 31.
- Fourth gene is a take-profit parameter described with a binary sequence of 7 alleles, representing integer values between 0 and 127.
- Finally, the fifth gene is a stop-loss parameter. It is a binary sequence of 6 alleles representing integer values between 0 and 63.

Evaluation of individuals is done in the following manner. Each individual is a set of parameters that are incorporated in trading strategy and tested against stock market data to obtain profit factor. The profit factor is adopted as a fitness function. Each individual is evaluated within population, while the process is repeated for each generation.

4. EXPERIMENTAL RESULTS

In this chapter we will present test data, experimental settings, performance measures and experimental results with the corresponding discussion.

4.1. Data

The data used in this experiment is a real US stock market data. We focus on two companies: Microsoft corporation (MSFT) and Nike Inc. (NKE). The data includes price series from 1 January 1994 to 31 December 2013. Data is separated in two samples: training data (in-sample) and test data (out-of-sample).

Table 2: *Microsoft data*

Date	Open	High	Low	Close
3.1.1994	2,52	2,52	2,48	2,51
4.1.1994	2,51	2,52	2,48	2,52
...	...	...	...	...
11.5.2000	33,31	24,06	32,88	33,94
12.5.2000	34,22	34,88	34,12	34,41
...	...	...	...	...
4.1.2007	29,7	29,97	29,44	29,81
5.1.2007	29,63	29,75	29,45	29,64
....	....	...	...	...
30.12.2013	37,22	37,38	36,9	37,29
31.12.2013	37,4	37,58	37,22	37,41

In Table 2 we present the structure of data. Data contains daily prices of shares including:

- price at the beginning of the trading day (open price)
- price at the end of the trading day (close price)
- the highest price for the trading day (high price)
- the lowest price for the trading day (low price)

4.2. Experimental settings

Here, we present the basic experimental settings of our model. The values of parameters used in the algorithm:

- Initial trading funds are 100.000 monetary units,
- Maximum number of iterations is 200 (which means GA will have 200 generations),
- Maximum population size is 64,
- Number of parents that are transferred to a new generation is 8 (12,5%),
- Number of children obtained is 56
- The number of alleles that will mutate in a selected individual is a random number between 1 and 9,
- Trading commission is accounted for 3%

4.3. Performance measures

The following measures are used to evaluate trading strategy performances:

- **Profit factor –** the ratio of total gains and total losses made by the strategy

$$Profit\ Factor = \frac{Total\ Gains}{Total\ Losses}; \tag{1}$$

- **Drawdown –** the biggest drop in trading funds relatively to the maximum achieved level;
- **Profit –** total net earnings made by the strategy; difference between final and initial size of trading funds.

4.4. Results and discussion

Having in mind the structure of genetic operators and the fact that initial population is chosen randomly, it is obvious that each new startup of our model will give different final solution. However, the solutions vary a little which indicates the obtained final solutions are relatively stable. In the following Tables 3, 4 and 5, we present results for best individuals (parameter combinations) obtained for MSFT in training period from 1 January 1994 to 31 December 2006.

Table 3: Best 5 individuals in training results for the first generation

Profit factor	Profit	Drawdown	Number of transaction	Short	Long	Roc period	Take profit	Stop loss
2,41	158,81%	-62,74%	13	3	13	10	13%	25%
1,26	51,33%	-72,52%	11	3	24	24	112%	21%
1,02	6,94%	-87,25%	14	13	20	22	47%	22%
0,94	-13,44%	-84,57%	11	4	19	27	64%	22%
0,89	-33,41%	-90,83%	14	14	27	16	114%	23%

Table 4: Best 3 individuals in training results for the 100th generation

Profit factor	Profit	Drawdown	Number of transaction	Short	Long	Roc period	Take profit	Stop loss
144.584,81	144,58%	-66,51%	14	11	30	14	5%	44%
144.584,81	144,58%	-66,51%	14	11	30	14	5%	46%
137.699,97	137,7%	-62,84%	14	11	12	12	5%	44%

Table 5: Best 3 individuals in training results for the 200th generation

Profit factor	Profit	Drawdown	Number of transaction	Short	Long	Roc period	Take profit	Stop loss
356.839,98	356,84%	-61,62%	10	10	30	10	15%	58%
322.377,43	322,37%	-61,62%	10	10	30	10	14%	60%
248.681	248,68%	-58,69%	18	10	30	10	6%	28%

As we can see in Table 3, there are only three profitable combinations of parameters in the initial population. Results for 100th generation shows that population contains 14 individual that are evaluated almost without losses. From the best three ones that are shown in Table 4, we can conclude that parameters begin to converge to certain values. This mean they are located in the vicinity of an optimum (local or global). In Table 5 we present results for the last 200th generation. Individuals in this generation are even more successful (with higher profit factor) than those in 100th generation.

Optimization of strategy using genetic algorithm took 2.348 seconds or a little less than 40 minutes. Compared to, for example, sequential optimizations, it takes much less time and the obtained final solutions are good enough. It is worth mentioning that the profit factor of the best strategy obtained by using genetic algorithm optimization is not much lower than the one obtained by sequential optimization. For this reason the time aspect is crucial. In order to react adequately and fast enough to changes in the market the data should be processed as quickly as possible. This information shows the importance and potential of using genetic algorithm to optimize trading strategies.

Tables 6 and 7 indicate the test results of the best strategies for MSFT and NKE in the period from 3 January 2007 to 31 December 2013.

Table 6: Test results for the best 3 individuals in training set (MSFT)

Profit factor	Profit	Drawdown	Number of transaction	Short	Long	Roc period	Take profit	Stop loss
53.415,46	53,42%	-62,59%	3	10	30	10	15%	58%
73.114,59	73,11%	-62,59%	4	10	30	10	14%	60%
0,84	-6,11%	-66,58%	6	10	30	10	6%	28%

Table 7: Test results for the best 3 individuals in training set (NKE)

Profit factor	Profit	Drawdown	Number of transaction	Short	Long	Roc period	Take profit	Stop loss
53.286,44	53,29%	-70,13%	3	10	30	10	15%	58%
1,52	17,92%	-50,21%	9	10	30	10	14%	60%
0,419	-34,71%	-68,74%	8	10	30	10	6%	28%

As can be seen from these tables, the first two strategies tested on the MSFT data operated positively. However, the gains were reduced. Contrary to the first two, test simulation of the third strategy shows negative profitability. The similar is with NKE data, though it should be noted that the second strategy has seen a big drop in profitability even though it remains positive. The reason for the fall in profitability of these strategies can be found in the fact the year of great economic crises in 2008 was covered by the test data sample. Such market behavior was not seen before that in train data which is the possible reason why the best fitted individuals in training experienced big drop in performance in test. The way in which this could be

overcome is to monitor the accounts and to stop the algorithm when losses hit a certain percentage of the maximum resources available, and then to have it re-learn from the new dataset including this period. This is one of the ideas for the future extensions of this study.

4. CONCLUSION

This paper describes stock market trading using genetic algorithm to optimize trading strategy parameters. The strategy employs technical indicators to obtain trading signals. The task of genetic algorithm is to optimize the parameters of technical indicators in order to find the most profitable trading strategy.

On the basis of results obtained in this paper, we can conclude that the genetic algorithm was successful in finding a strategy that will operate positively. We also conclude that one cannot absolutely rely on trading using the proposed algorithm, since the final solutions experience big drop in performances during test period. Further, the number of profitable trading strategies is not great. However, a good knowledge of financial instruments and properly written algorithm may lead to the creation of profitable trading strategies. Generally, the use of algorithms for trading on the stock market represents the future of automated trading. As automated trading makes up over 50% of the total trading on the stock exchange, we conclude that the application of genetic algorithm trading can be very useful and that it has a promising future.

Possible future directions of work on this topic may relate toward increasing the number of indicators used in the strategy and introducing fuzzy or some kind of multi-valued logic to model trading rules.

Abstract: *Keshavarz and Khorram (2011) developed a new approach to solve a fuzzy bi-criteria transportation problem, based on parametric linear programming. They stated four fuzzy goals, used the general non-linear programming model suggested by Bellman and Zadeh (1970) to aggregate them, and derived and solved two bi-level optimization problems. In this paper we propose an improved approach, such that the obtained solution reaches the highest level of satisfaction of the stated fuzzy goals. We recall an illustrative example to show the effectiveness of the new methodology.*

Keywords*: fuzzy programming, bi-criteria transportation, fuzzy interval, bi-level programming, parametric programming*

1. INTRODUCTION

The classical transportation problem is a particular case of a linear programming problem. Due to its particularity, the transportation problem is commonly solved using efficient specific algorithms, for instance simplified versions of the simplex technique. Despite the fact that the transportation problem is very old, nowadays researchers continue to pay attention to it. In the recent literature many heuristics are proposed to solve large-scale transportation problems. Also, generalized models involving fuzzy or stochastic quantities are introduced and discussed (see for instance Keshavarz and Khorram, (2011), Kundu et al. (2015), Li et al. (2014), Ojha et al. (2014), Sabbagh et al. (2015), Sterzik and Kopfer (2013), Wang et al. (2014)).

Kocken and Sivri (2015) proposed a new method to generate all optimal solutions to a fully fuzzy version of the solid transportation problem, i.e. a solid transportation problem with fuzzy costs coefficients, fuzzy supply, fuzzy demand, and fuzzy conveyance. They developed auxiliary programs to construct the parametric form of the solutions. Kaur and Kumar (2012) proposed a new algorithm for solving a special type of fuzzy transportation problems. They assumed that a decision maker is uncertain about the precise values of the transportation cost, but he is certain about the supply and demand of the product. They considered the uncertain quantities expressed by generalized trapezoidal fuzzy numbers; and developed their approach as direct extension of the classical one.

Ebrahimnejad (2014), by choosing a ranking function for the Kaur and Kumar's method to solve the fuzzy transportation problem, converted the original problem into a crisp one, thus reducing the computational complexity of the solving method. Keshavarz and Khorram (2011) solved a fuzzy bi-objective transportation problem using Bellman-Zadeh principle for aggregating the objective functions and the fuzzy goals. We address the same problem, and involve decisively the Pareto optimality concept in the solving approach.

The paper is organized as follows. In Section 2 we set up notation and terminology related to the fuzzy bi-criteria transportation problem (FBCTP). In Section 3 we briefly sketch the approach introduced by Keshavarz and Khorram (2011) to solving the FBCTP. In Section 4 we introduce an extended solving method, while in Section 5, we recall Example 2 from (Keshavarz and Khorram (2011) to illustrate the effectiveness of the new method. Section 6 provides the final remarks and suggests directions for the further research.

2. PROBLEM FORMULATION

In this section we present the general bi-criteria balanced transportation problem introduced by Keshavarz and Khorram (2011). The problem has *m* supply nodes and *n* destination nodes. Let S_i, $i=\overline{1,m}$, and D_j,

$j=\overline{1,n}$ denote the quantities that are supplied by the source node *i*, and the quantities that are required by the destination node *j*, respectively.

Let t_{ij} and p_{ij}, $i=\overline{1,m}$, $j=\overline{1,n}$ be the coefficients of the objective functions. Let x_{ij}, $i=\overline{1,m}$, $j=\overline{1,n}$ be the number of units transferred along the link (i,j). The problem is to determine a feasible way of transporting the available amount of commodities from sources to destinations, such that it minimizes the first objective function and maximizes the second one. The mathematical formulation of the general bi-criteria balanced (i.e. $\sum_{i=1}^{m} S_i = \sum_{j=1}^{n} D_j$) transportation problem is given by (1).

$$\begin{aligned}
&\min \quad \sum_{i=1}^{m}\sum_{j=1}^{n} t_{ij}x_{ij},\\
&\max \quad \sum_{i=1}^{m}\sum_{j=1}^{n} p_{ij}x_{ij},\\
&\text{s.t.} \quad \sum_{j=1}^{n} x_{ij} = S_i, \qquad i=\overline{1,m},\\
&\qquad \sum_{i=1}^{m} x_{ij} = D_j, \qquad j=\overline{1,n},\\
&\qquad x_{ij} \geq 0, \qquad i=\overline{1,m}, \quad j=\overline{1,n}.
\end{aligned} \tag{1}$$

For the FBCTP in (Keshavarz and Khorram (2011)), the coefficients t_{ij} and p_{ij}, $i=\overline{1,m}$, $j=\overline{1,n}$ were defined as fuzzy intervals, while the supply and demand quantities were exact numbers. For their problem, the desired solution must be a good compromise between four fuzzy goals defined as follows:

- given the coefficients α_{ij} and β_{ij}, the membership function of the first goal, on the link (i,j), is defined by

$$\mu_{ij}^{1}(t_{ij}) = \begin{cases} 1, & t_{ij} \geq \beta_{ij}, \\ (t_{ij}-\alpha_{ij})/(\beta_{ij}-\alpha_{ij}), & \alpha_{ij} < t_{ij} < \beta_{ij}, \\ 0, & \text{otherwise}, \end{cases} \tag{2}$$

- the membership function of the second goal is defined by

$$\mu^{2}(T(x)) = \begin{cases} 1, & T(x) \leq \alpha, \\ (\beta - T(x))/(\beta-\alpha), & \alpha < T(x) < \beta, \\ 0, & \text{otherwise}, \end{cases} \tag{3}$$

  where $T(x) = \sum_{i=1}^{m}\sum_{j=1}^{n} t_{ij}x_{ij}$, $\alpha = \min_{x\in X} \sum_{i=1}^{m}\sum_{j=1}^{n} \alpha_{ij}x_{ij}$, and $\beta = \max_{x\in X} \sum_{i=1}^{m}\sum_{j=1}^{n} \beta_{ij}x_{ij}$ (note that the second goal is inverse related to the first one, through the coefficients α_{ij} and β_{ij} used in defining both of them);
- given the coefficients a_{ij} and b_{ij}, the membership function of the third goal, related to the transportation on the link (i,j), is defined by

$$\mu_{ij}^{3}(p_{ij}) = \begin{cases} 1, & p_{ij} \leq a_{ij}, \\ (b_{ij}-p_{ij})/(b_{ij}-a_{ij}), & a_{ij} < T(x) < b_{ij}, \\ 0, & \text{otherwise}, \end{cases} \tag{4}$$

- the membership function of the fourth goal is defined by

$$\mu^{4}(P(x)) = \begin{cases} 1, & P(x) \geq b, \\ (P(x)-a)/(b-a), & a < P(x) < b, \\ 0, & \text{otherwise}, \end{cases} \tag{5}$$

where $P(x)=\sum_{i=1}^{m}\sum_{j=1}^{n} p_{ij}x_{ij}$, $a=\min_{x\in X}\sum_{i=1}^{m}\sum_{j=1}^{n} a_{ij}x_{ij}$, and $b=\max_{x\in X}\sum_{i=1}^{m}\sum_{j=1}^{n} b_{ij}x_{ij}$ (note that the forth goal is inverse related to the third one, through the coefficients a_{ij} and b_{ij} used in defining both of them).

3. KESHAVARZ AND KHORRAM'S SOLVING APPROACH

In this section we briefly present Keshavarz and Khorram's (2011) solving approach.

Keshavarz and Khorram (2011) chose the Bellman-Zadeh principle to solve the FBCTP. More precisely, the membership functions of the fuzzy goals of the FBCTP were aggregated using the max-min operator, as shown in (6).

$$\max_{x\in X}\left\{\min\left\{\min_{(i,j)\mid x_{ij}\neq 0}\left(\mu_{ij}^{1}(t_{ij})\right),\min_{(i,j)\mid x_{ij}\neq 0}\left(\mu_{ij}^{3}(p_{ij})\right),\mu^{2}(T(x)),\mu^{4}(P(x))\right\}\right\}, \tag{6}$$

where μ_{ij}^{1}, μ^{2}, μ_{ij}^{3}, and μ^{4} are defined by (2), (3), (4), and (5), respectively; and X is the feasible set of Problem (1). More precisely, for each $x\in X$, only those membership functions μ_{ij}^{1} and μ_{ij}^{3} that have indexes (i,j) such that $x_{ij}\neq 0$ were considered in (6).

Since the max-min problem (6) is generally nonlinear, Keshavarz and Khorram (2011) proposed a way to simplify it for the particular case of a FBCTP. They first formulated a bi-level problem with two parametric objective functions in the lower level (Model (23) in Keshavarz and Khorram (2011)); and announced that the optimal transportation assignment should be a Pareto optimal solution to the lower level problem.

Further, they proceeded to solve separately two bi-level problems, namely (7) and (8)

$$\begin{aligned}&\max \quad \lambda\\ &\text{s.t.} \quad \mathrm{f}(\lambda,\bar{\mathrm{x}})\le 0,\ g(\lambda,\bar{x})\le 0,\ \mathrm{f}(\lambda,\bar{\mathrm{x}})\cdot g(\lambda,\bar{x})=0\\ &\qquad \bar{x}\in \arg\min\left\{\sum_{i=1}^{m}\sum_{j=1}^{n}\left(\alpha_{ij}+(\beta_{ij}-\alpha_{ij})\lambda\right)x_{ij}\mid x\in X\right\}\end{aligned} \tag{7}$$

$$\begin{aligned}&\max \quad \lambda\\ &\text{s.t.} \quad \mathrm{f}(\lambda,\bar{\mathrm{x}})\le 0,\ g(\lambda,\bar{x})\le 0,\ \mathrm{f}(\lambda,\bar{\mathrm{x}})\cdot g(\lambda,\bar{x})=0\\ &\qquad \bar{x}\in \arg\min\left\{\sum_{i=1}^{m}\sum_{j=1}^{n}\left(b_{ij}-(b_{ij}-a_{ij})\lambda\right)x_{ij}\mid x\in X\right\}\end{aligned} \tag{8}$$

where

$$f(\lambda,x)=\lambda-\frac{\beta-\sum_{(i,j)\mid x_{ij}\neq 0}\left(\alpha_{ij}+(\beta_{ij}-\alpha_{ij})\lambda\right)x_{ij}}{\beta-\alpha},\quad g(\lambda,x)=\lambda-\frac{\sum_{(i,j)\mid x_{ij}\neq 0}\left(b_{ij}-(b_{ij}-a_{ij})\lambda\right)x_{ij}-a}{b-a}. \tag{9}$$

Finally, they compared the two solutions, and chose as final solution the one with the maximal value of λ.

Note that Keshavarz and Khorram solved two bi-level problems instead of the original bi-level problem with a bi-objective function on lower level; and obtained a Pareto optimal solution to the original bi-objective problem, but not that solution that defines the transportation assignment with the highest level of satisfaction of all four fuzzy goals. An improved solution, with respect to the satisfaction level of the original fuzzy goals, may be obtained by analyzing the entire set of Pareto optimal basic solutions. The extended method presented in Section 4 supports this statement. The numerical example presented in Section 5 illustrates it.

4. THE EXTENDED SOLVING METHOD

Our extended method decisively relays on the efficient set of the parametric bi-objective optimization problem

$$
\begin{aligned}
\min \quad & \sum_{i=1}^{m}\sum_{j=1}^{n}\left(\alpha_{ij}+\left(\beta_{ij}-\alpha_{ij}\right)\lambda\right)x_{ij} \\
\max \quad & \sum_{i=1}^{m}\sum_{j=1}^{n}\left(b_{ij}-\left(b_{ij}-a_{ij}\right)\lambda\right)x_{ij} \\
\text{s.t.} \quad & \sum_{i=1}^{m} x_{ij} = D_j, \quad j=\overline{1,n} \\
& \sum_{j=1}^{n} x_{ij} = S_i, \quad i=\overline{1,m} \\
& x_{ij} \geq 0, \quad i=\overline{1,m}, \quad j=\overline{1,n}
\end{aligned}
\tag{10}
$$

In order to solve Problem (10), we combine a parametric linear programming analysis with a bi-objective simplex method, and find all basic feasible solutions that are efficient solutions for at least one value of $\lambda \in [0,1]$.

A parametric simplex algorithm for bi-objective linear programs can be found in Ehrgott (2005). This algorithm aggregates the two objective functions using a parameter $w \in (0,1)$, and provides a sequence of efficient basic feasible solutions to the bi-objective problem. For a bi-objective problem with coefficients depending on a parameter λ, in addition, we apply an efficiency test (for instance Benson's method, see Benson (1978)) to each basic feasible solution to determine whether it is efficient or not, and, if it is efficient, to find for which values of the parameter λ it remains efficient.

In what follows we propose a general method – Algorithm 4.1 – to find the efficient basic feasible solutions to the parametric bi-objective linear programming problem (10).

Algorithm 4.1.

- **Step 1.** Set $h \leftarrow 0$, and $\lambda^h \leftarrow 0$.
- **Step 2.** While $\lambda^h < 1$ do
  - solve Problem (10) with $\lambda \leftarrow \lambda^h$, using the parametric simplex algorithm (Ehrgott (2005)), and obtain the set of all efficient basic feasible solutions X_{eff}^h;
  - for each $x \in X_{eff}^h$, using the efficiency test (Benson (1978)) find the maximal interval $[\lambda^h, \lambda_x]$ such that *x* is efficient solution to (10) for every $\lambda \in [\lambda^h, \lambda_x]$;
  - compute $\lambda_{\min} = \min\{\lambda_x \mid x \in X_{eff}^h\}$;
  - set $h \leftarrow h+1$;
  - if $\lambda_{\min} \geq 1$, then set $\lambda^h \leftarrow 1$ otherwise $\lambda^h \leftarrow \lambda_{\min}$;

  end-while.
- **Step 3.** Set $s \leftarrow h$.

Algorithm 4.1 provides a sequence of sets X_{eff}^r, $r=\overline{0,s-1}$ together with a sequence of intervals $[\lambda^r, \lambda^{r+1}]$, $r=\overline{0,s-1}$.

Further, we construct

$$
X_{eff} = \bigcup_{r=0}^{s-1} X_{eff}^r , \tag{11}
$$

and for each $x \in X_{eff}$ we derive the set

$$
\Lambda_x = \bigcup_{r \in \{h \mid 0 \leq h < s, x \in X_{eff}^h\}} [\lambda^r, \lambda^{r+1}] \tag{12}
$$

Algorithm 4.2 solves Problem (6); thus finding the transportation assignment with the highest λ-level of satisfaction of all four original fuzzy goals. It uses Algorithm 4.1 to solve the problem on the lower level. The steps of Algorithm 4.2 are summarized below.

Algorithm 4.2.

- **Step 1.** Find all sets X_{eff}^{r}, and the corresponding intervals $\left[\lambda^{r},\lambda^{r+1}\right], r=\overline{0,s-1}$ that solve the bi-objective problem (10) using Algorithm 4.1.
- **Step 2.** Construct X_{eff} and Λ_x, $x \in X_{eff}$ using (11) and (12), respectively.
- **Step 3.** For each $x \in X_{eff}$
  - find λ_x^f, the unique solution to $f(\lambda,x)=0$, *f* defined by (9);
  - find λ_x^g, the unique solution to $g(\lambda,x)=0$, *g* defined by (9);
  - compute $\lambda_x=\min\left\{\lambda_x^f,\lambda_x^g\right\}$. If $\lambda_x \notin \Lambda_x$, then remove *x* from X_{eff}^{r}.
- **Step 4.** Find $\lambda^*=\max\left\{\lambda_x \mid x \in X_{eff}\right\}$ and x^* such that $\lambda^*=\lambda_{x^*}$.

5. NUMERICAL RESULTS

In this section, we recall the numerical example from (Keshavarz and Khorram, 2011), and use it to show that our extended solving method yields a solution that is better than Keshavarz and Khorram's solution, from the point of view of the λ-level of satisfaction of all four original fuzzy goals.

Practically, we solve the FBCTP with parameters given in Table 1. The intervals that describe the fuzzy coefficients of the criteria are given as pairs $<\alpha_{ij},\beta_{ij}>/<a_{ij},b_{ij}>$, $i=\overline{1,3}, j=\overline{1,4}$.

Table 1: Fuzzy intervals $<\alpha_{ij},\beta_{ij}>/<a_{ij},b_{ij}>$ for the coefficients t_{ij} and p_{ij}, $i=\overline{1,3}$, $j=\overline{1,4}$,

	***j*=1**	***j*=2**	***j*=3**	***j*=4**	**Supply**
i=1	<5,10>/<2,7>	<4,9>/<3,8>	<5,8>/<6,9>	<6,7>/<3,5>	10
i=2	<3,9>/<8,11>	<3,6>/<7,9>	<6,10>/<6,12>	<6,15>/<4,10>	20
i=3	<2,12>/<7,12>	<5,10>/<5,11>	<7,9>/<7,7>	<8,10>/<3,4>	40
Demand	20	10	15	25	

The left and right endpoints of the intervals for defining the second and the forth goals, computed by Keshavarz and Khorram, are α =335, β =815, a =310, and b =695 respectively.

Following the extended methodology, we generated all basic feasible solutions $\overline{x^k}$, $k=\overline{1,6}$, that are efficient solutions to the parametric Problem (10) for at least one value of λ, hence handling the compromise among the second and forth goals. For each solution $\overline{x^k}$ we computed the λ-level of the satisfaction of the first and third goals, (λ_f^k and λ_g^k, respectively), and derived $\lambda_{\min}^k$ as $\min\left\{\lambda_f^k,\lambda_g^k\right\}$ (see Table 2). As final solution, we chose the solution $\overline{x^k}$ with the greatest value of $\lambda_{\min}^k$.

Our optimal solution is $\overline{x^3}$ =(0,0,0,10,0,5,0,15,20,5,15,0) with the corresponding $\lambda_{\min}^k$ =0.5275591.

Table 2: The efficient basic feasible solutions

k	$\overline{x^k}$	λ_f^k	λ_g^k	$\lambda_{\min}^k$	$T\left(\lambda_{\min}^k,\overline{x^k}\right)$	$P\left(\lambda_{\min}^k,\overline{x^k}\right)$
1	(0,0,5,5,0,0,0,20,20,10,10,0)	0.5052632	0.5507246	0.5052632	572.47368	535.8947
2	(0,0,0,10,0,0,5,15,20,10,10,0)	0.5191257	0.5401460	0.5191257	565.81967	524.2623
3	(0,0,0,10,0,5,0,15,20,5,15,0)	0.5363128	0.5275591	0.5275591	553.93701	513.1102
4	(0,0,0,10,0,10,0,10,20,0,15,5)	0.5647059	0.5	0.5	520	502.5
5	(0,0,0,10,0,10,10,0,20,0,5,15)	0.5875	0.475	0.475	497	492.875
6	(0,0,0,10,10,10,0,0,10,0,15,15)	0.6081081	0.4326923	0.4326923	477.5	476.5865

Optimizing the objective functions distinctly, Keshavarz and Khorram obtained only two Pareto optimal solutions to Problem (10), the marginal ones, $\overline{x^1}$ and $\overline{x^2}$ in Table 2. For each of these two solutions, they computed the λ-level of the satisfaction of the original fuzzy goals, and chose the solution with the greatest value of λ. Their maximal λ =0.5052632 was obtained for $\overline{x^1}$ =(0,0,5,5,0,0,0,20,20,10,10,0).

The values of the objective functions for each Pareto optimal solution $\overline{x^k}$, $k=\overline{1,6}$, are also given in Table 2. Comparing our solution to the solution of Keshavarz and Khorram we found $T\left(\lambda^3_{\min},\overline{x^3}\right)<T\left(\lambda^1_{\min},\overline{x^1}\right)$ and $P\left(\lambda^3_{\min},\overline{x^3}\right)<P\left(\lambda^1_{\min},\overline{x^1}\right)$. The value of the first objective function at our solution is better (smaller) than the old one, while the value of the second objective at our solution is worse (smaller) than the old one. Both transportation assignments $\overline{x^1}$ and $\overline{x^3}$ are efficient solutions from the point of view of the original objective functions, thus they cannot be compared without looking to an additional attribute. Since the additional attribute for the FBCTP is the λ-level of the satisfaction of the original fuzzy goals, we conclude that our solution $\overline{x^3}$ to the transportation problem is better than the one proposed by Keshavarz and Khorram (2011).

6. CONCLUSIONS

In this paper we addressed the FBCTP introduced by Keshavarz and Khorram (2011). Keshavarz and Khorram solved the FBCTP via Bellman-Zadeh principle and desired to obtain the highest level of satisfaction of four original fuzzy goals.

In order to solve the FBCTP, we involved the Pareto optimality concept in our solving approach; and developed an algorithm that chooses, among the basic feasible Pareto optimal solutions to a parametric bi-criteria transportation problem, the solution with the highest level of satisfaction of all four fuzzy goals. Using the same numerical example as in Keshavarz and Khorram (2011), and solving it using the new algorithm, we obtained improved results, thus illustrating the effectiveness of our methodology.

The FBCTP may be solved using the new concepts of fuzzy solution to fuzzy optimization problems. In our future work we want to research the possibility to find the values of a membership function related to a certain fuzzy set solution to the FBCTP.

Abstract *This paper present one problem that appear in supply chain from a perspective of a distributor in FMCG (fast–moving consumer goods), where goods are being ordered and sold every day in big quantities. Using predictive models for demand supply planning, planner calculate optimal quantities of products that should be delivered to retailers. However, these quantities rarely match with packaging units and truck weight limits and therefore must be adjusted. For solving the observed problem, mathematical model was formulated where we discuss two different ways of its application: obtaining of optimal weights and examination of the influence of packaging sizes on optimal vehicles loading. The optimization results show to decision maker how to avoid the decrease of DOC (days of coverage) and on the other hand to avoid increase of DOC for poorly performing products especially if they have high costs of stock-keeping. Second scenario shows that both proposed types of packaging are better in all performances than the results for pallet as packaging unit.*

Keywords*: supply chain, distributor, order quantities, mathematical model, optimization*

1. INTRODUCTION

A modern company must constantly respond to the huge challenges of the market and improve their business. To ensure optimal functioning, company has to react preventively and plan each of its activities. Distribution systems, which will be discussed in this paper as one of the most complex systems require constant analysis of supply chains. The challenge of coordinating operations across all facets of a business has become known as supply chain management (SCM) (Stank et al. 2001). Supply chain management can achieve significant savings by reducing the cost of inventory and planning, affect other business processes. SCM (Supply chain management) can be defined as integrated process wherein a number of various business entities (i.e., suppliers, manufacturers, distributors, and retailers) work together in an effort to: (1) acquire raw materials, (2) convert these raw materials into specified final products, and (3) deliver these final products to customers (Beamon, 1998). Another definition notes a supply chain is the network of organizations that are involved, through upstream and downstream linkages, in the different processes and activities that produce value in the form of products and services delivered to the ultimate consumer (Christopher 1992). It involves two basic processes tightly integrated with each other: the production planning and inventory control process, which deals with manufacturing, storage, and their interfaces, and the distribution and logistics process, which determines how products are retrieved and transported from the warehouse to retailers (Tsiakis et al. 2001). Supply chain management is not just another name for logistics. It includes elements that are not typically included in a definition of logistics, such as information systems integration and coordination of planning and control activities (Cooper et al. 1997).

The term supply chain management has risen to prominence over the past ten years (Cooper et al. 1997) and has grown in importance, although the approach was introduced in early 1980 (Oliver and Webber 1982). This concept received considerable attention in the popular business press and in some academic literatures (Cooper et al. 1997).

Uncertainty plays an important role in the modern supply chain systems (Xu et al. 2003). Underestimating uncertainty and its impact can lead to planning decisions that might jeopardize a company. One of the key sources of uncertainty in any production-distribution system is the product demand. (Gupta et al. 2003). Having the competitive product and right supply chain is not enough thus supply chain has to be right for the individual customer as well (Hoover et al. 2001). Demand chain design is based on a thorough market understanding and has to be managed in such a way as to effectively meet differing customer needs (Treville

et al. 2004). Demand integration includes increased access to demand information throughout the supply chain to permit rapid and efficient delivery, coordinated planning, and improved logistics communication. (Treville et al. 2004). In a broader sense, DCM (Demand Chain Management) can be defined as "a set of practices aimed at managing and co-ordinating the whole demand chain, starting from the end customer and working backward to raw material supplier (Selen et al. 2002).

Demand Supply chain problem became attractive in recently years. Authors analyzed a one-supplier–one-retailer model (Weng, 1995), one-supplier–two-retailer case (Zheng et al. 2001), generalized the model to one-supplier–many retailer case. (Zheng et al. 2001) and studied the situation in which the price–demand relationship varied from period to period, but was known in each period. (Zhao et al. 2002).

This paper deals with one particular problem recognized at FMCG Company. The observed problem appears in operational planning at supply chains distributors. Based on demand data and information about retailer's inventory, planner should decide which quantities of products to deliver to retailer. The goal is to provide desired days of stock coverage. However, such quantities often do not correspond to the packaging units of products as well as the total products quantities often do not correspond to the desired capacities utilization of provided vehicles. In this paper, we formulate this operational decision as an optimization problem. This particular problem directly arise from real life and, according to our knowledge based on available literature, it is not previously formulated in that manner.

The paper consists of four sections. Section 2 is related to detailed description of the observed problem and its mathematical model formulations. Section 3 gives numerical results of a group of scenarios on real-life example of distributer of fast-moving consumer goods. Conclusions and directions of the further research are described in Section 4.

2. PROBLEM DESCRIPTION AND MATHEMATICAL MODEL FORMULATION

From the perspective of a distributor in FMCG (Fast-moving consumer goods), where goods are being ordered and sold every day in big quantities, demand and supply planner encounters many problems in day-to-day business. One of the issues which we are trying to improve using this model is the problem of fulfillment of a truck when ordering from the producer. As the biggest part of the transportation costs are fixed, therefore the distributor and the producer agreed on ordering at least 97% (q) of the full truck (Q).

However, using predictive models for demand supply planning, optimal ordering quantities rarely match with the truck weight limits (volume is not the issue in this problem as all the products are of a high density). Therefore, a planner has to modify optimal quantities he got using predictive models and adapt them to fill each truck with at least 97% of its maximum weight capacity.

Every product has defined its perfect inventory period (ip) which serves as a target when modeling ordering quantities, hence every change in suggested optimal ordering quantity will modify the actual days of coverage (DOC) which represents the number of days for which our goods on stock (iap) can fulfill the needs of forecasted sales (sf). The ideal quantity of each product which is used as a target during every order planning represents inventory theoretical (it) which is calculated as a sales forecast (sf) for the targeted inventory period (ip). Having in mind that between two orders (daily, weekly, monthly) some sales have happened which is commonly followed by uncertainty, a planner uses a formula where from inventory theoretical subtracting actual inventory at the moment of ordering and adding sales forecast for the period until the next moment of ordering to get the optimal ordering quantities (tr). Later in the model explanation, these optimal ordering quantities will be called the estimated weight of the product. Additionally, those optimal ordering quantities have to fulfill the packaging unit condition which means that the ordered quantity of every particular product has to be rounded to nearest integer of packaging units.

Following changes of optimal quantities to satisfy the packaging units and the truck fulfillment conditions can have two possible negative outcomes; if the quantity is decreased from optimal, there is a chance there will be not enough goods to satisfy the sales, hence being out of stock and miss the sales opportunity; if the quantity is increased, negative outcome is increasing costs of stock-keeping and having non-optimal cash flow.

First negative outcome is often considered more undesirable and that is why we are going to give a bigger penalty in our model if the order quantities are to be decreased from optimal (pd). Penalty for increasing the ordered quantity is defined as (pi).

The notation used in the mathematical model of the formulated problem is as follows.

N – set of products,

Parameters:

Q – capacity of the vehicle,

q - minimum required vehicles' charge status (%),

tr_j - the estimated weight of the j-th product to load into vehicles, $j \in N$,

p_j - packaging unit of the j-th product, $j \in N$,

iap_j - inventory actual

sf_j - sales forecast of the j-th product (weight), $j \in N$,

it_j - inventory theoretical of the j-th product (weight), $j \in N$,

ip_j - preferred DOC, inventory coverage of the j-th product (days), $j \in N$,

pi - penalty for increasing the preferred inventory coverage,

pd - penalty for decreasing the preferred inventory coverage.

Variables:

x_j - weight of the j-th product that should be to loaded into vehicles, $j \in N$,

y_j - number of packages of the j-th product that should be to loaded into vehicles, $j \in N$,

z - number of vehicles needed for transportation,

di_j - increasing the preferred inventory coverage for the j-th product (days), $j \in N$,

di_j - negative deviation variables for the tr_j, increasing of the estimated weight of the j-th product to load into vehicles, $j \in N$,

dd_j - positive deviation variables for the tr_j, decreasing of the estimated weight of the j-th product to load into vehicles, $j \in N$,

$doci_j$ - negative deviation variables for the ip_j, increasing of the preferred DOC for the j-th product (days), $j \in N$,

$docd_j$ - positive deviation variables for the ip_j, decreasing of the preferred DOC for the j-th product (days), $j \in N$,

Using the introduced notation, the following mathematical model was formulated:

$$(\min)\ \ pi \cdot \sum_{j \in N}` doci_j + pd \cdot \sum_{j \in N}` docd_j \tag{1}$$

s.t.

$$x_j - di_j + dd_j = tr_j,\ j \in N \tag{2}$$

$$\sum_{j \in N}` x_j \geq Q \cdot q \cdot z \tag{3}$$

$$\sum_{j \in N}` x_j \leq Q \cdot z \tag{4}$$

$$\frac{ip_j \cdot (iap_j - sf_j + x_j)}{it_j} - doci_j + docd_j = ip_j,\ j \in N \tag{5}$$

$$x_j - p_j \cdot y_j = 0,\ j \in N \tag{6}$$

$$x_j \geq 0, di_j \geq 0, dd_j \geq 0, doci_j \geq 0, docd_j \geq 0, y_j \in \square^+, j \in N$$

Objective function (1) minimize total penalized increasing and decreasing the prefered DOC. The constraint (2) is related to the estimated weights of the products. These weights can not always be satisfied because of the products packaging units and vehicles capacities. Therefore, deviations are allowed but not penalized. The constraints (3) and (4) refer to the minimum and maximum vehicle capacity that must be reached and must not be exceeded. The constraint (5) is related to the preferred DOC which cannot always be reached for the same reasons stated in the constraint (2). Since the main goal of the transport planning is to achieve preferred DOCs, negative and positive deviations are penalized in the objective function. The constraint (6) conects two types of variables (weight and the number of packages of the j-th product) and ensure that the optimal weight of the product corresponds to the integer number of packages.

Note: Variable z that appears in constraints (3) and (4) can be defined as parameter if desired number of vehicle is known in advance.

3. NUMERICAL RESULTS

In order to evaluate the proposed mathematical model (1-6) we discuss two different ways of its application. First one refers to obtaining of optimal weights i.e. number of packages of products that should be loaded into vehicles in order to fulfill requested vehicle capacity with minimal disturbance of required days of coverare. The second application is related to the examination of the influence of packaging sizes on optimal vehicles loading.

Both applications will be ilustrated on a range of 234 products in the field of cosmetics and household chemicals. Total estimated weight of the products is 123947.621kg. Since the capacity of one vehicle is 23500kg this weight requires 5.2744 vehicles. It is obvious that the estimated weights of the products should be adjusted to fulfill whole number of vehicles. In addition, estimated weights of the products in most cases do not correspond whole numbers of packages. Therefore, this type of adjustment is also needed.

In determining the optimal weights of products that should be loaded into vehicles, the following four scenarios was tested:

1. Decreasing the preferred DOC is penalized five times more than its increasing; z is a variable.
2. Penalties for decreasing and increasing are the same; z is a variable.
3. Decreasing the preferred DOC is penalized five times more than it's increasing; z is a parameter equal to 5.
4. Penalties for decreasing and increasing are the same; z is a parameter equal to 5.

The model (1-6) has been implemented and solved using GNU Linear Programming Kit (GLPK, 2016). The optimal solutions for all four scenarios are shown in Table 1. In addition to total penalized increasing and decreasing (Objective), number of vehicles and total weight of optimal products quantities, Table 1 gives maximal inreasing and decreasing of DOC for each solution. The right part of the table shows the number of products for which increasing of DOC is between 2 and 5 days i.e. up to one week (column 1w), between 5 and 10 days i.e. 1 to 2 weeks (column 2w) and more than 10 days i.e. 2 weeks (column >2w). Analogue values are given in columns named DOC decreasing.

Table 1. Optimal solutions

				max DOC		DOC increasing			DOC decreasing		
Scenario	Objective	Number of vehicles	Total weight	inc	dec	1 w	2 w	> 2 w	1 w	2 w	> 2 w
1	188.581	6	136779	11.069	-1.048	37	5	1	1	0	0
2	130.537	6	136771	9.091	-8.660	19	3	0	10	1	0
3	222.168	5	117496	11.069	-5.372	34	5	1	0	1	0
4	138.381	5	117491	9.091	-8.660	17	3	0	12	1	0

Although the lower value of the objective function is achieved in the scenario 2, it requires one vehicle more than scenarios 3 and 4. In practice, the decision-maker would decide to fill 5 rather than 6 vehicles considering that the total estimated weight of products required 5.27 vehicles. Therefore, only scenarios 3 and 4 should be considered. Values of objective functions in these two scenarios are incomparable due to

the different penalties for DOC decreasing. In addition, none of these two scenarios dominating in all deviations of DOCs. Scenario 3 gives lower maximal DOC decreasing but higher maximal DOC increasing and more products with DOC deviation than scenario 4. On the other hand, scenario 4 gives 12 products with DOC decreasing more than scenario 3. Therefore, the final decision is on the decision maker. However, the decision maker should always have in mind prioritized products with high importance to avoid the decrease of DOC and on the other hand to avoid increase of DOC for poorly performing products especially if they have high costs of stock-keeping.

The packaging unit for about the half of the product portfolio in the previous example is the pallet. This is the main reason for the inability to obtain solutions with 5 vehicles in the scenarios 1 and 2, although the required number of vehicles based on estimated weight of the products is closer to 5 than 6. Hence, we have investigated how smaller packaging units influence on optimal weights of products and consequently optimal number of vehicles. Table 2 gives optimal solution for four previously defined scenarios when packaging units are layers (P1) and cases (P2) instead of pallets.

Table 2. Optimal solutions with smaller packaging units

Packaging unit	Scenario	Objective	Number of vehicles	Total weight	max DOC		DOC increasing			DOC decreasing		
					inc	dec	1 w	2 w	> 2 w	1 w	2 w	> 2 w
P1	1	106.541	6	136773	6.258	-0.409	19	2	0	0	0	0
	2	69.867	5	117494	4.080	-3.148	8	0	0	7	0	0
	3	126.648	5	117500	6.258	-3.787	18	2	0	1	0	0
	4	69.867	5	117494	4.080	-3.148	8	0	0	7	0	0
P2	1	92.8418	6	136772	6.258	-0.409	16	3	0	0	0	0
	2	60.1435	5	117500	4.080	-3.361	8	0	0	5	0	0
	3	107.128	5	117499	6.258	-3.558	16	2	0	1	0	0
	4	60.1435	5	117500	4.080	-3.361	8	0	0	5	0	0

The results obtained for both types of packaging are better in all performances than the results for pallet as packaging unit. However, if high penalty is given to the DOC decreasing (scenario 1), optimal solution with 5 vehicles cannot be obtained, regardless packaging unit. Finally, using layers as packaging units is more appropriate than cases due to reception issues in a warehouse where cases of the same product could be dispersed among different pallets and with layers that's not of concern.

4. CONCLUSION

The subject of this paper is one optimization problem that is recognized in real life FMCG distribution company. Planners are faced ones a week with the problem of determining the quantities of products that should be delivered to retailers. Based on demand and retailer's inventory data, planners calculate the quantities of products that provide the desired days of stock coverage. Since these quantities usualy do not correspond to packaging units and vehicle capacities, they should be adjusted. In this paper, we have observed that problem as an optimization problem and formulated corresponding mixed integer mathematical model. The proposed models can be used at two level. The first use is for obtaining the optimal weights of products that should be loaded into vehicles. The second use is related to the examination how packaging sizes influence on optimal vehicles loading. Both application were illustrated on FMCG company. Obtained results show that, as expected, package units smaller than pallets provide better adjustment. However, the final decision about packaging units should be made by responsible decision maker, which is enabled by the proposed approach.

The proposed mathematical model includes determination of the number of vehicles assuming they are of the same capacity. Since, the capacities of vehiclel can differ, observed problem could be modified by introducing the assignment of products to individual vehicles. The inclusion of this feature into the problem would require the modification of the mathematical model and, probably, development of appropriate heuristic.

OPTIMAL HETEROGENEOUS STAFF SCHEDULING IN CASE OF PLANNING A SPECIAL EVENT

Maja Hadžiahmetović*, Minja Marinović,
Universtiy of Belgrade, Faculty of Organizational Sciences
*Corresponding author, e-mail: hadziahmetovic.maja@fon.bg.ac.rs

Abstract: *In this paper a scheduling staff problem with multiple work skills in case of planning a special event is presented. This problem can be quite challenging because each special event has different conditions regarding days of preparation, activities which need to be done, the number of staff required and their qualification. However, not all staff members, whether they are a part of organizational management, interns or volunteers possess all of the required skills, and they cannot be available at all times which can bring to the scheduling problem. This paper deals with such problem, introducing an original mathematical model used on a real-life example of scheduling staff for the Knight Fest held each year in Belgrade, Serbia. The problem is formulated and solved using goal programming model.*

Keywords: *staff scheduling, goal programming, optimization, heterogeneous staff, multi-skill workforce*

1. INTRODUCTION

Scheduling staff represents a problem where organization assigns working schedules to its employees in order to meet the demand for the goods or services they provide. (Ernst et al. 2004) These schedules have a purpose of maximizing the employees' productivity or their preferences towards shifts, days off or holidays or minimize the costs of their assignment or even both. However, it is rather complicated to find the optimal solution to this problem since there are many conditions to meet in the organization itself as well outside of it. The cause of this complexity is that there are many government rules regarding staff deployment which vary from one country to another.

Staff scheduling as an optimization problem has become an extremely important and popular area in the field of operations research. The reason for that is that there are always new problems which occur in different branches of business where each requires special approaches, methods and applications. This is why there are many ways of solving scheduling problems, especially because there is no universal solution because each organization no matter what its' core businesses, has unique ways of functioning, deployment politics, or government regulations which need to be taken into account. However, what all of these organizations have in common is to use their staff in the most efficient way. Personnel scheduling is applicable at most for scheduling medical staff, see (Hall, 2012), (Cheang et al. 2003), (Azaiez and Al Sharif 2005), call center operators, see Avramidis et al. (2010), Stefanov et al. (2014) and airline companies (Brusco et al. 1995), (Barnhart et al. 2003) .

Assignment staff problem started to occur in the fifties of the XX century. The interest of science for this area and the subject continues to this day, even though the problem had some significant changes from the Dantzig (1954) and Edie`s (1954) problem that has been related to traffic delays at toll booths. One of the first classification methods for assigning staff was presented by Baker (1976), in which he presented three types of problems of scheduling staff. The first type covers scheduling shifts “shift scheduling”, the second type is related to “days-off scheduling” while the third type presents the combination of first two types (tour scheduling). Alfares (2004) proposes ten categories for staff allocation: (1) manual solution, (2) integer programming, (3) implicit modeling, (4) decomposition, (5) goal programming, (6) working set generation, (7) LP-based solution, (8) construction and improvement, (9) metaheuristics, (10) other methods. When it comes to literature review on this subject, comprehensive literature review of classical studies on this problem is given in Ernst et al. (2004) while the extensive amount of covered papers on this subject is presented by Van Den Bergh et al. (2012) Present scheduling staff problem can be divided according to belonging areas, with the largest number of published papers focused on allocating staff employed in airlines, medical personnel and call center’s operators as a new form of staff allocation. A similar problem of scheduling heterogeneous staff with part-time employees with limited availability is presented by Hojati and Patil (2010). Scheduling employees method that combines two-step procedure in one which iterates between

a schedule evaluator and a schedule generator is presented by Ingolfsson et al. (2011). Mohan (2008) suggests another approach for maximizing employees` satisfaction with certain restrictions considering their availability, preferences for the shifts and seniority level.

This paper presents a heterogeneous staff scheduling problem in case of planning a special event. This is a special form of staff deployment, since it is limited in time, requires a great number of staff with different skills, the tasks which need to performed have multiple level of difficulty. Consequently, it is possible to employ volunteers or interns since the days of preparation usually last much more than the event itself and they are carried out on various locations. The suggested solution would provide an optimal schedule of all staff depending on their skills and availability, respecting conditions concerning a minimal and a maximum number of staff allowed in order to minimize the costs of their assignment for each day required for the organization and preparation of the event itself. The problem was formulated using 0-1 goal programming model and solved exactly. Therefore, it would be needed to change only the input data about staff availability and to get a new optimal solution for each day necessary until the event is over.

The paper is organized as follows. After the introductory part, Section 2 describes a problem of scheduling employees in case of special events. Section 3 describes model formulation and presents an original mathematical model for the solving problem described in Section 2. Numerical results are presented in Section 4 and discussed in the real-life example of staff scheduling for the manifestation named Knight Fest. Conclusions and suggestions regarding future work are given in Section 5.

2. PROBLEM DESCRIPTION

The paper discusses a problem of determining the optimal schedule of staff members with different hierarchy levels when planning a special event. Each special event has different organizational goals and a specific way of deployment of its employees. This means that there is no common solution when planning events such as these since each event differs from other significantly. For that reason, it can be rather challenging to schedule employees where there is not a common pattern of work to follow or shifts to change on a daily or weekly level. These types of scheduling often require a large number of staff and recourses for the sake of everything to look the most authentic and go as planned. That is why the organization has to be done days, usually months in advance which leads to the fact that plenty of staff needs to be hired in order to everything go well. The staff is usually divided into groups, depending on their wages, position, availability and the scope of work they do. Since there is a vast number of activities which have to be done, it is expected that not all staff member are qualified to do them all. Especially because most special events demand to hire a large number of volunteers and interns to do less complex jobs, which do not require special skills, for a small or no fee included. This is why staff member with experience are eligible to work on all activities, where interns and volunteers do not have to be familiar with all of the activities which need to be done.

Besides the diversity in staff members, there are many activities which contribute to the organization itself, before the main event occurs. These activities, among many, may include marketing, promotion, organizational and IT skills and they have to be held in various locations depending on the prepared timeline. At each location, the activities are carried out in several terms during the day.

For each of these terms, there is a minimal number of available staff required, where it is necessary that, at least, one of the staff with experience (neither a volunteer nor an intern) is present during each term and location. Even though the volunteers do not receive a salary, a certain amount of money has to be set aside for their meals, transportation etc. Interns, however, do receive a salary, but it is significantly lower than managers' due to the fact they do not have as much experience. Since there is a difference in working hours for each of the group of staff, their availability during the day may vary. Depending on their function for each group the assigned number of given terms is different, including the fact that not all of them are available every day and every term. For example, the volunteers may be assigned to not more than two terms and locations during one day, interns have a maximum number of three terms and locations, where experienced staff should work four terms during one day (and four locations). The break period usually lasts one hour between terms and it could be used for rest, meals and switching locations if they were assigned so.

Taking everything into account, it is necessary to create an optimal schedule and assign all activities to staff members for each day, respecting the given constraints in order to minimize costs needed to pay staff members.

3. MODEL FORMULATION

In the formulation of a mathematical model for optimal staff scheduling using goal programming, the following notation has been used:

Sets:

I – set of all staff that need to be scheduled, $i \in I$,
I_v – set of volunteers, $I_v \subset I$
I_o – set of organizational managers, $I_o \subset I$,
I_p – set of interns, $I_p \subset I$, $I_v \cup I_o \cup I_p = I$,
J – set of activities, $j \in J$,
K – set of locations, $k \in K$
T – set of terms during the day, $t \in T$

The variable X can be described as follows:

$$x_{ijkt} = \begin{cases} 1 & \text{if staff member } i \text{ is assigned to the activity } j \text{ on the location } k \text{ in the term } t \\ 0 & \text{otherwise} \end{cases}$$

The matrix A describes whether the certain staff member is qualified to do the given activity. The elements of the matrix A are:

$$a_{ij} = \begin{cases} 1 & \text{if staff member } i \text{ is qualified to do the activity } j \\ 0 & \text{otherwise} \end{cases}$$

The elements of the matrix A could also be real numbers from 0 to 1, giving the fact that perhaps, some staff members are more or less familiar with a certain activity. In this case, number one would mean that the staff member *i* is fully familiar with the activity *j,* and zero would mean that he is not familiar at all.

As mentioned above, not all members are available to work every term of the day on each location. The matrix B shows if a staff member *i* is available to work on the given term and location. The elements of matrix B are:

$$b_{ikt} = \begin{cases} 1 & \text{if staff member } i \text{ is available on the location } k \text{ in the term } t \\ 0 & \text{otherwise} \end{cases}$$

Mathematical model of staff scheduling is described as follows:

$$\min \sum_{i \in I} \sum_{j \in J} \sum_{k \in K} \sum_{t \in T} c_i \cdot x_{ijkt} \tag{1}$$

s.t.

$$\sum_{i \in I} \sum_{j \in J} x_{ijkt} \le p_{kt}, \; k \in K, \; t \in T \tag{2}$$

$$\sum_{i \in I} \sum_{j \in J} x_{ijkt} \ge d_{kt}, \; k \in K, \; t \in T \tag{3}$$

$$\sum_{i \in I_o} x_{ijkt} \ge 1, \; j \in J, \; k \in K, \; t \in T \tag{4}$$

$$\sum_{i \in I_p} x_{ijkt} \ge mip_{jkt}, \; j \in J, \; k \in K, \; t \in T \tag{5}$$

$$\sum_{i \in I_v} x_{ijkt} \ge miv_{jkt}, \; j \in J, \; k \in K, \; t \in T \tag{6}$$

$$\sum_{j \in J} x_{ijkt} \leq b_{ikt}, \; i \in I, k \in K, t \in T \tag{7}$$

$$x_{ijkt} \leq a_{ij}, \; i \in I, j \in J, k \in K, t \in T \tag{8}$$

$$\sum_{j \in J} \sum_{k \in K} \sum_{t \in T} x_{ijkt} \leq mv, \; i \in I_v \tag{9}$$

$$\sum_{j \in J} \sum_{k \in K} \sum_{t \in T} x_{ijkt} \leq mp, \; i \in I_p \tag{10}$$

$$\sum_{j \in J} \sum_{k \in K} \sum_{t \in T} x_{ijkt} \leq mo, \; i \in I_o \tag{11}$$

$$\sum_{j \in J} \sum_{k \in K} x_{ijkt} \leq 1, \; i \in I, \; t \in T \tag{12}$$

The goal function (1) minimizes the costs which need to be paid for each worker. The parameter c_i represents the cost for the staff member *i*, regardless of the skill level they possess. The majority of these costs include wages, but these costs include expenses such as food or transportation since volunteers do not receive wages for the activities they do. Constraints (2) and (3) refer to the maximum and minimal number of staff on each location and term of the day, where parameters p_{kt} and d_{kt} represent these numbers respectively. Constraints (4)-(6) represent a minimal number for each staff group for every activity, term and on each location. Parameters miv_{jkt}, mip_{jkt}, mio_{jkt} are integer numbers for each group. The seventh constraint assigns location and term for each available staff member defined by matrix B. Constraint (8) provides that only qualified members for certain activities are assigned to those activities. Constraints (9)-(11) describe a maximum number of locations which need to be assigned. For volunteers that number is two, for interns three, and for organizational managers, the maximum number of locations is four. Finally, constraint (12) provides that it is impossible to assign the same term for different location when it comes to the staff member *i*.

4. NUMERICAL RESULTS

Each year a traditional manifestation, the Knight Fest, is held in Belgrade, Serbia. The Knight Fest is a multimedia knight spectacle which is held on a great children holiday – Lazarus' Saturday/Palm Sunday on Belgrade fortress ("Knight Fest", 2016). The event falls into one of the most interesting events of this type, and it is a major tourist attraction.

The main event, the festival itself, is held on Belgrade fortress while the activities concerning preparation and promotion of the festival are held in various locations in Belgrade such as city center, shopping malls and other manifestations and events. Activities consist of festival organization, marketing activities, human resources activities (HR), knowing knight skills (such as fencing, horsemanship, and medieval warfare), logistics and IT skills, and all of these activities are held in locations mentioned above. The staff is divided into three groups, in total of 98 persons, and they all consist of eight organizational managers, 20 interns and 70 volunteers, where interns and volunteers do not have the full-time commitment; however, there is a difference in working hours for both of these groups. The whole preparation lasts for 15 days (including the two days of the festival), and each day consists of five terms which last two hours and between the terms there is a break included. The first term starts at 8:00 AM, and the last finishes at 10:00 PM. The maximum number of terms for each of these groups varies. The volunteers should not work more than two terms per day, the interns three, while the organizational managers not more than four terms a day. However, there should always be present at least one member of the organizational management to supervise and give additional help to interns and volunteers. There is as well a maximum and a minimal number of all staff members for each location and each term, and a minimal number of interns and volunteers for each activity, location and term. For example, if a minimal number for each term in on the certain location for interns and volunteers is 10 for all activities given above, and there is at least one member of organizational managers included that would be a total of at least 11 staff members. In spite of this, the minimal number for that location and term is 15. Therefore, four additional members must be assigned depending only on their availability and costs.

These minimal numbers for terms and locations excluding the qualifications are eight for all shopping malls, 15 for the city center and 20 for each place on the Belgrade fortress, while the minimal number for each activity, location and term varied from two to five depending on the term itself, size and attractiveness of the locations and number of activities which could be performed there.

The problem was observed on one day, and it could be applicable to all days of the festival, including the preparation and the manifestation itself, changing only the input data about availability of the staff and the quotes for the maximum and minimum number regarding the terms, activities and locations.

The problem was successfully solved using the GNU *Linear Programming Kit* (GLPK) (GLPK, 2016), open source software for solving problems of linear and mixed integer programming, on the computer with the following specifications: *Intel(R) Core (TM) i7-2600 CPU* (3.40 GHz), *RAM* 12 GB. The process of finding the optimal integer solution took 0.3 seconds. This problem contains 123480 variables. The goal function value is 13650 monetary units. The optimal solution for the each term is shown in Tables 1-5.

Tables 1-5 present the optimal schedule for the each term of one day in the organization the Knight Fest. The integer number before the letter shows how many of certain type of staff is assigned to given activities and locations, where the letter *o* stands for the organizational manager, letter *v* for volunteers and the letter *p* stands for interns. From the Table 1, it is possible to conclude that there is a total of 6 organizational managers, 56 volunteers and 17 interns assigned in total for the mentioned activities and locations. The minimal number of all staff members in the first term and location1 was 15 and the minimal number for each activity was 4, 2, 1, 1, 2, 1 respectfully as given in the table. This means that there were four staff members

to assign additionally in order to fulfill the constraint regarding the minimal number. This was achieved by assigning four extra volunteers who were available regardless of their qualification. The same observation can be applied to other four tables. One interesting example can be found in term 5 on location1 where there was a need for a minimum of one organizational manager, three interns, and seven volunteers, but because of unavailability of volunteers software found a solution with only two additional volunteers, one additional organizational manager and one additional intern.

5. CONCLUSION AND FURTHER RESEARCH

The subject of this paper is the problem of scheduling heterogeneous multi-skill staff in case of organizing a special event. Although the staff scheduling problem, in general, was recognized more than sixty years ago, most organizations still perform this type of work manually, without the help of software which causes more time, energy and there is no warranty that the solution found this way would be even acceptable, nevertheless optimal. The paper proposed an optimal solution to a certain problem of this type – staff scheduling in case of planning and organizing a special event, as a specific type of staff scheduling. Since the schedule is applicable only for the time of the event whereas its preparation is limited in time, its organization requires multiple locations where different activities are carried out. Therefore, additional staff can be deployed and for less complex activities it is possible to hire volunteers or students as a part of their internship program. This is why it can be quite complex to create an optimal schedule which would provide minimal costs of deployment and respect all the conditions which were given. The problem was observed on the real-life example and translated into a mathematical model using 0-1 goal programming model and successfully solved using GLPK software.

The problem was scheduling multi-skill heterogeneous staff in order to plan a manifestation named The Knight Fest held each year in Belgrade, Serbia. The festival required around two weeks in total for preparation and the manifestation itself. For each day there were several locations to work on, and various activities had to be carried out. A single day was observed for this problem, where each day had five terms where actual work had to be done, and four breaks between. The staff assigned to this event consisted of organizational managers, interns and volunteers, unevenly distributed. Each of these groups had different wages and limitations concerning the minimal number of each group, the maximum number of the locations and terms which needed to be assigned to them and their availability and qualifications were taken into account.

Since the problem was observed on a single day of the festival organization, the future research could include planning for every day of the organization. This would probably lead to the fact that staff could have certain shifts and maybe a fixed working schedule. Also, it could lead to assigning the same activities to the same people during whole 15 days. As said before, their qualifications could be real numbers from 0 to 1 so it should be aimed to maximize their qualifications as well as minimizing costs which would lead to multi-criteria optimization. One of the ideas could be to decide whether is it better to deploy one organizational manager or two volunteers since in this proportion their wages would be very similar but the amount of work, knowledge and decision-making process would be different when it could be possible to choose between these two options.

AGENT-BASED MODELS: A REVIEW OF APPLICATIONS

Nikola Zornic*[1], Aleksandar Markovic[1]
[1]University of Belgrade, Faculty of Organizational Sciences
*Corresponding author, e-mail: nikola.zornic@fon.bg.ac.rs

Abstract: *Agent-based models (ABMs) have been used in various fields of science with growing interest. After a description of the approach, some interesting bibliometric data on ABM usage in numerous fields is presented, including a citation network analysis. Almost 3000 papers from Thomson Reuters Web of Science (Science Citation Index Expanded and Social Sciences Citation Index) databases have been scrutinized in terms of keywords and field of application, as well as publishing frequency in the observed journals for the period 2000-2015. Examples of thought-provoking usage in solving optimization problems and analysis of customer behaviour are also presented to depict the vast applicability.*

Keywords*: agent-based model, agent-based simulation, application review, bibliometrics, literature review*

1. INTRODUCTION

Agent-based models (ABMs) consist of a set of elements (agents) characterized by specific attributes, which interact with each other through the definition of appropriate rules in a given environment. ABMs can be used to reproduce systems related to ecology (Gerst et al., 2013), economy (Shafiei et al., 2012), agriculture (Rebaudo & Dangles, 2013), medicine (Kasaie, Andrews, Kelton, & Dowdy, 2014), to solve optimization problems (Nikolopoulou & Ierapetritou, 2012), and many others. The use of ABMs can help in understanding properties and patterns concerning the whole scenario (Billari, Fent, Prskawetz, & Scheffran, 2006) that could not be anticipated nor predicted by the observation of agents individually due to the complexity of the interactions among the elements of the system (Barbati, Bruno, & Genovese, 2012). Wooldridge and Jennings (1995) defined agent as computational system interacting with an environment, that can be described with the following features:

- *Independence* - Each agent acts without the direct control of human beings or other devices.
- *Social ability* - Interactions occur among agents through a communication language with the aim to satisfy the objectives.
- *Re-activeness* - Agents answer in a precise way to signals coming from the environment.
- *Pro-activeness* - Agents are capable of acting goal-directed. They take the initiative in order to satisfy their objectives.

Furthermore, it can be concluded from Billari et al. (2006) and Weiss (1999), that the development of an ABM needs a set of basic building blocks to be defined:

- *The object of the simulation* - It has to be specified what is the phenomenon/problem to be reproduced. Also, space, where the simulation takes place, has to be defined.
- *The agents' population* - Agents can be grouped into different categories with common characteristics, reproducing the various components of the reproduced system.
- *The adaptive capability of each agent category* - Agents of each category present a specific adaptive capability, i.e. the degree of reactiveness and pro-activeness.
- *The interaction paradigm among agents* - Each agent can interact with agents of the same or another category. In this context, agents can be competitive if they have conflicting objectives and non-competitive otherwise. In the literature, various interaction paradigms have been defined, which can be mainly classified as *Cooperative paradigms*, when a coordination from among non-competitive agents exists and *Competitive paradigms*, in which some rules for the behavior of competitive agents are defined (Weiss, 1999).

In order to follow their own objectives, agents are interacting and communicating among themselves. Communication capabilities consist of the ability to send and receive messages. This is required to ensure a coordination mechanism among agents, in order to prevent and avoid conflicts among agents' accessing resources or achieving objectives.

Implementing a cooperation-based paradigm means employing planning approaches to reduce resource contention and to ensure the achievement of global objectives. No mediator is involved. In this case, each

agent is self-interested, meaning that the final solution may be the best for the single agent involved, but not for the group as a whole. These approaches can be distinguished into two main categories (Barbati et al., 2012):

- *Distributed approaches*, in which agents are endowed with self-organizing rules for resource sharing and goal pursuing.
- *Centralized approaches*, in which a mediator agent is assigned with the task of regulating and supervising agents' behaviors.

Since its first appearance in early 1970s, the exploration of the ABM literature has seen vigorous development, especially in the last decade owing to availability of various ABM software. This paper employs a bibliometric methodology that is geared towards a review of literature productivity, and an observation of the trends in ABM.

After defining agent-based models more closely, the paper is organized as follows. A bibliometric review of ABMs usage in scientific papers is presented in section 2. Then, the application of ABMs in chosen fields is exemplarily demonstrated in section 3. Finally, conclusions and some prospects for the future research are provided in section 4.

2. BIBLIOMETRIC REVIEW OF ABMs APPLICATION

In order to analyze the presence of ABMs in the scientific literature we have performed a search through the Thomson Reuters Web of Science (Thomson Reuters, 2016b) in Science Citation Index Expanded (SCI-EXPANDED) and Social Sciences Citation Index (SSCI) databases and collected data. The keywords we were looking for are:

"agent-based simulation" OR "agent-based model"

for the time interval 2000-2015, as there is an inconsiderable amount of published papers in previous years. The search was conducted for the *topic*, which includes: title, abstract, author and keywords in Web of Science (Thomson Reuters, 2016b).

As displayed in Table 1, we have collected data for 2902 papers. The increase in a number of papers per year is evident, which means the method is becoming more acknowledged. The number of ABM-related papers increased almost 30 times from 2000. until 2015, while total number of SCI-EXPANDED and SSCI papers increased only 1.77 times in the same time period. The biggest leap in ABM-related published papers occurred in period 2012-2013, from 294 to 380.

Table 1: Number of ABM-related and total SCI-EXPANDED & SSCI papers

Year	ABM Papers	Total SCI-EXPANDED & SSCI Papers
2000	15	1,099,828
2001	33	1,087,477
2002	30	1,132,596
2003	61	1,177,644
2004	72	1,272,284
2005	92	1,340,592
2006	116	1,399,016
2007	118	1,471,075
2008	137	1,553,662
2009	173	1,613,263
2010	227	1,650,449
2011	290	1,736,725
2012	294	1,820,086
2013	380	1,917,193
2014	415	1,942,001
2015	449	1,945,858
Total	**2902**	**24,159,749**

Those 2902 papers are published in 908 journals. In Table 2 we present 19 journals with at least 20 papers published in the observed period. The top contributor is the *Journal of Artificial Societies and Social Simulation* with 208 papers published. Since its first issue in 1998, it has been one of the leading references for readers interested in social simulation and the application of computer simulation in the social sciences. The list of journals shows a multidisciplinary interest in ABMs. In addition to journals that are expected to be on the list, journals specialized in Simulation and Modeling (*Journal of Artificial Societies and Social Simulation*, *Simulation Modelling Practice and Theory*, etc.), there are journals specialized in other scientific fields, like: Ecology (*Ecological Modelling*, *Environmental Modelling & Software*, etc.), Biology (*Journal of Theoretical Biology*), Economics (*Journal of Economic Dynamics and Control*, *Journal of Economic Interaction and Coordination*), etc.

Table 2: Journals accounting for at least 20 papers

Journal	Papers	Journal IF (2014)	IF Without Journal Self Cites (2014)	% IF Change Without Self Cites
Journal of Artificial Societies and Social Simulation	208	0.941	0.811	-13.82%
Physica A: Statistical Mechanics and its Applications	88	1.732	1.181	-31.81%
PLoS ONE	88	3.234	2.885	-10.79%
Journal of Theoretical Biology	62	2.116	1.868	-11.72%
Ecological Modelling	61	2.321	2.085	-10.17%
Environmental Modelling & Software	49	4.420	2.636	-40.36%
Advances in Complex Systems	45	0.968	0.920	-4.96%
SIMULATION: Transactions of The Society for Modeling and Simulation International	40	0.818	0.631	-22.86%
Simulation Modelling Practice and Theory	33	1.383	1.064	-23.07%
Computers, Environment and Urban Systems	32	1.537	1.349	-12.23%
Computational and Mathematical Organization Theory	24	0.840	0.740	-11.90%
Expert Systems With Applications	24	2.240	1.793	-19.96%
Journal of Economic Dynamics and Control	22	1.018	0.851	-16.40%
Journal of Economic Interaction and Coordination	22	0.962	0.807	-16.11%
Energy Policy	21	2.575	2.106	-18.21%
Physical Review E	21	2.288	1.778	-22.29%
Environment and Planning B: Planning and Design	20	0.983	0.941	-4.27%
Journal of Economic Behavior & Organization	20	1.297	1.154	-11.03%
Journal of Simulation	20	0.580	0.500	-13.79%

Table 2 also reports impact factor (IF), IF without journal self-citations, and percentage of change in IF after the self-citations have been excluded. Data about journals and IF is collected from Tomson Reuters InCites™ (Thomson Reuters, 2016a). We can see that the journal with the highest IF (4.420) is *Environmental Modelling & Software*, which is also the journal with the highest decrease in IF after the self-citations were excluded (-40.36%). Journal that stands out with high IF (3.234) and a small percentage of change after the self-citations have been excluded (-10.79%) is *PloS ONE*. We can also see that there are journals with IF lower than 1 (*Environment and Planning B: Planning* and *Design and Advances in Complex Systems*) whose IF did not drastically change after excluding self-citations - change is lower than 5%.

Additional analysis of citations is conducted using network visualization and exploration software Gephi (Gephi, 2016). Total citation count for the selected journals has been collected from the Tomson Reuters InCites™ (Thomson Reuters, 2016a) for the period until 2014. The obtained results are displayed in Figure 1, where node size is determined by the percentage of self-citations specific journal has (number self-citations divided by a total number of citations). For example, it is noticeable that *Computers, Environment and Urban Systems* has lowest (5.56%) and *Environmental Modelling & Software* highest (20.48%) percentage of self-citations. The weight of the line is defined as the sum of percentages of citations acquired from the other observed journal. For example, *Physica A: Statistical Mechanics and its Applications* got 1015 citations from *Physical Review E* and has 16,974 citations in total, which means *Physica A: Statistical Mechanics and its Applications* got 5.98% of citations from *Physical Review E*. In the other direction, *Physical Review E* got 2948 citations from *Physica A: Statistical Mechanics and its Applications* and has

81,746 in total, which means *Physical Review E* got 3.61% of citations from *Physica A: Statistical Mechanics and its Applications.* The weight of line is determined by the sum of these percentages (5.98% + 3.61%). The size of the arrow is defined separately for each side in a similar manner. For example, the two-sided arrow between *Physical Review E* and *Physica A: Statistical Mechanics and its Applications* means that journals have cited each other quite often. Connection between *Physica A: Statistical Mechanics and its Applications* and *Advances in Complex Systems* stands out. Namely, *Advances in Complex Systems* is very frequently cited by *Physica A: Statistical Mechanics and its Applications* (8.19% of total citations *Advances in Complex Systems* received are from *Physica A: Statistical Mechanics and its Applications*). Similarly, we can analyze the remaining connections between journals.

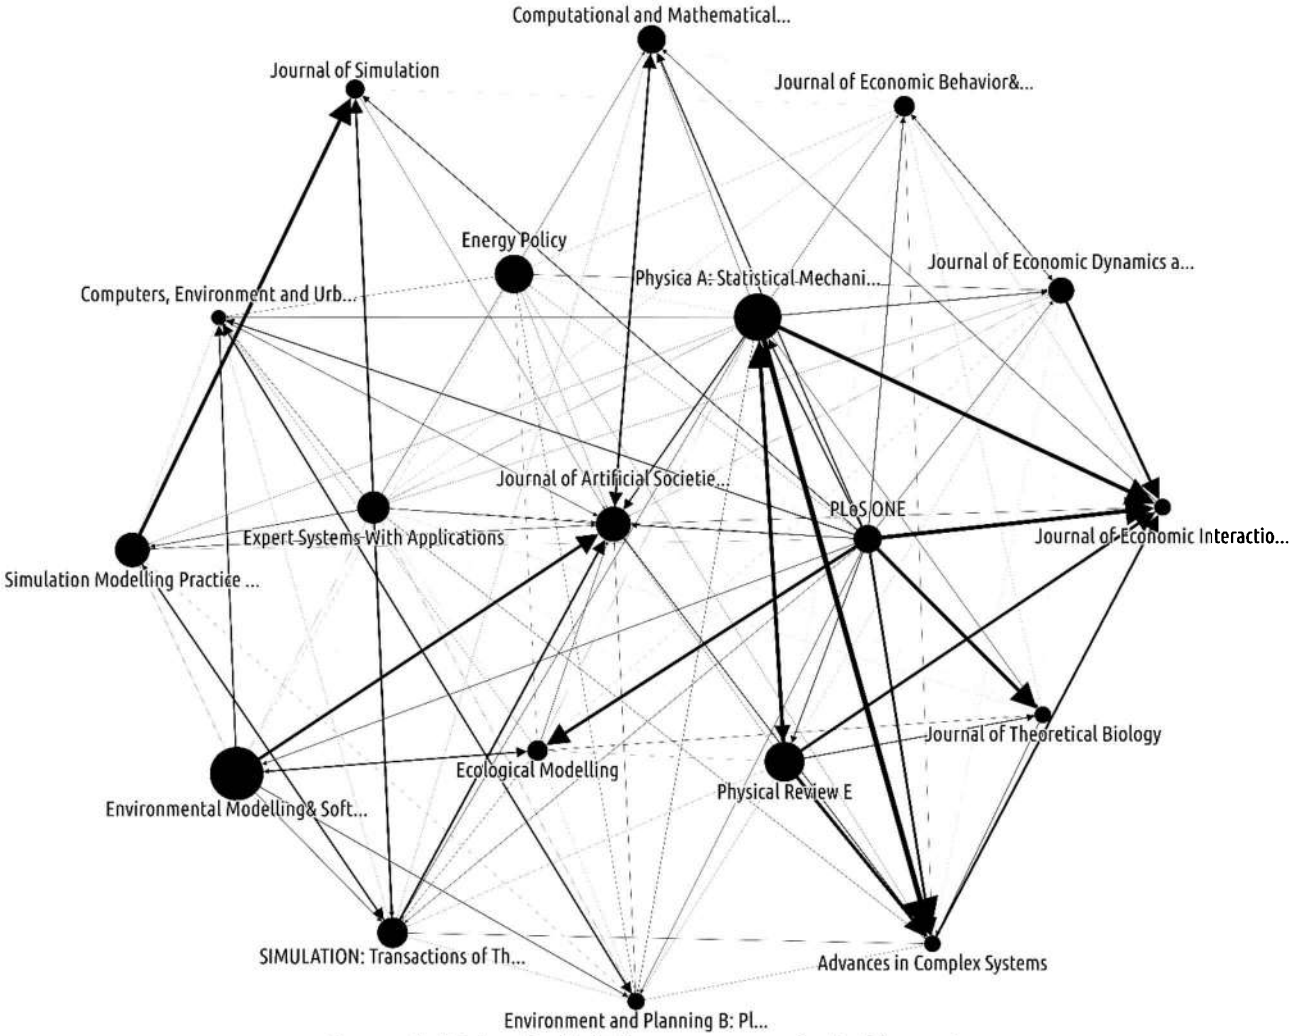

Figure 1: Network of citations among selected journals

Analyzing the research area retreived from Web of Science (Thomson Reuters, 2016b), ABMs are applied in (Table 3), we can provide one more evidence that ABMs are suitable for solving various problems. It is particularly interesting that *Environmental Sciences & Ecology* and *Business & Economics* are among areas with most frequent ABMs usage, just behind IT related areas. In the next paper section, we presented some of the applications in these fields.

Table 3: Research area

Research Area	Papers	Research Area	Papers
Computer Science	635	Life Sciences & Biomedicine - Other Topics	140
Environmental Sciences & Ecology	441	Geography	101
Engineering	396	Transportation	86
Business & Economics	364	Mathematical Methods In Social Sciences	63
Social Sciences - Other Topics	254	Public, Environmental & Occupational Health	63
Science & Technology - Other Topics	219	Biochemistry & Molecular Biology	55

Research Area	Papers	Research Area	Papers
Mathematics	202	Sociology	53
Operations Research & Management Science	185	Information Science & Library Science	52
Mathematical & Computational Biology	165	Psychology	51

We also wanted to place attention on the keywords authors chose to best represent their work (Table 4), the most frequent keywords used in the observed papers. Disregarding the presumed ones (such as *model*, *systems*, *simulation*, etc.), other keywords are describing the field of application (such as *management*, *social networks*, etc.). Another keyword which is very popular in recent years is *optimization* (Barbati et al., 2012).

3. APPLICATION EXAMPLES

The applicability of the agent-based models and agent-based simulation is exemplarily demonstrated in two fields which were found interesting: optimization problems and analysis of customer behaviour.

3.1. Optimization problems

Agent-based approaches are successfully employed to tackle a broad class of scheduling, transportation, supply chain planning, and other optimization problems (Barbati et al., 2012). Some of the attention-grabbing examples are presented in the following research papers.

Böcker, Lind, and Zirkler (2001) presented the scheduling system for railway transport system train coupling and sharing (TCS). This scheduling system includes the planning of travel units and the optimization of solutions. The usage of ABM allows planning in a real-time scenario. The initially defined solution is then optimized by a simulated trading approach.

Fischer and Gehring (2005) used ABM as a supporting system for planning transshipments of imported finished vehicles via a seaport. The focus was on storage allocation, i.e. allocation of parking areas for the temporary storage of vehicles and on deployment scheduling, i.e. the allocation of drivers to the vehicles that have to be moved in the terminal area. Planning tasks, which is usually carried out by different operators, are assigned to two different agent types: a further agent and the coordinator agent, who is responsible for combining the local sub-plans into a global plan in such a way that the demand for drivers is minimized and balanced.

An ABM, which can simulate a supply chain, was developed by Liang and Huang (2006). The main purpose of their model is to coordinate all entities of the supply chain and minimize total cost while every entity may

use different inventory system. Two types of agents are employed: control agents (each echelon has agents of this type) and demand forecast agents. The control agent collects historical demand data and strategies from managers and aims at building rule-base for supply chain management. The demand forecast agent, which communicates with control agents, is using a genetic algorithm (GA) to forecast each echelon's demand and minimize the total cost for the entire supply chain.

3.2. Analysis of customer behaviour

Consumer behavior research is a multidisciplinary phenomenon which involves various areas: psychology, marketing, sociology, economics, and engineering (Zhang & Zhang, 2007). The process in which consumers make their purchase decisions has been of great interest to researchers and practitioners for a long time (Burnett & Lunsford, 1994). Interactions among consumers and the purchase decision-making process generate market dynamics, such as the decoy effect and lock-in. Research into consumers' purchase decision-making and interactions increases the understanding of market dynamics. Traditional studies on consumer decision patterns, such as data mining, focus on using static equilibrium-based mathematical and statistical techniques to model consumers' socio-demographic and behavioral data (Zhang & Zhang, 2007). However, three types of data exist regarding consumer purchase decisions: 1) demographic data, 2) behavioral data, and 3) psychographic data (Rud, 2001). ABMs take a stage exactly here as they can incorporate all three types of data to analyze customers' behavior in more detail.

Cavoski and Markovic (2015) applied ABM to analyze customers' behaviour and online retailers' strategies. They identified three key segments of the observed system: the seller segment, the consumer segment, and the communication channel segment. Each of these segments are afterwards modeled as one type of agent population. Namely, they used empirical and theoretical data retrieved from the B2C online market for modelling agents. As a result of this modelling process, market managers are provided with the tool for investigating impacts of implementing their own business strategies (Marković, Čavoški, & Novović, 2016).

Another interesting application of ABM is in predicting electric vehicles market share evolution (Shafiei et al., 2012). The model has potential to analyze the effects of fuel prices, vehicles' attributes, consumer preferences, and social influences. The market share evolution of electric vehicles is observed in different scenarios. The results showed that electric vehicles can be successfully adopted in moderate and favorable scenarios. In adverse scenarios, like the ones with low gasoline price and the one with constantly high electronic vehicle price, support policies are needed (such as reduction in import taxes and infrastructure development for easier recharging).

4. CONCLUSION

In this work, the application of agent-based models is reviewed. Firstly, the comprehensive bibliometric data has been presented, including IF, IF without journal self-citations, and citation network analysis. We can conclude just at a glance that ABMs are successfully used in various fields of science. Moreover, their usage is growing with the course of time, from 15 papers published in 2000, this number increased to 449 in 2015. This proves that researchers from numerous scientific fields recognized the power of ABMs and are utilizing that power for solving the problems they run into.

Further in the paper, ABMs' applications are presented. The focus of the chosen papers was on solving optimization problems and analyzing the customer behaviour. It is proved that ABMs can be successfully employed to cope with scheduling, transportation, and supply chain optimization problems. Also, we provided insights on the implementation of ABMs for customer's behaviour and market share prediction.

The growing interest in agent-based modeling and agent-based simulation seems to be a very promising field of study. For this reason, future researches will be devoted to recognize and model other classes of problems using ABMs.

THE INFLUENCE OF EDUCATIONAL DEVELOPMENT INDICATORS ON GRADUATES' EMPLOYMENT RATES

Ana Bjelaković[1], Marina Dobrota*[1]

*Corresponding author, e-mail: dobrota.marina@fon.bg.ac.rs

Abstract: *Education as one of the fundamental factors of the development improves the quality of life and leads to broad social benefits to individuals and society. It has a major impact on employment prospects. Economic development is impossible without a substantial investment in human capital. This paper investigates the role of the education system in employment. We determined a set of non-financial and financial indicators of educational development as explanatory factors. To examine the correlation between proposed factors and the employment rate of recent graduates, backwards multiple linear regression analysis was conducted. Our findings suggest that we have both financial and non-financial indicators influencing the employment rates in the final model. The most influential non-financial indicators were those that measure a number of young people that continued their education and foreign languages spoken by the nation while the financial factors were public expenditure on education and annual expenditure per student.*

Keywords*: education, development, employment, human capital*

1. INTRODUCTION

The population is continuously progressing and boosting throughout observation and learning, and this fact makes education and lifelong learning the major segments of human development (Dobrota & Benkovic, 2014; Dobrota, Martic, Bulajic, & Jeremic, 2015; Dobrota, Savic, & Bulajic, 2015). Being as important as it is, education has been a main topic of a number of scientific research (Andjelkovic Labrovic, Bijelic, & Milosavljevic, 2014; Benkovic & Dobrota, 2012; Dobrota, Savic, et al., 2015; Radenkovic, Despotovic Zrakic, Bogdanovic, Barac, & Labus, 2014). According to Hirsto, Lampinen, and Syrjakari (2013), in the field of educational development, many different concepts have either been used interchangeably or to focus on different aspects of development. Early research originally examined key developments affecting higher education worldwide and patterns in higher education development (Altbach, 2003). More than ever before, education has become a lifelong course in which individuals proceed to learn in formal and informal environments throughout their lives (Blossfeld, Roßbach, & von Maurice, 2011; Dobrota, Jeremić, Bulajić, & Radojičić, 2015; Dobrota, Savic, et al., 2015; Fleming, 2011; Nguyen & Walker, 2016; Radenkovic et al., 2014; Roche, 2015; Volles, 2016).

Education correlates strongly with most important social and economic outcomes (Hout, 2012). The belief that education is an engine of growth rests on the quality and quantity of education in any country (Horvat, Dobrota, Krsmanovic, & Cudanov, 2015; Horvat, Krsmanovic, Dobrota, & Cudanov, 2013; Lutz & KC, 2011). Further policy reforms and changes in higher education systems have become top national priorities, as governments in several countries embrace the notion that higher education is a key component of their efforts towards economic and social development (Chapman & Miric, 2009). Educational systems are expected to boost the society in various ways through the deployment of different educational models, on primary and secondary, but especially tertiary level. Higher education models are various, and for a new model to contribute something novel, it must have the potential to move educational practice and research forward in ways that improve teaching and learning experiences and outcomes (Benkovic & Dobrota, 2012; Dobrota & Benkovic, 2014; Knewstubb, 2016).

Theories have proved that formal education is necessary to improve the production capacity of a nation and discusses the rationality behind investment in human capital (Olaniyan & Okemakinde, 2008). Education has a substantial impact on labor market outcomes such as earnings and employment, as well as non-market outcomes such as health, longevity, civic participation, and even criminal activity (Oreopoulos & Salvanes, 2011). The primary focus of the paper is examining the relations between the educational system features on one hand, and earnings and employment as a major factor of social development and well-being on the other.

It is well-known that the education has a major influence on earnings and employment (Blundell, Dearden, Goodman, & Reed, 1997; P. Brown, 1995; Evans, 2016; Purcell & Quinn, 1996; Waters, 2009; Weiss, Klein,

& Grauenhorst, 2014). For example, Brown and Sessions (1998) debate that, regardless of whether schooling signals or augments productivity, the correlation between education and earnings renders the enhancement of lifetime earnings and, as such, may represent a good investment for individual workers. However, the path from a pupil or a student to an employee is not always so mere. According to Charles (2015), the transition from higher education to employment requires a pre-professionalization, which is characterized by the dominant role of professional skills and their incorporation into the structure of initial higher education. This mechanism is explained by the persistence of an idealized conception of "matching" that still profoundly marks the relations between education and employment (Charles, 2015). The question finally arises as to whether or not a student simply needs a Ph.D. diploma in order to be a dominant employee candidate in a private sector (Pedersen, 2016).

In the course of previous studies on education and employment, the goal of this study was to show which indicators of the educational development have a significant impact on the employment rate of recent graduates. The research data were obtained from an accessible dataset Eurostat (Eurostat, 2016) that includes levels of educational development and structure based on individual criteria. In the following section, we defined the methodology and indicators that were used. This is followed by a presentation and discussion of the results. Finally, a conclusion was given.

2. METHODOLOGY

In this article, the main goal was to determine whether there exists and what is the strength and form of the relationship between various educational indicators and employment rates of recent graduates. For this purpose, twelve different criteria were chosen to determine a country's educational structure and development. These are (Eurostat, 2016):

Non-financial indicators of the educational structure:

- *Employment rates of recent graduates* - the employment rates of persons aged 20 to 34.The indicator is calculated based on data from the EU Labour Force Survey.
- *School expectancy* - expected years of education over a lifetime (this type of estimate is accurate if current patterns of enrolment continue on the same trend in the future).
- *18-year-olds in education* - the percentage of all 18-year-olds who are still in any kind of school (all ISCED levels). It gives an indication of the number of young people who have not abandoned their efforts to improve their skills through initial education, and it includes both those who had a regular education career without any delays as well as those who are continuing even if they had to repeat some steps in the past.
- *Mobility of students in Europe* - the incoming students and outgoing students for each country, using the figures provided by the host country on foreign students enrolled in tertiary education by nationality. The lack of data on the distribution of students by nationality in some countries leads to underestimation of the values.
- *Share of women among tertiary students* - the percentage of women among all students in tertiary education, regardless of the field of education they are in.
- *Pupil teacher ratio in primary education* - calculated by dividing the number of full-time equivalent pupils by the number of full-time equivalent teachers teaching at ISCED level 1. Only teachers in service (including special education teachers) are taken into account.
- *Foreign languages learnt per pupil* - average number of foreign languages learned per pupil in secondary education. A foreign language is recognized as such in the curriculum or other official documents relating to education in the country.
- *Pupils learning English* - the percentage of all pupils in upper secondary education who are learning English as a foreign language. It only covers general and not vocational education in countries where English is described as a foreign language in the curriculum or other official document relating to education in the country.

The next five variables represent financial indicators of the educational structure

- *Annual expenditure on public and private educational institutions per student*
- *Private expenditure on education*
- *Annual expenditure on public and private educational institutions compared to GDP per capita*
- *Total public expenditure on education*
- *Public expenditure on education*

These variables show education funding of the public sector either by directly bearing the current and capital expenses of educational institutions (direct expenditure for educational institutions) or by supporting students and their families with scholarships and public loans, as well as by transferring public subsidies for educational activities to private firms or non-profit organizations (transfers to private households and firms). These financial indicators demonstrate the importance given to education in any particular country and the potential for its further development.

The main idea was to determine whether the employment rates of recent graduates depends on other listed variables, i.e. financial and non-financial indicators of educational development (Dobrota, Savic, et al., 2015). We used backwards multiple LS linear regression (Narula & Wellington, 1982; Rencher & Christensen, 2012; Seal, 1967) to create a model, which would automatically exclude non-significant variables from the observation (Gujarati, 2002). The original multivariate regression model is given by the following formula:

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \ldots + \beta_k X_{ki} + \varepsilon_i \quad (1)$$

where Y_i is an i-th observation od the dependent variable Y, β_j is a j-th regression coefficient (j=1,…k), X_{ji} is an i-th observation for the j-th independent variable, and ε is a residual.

Employment rates of recent graduates was chosen as a dependent variable while other listed variables were chosen as independent explanatory variables.

3. RESULTS

Before presenting the multiple LS linear regression model, we examined and established the possible relationships among variables used in this research. First, we wanted to identify is whether there exists and what is the form of the dependency of Employment rates from some of the most specific indicators of educational development.

Figure 1 shows the dependency of the Employment rates of recent graduates from an explanatory variable Annual expenditure on public and private educational institutions per student.

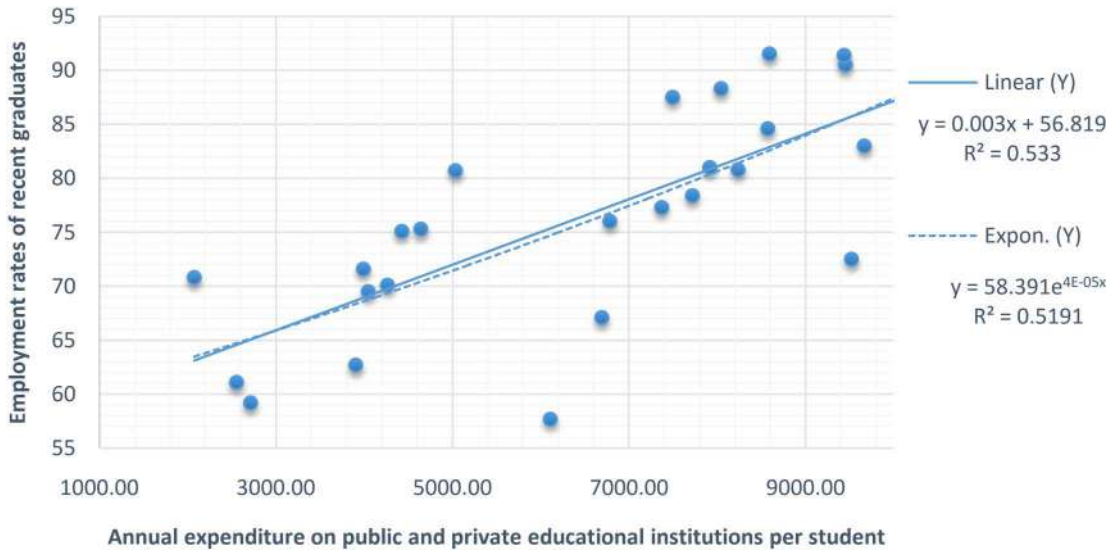

Figure 1: Relationship between Employment rates of recent graduates and Annual expenditure on public and private educational institutions per student

As can be seen in Figure 1, there is a mutual dependency between these two variables. We were able to extract a positive linear relationship from the given data, and the linear model is given in Figure 1. The Pearson's correlation coefficient r=0.73 ($p<0.001$), and the coefficient of determination R^2=0.533, indicating that 53.3% of the variability of Employment rates is explained by the model. For comparison, we also showed an exponential relationship between these two variables. Model is showed in Figure 1, where the coefficient of determination R^2=0.519, indicating a bit lower percent of explained variability.

Figure 2 shows the dependency of the Employment rates of recent graduates from an explanatory variable Public expenditure on education.

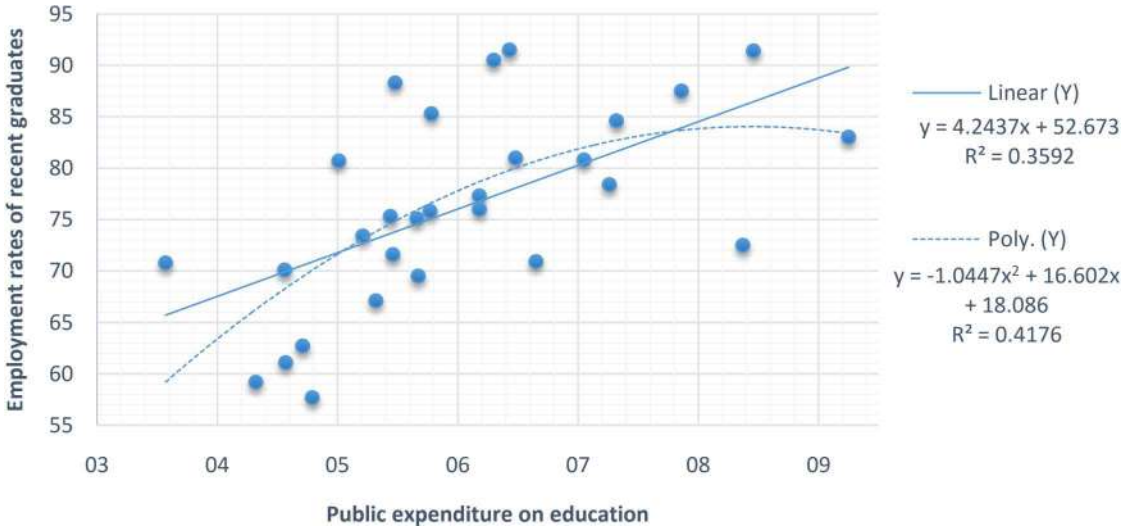

Figure 2: Relationship between Employment rates of recent graduates and Public expenditure on education

From Figure 2, we can see that there is a mutual dependency between these two variables and the linear model is given in the figure. We also extracted a positive linear relationship from the data and the Pearson's correlation coefficient r=0.599 (p=0.001). The coefficient of determination R^2=0.359, indicating that 35.9% of the variability of Employment rates is explained by the model. For comparison, here we showed a polynomial relationship between these two variables, given in Figure 2. In this model, the coefficient of determination R^2=0.417, indicating a higher percent of explained variability, having that the polynomial model could be a better fit for these data.

Figure 3 shows the dependency of the Employment rates of recent graduates from an explanatory variable Annual expenditure on public and private educational institutions compared to GDP per capita.

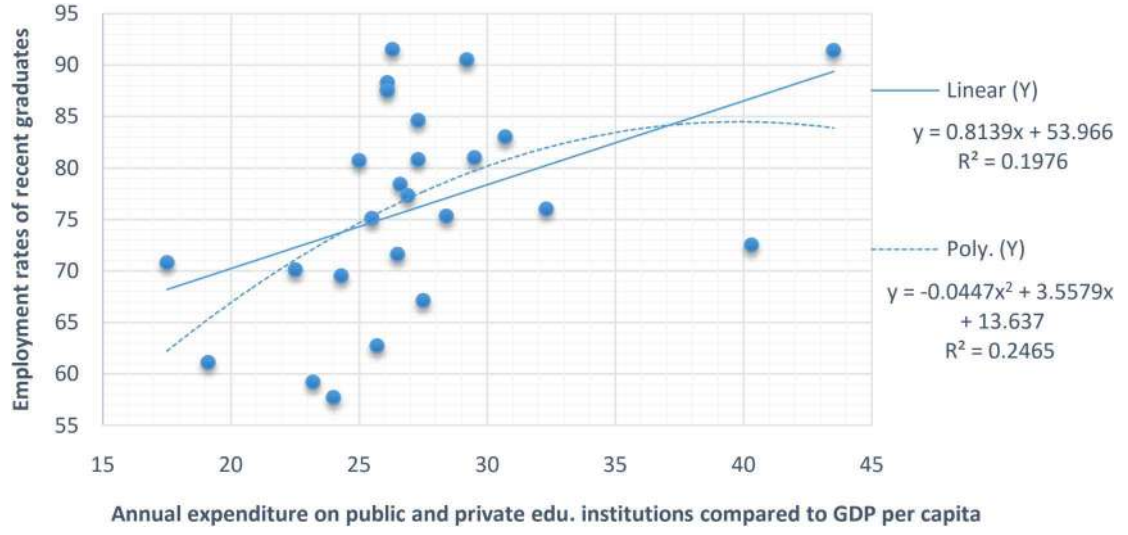

Figure 3: Relationship between Employment rates of recent graduates and Annual expenditure on public and private educational institutions compared to GDP per capita

From the Figure 3, a larger dispersion can be seen, which is also the characteristic of most of the other independent variables, especially non-financial. For the majority of financial independent variables, positive dependence is found, while this is not the case for non-financial variables (Table 1). In this model, we extracted a positive linear relationship where the Pearson correlation coefficient r=0.445 (p=0.026). The coefficient of determination R^2=0.197, indicating that only 19.7% of the variability of Employment rates is

explained by the model. For comparison, we also showed a polynomial relationship, given in Figure 3, for which coefficient of determination R^2=0.246, indicating a bit higher percent of explained variability.

Table 1 presents the Pearson's correlation coefficients between all the given variables. These are given in order better to understand the relationships and dependencies between data.

Table 1: Pearson's correlation coefficients between variables

Employment rates of recent graduates	ERR	SE	18ED	MEU	SWT	PTR	FL	PLE	AEE PP	PREE	AEE GDP	TPEE

*p<0.05, **p<0.01
[1]Dependent variable: Employment rates of recent graduates

In the original model, all of the variables listed in section 2 were included in the analysis. From Table 2 it can be seen that, when combining independent variables in this way, only Annual expenditure on public and

private educational institutions per student significantly influences the dependent variable Employment rates of recent graduates. All other variables have significance larger than 0.05. With the coefficient of determination R^2=0.553, the model reveals that 55.3% of the variability of Employment rates of recent graduates is explained by the given combination of explanatory variables. The whole model is significant at 0.05 level of significance. The model also exhibits a large level of multicollinearity.

Table 3 presents the reduced backwards multiple linear regression model. This model was used to exclude the non-significant variables from the model, step by step automatically, and thus create the model that fits the given data in a best possible way. The method performed eight continuous iterations until the final model was obtained.

Table 3: The reduced backwards multiple linear regression model

Predictors[1]	**M**	**SD**	**B**	**SE**	**Beta**	**95%CI B**	
Intercept			63.335	18.131		24.899	101.772

F	11.059**						

*p<0.05, **p<0.01
[1]Dependent variable: Employment rates of recent graduates

The reduced model includes only five, of originally eleven independent variables. Among them, we have two financial and three non-financial indicators influencing the Employment rate of recent graduates. The most influential non-financial indicators were 18-year-olds in education, Foreign languages learnt per pupil, and Pupils learning English; the most influential financial indicators are Annual expenditure on public and private educational institutions per student and Public expenditure on education. Among them, 18-year-olds in education and Annual expenditure on public and private educational institutions per student are significant on 0.01 level of significance while others are on 0.05 level of significance. The most significant absolute influence has Annual expenditure on public and private educational institutions per student, followed by Public expenditure on education, and then 18-year-olds in education, Foreign languages learnt per pupil, and Pupils learning English respectively, which can be seen from the column Beta in Table 3. The estimated model is presented as follows in the given formula:

$$\hat{Y} = 63.335 + 0.246X_1 + 10.416X_2 - 0.313X_3 + 0.006X_4 - 5.752X_5 \quad (2)$$

where Y is the dependent variable Employment rates of recent graduates and X_1 to X_5 are 18-year-olds in education, Foreign languages learnt per pupil, Pupils learning English, Annual expenditure on public and private educational institutions per student, and Public expenditure on education, respectively. With the coefficient of determination R^2=0.705, the model reveals that 70.5% of the variability of Employment rates of recent graduates is explained by the given combination of explanatory variables. The whole model is significant at 0.01 level of significance.

4. CONCLUSION

Under the influence of the Human Capital theory, which elaborated on the functions of education in promoting employment and increasing employment incomes (Schultz, 1961), many countries devoted major efforts to educational development in the 1960s and 1970s (Chen & Wu, 2007). This paper investigates the influence of educational development indicators on the employment rate of recent graduates.

We extracted the 12 financial and non-financial indicators that served as explanatory factors in the least squares linear regression model. We used a backwards method to exclude non-significant variables from the model automatically. The final model was obtained after eight iterations. Our findings suggest that we have both financial and non-financial indicators influencing the employment rate of recent graduates in the final model. The most influential non-financial indicators were those that measure a number of young people that continued their education and foreign languages spoken by the nation while the financial factors were public expenditure on education and annual expenditure per student.

The given model explains 70.5% of the variability of graduates' employment rates. Accordingly, it is important to recognise that the employment does not depend solely on the educational development factors but from the series of other factors (Barnes & Brown, 2016), such as the area of employability, social conditions, but their individual features as well. For example, it is discussed that graduates of entrepreneurial education should be better prepared for the employment market and the rapidly changing economic environment, and thus, more productive, even in wage employment (Kucel, Róbert, Buil, & Masferrer, 2016). Future research directions might imply the further and more detailed analysis of influential factors on the employment.

IMPACT OF LARGE EXPORTERS' OWNERSHIP STRUCTURE ON THE GROWTH OF EXPORT IN SERBIA

Zoran Jeremić[1]

[1]Singidunum University, Faculty of Business Economics
*Corresponding author, e-mail: zjeremic@singidunum.ac.rs

Abstract: *In this paper, we will analyse 100 largest exporters in Serbia in 2014 primarily from the standpoint of ownership structure i.e. whether the exporting company was founded by a foreign or domestic legal entity/ person as well as whether it operates as a limited liability company or a joint stock company whose shares are traded on the Belgrade Stock Exchange. The ownership structure is analysed in order to determine the extent of foreign i.e. domestic private or state-owned capital involved in these companies. The aim is identify largest exporters among domestic companies in order to determine what industries they operate in and the group of companies they belong to, as it provide insight into which domestic companies that are competitive on the international market.*

Keywords: *export, industrial sectors, competitiveness, ownership structure*

1. INTRODUCTION

The significance of export in a small country with an impoverished market is undisputable along with strategic ambition to create a suitable environment for further development of export. Even though there is a general consensus among domestic public and in strategic documents with this statement, the practice shows the presence ofa series of questions which haven't been resolved and different views on how to achieve the proclaimed goal of strengthening export. High rate of consent on this goal is also evident among international organisations such as World Bank and IMF whose publications and documents prioritise growth of export in Serbia. The subject matter of this paper is analysis of the ownership structure of 100 largest exporters in Serbia, with special focus on exporters founded by domestic legal entities and natural persons in the form of joint stock companies, limited liability companies and sole proprietorships.

For the purpose of this analysis, a database was created on actual export and import of 100 largest exporting companies based on data available to Customs Administration and we processed their balance sheets and income statements based on data obtained from the Serbian Business Registers Agency. In order to ensure comparability of export data with data contained in balance sheets and income statements, amounts expressed in dinars were converted into euros by applying average annual exchange rate for income statement items and the exchange rate prevailing on the last day of the year for balance sheet items. Ownership structure was determined by using websites of Serbian Business Registers Agency and of the companies which are the subject matter of this analysis as well as the website of Belgrade Stock Exchange for the listed joint stock companies. Database covers the period from 2008 to 2014, with 2008 being regarded as the base year for analysis since it is the last year for which comprehensive data on companies' balances is still available, though the focus of analysis will be placed on 2014.

The group of top 100 exporters is relevant for our research because it had more than half of the share in the commodity export in 2014. Moreover, the share which top 100 exporters have in total export is continuously on the rise. While this share was 41% in 2008, in 2014 it grew to 55%. This group achieved total export equal to €6,203 million euros, total assets of €11,341 million euro, capital worth €4,745 million euro, operating income of €11,629 million euro, net profit of €716 million euro while the total number of their employees amounted to 68,690 people. These indicators show that this group certainly is not a relevant sample only in terms of exporting companies but also for analysing the state of Serbian economy. Aggregate data on 100 largest exporters are divided into three groups according to who is the majority shareholder: foreign company, domestic legal entity or natural person, or the state. After this, we analysed the share that each of these subgroups had in the total export of 100 largest exporters. What is particularly important is to identify the industrial sectors and groups they operate in, ratio of export and import and business performances of these companies over the observed period.

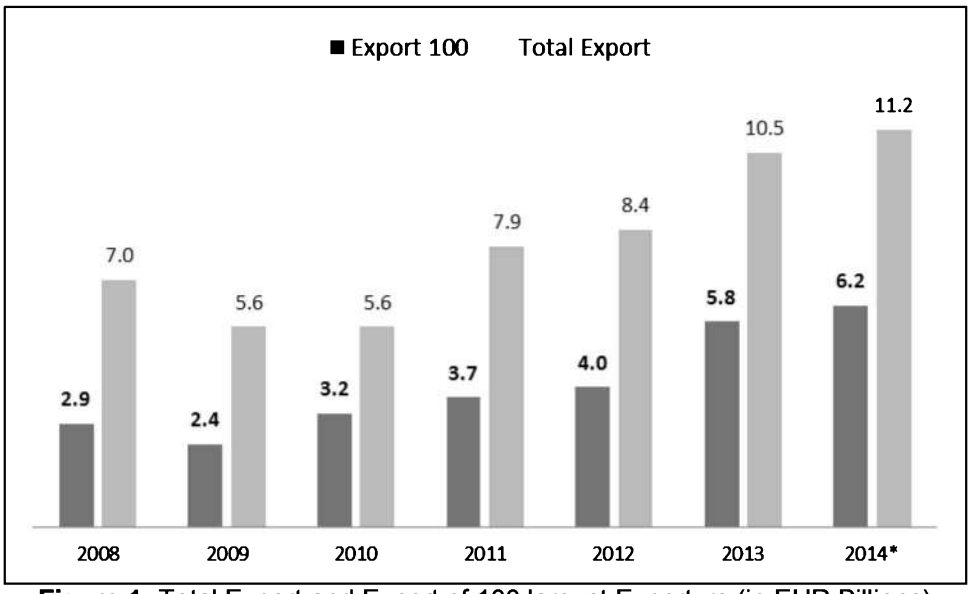

Figure 1: Total Export and Export of 100 largest Exporters (in EUR Billions)
Source: Republic of Serbia, Customs Administration, summarised by author

By observing the period between 2008 and 2014, we noted positive changes in the growth of export, export structure and the import coverage ratio. Export has recorded faster growth than import with a slightly positive change in terms of its structure. A certain number of new companies emerged on the market in the observed period primarily export-oriented with positive effect on the reindustrialisation, mainly drawn to this market by government subsidies and low labour costs. Simultaneously, some of the leading exporting companies recorded a dramatic downfall in their business at the time of economic crisis which resulted in the drop of export as well.

However, when it comes to export in 2014, the positive trends observed in the previous years were continued. By analysing the fluctuation of export among the 30 largest net exporters, it was observed that net exporters are mainly companies in the processing industry, primarily metal processing industry and electric power industry followed by agricultural production (maize, sugar) and by military industry on a smaller scale. Having in mind the rising trend in export recorded by the largest exporters, special attention should be paid to their analysis by answering the following question: Are there any potential "stars" among Serbian exporters which could contribute to faster growth of the country's export as had already happened in several other countries (see: Export stars...) particularly if such growth would imply integration of smaller domestic companies into their production chain instead of providing incentive for each company individually to enhance its export. What is worrying when it comes to large exporters is the fact that they are simultaneously large importers as well, and for this reason, it would be interesting to find out the group in which net export is predominant. It could be reasonably assumed that domestic companies are in advantage in respect of net export and thus their total effect on the country's economy is more useful,which is why this hypothesis will be tested here as well.

2. FOREIGN COMPANIES AMONG 100 LARGEST EXPORTERS

By dividing the largest exporters according to their country of origin into group of companies owned by foreign companies and exporters whose majority shareholders are domestic privately-owned or state-owned companies, we note a strong dominance of foreign countries both in terms of their number (63) and their share in the total export (77.1%). Foreign companies' share in the export realised by 100 largest exporters in 2014 was 77.1% i.e. € 4.8 billion euro, employing 49,313 workers i.e. 71.8% of the group's employees. This group also includes large net exporters, for example in the area of car spare parts industry, which came to Serbia primarily because of high government subsidies and low labour costs and partially due to presence of FIAT company. The next group includes home appliances and machine manufacturers – three Gorenje factories.

Table 1: Ownership structure of 100 largest exporters

Ownership structure	Number of exporters	of which: net exporters
Total number of exporters	100	67
a. Owned by foreign companies	63	40
b. Owned by domestic companies	30	20
c. Owned by state	7	7
of which in restructuring	4	4

Source: Republic of Serbia, Customs Administration, summarised by author

Though there had been plenty of off-target and unnecessary government subsidies, the effects are visible in cases where foreign investors oriented to exports and new technologies were attracted to Serbia. However, the issue here is that the economic climate was not further improved but, on the contrary, macroeconomic flows and the business conditions were dramatically aggravated so the subsidies were necessary to attract the investors because without such subsidies we would have obtained lesser level of foreign investments. However, attracting foreign investors with subsidies, as a compensation for poor economic environment, with employment of unqualified and poorly paid labour force, cannot be used as a permanent model to increase export and the solution should be sought in improvement of the business and investment climate and reduction of subsidies can then go hand in hand with such improvement.

Table 2: Export, Import (in EUR Millions) and Number of Employees

Companies	Export	Import	Net export	No. of empl.
a. Owned by foreign companies	4.780,1	5.828,7	-1.048,6	49.313
b. Owned by domestic companies	836,1	573,8	262,3	10.422
c. Owned by state	587,1	251,8	318,1	8.955
Total	6.203,3	6.654,3	-468,2	68.690

Source: Republic of Serbia, Customs Administration, and Agency for Business Registers, data processed by author

In addition to their high concentration among top 100 exporters, the growth of the group of 5 to 7 largest companies is conspicuous and they also record the largest growth of export. The general trend in export shows that the concentration of large companies is growing as they are more competitive and better prepared to face the international competition whereas smaller companies have issues with emerging on the foreign markets and maintaining their market position. Large exporters are also large importers, with third of exporters having higher import than export. These are vital facts. For this reason, we will identify the most significant net exporters, from the standpoint whether they are owned by foreign or domestic companies, as well as what industry they operate in. Net exporters namely have significantly higher contribution to the newly added value of gross domestic product and more significantly improve the country's balance of trade and the balance of payments.

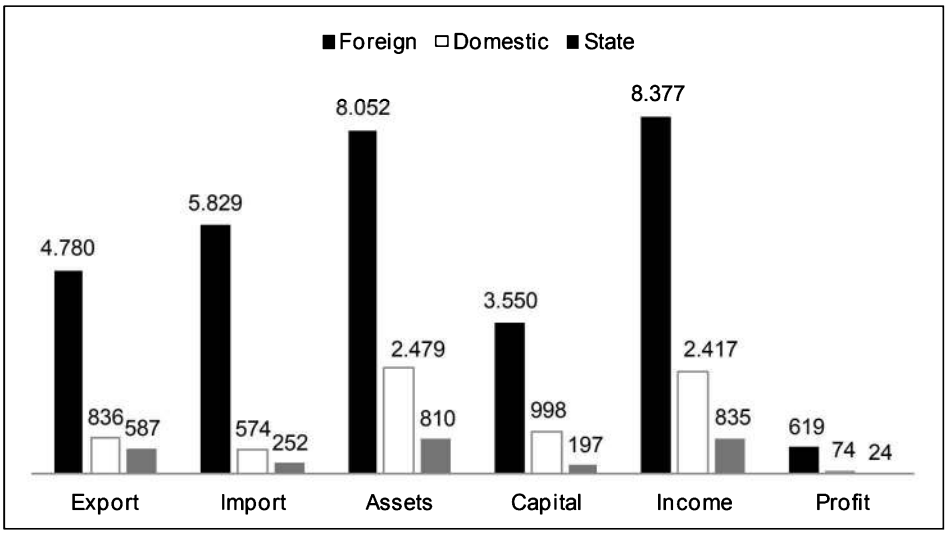

Figure 2: Foreign, Domestic and State-Owned Exporters (in EUR Millions)

Source: Republic of Serbia, Customs Administration, and Agency for Business Registers, data processed by author

3. COMPANIES OWNED BY DOMESTIC LEGAL ENTITIES AND NATURAL PERSONS

Out of 30 companies owned by domestic legal entities and natural persons which are among 100 largest exporters, 15 are agricultural produce processing companies (sugar beet, soya, oils, meat, animal feeds, and dairy products). This group also includes one company which is a successful metal-processing company, one furniture company and one bankrupt company while the rest are mainly involved in the export of primary agricultural products and in food import and processing for their own needs. So, export of primary and secondary agricultural products is dominant while export of other industrial products is on a minimum level. Largest agricultural produce processing companies include 4 sugar-processing companies, 4 fruit-processing companies, 2 animal-feed processing companies and one soya and one milk-processing company.The largest exporters were 4 sugar processing companies which are also the largest net exporters as import plays a very small role in their business. The structure dominated by agricultural produce manufacturing and processing companies reveals that it is difficult to be competitive and to penetrate the foreign markets in other non-agricultural industrial sectors. This observation particularly applies to the medium and small size companies, with 90% of them having recorded no export at all and having no potential to expand to foreign markets. They can find their chance for export if connected to exporting companies which are competitive on foreign markets.

4. STATE-OWNED EXPORTERS

The group of large exporters owned by the state is dominated by factories operating in military industry such as *Prvi Partizan*, Užice and *Zastava oružje*, Kragujevac. The broad list of exporters includes several factories which carry out their export via *Jugoimport SDRP*. Having in mind their export potential, we may expect further growth of export in military industry. HIP-Petrohemija is also an important exporter but for the time being there is no clear solution on sight for its strategic partner.

When it comes to export, *Železara Smederevo* is an ever-present topic. If the agreement concluded with the Chinese partner were to be realised, it would certainly be a huge encouragement for Serbian export and great relief on the country's budget. Železara can be profitable only if investments are oriented to highly processed products as was announced by the potential strategic partner. The balance sheet and income statement data of *RTB Bor* were not included in this analysis, but only export achieved by RTB Invest. The analysis of this company is far too complex since the data are controversial and non-transparent. However, it is certain that the recovery of *Železara Smederevo* and *RTB Bor* would largely depend on the future recovery and growth of the global economy i.e. on the increase of prices of export products since these companies cannot stay profitable with the prices remaining at the current level. Out of 7 companies owned by the state,

four are in the restructuring process and it remains uncertain whether a solution would be found for them before the deadline expires.

5. CONCLUSION

Analysis of 100 largest exporters revealed several of their important characteristics: the export is dominated by companies in foreign ownership both in terms of their number and the value of their export. High concentration of export is also evident since 100 largest exporters had a share of 55% in total export in 2014. Even more important is the concentration of 5 to 7 largest exporters which continuously increase their export. Large exporters founded by foreign companies are also large importers with only 67 companies characterised by export exceeding import. In this respect, companies with domestic capital are more useful from the perspective of newly added value, with the most significant group of companies being agricultural product processing companies.

Out of 30 companies owned by domestic legal entities and natural persons which are among 100 largest exporters, 15 are agricultural products processing companies (sugar beet, soya, oils, meat, animal feeds, and dairy products). This group also includes one company which is a successful metal-processing company, one furniture company and one bankrupt company, while the rest are mainly involved in the export of primary agricultural products and in food import and processing for their own needs. So, export of primary and secondary agricultural products is dominant whereas export of other industrial productsison a minimum level. When we add 7 exporting companies owned by the state and operating in the ore-processing and military industry, we practically summarise the total export potential in domestic ownership. If Železara, RTB Bor and Petrohemija find their strategic partners in the future, which is a pre-condition for their survival, the state will retain the ownership only over the exporting companies operating in military industry. It should certainly be noted that the state is the co-owner of two large companies whose majority shareholder is a foreign company i.e. NIS a.d. Novi Sad and Air Serbia, and this model should not be excluded as a solution for the rest of the state-owned companies which are large exporters.

When it comes to private companies with domestic capital, they have a one third share in the top 100 exporters but their export value ranks them at the bottom portion of the list. In addition to that, they are mainly characterised by poorer business performance than the companies owned by well-known global companies. Even though some of our domestic companies have managed to come to the spotlight (Alfa plam), for domestic exporters it is an increasingly difficult battle to fight off foreign competition as those foreign companies bring with them knowledge, captured foreign markets to which they export their products, better corporate governance, bigger budgets for research and development and expert personnel. Domestic companies, however, are frequently exposed to unfair competition as their foreign competitors receive government subsidies just to come to Serbia. Domestic medium and small size enterprises are facing even greater difficulties to fight off comparative advantages of large foreign companies. What is an even bigger issue for them is to have sufficient demand and obtain necessary guarantees while they do not have neither financial nor development capacities to conquer foreign markets and oppose the mighty competitors. For this reason, further enlargement of companies may be expected in the upcoming period via takeover of some of current exporters by the stronger domestic companies but more so by foreign companies. The example of sugar processing companies that are large exporters sheds a lot of light on the issue. Due to fiercer competition on the European market, which is the main export market for Serbian sugar processing companies, further consolidation will be necessary because small sugar processing companies which are far removed from raw material base, falling behind in respect of technology while using more expensive energy sources, will not be able to survive on the market. Fruit and vegetable processing industry showed great possibility for export growth but it also requires well-thought through incentive for connecting primary production with domestic processing companies. This would greatly contribute to the growth of export, more even regional development and strengthening of domestic processing industry in the segment in which it can be competitive since Serbia is the global leader only in the quality and production of certain agricultural products such as raspberry, blackberry, apple... This sort of incentive does not mean that Serbia should not pay greatest attention to information industry and to the strengthening of high technology sectors but in this instance,the changes to the system of education would be of greater significance than financial incentives. Having in mind that export is a precondition for development and survival of a small and poor economy such as Serbian, it is vital to support exporting companies in all shapes and forms: by creating better business climate, by targeted incentives and assistance to industrial sectors in which Serbia can be competitive. The example of 100 largest exporters showed that the choice of competitive industrial sectors is very narrow. The most realistic chances lie in the development of processing industry based on high quality primary agricultural raw material. This is precisely where the added value is the highest as the share of import in this segment is the smallest, which makes 15 food processing companies also the largest net exporters. The wood and metal processing industries also have good chances for increasing export. In addition to food-

processing industry, we also have information industry where we can be competitive while the mining industry and tourism also provide good basis for further growth of export.

Attracting foreign investments with government subsidies as a compensation for poor economic climate, along with employment of unqualified and poorly paid labour forrce, cannot be used as a permanent model to increase export even though these incentives were necessary in current circumstances. Companies owned by foreign companies are primarily needed to bring new knowledge and new technologies and should employ domestic labour force having highest education and if they do not meet these criteria, any subsidies to such companies would be very questionable. The solution to the problem lies, naturally, in the continuous improvement of the business and investment climate and the reduction in subsidies can then go hand in hand with such improvement.

When it comes to changing the export structure, it is necessary to ensure that the main articles exported abroad are not agricultural produce such as maize, raspberries, apples and copper and such change in the export should be achieved systematically, having long-term goals in mind, in order to increase the share of highly processed products in export, which implies the use of new technologies,as well as to create economic climate which would favour net exporters.

THE ALTERATION OF U21 RANKING METHODOLOGY: FROM EXPERT-DRIVEN TO DATA-DRIVEN WEIGHTING SCHEME

Milica Maričić*[1], Milica Bulajić[1], Marina Dobrota[1]
[1]University of Belgrade, Faculty of Organizational Sciences, Laboratory of Statistics

Abstract: *Indicator-based measurement of higher educational institutions and higher education systems' performance has started to play a significant role in defining national education policies and reforms. However, the issues surrounding the process of assessment and ranking are complex and far-reaching. Therefore, the controversy about ranking methodologies remains, whereas the critical pitfalls are the weighting scheme and the aggregation method. This study aims at tackling one of the two critical pitfalls by proposing a data-driven weighting scheme of the U21 ranking of national higher education systems (U21) using the Composite I-distance Indicator (CIDI) methodology. The CIDI weights proved to be more balanced and less oriented on the higher education systems' output. The presented approach and results can be a foundation for further academic research on university or higher education systems rankings that will be independent of subjectively formed weighting factors.*

Keywords*: U21 Ranking, I-distance method, CIDI Methodology, composite index, ranking of countries, higher education system*

1. INTRODUCTION

University rankings have long been employed, first on the national scale and later on a global scale (Marginson & van der Wende, 2007). In the last decade, the interest of various stakeholders for university rankings had risen. Firstly, the growing population of students and researchers needed insights on the quality performance of higher educational institutions (HEIs) (Saisana, D'Hombres, & Saltelli, 2011). On the other hand, the results of university rankings became a valuable source of information for policymakers. Ranks of national universities have become a symbol of national achievement and prestige, but also an engine of economic growth (Marginson & van der Wende, 2007). Therefore, university rankings can be used to trigger debates and policy reforms on a national level (Saisana & D'Hombres, 2008). Consequently, the rankings influence the higher educational institution's mission, strategy, recruitment procedures, and teaching process; i.e. nearly every aspect of the educational process (Harzing & Mijnhardt, 2015). Steadily, global university rankings are integrating into higher education, and there are various benefits from such occurrence. Just some of them are a positive impact on the number of potential applicants, opportunities to collaborate with the industry or with international higher educational institutions, additional government and non-government funding, and attraction of prospective students and academics.

Putting aside the potential benefits of the global university rankings, one should bear in mind the concerns the academic community has risen on this matter. Namely, academics have often criticized some of the rankings for their statistical inaccuracy (Huang, 2012), possible unfavourable impact on the overall performance of universities (Cheng, 2012), and for their influence on the educational policy (Hazelkorn, 2014). Saisana and D' Hombres (2008) outlined the fact that many ranking methodologies fail to follow accepted methodologic rules when selecting indicators and afterwards aggregating them into a composite index.

University rankings proved to be very useful, especially for government representatives in decision-making on the national level. However, users of university rankings, and especially the government, should have in mind the fact that although higher education system consists of separate institutions, it is necessary to have a holistic approach to ranking. Therefore, a new direction in the development of educational rankings emerged: the rankings of higher education systems. Martin and Sauvageot (2011) refer to the national higher education system as an integral part of the modern economy and social structure. As such, it should give as many people as possible a chance to gain analytical skills and technical knowledge that will enable them to respond to the competitive conditions in the labour market. Promotion and long-term investments in a small number of institutions will not raise the overall quality of the educational system. Also, a small number of institutions that are advancing faster cannot respond to the overall national needs for highly educated staff. In addition, it is necessary to show the public how their country is positioned on the global map of higher education systems (Williams et al., 2013).

For the foregoing reasons, in the last few years, additional efforts have been placed to devise a ranking of higher education systems. In 2012, one of them appeared: the Universitas Ranking of National Higher Education Systems (U21) devised by Universitas 21. Since then, the index attracted attention and positive and negative critique on its methodology. According to Soh (2014), although it has a clear theoretical base and more trustworthy data sources compared to other ranking methodologies, its weights show discrepancy as they are subjectively assigned. Also, Millot (2014) concludes that U21 has the potential to differentiate itself from university rankings and become a valuable supplement in assessing higher education.

The aim of this paper is to analyze the subjective weighting scheme of the U21 ranking and to propose a new one that will rely on a statistically defined framework. The multivariate statistical analysis used to perform such a task is the Composite I-distance Indicator (CIDI) methodology (Dobrota et al., 2016).

The paper is organized as follows: the second section features the U21 ranking methodology, followed by the statistical method used to perform the analysis: the CIDI methodology. The research results are presented and elaborated in Section 4, while we provide the concluding remarks in the final chapter.

2. UNIVERSITAS U21 RANKING OF NATIONAL HIGHER EDUCATION SYSTEMS

Universitas 21, an international group of 25 world universities, devised in 2012 a composite index for ranking national higher education systems and named it U21. The basic idea of the Universitas 21 group was to draw attention from the ranking of universities and individual institutions on the ranking of the national higher education systems. To achieve its goal, the U21 composite index includes four categories (*Resources, Environment, Connectivity,* and *Output*) and 25 indicators. The index is calculated for 50 world countries, but due to the lack of data, the recreated database, which we used to perform the analysis, contains data for 48 countries; Brazil and Saudi Arabia had to be excluded from further research.

The data for 25 indicators, which are used for the computation of the ranking according to the latest methodology, is collected from reputable sources such as OECD, UNESCO, and the World Economic Forum (WEF) (Universitas 21, 2015). Table 1 provides the categories, indicators, effective weights, and codes of indicators, assigned by the authors for easier presentation in the rest of the manuscript.

The *Resources* category provides information on the material and immaterial pre-conditions for the core transformation processes in a higher education system. This dimension aims at measuring the government's readiness to invest in higher education and at investigating what are the consequences of their investment. Although resources are vital for a system to operate, they are not enough to ensure its efficient and proper functioning (Williams et al., 2013). To ensure the effective use of inputs, a regulatory *Environment* is needed. Lately, the idea of internalization became firmly embedded in the institutional mission statements, strategies, as well as national policy frameworks. Category *Connectivity* aims at measuring the relationship between the national higher education system and the industry and government. Finally, the last category (*Output*) includes the measurement of higher education systems output through the scientific output (research papers), the number of scientific workers, enrolment rate in higher education institutions, as well as the percentage of the population that has a college degree.

Although being a comprehensive ranking methodology obtained using mostly objective data, U21 ranking has its limitations. Namely, U21 methodology has been criticized for several reasons (Rauhvargers, 2014). One of the drawbacks is that the model is, in fact, a production model (Cheng, 2012). Another is that the index does not include measurements of teaching while it gives high significance to output (Millot, 2014). For this research, the most important critiques are the ones regarding the weighting scheme and the aggregation method. As many composite indexes, U21 faces the issue of expert-driven weights. The lack of information and justification of the assigned weights are one of the major drawbacks of this newcomer to the university ranking scene (Soh, 2014).

The aim of this research is the alteration of the U21 weighting scheme, thus making it data-driven. We propose the twofold Composite I-distance Indicator (CIDI) methodology to obtain objective and unbiased weights.

3. METHODOLOGY

3.1 Composite I-distance Indicator (CIDI) Methodology

A need for an unbiased ranking of countries was emphasized in the 1960s. Many ranking methodologies emerged, but one that stood out was the I-distance method devised by Ivanovic (1977). Namely, his method ranked countries according to their level of socio-economic development by using several indicators. What sets the I-distance apart from the others is its ability to bypass the process of weighting individual indicators as it aggregates indicators without assigning weights. Also, recent research shows that the I-distance can be applied with success not only in various fields but for both creation (Zornic et al., 2015) and evaluation of composite indexes (Dobrota et al., 2015).

Table 1 U21 categories, indicators, devised indicator codes, and their effective weights (Universitas 21, 2015)

Category	Indicator	Code	Effective weight
Resources (20%)	Government expenditure on tertiary education as a % of GDP, 2011	R1	5.0%
	Total expenditure on tertiary education as a % of GDP, 2011	R2	5.0%
	Annual expenditure per student (full-time equivalent) by tertiary education institutions at USD purchasing power prices, 2011	R3	5.0%
	Expenditure in tertiary institutions for research and development as a percent of GDP, 2012	R4	2.5%
	Expenditure in tertiary institutions for research and development per head of population at USD purchasing power prices, 2012	R5	2.5%
Environment (20%)	Proportion of female students in tertiary education, 2012	E1	1.0%
	Proportion of academic staff in tertiary institutions who are female, 2012	E2	2.0%
	Data quality	E3	2.0%
	Qualitative measure of the policy environment	E4	10%
	Responses to WEF survey question: “How well does the educational system in your country meet the needs of a competitive economy?”	E5	5.0%
Connectivity (20%)	Proportion of international students in tertiary education, 2012	C1	4.0%
	Proportion of articles with international collaborators	C2	4.0%
	Number of open access full text files on the Web, per head of population, 2009-2013	C3	2.0%
	External links that university web domains receive from third parties, per head of population, 2009-2013	C4	2.0%
	Rating of knowledge transfer between university and companies, 2013	C5	4.0%
	Percentage of university research publications co-authored with industry researchers, 2009-2012	C6	4.0%
Output (40%)	Total number of journal articles produced by higher education institutions, 2012	O1	10.0%
	Total articles produced by higher education institutions per head of population, 2012	O2	3.0%
	Average impact of articles measured by citations in 2012 to articles published in previous years using Karolinska Institute normalized impact factor	O3	5.0%
	Weighted Shanghai ranking scores for universities per head of population, 2014	O4	3.0%
	Average of nation’s best three universities on the 2014 Shanghai Jiao Tong ranking	O5	7.0%
	Tertiary enrolment rates as a percentage of the eligible population, 2012	O6	3.0%
	Percentage of population aged 24-64 with a tertiary qualification, 2012	O7	3.0%
	Number of researchers in the nation per head of population, 2012	O8	3.0%
	Unemployment rate of the tertiary educated compared with unemployment rates of those with only upper or post-secondary non-tertiary education, 2012	O9	3.0%

The I-distance method is based on calculating mutual distances between the entities being processed, whereupon they are compared to one another so as to create a rank (Ivanovic, 1977). In order to rank entities (in this case countries) by using the I-distance method, it is necessary to determine one entity as a referent in the observed set. The referent entity can be the minimal, maximal, or average observed or fictive value (Jeremic et al., 2011). In our analysis, the referent entity was the one with minimal values.

For a selected set of variables $X^T = (X_1, X_2, ...X_k)$ chosen to characterize the entities, the I-distance between the two entities $e_r = (x_{1r}, x_{2r}, ...x_{kr})$ and $e_s = (x_{1s}, x_{2s}, ...x_{ks})$ is defined as:

$$D^2(r,s) = \sum_{i=1}^{k} \frac{d_i^2(r,s)}{\sigma_i^2} \prod_{j=1}^{i-1} \left(1 - r_{ji.12...j-1}^2\right) \quad (1)$$

where $d_i(r,s)$ is the distance between the values of the variable X_i for e_r and e_s e.g. the discriminate effect

$$d_i(r,s) = x_{ir} - x_{is} \quad i \in \{1,...k\} \quad (2)$$

σ_i is the standard deviation of X_i, and $r_{ji.12...j-1}$ is the partial coefficient of the correlation between X_i and X_j $(j < i)$ (Ivanovic, 1977).

The construction of the I-distance is an iterative process, which consists of several steps. First, the value of the discriminate effect of the first variable (the most significant variable, which encompasses the highest amount of information on the phenomena upon which the entities will be ranked) is calculated. Then, the value of the discriminate effect of the second variable that is not covered by the first one is calculated. This procedure is repeated for all of the observed variables in the data set (Jeremic & Jovanovic-Milenkovic, 2014).

The values obtained using the I-distance value are not comparable as they represent the distance between entities. Therefore, I-distance results could be employed so as to create a weighting scheme (Dobrota et al., 2016). Namely, besides aggregating variables, I-distance method can determine the relevance of the input criteria and so clearly point out variables which are important for their contribution to the final rank (Jeremic et al., 2011). Namely, Pearson's correlation coefficient between each indicator and the I-distance value provides additional information about the importance of each indicator for the ranking process. Therefore, weights can be determined as the ratio of the indicator's correlation coefficient and the sum of all correlation coefficients with I-distance value. The proposed methodology is called the Composite I-distance Indicator (CIDI) methodology. The equation for determining weights is:

$$w_i = r_i \Big/ \sum_{j=1}^{k} r_j \quad (3)$$

where $r_i (i = 1,...,k)$ is the Pearson's correlation coefficient of variables with the I-distance value (Dobrota et al., 2016; 2015). The sum of the obtained weights equals 1 at both indicator and domain level. Therefore, applying the newly obtained weights on the original data provides unbiased and comparable results and rankings.

3.2 Twofold CIDI Approach

The twofold approach for evaluation has repeatedly been used in operational research and statistics (for example Simar & Wilson, 2007). However, the twofold I-distance approach has been recently introduced by Maricic and Kostic-Stankovic (2016) and Jovanovic-Milenkovic et al. (2015). The basic idea of the fresh approach was to follow the structure of the composite index and apply the I-distance method on each of the indicator levels. Therefore, the I-distance method is applied several times before obtaining the overall result. Herein we propose a twofold CIDI approach based on the idea of the twofold I-distance approach.

The original twofold I-distance algorithm has been changed, and the latest development of the CIDI methodology has been incorporated into it. The first step remains the same; the I-distance is applied on indicators within each category to obtain the Category I-distance value. Next, correlation coefficients between each indicator and the Category I-distance value it belongs to are calculated to perform the CIDI in the following step. Upon acquiring the CIDI indicator weights, the new CIDI Categories are calculated. Again, the procedure is repeated to obtain the CIDI category weights. Therefore, the weighting scheme is now acquired on two separate levels: first on the indicator level and second on the category level.

4. RESULTS AND FINDINGS

The aim of this paper was to scrutinize the U21 weighting scheme using the twofold CIDI methodology which is based on the previously introduced I-distance method. First, the CIDI methodology was employed on indicators of each category and afterwards on the newly calculated CIDI category values. The obtained CIDI weights and the effective weights are presented in Table 2.

Table 2 Weights of U21 indicators and categories based on the CIDI methodology

Category	Indicator	Weight assigned to indicators within category (a)	Weight assigned to category (b)	Effective weights (a*b)
Resources	R1	20.2%	24.22%	4.89%
	R2	17.9%		4.33%
	R3	20.4%		4.94%
	R4	19.8%		4.79%
	R5	21.7%		5.25%
Environment	E1	21.90%	23.83%	5.21%
	E2	18.70%		4.45%
	E3	17.90%		4.26%
	E4	24.90%		5.93%
	E5	16.60%		3.95%
Connectivity	C1	15.10%	27.31%	4.12%
	C2	15.80%		4.31%
	C3	15.00%		4.10%
	C4	18.40%		5.02%
	C5	19.30%		5.27%
	C6	16.40%		4.48%
Output	O1	7.1%	24.64%	1.75%
	O2	12.1%		2.99%
	O3	13.8%		3.41%
	O4	12.4%		3.06%
	O5	13.6%		3.36%
	O6	9.8%		2.42%
	O7	11.8%		2.91%
	O8	11.9%		2.94%
	O9	7.5%		1.85%

When analysing the new weighting scheme on the category level, we can see that CIDI suggests balanced weights. Such a distribution of weights is in accordance with the attitude held by Hazelkorn (2014), who argues that the balance is needed for the optimal functioning of the higher education system. The biggest difference in the weights assigned to categories is in the case of *Output*, which has been reduced from 40% to 24.64%. It is crucial that any ranking methodology, either ranking of higher education systems, either higher educational institutions, does not give significantly more importance to a particular aspect of education. Putting ahead high-quality outputs at the expense of lecture and teaching quality can lead to a situation in which the quality of the basic university mission significantly drops.

To better present the differences between the newly obtained and the official weighting scheme, the comparison of the official U21 and CIDI effective weights is provided. Namely, within the category *Resources*, the biggest weight changes occurred for indicators R4 and R5. According to the official

methodology, both indicators have effective weights of 2.5%, and now their effective weight increased to 4.79% (R4) and 5.25% (R5). These two indicators measure the level of expenditure on research and development, and an increase in their significance is in accordance with the idea of improving the competitiveness of the higher education system. In the next category, *Environment*, CIDI suggests more evenly distributed weights. Namely, according to the official methodology, the effective weights vary from 1 to 10%, and according to the CIDI they vary from 3.95 to 5.93%. Indicators E1 and E2, which measure the share of the female population in higher education (as a student and as a teacher) gained importance. It can be concluded that the new weighting scheme favours gender equality. The significance of the indicator E4 has reduced from 10% to 5.93%. Though this indicator is comprehensive and consists of sub-indicators, it is based on surveys conducted by Universitas. The validity of data collected using the survey is questionable, therefore, lowering the weight assigned to this indicator can be justified as a tendency to reduce the subjectivity of the overall index. All indicators of the category *Connection* gained importance, whereas indicators C3 and C4 stand out as their effective weights increased by 2.1 and 3.02 percentage points respectively. These indicators measure the presence of higher education institutions on the Internet and number of open access articles. Both indicators are oriented to measure the implementation of modern technologies in higher education, so the rise of their importance is in accordance with global trends. Weights of the fourth category, *Output*, went through drastic changes; their values either decreased or remained almost unchanged. For example, indicator O1, which measures the total number of published scientific papers, plummeted from 10% to 1.75%. Giving high significance to just one aspect of the output of higher education limits the overall metric, so the proposed weight reduction is justified. Also, we should mention the reduction of significance indicator O5, which is defined as the average value of the top three universities in the Shanghai ranking. As several authors raised the question of the validity of the Shanghai ranking list (for example Docampo & Cram, 2015; Dobrota & Dobrota, 2016), reducing the impact of its results should not be interpreted as a pitfall of the CIDI weighting scheme.

When the new weighting scheme was obtained, it was possible to calculate the values of the CIDI index using the official data and the CIDI weights. In Table 3 are given CIDI index values, CIDI ranks, and their comparison with the official U21 scores for the top 15 observed countries.

Table 3 Twofold CIDI scores, ranks, and comparison with the official U21 scores and ranks for 2015, 15 top ranked countries according to twofold CIDI values

Country	Twofold CIDI score	Twofold CIDI rank	U21 score	U21 rank
Switzerland	75.95	1	87.1	2
Sweden	74.17	2	84.7	5
Denmark	74.09	3	85.3	3
Finland	73.90	4	85.2	4
United States	73.63	5	100	1
Canada	69.60	6	82.8	6
Netherlands	68.90	7	81.6	7
Singapore	67.70	8	80.3	9
Norway	65.92	9	75.3	12
Austria	65.20	10	74.6	13
Australia	64.86	11	77.1	10
United Kingdom	64.50	12	80.6	8
Belgium	64.44	13	76.0	11
Germany	60.20	14	72.1	14
New Zealand	59.83	15	69.6	16

The ranks of the countries covered in the research largely coincide; however, differences between U21 and CIDI results can be observed. The measured Pearson's correlation coefficient is $r=0.862$ ($p<0.01$), which means that the correlation between the two overall scores is strong. Countries in the CIDI top 15 who dropped the most compared to the official U21 methodology, are the United States and the United Kingdom, both for 4 places. The reasons for such a difference in ranks can be found in the new weighting scheme. Namely, both countries are ranked exceptionally by the *Output* category, which is, according to the proposed methodology, less important for the ranking process. On the other hand, Sweden, Norway, and Austria have advanced for 3 places, as the proposed weighting scheme is more balanced and favors egalitarian societies and systems. Other countries are ranked similarly by both methods, with little rank changes. In order to thoroughly assess the validity of CIDI indicator, in addition to the comparison of the CIDI and U21 scores, we

compared their ranks. The obtained Spearman's correlation coefficient is also very high, and statistically significant, $r_s = 0.867$ ($p<0.01$).

5. CONCLUSION

In the recent years, a new type of rankings appeared: rankings of national higher education systems. Together with global university rankings, they are becoming a valuable tool for framing higher education on a global scale. However, their results should be used with caution due to their possible statistical inaccuracy and their influence to push the academic world into becoming more oriented on its assessment than its primary mission - teaching (Shin, Toutkoushian, & Teichler, 2011). Nevertheless, there are many drivers fueling further development and application of rankings, so it is exceptionally important to provide rankings as accurately as possible.

One of the newcomers to the rankings market is the U21 ranking of national higher education systems. The creators of this ranking acknowledged the priority of devising a tool for comparing national higher education systems across countries. They have taken courageous steps to deal with such a daunting task, but there is still place for improvement (Millot, 2014). Major concerns have arisen regarding its subjective weighting scheme. Therefore, the aim of this paper was to analyze and suggest a novel, data-driven weighting scheme based on the CIDI methodology. Namely, the methodology has previously been applied with success for assessing ranking methodologies of universities (Dobrota et al., 2016).

The twofold CIDI approach was implemented on the U21 index. Research findings show that among the categories, *Connectivity* stands out as the most important for the ranking system, followed by *Output*. This is a change compared to the official weighting scheme, as the focus is moved from *Output* to other categories.

In the case of indicators, the analysis outlined that *Output* category needs refinement as some indicators were given significantly lower importance compared to the official ranking methodology, especially the indicator related to the number of published papers. What can also be noted is that the U21 is missing complex bibliometric indicators such as percentile-based indicators which take into account the citations count (for example Bornmann & Mutz, 2014). Also, differences in citing behavior between sciences should be taken into account. A study conducted by Bornmann, de Moya Anegón, and Mutz (2013) proved that certain subject-specific types of institutions are in advantageous position when it comes to ranking in terms of outcome performance. Therefore, one of our suggestions for further development of the U21 ranking is the inclusion of more sophisticated bibliometric indicators.

Two other directions of further research could be additionally defined. First, the question of the level of objectivity of metric arises. Performing the CIDI methodology (either one-fold or two-fold) creates an objective metric, and eliminates the experts' knowledge. However, such an approach can raise certain concerns regarding the possibility of creating a measurement that may not be in accordance with the nature of the observed phenomenon. Therefore, we suggest a hybrid approach (Maricic et al., 2015). Namely, weights on one indicator level could be redefined using the CIDI methodology, while the weights on the other level would be left as suggested by the experts. Such an approach would take into account benefits of both subjective and data derived weighting methods. Next, the presented results suggest that the number of indicators can be refined. To tackle this, the I-distance post hoc analysis could be employed (Markovic et al., 2016). This analysis is an iterative process where the number of indicators in each iteration is reduced for the indicator which has the lowest correlation coefficient with previously obtained I-distance value.

International academic rankings are faced with methodological difficulties which affect the validity of their results. Herein we proposed a transparent approach for redesigning a ranking methodology that is primarily oriented on the process of assigning weights. We believe our paper might act as an incentive for further academic research on the topic of national higher education systems rankings and their weighting schemes.

Abstract: *One of the general problems we face when crating composite indices is the missing data. It is almost impossible to have complete datasets for all the observed entities according to different indicators. Firstly, the paper discusses what to do when having incomplete datasets. The easiest ways are to exclude the indicators or the cases for which a large amount of data is missing. None of these solutions is the best, since neither we want to lose any aspect of the observed phenomenon, nor the cases we observe. Therefore, we need to opt for an imputation technique. The paper further provides an overview of several ideas and explanations of imputation, and addresses the next problem that arises on how to select one appropriate technique among the available ones. Bearing in mind the extent to which the data can be manipulated when imputing, we provide an analysis oriented to find an answer to the posed question. The analysis tests six single imputation techniques applied to several countries for two observed indicators – R&D expenditures and R&D researchers.*

Keywords*: missing data, imputation, single imputation, mean imputation, regression imputation, cluster analysis, composite index*

1. INTRODUCTION

Composite indices have evolved and become a very popular way of assessing large phenomena that cannot be captured by one single indicator. They serve as a tool for measuring countries performance, and ranking accordingly. Scholars and international organizations create different methodologies for constructing composite indices to meet a wide range of purposes, primarily to "fairly" rank the countries and enable the cross-country comparisons, and to facilitate the strategic decision-making processes. Examples include assessments of human development, ICT development, technological readiness, e-readiness, innovativeness, competitiveness, sustainability, wellbeing, quality of life, gender equity, ease of doing business and many others (see Bandura, 2008).

However, although having dozens of new or improved composite indices every year that are proven to have many positive aspects, we should be aware of their shortages and different difficulties we come across while constructing. There are several general problems we face: from selecting the indicators that will be included in the final index, through finding the right sources for collecting the data, dealing with the missing data and standardizing the data, to finding the right methods for weighting and aggregating the selected indicators. Our decisions in each step will highly affect the final result. For example, Grupp and Mogee (2004) showed how innovation scoreboards can be manipulated in the policymaking system, depending on the selected indicators. Hurdlikova (2013) showed seven different scenarios of the EU countries ranking according to the selected indicators for Europe 2020 with the aim to highlight the sensitivity of results which vary and depend on choosing both the normalization methods and the weighting and aggregation schemes. One of the mostly criticized aspects of constructing indices is the choice of weighting method, since weights are subjective by nature and can considerably affect the final results. Cherchye et al. (2006), and Filippetti and Peyrache (2011) propose the use of Data Envelopment Analysis (DEA) for this purpose. However, there is one crucial problem which precedes, and that is the missing data.

The authors have been creating a composite index of technological capability of countries and experienced how difficult it could be to deal with the missing data problem, since different imputations can highly affect the changes of ranks, i.e. the final scores of countries. As Foa and Turner (2012) highlight, one of the key decisions we have to make when designing composite indices is how to deal with this problem in such a manner to ensure that the final index values reflect a meaningful image of the available information. This paper firstly provides an overview of existing imputation techniques, and then addresses the issue of missing data imputation in such a manner to provide explanations on how to select the most appropriate imputation technique. We restrict the analysis to the single imputation techniques implemented in IBM SPSS Statistics 22. In some cases cold desk imputation is the most appropriate, sometimes the regression analysis provides better results than the simple mean value, in some cases it is better to firstly classify the countries and then to impute the missing values by using an average cluster value or regression analysis over the selected cluster, etc. This will be elaborated later in the text.

The rest of the paper is organized as follows. Section 2 explains the possible ways to solve the problem of missing data and provides an overview of several imputation techniques. Section 3 provides an analysis on choosing the "right" imputation technique among six applied on the sample of several countries observed according to two indicators – R&D expenditures and R&D researchers; root mean square error is calculated in order to test decisions by finding accuracy of the applied techniques on different datasets for two of other indicators used for assessing countries' technological capability: ICT goods imports and Electric power consumption. This section offers the results and discussion of the study. Section 4 concludes the paper.

2. SOLVING THE PROBLEM OF MISSING DATA

After deciding which indicators to include in an index, we collect the data. At this point we become aware of the amount of the missing data, and whether we will be able to encompass the selected group of indicators or not. If a lot of data is missing that cannot be imputed meaningfully, we have to exclude some indicators from the analysis, i.e. to drop out the variables or instances for which the data is missing. So, the **case deletion** is the first and the most radical way of dealing with this problem. This method is used in the case when, for example, among the observed countries we miss the values for the majority of countries for the larger part of the observed period of time, so that we cannot estimate and impute the missing values. For example, the famous Human Development Index deals with the missing data problem in this way, selecting the variables for which complete data across the domain of countries is relatively easy to obtain, restricting to a small set of indicators for which complete data exists. On one hand this is good since it provides objective and more reliable results, but on the other hand this way we cannot include all important aspects of one phenomenon, but have to restrict to the basic ones. The case deletion approach is, of course, appealing because of its simplicity. However, this is not applicable in cases when missing values cover a lot of instances, or their presence in essential attributes is large (Little & Rubin, 1987).

Generally, if this radical exclusion of indicators is not needed or wanted, composite indices can deal with the problem of missing data in three ways (Foa &Tanner, 2012). The first and the simplest solution is to drop out any country for which complete data does not exist; the second solution is to impute missing values using different methods; and the third is to use only existing data in the estimation of the index, but supplementing with an estimated margin of error. The first solution of reducing the sample is not always acceptable, especially if we want to make the global cross-country comparisons. However, there are indices, as the Doing Business Indicators whose authors want to avoid the methodological problems and obtain an objective result (Foa & Turner, 2012). This is why the country domain is smaller than in the case of e.g. ArCo index of technological capability of countries (Archibugi & Coco, 2004), which is measured for 162 countries. So, in order to enlarge the sample, we need to find the "right way" of imputing the missing values, always having in mind that the selection of methods manipulates the results. We will discuss this in detail in the Section 2.1. The third proposed solution refers to using only the existing data in the estimation of the index, but supplementing the results with an estimated margin of error, based on the number of missing items, among other criteria observed. This approach is used in a number of recent indices such as the Corruptions Perceptions Index (CPI) where the confidence range indicates the reliability of the country scores. It tells that allowing for a margin of error we can be 90 percent sure that the true score for countries lies within the given range.

2.1. Missing data imputation techniques – an overview

The literature on the analysis of missing data is extensive and in rapid development. OECD & EC-JRC (2008) published the *Handbook on Constructing Composite Indicators – Methodology and User Guide*, which provides help in creating indices. The Handbook aims to contribute to a better understanding of the complexity of composite indicators and to an improvement in the techniques currently used to build them. Among others, the Handbook deals with the problem of missing data imputation, and suggests single and multiple imputations as possible solutions. As defined in the Handbook, "imputations are means or draws from a predictive distribution of missing values." The predictive distribution must be generated by using the observed data.

Single imputation refers to both implicit and explicit modelling. The implicit techniques are simple. ***Hot desk imputation*** refers to filling in the blanks cells with individual data which are drawn from the unit that has similar characteristics (for example if we observe units according to four indicators and miss a value for one unit for indicator x, we will fill in that missing value with the value of indicator x for the unit which is the most similar to the one observed according to the other three indicators). ***Substitution*** means the replacement of non-responding units with the unselected units in the sample, while ***Cold desk imputation*** is the replacement of missing values with the values from an external source (for example from the previous

realization of the same survey or the value of an indicator from the previous year in the case of assessing the countries performance). Additionally, we propose the ***Simple mean imputation*** which refers to imputing the missing values considering only one instance and its' dataset (separate from the sample), imputing the missing value by finding average of the previous and the next value to the one missing (it is important to have in mind that assessing countries performance we deal with time-series datasets).

Explicit modelling is more complex and demands more detailed explanations. Using ***unconditional mean imputation*** means that we impute the missing values with the sample mean (median, mode) for the observed indicator. The limitation of mean value based imputation and its variations is its focus on a specific variable without taking into account the overall similarities between instances (Ayuyev et al., 2009). This is the easiest way of explicit modelling, but not always precise enough. Therefore, we could use other two more sophisticated techniques. Firstly, the ***regression imputation*** where missing values are imputed with the predicted values obtained by regression. Here we observe dependent variable and independent variable(s). The dependent variable is the indicator for which we miss some values, and the independent variable(s) is (are) the individual indicator(s) which show strong relationship (usually high correlation) with the dependent variable. ***Expectation maximization imputation*** focuses on the interdependence between parameters of the model and the missing values. It is an iterative process. First, the missing values are predicted based on initial estimates of the model parameters values. These predictions are then used to update the parameters values, and the process is repeated. The sequence of parameters converges to maximum-likelihood estimates, and the time to convergence depends on the proportion of missing data and the flatness of the likelihood function. For more detailed mathematical explanation on explicit modelling techniques see OECD & EC-JRC (2008, pp. 55-58).

Multiple imputation is considered to be one of the most powerful approaches to missing values estimation (Ayeyev et al., 2009). It is a general approach that does not require a specification of parameterised likelihood for all data. The missing data is imputed with a random process that reflects uncertainty. Imputation is done N times, to create N "complete" datasets. The parameters of interest are estimated on each data set, together with their standard errors. Average (mean or median) estimates are combined using the N sets and between-and within-imputation variance is calculated. Although any imputation method can be used in multiple imputation (used repeatedly to obtain N values), one of the most general models is the ***Markov Chain Monte Carlo (MCMC) method***. It is a sequence of random variables where the distribution of the observed element depends on the value of the previous one. It is assumed that data are drawn from a multivariate normal distribution and requires the following assumptions: missing at random (MAR) and missing completely at random (MCAR). For more detailed explanation see OECD & EC-JRC (2008, pp. 58-61). For example, the Environmental Sustainability Index uses the MCMC technique to substitute the missing values (Srebotnjak, 2001).

Based on the amount of operations performed, Zhang (2011) presents the following categorisation of imputation techniques: single, multiple, fractional and iterative. **Fractional imputation** represents a compromise between the single and multiple imputation methods, while **iterative imputation** techniques primarily use a generate-and-test mechanism, taking into account useful information (including incomplete cases).

Fujikawa and Ho (2002) consider a **clustering based approach for missing data imputation**, where the premise is that units could be grouped such that all the imputations in identified groups are independent from other groups. ***Distance-based clustering*** is focused mainly on development of supervised clustering methods and mean/mode based imputations in these clusters (De Mántaras, 1991). They are based on a strict separation for objects within clusters, so it is assumed that there is no influence of instances in one cluster to an imputation process in other clusters. Ayuyev et al. (2009) suggest the improved ***dynamic clustering-based imputation (DCI)*** of missing values in mixed type data. They consider the appropriate choice of a method for imputation especially important when the fraction of missing values is large and the data are of mixed type. The proposed DCI algorithm relies on similarity information from shared neighbours, where mixed type variables are considered together. Around each instance with a missing value they deterministically construct an independent cluster of similar instances with no missing values for a particular attribute. In contrast to a typical clustering method, they allow cluster intersections meaning that the same unit may be included in many clusters. It relies on a distance measure that considers both categorical and continuous variables and is applicable for estimation of missing values in high dimensional mixed type data.

Different authors propose and analyze other complex algorithms for missing data imputation. For example, Abdella & Marwala (2005) introduced a new method for imputing the missing values which uses a combination of **genetic algorithms and neural networks** for approximation of the missing data. Nelwamondo et al. (2007) compare neural network and expectation maximization techniques, while Lobato

et al. (2015) offer a **multi-objective genetic algorithm** for missing data imputation (MOGAImp) which is an iterative imputation technique. Explanation of these complex methods is beyond the scope of this paper.

3. MISSING DATA IMPUTATION: MAKING A CHOICE AMONG SIX SINGLE IMPUTATION TECHNIQUES – RESULTS AND DISCUSSION

While assessing the technological capabilities of countries, we faced the missing data problem. Firstly, we needed to exclude some of the indicators because of a large amount of data missing for the observed period of time. Secondly, we excluded some countries with incomplete datasets, where meaningful imputations could not be performed. Among the countries left, we needed to impute the missing values for some crucial indicators that could not be excluded from the analysis, such as *Researchers in R&D (per million people) – IND1* and *R&D expenditures (% of GDP) – IND2*. In this section we will try to elaborate and explain how to choose the "right" imputation technique on the example of these two indicators, selecting from the six single imputation techniques applied. Table 1 shows the results of imputation using the following techniques: CD – Cold desk imputation, SM – Simple mean imputation, EM – Expectation maximisation imputation, R – Regression imputation, C-M – Cluster mean imputation, C-R – cluster regression imputation. For two countries we apply C-R_{II}, which will be explained later in the text. For the first and the second indicator we analyse four and five countries, respectively. For each country, in the first row we present the existing dataset for the observed period. Framed positions are missing. In the next six (or seven) rows we present different results obtained by applying the mentioned techniques. We marked the chosen (most appropriate) techniques by putting an asterisk next to the technique(s) name(s) and formatting numbers in bold.

As we can see from the Table, CD imputation can be used always. We propose it to be applied this way: if the value for one year exists and we miss the value for the previous one, we impute the missing value by copying the value from the current year (e.g. Chile for both indicators). Otherwise, if we have the previous values, we always consider that to be a better situation, and copy that value for the next year missing (e.g. Greece for IND1). This technique is surely not accurate enough, but sometimes better to be applied that the others. This refers mainly to the cases where we miss the values for long time period. It is hard to predict the trend of the indicator in the past/future, especially if we miss the values for the same period for the indicator that is correlated with the one observed. This is the case with Chile, where we miss the values for the period 2000-2006 for both indicators and cannot apply the trend from one indicator to the other. For example, for Israel we also miss the values for the long time period 2000-2010, but we are in better situation because we have the whole dataset for Israel for IND2. In this case we firstly clustered the observed countries according to R&D researchers for the periods for which the values exist (2011-2013) and obtained Israel to be in a cluster with Japan, Korea, Sweden and Finland. Then we applied C-R_{II} imputation, meaning that regression analysis is performed over the obtained cluster, using R&D researchers as a dependent variable, and R&D expenditures as the independent. Of course, it is questionable whether we can accept any of these results, since a lot of values are missing. If not, the safest approach is to exclude these two countries from the further analysis. If we accept these values, than we need to be cautious when processing this data because illogical result may appear. In other cases (except Israel, Australia and Greece for IND1) C-R imputation means that we firstly performed the cluster analysis, and then the regression over the observed cluster, for one indicator observed (we did not connect two indicators because the data was missing for both).

Regarding the SM imputation, it is best to be applied in the situation when we miss one value between two which exist, and regression is not applicable because of the unstable trend which cannot be captured. This is the case with Australia and New Zealand for IND2, and for Australia (2005, 2007) and Greece (2000, 2002, 2004) for IND1. The rest of the missing values for both Australia and Greece for IND1 cannot be obtained by SM imputation. We tried to perform C-R_{II} which did not provide satisfactory results, so we use CD for Australia for 2009-2013 (copying value from 2008) and for Greece for 2008-2010 (copying from 2007).

Regression imputation, which refers to performing the regression analysis over the whole sample, is applicable and good when the trend is captured. This is the case with Greece and Luxembourg for IND2. Besides this, both SM and CD could have been applied. This is where we easily see how our decision in this step would affect the final result (score of country). It is interesting to notice that when comparing R and C-R imputation, we obtain quite different results (see e.g. Greece for IND2, period 2008-2010). However, none of these gives good results if a lot of data is missing, and the trend cannot be captured.

C-M imputation has not proved to be a good solution in any of the cases presented. Large deviations from the existing values are noticed. For example, for Chile for IND1 we obtained the following values for the missing period 2000-2006: 543.62, 539.82, 569.74, 592.36, 640.42, 700.28, 683.89, and the existing value for 2007 is 337.18. It doesn't reach even 400 until the end of the period observed. The problem with C-M is that the instances in one cluster should be really close in order to be in a position to perform this imputation

technique. That cannot be the case with Chile which is among the countries with the lowest values in the sample. In this case average of both the cluster and the sample would be over the values for Chile. This is also the case if we observe the country among those with the highest values in the sample (the mean value, both cluster and sample, will always be lower than needed).

Table 1: Comparison of the applied techniques – results for R&D researchers and R&D expenditures

Performing this analysis, we can easily see how the final country score would surely depend on the imputation technique we decide to apply. Looking for example at Australia for 2005 (IND1), we obtained six pretty different values: 4062.53, 4147.15, 3741.31, 3843.00, 3061.57, and 3840.89 using six techniques. Deciding which to use is completely subjective and enables the manipulation of results. This is a huge problem, since a country could be many places up or down on the list depending on the technique accepted. Besides this, it should be highlighted that one imputation technique cannot be applied for one indicator for all the countries for which data is missing. It highly depends on the nature of the existing data, and the amount of data missing. Additionally, we could conclude that when imputing we should always look at the bigger picture, connecting (when possible) different observed indicators (in our case the correlated R&D expenditures and researchers), in order to ensure the reliability of the imputations.

For the purpose of testing accuracy of imputation methods, we performed another analysis that includes more datasets for two other indicators used for assessing countries' technological capabilities, for which complete data exists across the observed domain of countries: *ICT goods imports (% of total goods imports) – IND3* and *Electric power consumption (kWh per capita) – IND4*. The idea of this analysis is to delete the values for the same years that were missing for IND1 (in Table 1), and calculate the root mean square error (RMSE) for each technique applied, for each country. The results for IND3 are presented in the Table 2. For each country, in the first row we present the existing (complete) dataset for the observed period. In the second row we deleted the values; framed positions are now "missing". Next six rows present different results obtained by applying the same techniques used in the previous analysis. For each technique we calculated the RMSE (presented in the last column) by applying the following formula (Chai & Draxler, 2014):

$$RMSE = \sqrt{\frac{1}{n}\sum_{t=1}^{n}(y_t - \hat{y}_t)^2} \quad (1)$$

where y_t is the observed, actual value and $\hat{y}_t$ is the predicted, imputed value.

The aim of this analysis is to examine whether we would intuitively choose the technique with the smallest error as the most appropriate, following the principle we used for the first analysis. For each country, the techniques with the smallest RMSE are marked by putting an asterisk next to the technique(s) name(s).

Regarding the values for Australia for IND3 (Table 2), we would certainly choose SM imputation for years 2005 and 2007 (which also has the lowest RMSE), but would definitely make a mistake by choosing CD imputation (RMSE=0.982) for the years 2009-2013, since EM has lower RMSE value (0.593). But not having

the values with which to connect and compare, it would be brave and uncertain to choose EM values as the most appropriate. Here we can easily see how the results are questionable when the data is imputed. Secondly, regarding Chile, the only method we could use is CD since a large amount of data is missing and we cannot predict the trend by connecting to another correlated value (performing C-R_{II}). CD imputation has RMSE value of 1.47, which is much higher than the EM which again proves to be better, with RMSE of 0.57. However, again it would be hard to justify such a decision on choosing EM for imputation. Regarding Greece, we would again be fine with the values for 2000, 2002 and 2004, performing the SM imputation (RMSE=0.329). This shows that it is not a problem when one value is missing between two which exist. However, for the years 2008-2010, a mistake would be made by using CD (RMSE=0.687) instead of R (RMSE=0.428). But it is encouraging that in this case the mistake wouldn't be large, since the values of RMSE are close (unlike for Australia). Israel is the most challenging case, since a large amount of data is missing. As we can see from the RMSE values for all techniques for Israel, the errors are higher. This indicates that inaccurate decision would surely be made when a lot of data is missing. This result is logical and expected, and supports the claim that entities with a large number of missing data should be excluded from the analysis. For the opposite reason SM is always the best technique (but can be applied only in a few cases). For Israel, C-M imputation stands as the best one but still with a large error of 1.041.

In order to obtain a general value of accuracy of the applied techniques, total RMSE is calculated using the aforementioned formula, but gathering the data for all countries. The results are presented for IND3 and IND4 (Table 3). Because of the space limitations, we did not provide the detailed analysis for RMSE values for IND4 for each country, but only the total. SM imputation is applied for 5 missing values, and other techniques are used for 31 imputations for IND3, i.e. 30 for IND4 (because IND4 is not measured for 2013).

Table 3: Total RMSE values

IND 3 - ICT goods imports						IND 4 – Electric power consumption					
CD	**SM**	**EM**	R	C-M	C-R	CD	**SM**	**EM**	R	C-M	C-R
1.498	**0.436**	**1.078**	1.574	1.454	1.588	358.18	**161.72**	**270.67**	450.33	1447.79	459.45

From the Table 3 we can see that SM expectedly proves to be the most accurate technique, since it is applicable only in a few cases and is measured as the average value between the two which exist. More importantly, EM proves to be the best technique among those which can be applied always. It is an interesting result, since we did not choose EM in none of the cases presented in the first analysis. Looking at Tables 1 and 2, it is obvious why we did not choose EM, since there is no explanation on such a decision. We can explain why we choose simple methods as CD, believing that we make smaller mistake by arguing that the trend has not changed over time. This analysis proves this to be wrong. Other techniques have higher errors, ranked differently for these two indicators. It is not possible to claim which one is the most inaccurate; it depends on the sample.

4. CONCLUSION

Using composite indices for assessing large phenomena and ranking the countries accordingly has been widely accepted. Even being aware of the shortages of composite indices, the race for a better country rank on different lists has taken its toll. Understanding the importance of composite indices today, many scholars try to deal with different methodological problems mentioned in this paper, all with the aim to create something maybe unreachable, and that is the objective and precise methodology for creating indices, in order to ensure the reliability of the results. The problem we address in this paper is the missing data. It is almost impossible to have complete datasets for all the countries observed according to different indicators that an index includes. To avoid exclusion of indicators or the countries observed, we need to opt for an imputation technique that will make the data complete, and countries performance possible to assess. In this paper we showed an overview of different imputation techniques, both single and multiple. Having different techniques among which we can choose is good, but we stay with a big problem of deciding which method to use to fill in empty data spaces. Luengo et al. (2012) considered this problem, choosing the best imputation method considering three groups of classification methods. We also try to provide an answer to this question in the Section 3 where we analysed two basic indicators needed for assessing technological capabilities of countries, which cannot be excluded from the analysis, and for which a lot of data is missing. On the examples of different countries we show how to select one appropriate out of six different single imputation techniques applied. Additionally, in order to strengthen the results and principles used in the first analysis, we performed an analysis on measuring accuracy of the applied techniques on another two indicators for the same countries for which the whole datasets exist, calculating the RMSE. This analysis enhances the claim that imputation of the missing data leads to doubtful results, enabling the manipulation.

It is important to emphasize that one imputation technique cannot always be applied for all the countries observed according to one indicator (sometimes even not for one country for the whole time period), but depends on the amount of the missing values and the nature of the existing data (e.g. whether the observed country has higher, lower or average values comparing to the others in the sample; whether we can catch the trend in the existing values which can be used for predicting the missing once), and depends on the sample (if the imputation technique is not separated from the sample). Besides these, it is important to notice that when we speak about the values for indicators for a period of time, we deal with time-series and not random values, and therefore need to be couscous when imputing. As mentioned in OECD-JRC (2008) there is no "a" method that should be used for imputing the missing values, but the method should be fitted to the characteristics of the missing information.

As Dempster and Rubin (1983, pp.3-10) remark, imputation "is seductive because it can lull the user into the pleasurable state of believing that the data are complete after all, and it is dangerous because it lumps together situations where the problem is sufficiently minor that it can legitimately be handled in this way and situations where standard estimators applied to real and imputed data have substantial bias." As Foa and Turner (2012) highlight, there is a serious problem of legitimacy when nations are rated based on estimated, rather than actual values. In such cases, it is very difficult to guard against challenges by critics from countries which are rated poorly, arguing that the scores are inaccurate. This is why the use of imputation is more common among academicians than among international organizations such as the United Nations, the European Commission, or the World Bank.

THE CONJOINT ANALYSIS OF PARENTS' PREFERENCES TOWARDS CHILDREN'S PHYSICAL ACTIVITIES

Jelena Šormaz*, Marija Kuzmanović, Veljko Jeremić
University of Belgrade, Faculty of Organizational Sciences
*Corresponding author, e-mail: jelenasormaz91@gmail.com

Abstract: *Knowing parents' attitudes and preferences, as well as the challenges they face when choosing and organising their children's activities gives us the opportunity to perceive key problems in this field and to offer possible solutions. The right choice of the activities influences the correct development of children, in the present, as well as in the future. In this study it is shown how Conjoint analysis, which has rarely been used in this field, could help in obtaining detailed insight into the current situation, parents' priorities and wishes, but also potential problems that could arise. The study may help to draw attention to the importance of this field, to point out the possibility of its research through different disciplines and to initiate further efforts towards its comprehension and development.*

Keywords: *parents' preferences, physical activities, Conjoint analysis, children's development, health risks*

1. INTRODUCTION

Childhood presents the key period for creating a basis for the development of all aspects of personality, primarily through different activities and experiences. This is the period during which children are gradually forming their attitudes, interests, preferences, habits which usually stay present later in the future, with more or fewer alterations.

Naturally, parents have the pivotal role in the choice of children's activities in the early childhood. Later on in life, the importance of other factors prevails, such as friends, school, and media. With time, the latter becomes more and more influential.

We can conclude that there is a combination of different factors, pressures, and limitations that influences children as well as their parents when it comes to deciding which activities the child should choose. Lack of time and financial resources, peer and media pressure represent just a few among the challenges they face on a daily basis.

The aim of this paper is to examine how they cope with these challenges, which criteria they take into account when choosing children's activities and whether the parents are aware of the importance that each activity has on their child's development. Also, we would like to find out what potential problems could arise when it comes to choosing and organising those activities. If we could understand parents' preferences, as well as the challenges they face, we would be able to point out some major issues and suggest potential solutions.

First, we will talk about the importance of the physical activities in childhood and their impact on developing permanent healthy habits. Moreover, we will discuss the possible consequences of inactivity, as well as certain limiting factors that impede parents from organising their children's activities. Also, we are going to introduce Conjoint methodology, used for obtaining the results of our survey, that will also be presented in more details within this part. Afterwards, we need to analyse the obtained results. First of all, we will get to know our sample and its characteristics. Later on, we will talk about attitudes and experiences parents shared with us in the second part of the survey. Lastly, we will present the results of the Conjoint analysis, discussing the most important conclusions about respondents' preferences. The last part of the paper is dedicated to the discussion of the new findings. We have tried to give a comprehensive overview of the key problems, their possible solutions and potential recommendations for the future research.

2. THE IMPORTANCE OF PHYSICAL ACTIVITY

The way children spend their leisure time has changed over time. Electronic entertainment represents one of the indoors activities, which takes up to 7.5 hours a day of children's free time (Hofferth & Curtin, 2003). In the last decade, the use of electronic devices increased dramatically. Even though the time dedicated to watching television is still significant, we are now witnessing the increase of usage of other media (Hofferth &

Sandberg, 2001). It is alarming that this way of life leads to the increase of chronic diseases. It is significant to emphasise that this happens despite the high level of children's participation in organised physical activities. A lot of children practise different sports, but it might be possible they are not aware of the relevance of physical activities. Therefore, they can't form healthy habits in the right way.
In our research, we decided to consider parents whose children attend primary school as our target group because the period of the primary school is vital for children's personality development. Furthermore, it enabled us to examine how physical activities are combined with school responsibilities since parents often have the tendency to believe that the school results and the level of physical activities are conflicting. In other words, they think the more time children dedicate to physical activities, the poorer results they will achieve at school (Inspiring Children's Physical Activity: Exploratory Research with Parents, 2003). This shows us why it is important to explain to parents that this is a mistake and physical activity, in fact, has a positive impact on different aspects of a child's life, even on the development of their intellectual skills and on school results presently, as well as in the future.

The beginning of primary school (between six and eight years) represents the crucial period for the development of physical capabilities (Dauer & Pangrazi, 1989; Fox, 2009) during which children form habits related to physical activity and nutrition (Jago et al., 2005). It has been proven that the habits formed during childhood stay present during adulthood as well (Malina, 1996; Twisk et al., 2000). Consequently, the acquisition of healthy habits in the early childhood has had a tremendous significance and impact on children's health in the present, as well as in the future. Adequate participation in physical activities during childhood and adolescent period represents the key factor for keeping good health in the long term (Trost, 2010).

Having in mind broad prevalence of physical inactivity and constant spreading of the obesity problem (Ogden et al., 2008), the promotion of regular activity among the youth has become the top priority of health organisations worldwide. Establishment of healthy behaviour in the early childhood constitutes a pivotal role for future habits and activities. Encouraging physical activity, especially outdoor, could be the key factor in the struggle against health risks caused by modern lifestyle.

Parents have the possibility to influence the children's behaviour, and they have a pivotal role in encouraging their physical activity (Brockman et al., 2009). The research have shown that this encouragements, together with parents' logistical support (providing resources and equipment for the activities, driving or accompanying their children to the venue where the activity is taking place), has the major impact on the children's level of activity (Davison et al., 2003; Hennessy et al., 2010; Jago et al., 2010). Bearing in mind the increase of problems with overweight and obesity, the extent to which parents influence their children's habits concerning nutrition, physical activity and passive ways of spending free time (watching television, using computers, etc.) became the issue of special interest (Pocock et al., 2010).

However, we have to be aware of the factors that limit the possibility to take part in different activities. Some of the factors parents identified as limiting were lack of time (Hesketh et al., 2005; Mitchell et al., 2011), lack of resources and excessive costs (Mitchell et al., 2011; Smith, 2005), security, violent peers, as well as the peers' pressure to sedentary activities (such as watching television and computer usage), lack of adequate program opportunities and offers (Smith, 2005) and a great distance to the venue of the training (Hesketh et al., 2005). Parents' experiences show that these obstacles make it difficult or even impossible for them to involve their children in different activities.

Since the sedentary way of life has become more and more prominent in the modern life, we can notice the increase of its consequences on health and other aspects of children's personality. It is important to point out these consequences continue later on in life because the habits acquired in childhood continue in the mature age as well. That is one of the main reasons why we decided to focus on the physical activity in our research.

Understanding the social and environmental factors that influence physical activity play vital role in developing effective measures and initiatives for increasing the level of children's and adolescent's activity. On the one hand, our results could encourage parents to pay more attention to this topic and help them to get a broader insight into its importance. At the same time, these results can also be beneficial to schools, relevant ministries, and organisations when it comes to starting different initiatives. They could help them create innovative programs and focus on the key matters revealed during the research.

3. METHODOLOGY AND RESEARCH

3.1. Conjoint analysis

Our goal was to determine which factor is the most important between different types of training, as well as which combination of characteristics is the most appealing one for parents. To be able to answer these questions, we used Conjoint analysis, which reveals respondents' preferences through the simulation of the real problem of choice.

The previously mentioned term was introduced in 1978 by Green and Srinivasan. However, there isn't a clear-cut definition of this term, but several are provided. Hair (Hair et al., 1998.) defined it in his paper saying that 'Conjoint analysis is a multivariate technique used specifically to understand how respondents develop preferences for products or services. It is based on the simple premise that consumers evaluate the value of a product or service by combining the separate amounts of value provided by each attribute.' Sudman and Blair (1998) pointed out that it must be regarded as a type of 'thought experiment' designed to show how various elements of products or services (price, brand, style) predict customer preferences for a product or service.

The central assumption of the decomposition approach is that consumers evaluate overall utility of product/services combining part-worth utilities of various levels for each attribute which describe a certain product. Those partial utilities are defined as numeric values that show the level of appeal of different characteristics of product/services. When a consumer chooses between different products, they don't observe only one isolated characteristic, but they make their decision by observing (perceiving) and analysing its characteristics all at once. The name of the method comes from that fact – CONsidered JOINTly (Kuzmanovic, 2006).

The researcher defines some key attributes of the analysed entity. Then he needs to choose several different levels, variation for each attribute. Each combination of the different levels of attributes forms one profile or concept (Kuzmanovic, 2006).

Two main goals of the Conjoint Analysis are:

- To evaluate the contribution (influence) of each attribute on consumers' overall preferences
- To create a valid model of consumers' judgment which would be helpful in forecasting his reactions to the changes in the characteristics of the existing product or introduction of a new product to the market.

This method represents very well real conditions and the consumers' behaviour on the market. It simulates the whole process of choice in a certain way. Upon completing the survey, the respondent has to put themselves in the position of a consumer and to truly analyse and evaluate all of the presented offers according to their preferences, needs, and priorities.

The process of implementation of the Conjoint analysis study consists of the following key steps:

1. Attribute List Formulation - A business problem is defined, and an attribute (features) list, as well as their performance levels, is developed to study the problem.
2. Data collection - Respondents are asked to express the trade-offs they are willing to make among product features by rating, sorting or choosing among hypothetical product concepts.
3. Utility calculation - A set of preference values (also called part worth utilities or part-worths) is derived from the interview data; they reflect the trade-offs each respondent has made.
4. Market Simulation.

Owing to the Conjoint Analysis, we can understand which characteristics are the most important to them when choosing a product/service. Furthermore, we are able to see which level of each attribute is the most appealing to them. In this way, we are able to adjust the offer to their needs and preferences. We can identify the key factors which they pay attention to the most and which affect their decisions and choices. In addition, we can modify them in order to create the optimal mix of characteristics. In that way, we maximise consumers' satisfaction, as well as we maximise our opportunities/income/success. We get a realistic image of the needs and wishes on the market.

This method has rarely been applied in the field of children's development. However, considering the fact that our main goal is to get an insight into parents' preferences, it is undoubtedly suitable for this research.

What we are expecting to achieve with this choice of method is to shed the light on the new possibilities a contribution that similar multidisciplinary research could bring, broadening the knowledge and understanding of this field.

3.2. Research

During October 2015, 109 parents participated in the survey. The surveys were distributed online, using various social networks, as well as in the paper version in several primary schools in Serbia.

We decided to focus on the parents whose children attended primary schools since we have learned from the referenced literature that this was the critical period for children's development. The children included in this study were between 6 and 14 years old.

The survey consisted of two parts. In the first part, demographic questions and issues that concern parents' attitudes and experiences towards their children's physical activity were included. The second part comprised 16 scenarios analysed by the Conjoint analysis. Each scenario represented the combination of various levels of seven different attributes. All attributes with all their levels are the following:

- Type of sport:
  - Individual
  - Team
- Contact:
  - With contact
  - Without contact
- Training intensity:
  - High
  - Medium
  - Low
- Frequency of training:
  - Once a week
  - 2 – 3 times a week
  - More than 3 times a week
- Parents involvement:
  - Children need to be accompanied by their parents to the venue
  - Children don't need to be accompanied by their parents to the venue
- Possibility of competition:
  - Existing
  - Non existing
- Monthly price:
  - 10% above the average
  - Average
  - 10% below the average

Parents were asked to evaluate each offer of training (5-I like it very much, ..., 1-I do not like it at all) based on their preferences and priorities.

4. RESULTS

As it was expected, mothers represented the majority of the sample. 88 mothers and 21 fathers have completed our surveys. 88 girls and 70 boys have been included in the research. The average age of children was 10.97 years. 74.3% of parents were from the territory of Belgrade, and the remaining 25.7% came from all over Serbia, mostly from the province of Vojvodina, 16% of them. An average household income was shown to be on a rather high level, as 25.7% of parents said their average monthly income was 120.000 RSD.

In the following part of the survey, we focused on children's physical activity. The results have shown that 75.6% of children practice some kind of sport, and the team sports stand out as the most popular ones. Figure 1 illustrates the distribution of children's participation in different types of sports.

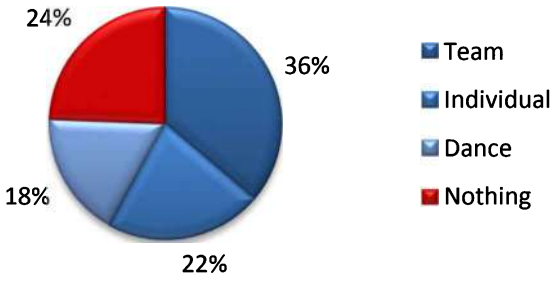

Figure 1: Children's organised physical activities

It has also been shown that there is statistically significant difference ($p<0.05$) when it comes to comparing the level of activity between boys and girls, girls being slightly less active than boys.

It was interesting to examine whether there has been some statistically significant difference between the level of activity of parents and their children. It has been found that such difference exists ($p<0.01$) and that there is a direct correlation between these two variables (parents' level of activity and child's level of activity). In other words, if parents practise, or had practiced some kind of sport, there is much greater possibility for their children to practice some sport, as well. Numerous research has confirmed this pattern – the more parents are active, the more their children will also be (Moore et al., 1991; Anderson et al., 2009).

Some of the questions concerned the parents' satisfaction with the level of their children's physical activity. The obtained results indicate that the parents are to a great extent satisfied with this level, since more than 78% of them declared as satisfied, as opposed to 5% of highly unsatisfied respondents. Moreover, it has been shown that there is no statistically significant difference between the extent of satisfaction between the boys' parents and girls' parents. It is interesting to mention that some research have shown that there has been noticed a lower level of activities among girls, but their parents did not express any discontent, since they considered it natural for girls to lose their interest in sport at some point, while the boys were more forced to be physically active (Anderson et al., 2010). Besides, it has been noted that parents who are or were actively practicing some kind of sport were somewhat more satisfied with the level of their children's activity, which is another proof that the physical activities of parents and their children are directly correlated.

The parents who were not entirely satisfied were asked to evaluate the influence of certain factors that could be responsible for children's insufficient activity. Each factor was evaluated using the 1 – 4 scale, where 1 represented 'completely without influence', and 4 'highly influential'. The results show that the lack of financial resources was identified as the greatest problem, since almost 45% of parents considered this factor as highly influential. The lack of child's free time was recognised as another important obstacle. It has been shown that the lack of adequate programs was considered as one of the least influential factors, which is consistent with the results of other similar research around the world. In these research respondents also considered the offer of programs quite satisfying, while they saw the price as the greatest obstacle (Inspiring Children's Physical Activity: Exploratory Research with Parents, 2003). The lack of child's interest was shown to be the least influential, but it is important to point out that generally there are no significant differences in the extent of influence. What we found interesting was the fact that there was statistically significant difference ($p<0.05$) between the mothers' and fathers' responses. Fathers considered the lack of parents' time to be far more influential than mothers did while for mothers the lack of financial resources represented a more important obstacle than it was for fathers.

Since the finance was overall seen as the most influential factor, we were curious to see how much money are parents willing to devote to children's training on a monthly basis. The range of the amount of money was between 0 and 15 000 RSD while the average amount was 3945.4 RSD. It has been demonstrated that there was a statistically significant difference between the sums. The respondents from Belgrade were willing to invest, as opposed to the respondents from the rest of the country. The results of t-test have shown that the value of statistic was $t = 2.403$, while the p-value was $p = 0.018$ ($F = 5.416$, $p = 0.022$). The residents of Belgrade were on average willing to invest 4258.2 RSD while this amount was 2928.7 RSD when it comes to the respondents outside the capital.

Taking into account the challenges parents are facing in everyday life, such as stress, a multitude of obligations and responsibilities, etc., we wanted to examine to which extent these conditions influence the choice of children's activities. Foreign research has shown that parents have less time for organising and participating in those activities. Furthermore, some parents have admitted that sometimes they prefer that their children are less active. When they return home from work, they do not need any additional activities,

and consequently, it is easier for them that their children spend time using a computer or watching television (Inspiring Children's Physical Activity: Exploratory Research with Parents, 2003). However, although sometimes it seems easier to turn to unhealthy habits, parents have the responsibility to guide their children towards a healthy lifestyle (Sallis et al., 2000).

Parents completing our survey were asked to say whether they agreed with the given statements considering the difficulties they could have in organising and arranging children's activities. 52.3% of parents admitted they find it difficult to cope with this task and that they found it highly challenging while the rest of 47.7% of the respondents stated that they were not perceiving it as a difficulty.

After gaining insight into parents' experiences and opinions, we turned to Conjoint analysis in order to comprehend the way they choose activities for their children. We wanted to learn which criteria were the most important to them and how their priorities and preferences had reflected to their final choice.

Using Conjoint method, we came to a conclusion that the most desirable combination of characteristics which forms the optimal training type is the following:

- Team sport
- Without contact
- High intensity
- 2-3 times a week
- Children do not need parents' help to get to the venue
- Possible competitions
- Monthly price 10% above average

Among the list of the variables, the most significant ones that stand out and influence parents' choices the most are the frequency of training, price per month and training intensity. The least important one for parents is the question of a contact or non-contact sport. In the following graph (Figure 2) we can see the average importance of each variable.

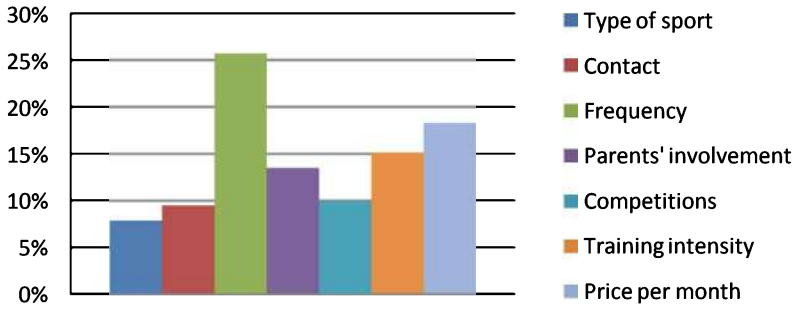

Figure 2: Average importance of attributes on aggregated level

As we can see in the following graph showing the partial utilities for each level of attributes (Figure 3), parents prefer training 2-3 times per week, and they are very sensitive to changes of this level. Furthermore, it is very important for them that children can go alone to the venue where the training is held and that the price is below the average. If these levels change, the attractiveness of the offer reduces.

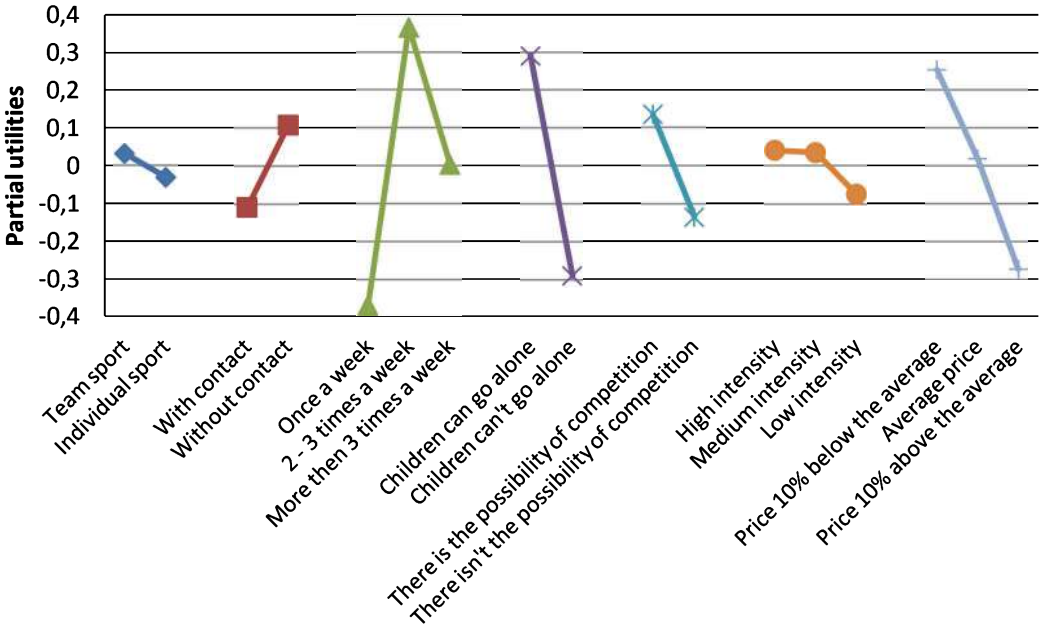

Figure 3: Partial utilities of levels of attributes

Values of Pearson's and Kendall's coefficients confirm the high level of significance and credibility of results. ($R=0.987$, $p<0.01$; $\tau=0.929$, $p<0.01$).

4. CONCLUSION

This paper deals with a very current topic in order to indicate the importance of physical activity during childhood, family support and encouragement in the process of child's development and the problems arising in this field.

Although in Serbia is not paid much attention to this issue, numerous research with a different focus (health, family relations, academic achievements, etc.) has been conducted around the world. What makes our research stand out among other similar ones is the fact we used Conjoint analysis to determine parents' preferences, which enabled us to reveal some attitudes and opinions that were not obvious instantaneously.

We found out that parents were mostly satisfied with the level of their children's activity, although they were worried about the sedentary way of life. Furthermore, the research has demonstrated that most parents find the lack of financial resources as the most limiting factor when choosing activities for their children.

Bearing in mind the conditions brought by the modern way of life – fast technological changes influencing all aspects of life, more stress and pressures from the environment, it is extremely important to draw the attention of parents to the significance of dedicating their time, resources and effort to their children's activities. Moreover, it is essential to help them organise and use their free time, as well as their children's free time, in the most effective way and, since the focus of the research was directed towards physical activity as one of the most important and simultaneously the most endangered nowadays, it is also vital to make an influence on parents and children so that they could develop and maintain their healthy habits. When it comes to parents, one of the possible strategies could be using websites, specialised magazines, and social networks to promote not only the positive effect of sport on health but also the risks of constant inactivity. Furthermore, school programs should encompass informing and educative initiatives dedicated to physical activity. The sport should be presented as a healthy habit, an essential part of everyday life, and not only as a secondary competitive activity.

Analysing the results, we came to the conclusion that if we want to make our children more active, what we need to do is to start sports programs that would not be financially demanding, making them affordable to the larger number of children.

Although we came to some important findings, there is still a wide range of opportunities when it comes to investigating this topic. For instance, it would be recommendable to include younger children in the future research. One of the reason is the fact that the processes of personality development begin long before primary school, and so we would be able to examine the effects of different factors present in the earlier period, which would give us the opportunity to react on time according to those potential new findings. Another important benefit would be the possibility to compare preschool and school children and to discover

potential differences and its causes. Moreover, focusing only on school children, we missed out the opportunity to investigate the influence of younger or older children on their parent's opinions and family dynamic in general.

Also, it would be desirable that the future research cover greater and more heterogeneous sample, not only to include the children of different age but also to reach more children out of Belgrade, so that we could have more comprehensive insight into the current state in this field.

Apart from that, having in mind the modern way of life, it would be truly prudent to thoroughly examine children's relation to the new media, especially the time they dedicate to the new technologies and its influence on different life aspects.

In conclusion, we want to emphasise once more that this is the topic that demands attention due to its importance and influence in present, as well as in the future, when we would be able to perceive the consequences of the present (in)activity. This is why it is crucial to deal with this problem now, to dedicate our attention to it and resources if we want to ensure the proper development of the new generations, in spite of the increasing challenges.

Abstract: *The number of internet users is continuously increasing, and more companies recognise the significance of online visibility and digital media in communication with the stakeholders. The use of digital media in communication has affected the way the stakeholders get the information about companies and the way the companies are involved in the corporate responsibility. The subject of the research in this paper is online tools and digital media usage in communicating corporate social responsibility. The focus is on digital media special features, which due to their wide application and rapid development contribute to communicating the social responsibility. By employing a comparative case study, the paper analyzes the usage of digital media in promotion of social responsibility of the companies in different industries. Based on the results, the specific features of this form of communication are identified, and guidelines for improving online communication of corporate social responisibility are defined.*

Keywords*: corporate social responsibility, digital media, online communication*

1. INTRODUCTION

Corporate Social Responsibility (CSR), defined as “a commitment to improve community well-being through discretionary business practices and contributions of corporate resources” (Kotler & Lee, 2007), takes a prominent place in the global corporate agenda in today’s socially responsible business environment.

More than ever, companies invest significant resources in the form of starting different social and ecological initiatives – from investments in the local community, and reduction of greenhouse gas emissions, to socially responsible business in the area of employment, acquisition, product design, production, etc. These unprecedented efforts in the area of socially responsible business are not guided solely by the ideological attitudes of companies, but also by financial gain that could be realised through these endeavours. Many top managers and experts in the area of CSR point out that corporate social responsibility creates a unique business value in a number of ways – it has a positive effect on the reputation, employees’ moral, and strengthens the competitive advantage (Bonini et al., 2009). Establishing good relationships with the stakeholders is the key to successful business, and CSR has a special ability to additionally strengthen and preserve those relationships.

Corporate social responsibility depends on the stakeholders’ awareness of the socially responsible activities of a company. However, empirical studies have discovered that the awareness of the socially responsible business of a company among the external stakeholders, but also the internal stakeholders, is usually low, hence represents the key obstacle to the company’s experiencing the advantage of its CSR programmes (Sen et al., 2006). This is why it is necessary to create the constituents’ awareness of the strategy and objectives of the social responsibility of the company, as well as of the achieved results of the realised socially responsible activities.

It has shown that the outdated practice of communicating social responsibility, which meant printing brochures, flyers, and prospectuses, with the same messages for all the stakeholders didn’t have satisfying results, so the companies across the world started taking an online approach establishing a two-way communication on the global level whereby providing personalised messages for each group of stakeholders. A successful applying of this approach requires extensive knowledge of digital media channels, their advantages and risks, and this is why a special segment in the paper is dedicated to them in particular.

The paper presents analysis of digital media usage in communicating CSR of the companies from different industries and with different strategies, it shows in which way the communication of this concept is improved through using online approach. Furthermore, potential risks will be pointed out, as well as guidelines for the additional improvement of this process.

2. COMMUNICATING CSR

Today, more than ever before, the public expects from the corporate sector to have a more proactive role in social, environmental and economic development of the society. On one hand, people are more aware of ethical issues and more sensitive to their occurrence. On the other hand, the impact which corporate business operations have on people's quality of everyday life and society as a whole has increased significantly (Dahlsrud, 2008; Carroll, 1999). In order to be socially responsible each company needs to fully understand how its business activities affect the local community in which it operates. The concept refers to the integrated concerns about society and environment in day-to-day corporate activities (European Commission, 2003). With this in mind, companies should consider themselves as equal members of the community who have certain duties and responsibilities (Vlastelica Bakić et al., 2015).Elaborated description of the most important CSR concept definitions used in both academic literature and practice is given by the author Vlastelica Bakić (2012).

As it is mentiond above, stakeholders awareness and perception of the CSR strategy, programs, acitivities and results is of great importance. In order to inform stakeholders, companies use various media for communicating CSR. It has shown that tradional media are less effective, and the companies icreased their usage of online communication tools in CSR communication. Online communication requires extensive knowledge of digital media, their features, as well as their advantages and risks.

Digital media become a powerful channel for informing of stakeholders not only about company's offering, but also about other business issues, such as CSR programs and activities. The most common digital media used by companies include website, social media (Facebook, Twitter, YouTube, LinkedIn) and corporate blog (Georgescu&Popescul, 2015; Bagozzi et al., 2012; Tate, 2010; Safko&Brake, 2009; Scoble&Israel, 2006).

3. METHODOLOGY

The method employed in this paper is comparative case study analysis. Comparative case study represents a research method which as its goal has the identification of similarities and differences in processes, events and activities which are the subject of the analysis (Khan & VanWynsberghe, 2008). The following part will analyse the usage of digital media channels by companies Unilever and Starbucks in communicating corporate social responsibility.

The criteria used while choosing these companies are the following: Unilever is the leader in its industry for the year 2014 according to Dow Jones Sustainability index (http://www.sustainability-indices.com/review/industry-group-leaders-2014.jsp). This company is the first on the list of the 100 best European companies in online communicating corporate social responsibility (http://www.lundquist.it/6th-csr-online-awards-white-paper?cat_slug=whats-on/white-papers). Starbucks is one of the most successful multinational companies in the world and is on the Forbs list of the 100 most valuable world brends (http://www.forbes.com/companies/starbucks/). The companies in question belong to different industries, with different strategies for communicating corporate social responsibility, which makes them suitable for comparative analysis.

The sources used during the analysis of communicating corporate social responsibility are the official websites, verified Facebook, Twitter, LinkedIn and YouTube profiles of these companies, as well as the official corporate blogs.

4. ANALYSIS OF COMPANIES

4.1. Unilever Company

Unilever Company is one of the biggest producers of the consumer goods. With 400 brands and products which are sold in more than 190 countries, Unilever products are used by around two billion people every day across the world. According to the data available on the official website of the company (http://www.unilever.com) the company achieved a turnover of 48.4 billion Euros in 2014, and employs more than 172,000 people.

4.1.1. Unilever Company Website

What is noticeable when accessing the corporate website of the company (http://www.unilever.com/) is that the pieces of information regarding sustainable development pervade a number of the website segments. For example, in the "About" segment, in addition to information about business and brands, there is also a description of the responsible business of the company. On the same page the users can access the links which directly lead to the special page about sustainable development.

Even in the vision itself which is quoted in the "About" part, the company commits to doing business responsibly and promoting sustainable development, which clearly indicates the level of determination in the company's way of doing business. In purpose and principles ("Purpose & principles") description Unilever emphasises the importance of responsible and fair behaviour towards all of the stakeholders – the employees, suppliers, business partners, the local community, etc., and in the graphical representation of the business model the central part is occupied by sustainable development.

The recognisable logotype of the company, created in 2009, is composed of a multitude of symbols. Some of them, like the symbol of the bee, points to dedication of the company to influence the environment protection, reduce waste, and do business in a sustainable manner, which is very innovative in a sense of communicating corporate social responsibility.

A special page of the website is dedicated to sustainable development, to which leads a special tag in the horizontal navigation named "Sustainable living". The first part encourages interaction with the stakeholders in a number of ways. By clicking on the **"**News**"** field the stakeholders can get informed on the latest news in the area of corporate social responsibility. The news is divided into videos, press releases, and speeches and interviews. The company enables the users to share the news on the most popular social networks, but the downside of the page is that it is not possible to leave a comment. By clicking on the "Join In" field, the users can get more information on the CSR campaigns and areas in which the company invests its resources. In addition to textual information and video material, the company provides the possibility for the users to, by filling in a questionnaire "What is important to you", give their opinion on which aspect of environment protection is the most important for them. After voting, stakeholders can see the currents results of the voting. In this way, the company establishes a two-way communication, interaction which is in the most cases hard to establish through the channels of communication such as web sites. Also, the users can subscribe for the company bulletin which is completely dedicated to corporate social responsibility. By clicking on the field "What matters to you", the users can get answers to the most frequent questions. This points to how much the company takes into account the stakeholders' needs and tries to answer all of their requests.

The other part of this page is called "Sustainability Living Plan", and it describes the plan of the company to accomplish the vision of doubling the business, along with reducing the environmental impact and raising the positive impact on the society development until 2020. Moreover, at one's disposal is the link leading directly to company strategy regarding the responsible business. The three pillars of the sustainable business of the company, i.e. the three most important objectives within "Sustainability Living Plan" represented in three different segments are: improving health & well-being, reducing environmental impact and enhancing livelihoods.

4.1.2. Unilever Company Facebook Page

Unilever official Facebook page (https://www.facebook.com/unilever) has over 3 million users. The company posts around two times per week, and every post gets around 28,900 likes, comments, and shares in average, which points to extremely high level of engagement among the stakeholders. Through the posts analysis it is noticeable that the company intensively communicates the sustainable business subjects. In addition to textual information the posts contain videos, links, and photographs. There is a room for improvement in the way of addressing the customers, namely, the posts themselves don't directly call for the users' egagement, which would be achieved, for example, through asking them questions.

4.1.3. Unilever Company Twitter Account

The official Unilever Company Twitter account is called Unilever News (https://twitter.com/unilever), which is followed by 91,348 users. In a month's time period, the company tweets around 48 times, which is averagely 1.6 tweets per day, whereas the main competitor, Procter&Gamble Company, during the same time period tweets as many as 7.7 times a day. The more intensive competitor's communication on this social network has certainly paid off, since it has a few tens of thousands followers more than Unilever.

Unilever Company shares content and is involved in the subjects with the key words #marketing, #business strategy, #sustainability, #SustLiving, which points to the fact that the posts are mostly about sustainable

development, just as in the case on the website. The way of communication is very similar to that through the Facebook page, interesting pieces of information regarding current campaigns are predominant, and interesting data from the CSR report are picked out, and what is characteristic is that in addition to textual statement, posts also contain photographs, videos, or links. However, just as on the Facebook page, what is missing is addressing the users directly through asking questions or their opinion which would additionally encourage their engagement. In addition to the official account, Unilever has a number of other Twitter accounts, which can be confusing for the users.

4.1.4. Unilever Company YouTube Channel

Unilever has its official YouTube channel (https://www.youtube.com/user/Unilever), and multitude of other brand channels (such as Dove, Knorr, etc.). On the official channel, the users can access play lists with video material regarding company's business presentation, as well as sustainable business. How important for Unilever this platform is as means of communicating corporate social responsibility states the fact that this channel has more than 417,000 subscribers, which is significantly higher number than that of Proctor&Gamble Company's.

The significance of the YouTube channel for Unilever Company is also stated in the fact that it has presented its largest socially responsible project "Project Sunlight" through a video on its official channel on precisely this social network. The project aims at encouraging people to adopt the sustainable way of life. It was started in 2013, and in 2014 the name of the project has been changed to "brightFuture". Within this project, the company has put at the users' disposal a large number of online activations enabling them to be involved in various ways and for the sake of contributing to the sustainable way of life – they can directly donate the resources for a certain campaign or simply fill in a form and give their voice to support a certain action, they can share the company film about the project through social networks, post their videos, and share the ideas for the new ways of sustainable living on Facebook and Twitter by using hashtag #brightFuture.

For the promotion of the video which presents Project Sunlight, the company used Trueview, a true innovation in YouTube advertising. What distinguishes Trueview from the classic forms of advertising on this social network is that the viewers have the option to watch the whole video or to "skip ad" after 5 seconds, just like with the classic advertising, but the advertisers are paid only if the viewers watch the whole video ad.

4.1.5. Unilever Company LinkedIn Profile

What one notices first on the official LinkedIn company page (https://www.linkedin.com/company/unilever?trk=top_nav_home) is the photography of the smiling, cheerful people, employed in Unilever, who form harts with their hands. In this way, the company sends a clear message that it wants to position itself as a responsible and eligible employer, who treats its employees in a suitable manner. Very often does the company post things regarding the subject of sustainable business which can be shared and commented by the users, but it is also noticeable that the company doesn't answer the questions from the comments, which can be interpreted by the stakeholders as the company's lack of interest to dedicate itself to them or the wish to hide something.

4.2. Starbucks Company

Starbucks is a multinational company which deals in coffee retail and owns a chain of coffeehouses around the world, but it is also present on many other markets. According to the data available on the company website, there are more than 21,000 Starbucks coffeehouses in more than 64 countries around the world, which annually sell more than 2 billion cups of coffee ((http://www.starbucks.com). Starbucks is one of the global brands which was the first to accept, use, and recognise the strength of digital media and thus took over the leader position in that area for a while. For communication with the stakeholders, they use almost all of the available channels – website, corporate blog, but also social networks, such as Facebook, Twitter, YouTube, LinkedIn, Google +, Pinterest, and Instagram.

4.2.1. Starbucks Company Website

Unlike Unilever Company, which intensively communicates sustainable development related subjects through a number of website segments, Starbucks focuses on its page on the corporate social responsibility, and the link to it is in the horizontal navigation at the website home page (http://www.starbucks.com/) under the name "Responsibility". In addition to the company news, there are campaign news and CSR news.

A click on the "Responsibility" link in the horizontal menu leads to a special website page about the corporate social responsibility of the company. The page is structured in such a manner that an average user can quickly notice that the company's CSR focuses on three areas – environment, ethical sourcing, and community. A special segment is dedicated to promoting CSR reports. Each CSR area is an individual subpage which offers additional information on realised and current activities and campaigns. Navigation is

additionally facilitated since the users can move from one subpage of the website to another without previously going back to the homepage. The subpages are very simple, and, one could say, visually poor in comparison to the Unilever Company website, since in addition to the text they usually contain one video and a multitude of links.

The company doesn't offer a lot of ways of communication with the users on the subject of corporate social responsibility via the website. One of the possibilities is that the users send their ideas and suggestions to the special email address.

4.2.2. Starbucks Company Facebook and LinkedIn Profile

Starbucks Company Facebook page has just above 35,637,571 followers, and it releases the company news averagely two times per week. Unlike Unilever, Starbucks invests additional efforts to create natural conversation by answering almost every question or comment of the users, especially in they are negative.

According to the intensity of communicating realised and current campaigns on the subject of investments in the local community on the company website, it can be concluded that Starbucks invests the majority of the resources in this area of corporate social responsibility. A similar way of communication is used on the Facebook page.

Through the analysis of the posts and additional applications, one gets an impression that the company, via Facebook social network, mostly addresses the consumers and potential employees as the members of the community in which it does business, hence the desire to represent itself as a responsible and eligible employer is noticeable. For example, the specially emphasised sentence is that Starbucks provides equal opportunities for employment to all qualified persons including women, the elderly, and persons with disabilities, and the word "employees" is substituted by the word "partners" in all the news and videos.

The communication on LinkedIn social network (https://www.linkedin.com/company/starbucks) is similar to that on Facebook. The stakeholders can read and comment the news which is usually redirected from the company website. The covered topics usually have to do with employment or have a goal of promoting the company as a responsible and eligible employer. For example, the news released in June 2015 regarding the recognition for the leader in employing persons with disabilities in 2014, which was awarded by the American Association of People with Disabilities, after only four days had 352 likes and 17 comments, whereas a post regarding a company product has around 200 likes and 10 comments in average, which points to the interest of the stakeholders for social issues and the significance of communicating corporate social responsibility. There is also a special section called "Starbucks Careers" available for the users, with very similar content and functionality as the "Open Jobs" Facebook application. Starbucks LinkedIn page has more than half a million followers, among which there is a large number of the people already employed at this company.

4.2.3. Starbucks Company Twitter Account

Starbucks Company Twitter page (https://twitter.com/Starbucks) named "Starbucks Coffee" gathers around 8,500,000 followers. The company mostly posts things with the aim of promoting its products and brand. Although it looks like the company has left out this channel of communication from communicating corporate social responsibility, it hasn't always been like that. Starbucks realised a very successful campaign in 2013, named #comeTogether, inviting the American citizens to sign the petition which was started as a response to American Government Shutdown and human rights endangerment. After the campaign was over, the Starbucks Company gathered more than two million signatures which was a pretty good result, considering the subject of the campaign.

Communicating corporate social responsibility via social networks can have numerous advantages, such as improving the relationship with the stakeholders, and strengthening the reputation, but it can also have a completely opposite effect. Starbucks Company has started another campaign, and this time under the name #raceTogether with the aim of raising the awareness of the racial discrimination. On the day of the campaign start, 17th March 2015, the discussion on Starbucks Twitter account has risen for an incredible 266%, however, the 60% of the responses were characterised as negative. The next day, 18th March, the extent of the discussion has risen for 408%, compared to the trend in the previous months, but 62% of the posts were negative or very critical of the campaign (http://www.adweek.com/socialtimes/starbucks-race-together-campaign/617593). After the negative reaction of the stakeholders, Strabucks abandoned the campaign, but the damage had already been done.

4.2.4. Starbucks Company YouTube Channel

It is interesting that Starbucks doesn't own any additional YouTube channels except for the official company channel, which has over 77 thousand of signed in followers. Through the videos analysis, a conclusion is reached that the company uses video material for promotion of corporate social responsibility to some extent, but not with the intensity of Unilever Company. The most famous campaign in the CSR area on this social network that Starbucks Company conducted, was realised during 2013, under the name "Giving Back". Through a set of videos, the company wanted to present the way in which it contributed to the local community, i.e. the results of various socially responsible projects, but from the perspective of the project users. This is an excellent way of representing the results because videos are very emotional and the viewer can easily sympathise with the project users and the depicted problems.

4.2.5. Starbucks Company Blog

This communication channel enables the companies to connect to the stakeholders in a way which is more personalised, transparent, and interactive than the reports, press releases, and other formal communicational channels. The companies can tell their story about CSR in a more informal way and show they are open for discussion, new ideas, and suggestions. The blog which was started by Starbucks Company certainly had a great potential for such a thing. The blog is made up of 13 categories, one of the categories is dedicated to corporate social responsibility. The posts within categories contain video material, photographs, as well as the statements of the company CEO, who directly addresses the users on different subjects. The users can also access the archive of posts from 2009 to 2013. However, the last post on the corporate blog was published on 7th October 2013, so it could be said that the company missed the opportunity to use the great potential the corporate blog had as a channel of communicating corporate social responsibility to the stakeholders.

The result of content examination this company communicates through digital media channels shows that it is a very consistent way of communication, directed towards the consumers and potential employees with the aim of creating a perception that the company is a responsible employer who invests in the local community in which it does business and in the employees as the members of the local community in question. The company has an incredible reach on social networks (Facebook, Twitter, LinkedIn, YouTube), functional and attractive website, as well as a well set blog, but all of these channels are insufficiently used for communicating CSR strategy, aims, but also the results of the many CSR campaigns the company conducts.

5. CONCLUSION

In order for the right information to reach the stakeholders, the companies must take the integrated approach in communicating corporate social responsibility. It is an approach which includes using as largest number of digital communication channels as possible, from websites and blogs, to social networks, among which the most important are Facebook, Twitter, LinkedIn, and YouTube.

Successful and holistic communicational plan of corporate social responsibility should incorporate using as many channels as possible so as to deliver the message to various target publics. On the homepage of a corporate website there should be a clearly positioned link which would lead to a special page with more information about social responsibility of the company, because if the users cannot find this type of information, they will assume that the company doesn't engage in it at all. A page dedicated to corporate social responsibility has a positive influence on the stakeholders while collecting the information about the company business. CSR related content, whether it is on a special page or pervades a number of website elements, should contain value added, i.e. the pieces of information which cannot be found anywhere else, so as to attract the interest of the key stakeholders. Moreover, it is necessary to additionally encourage two-way communication, which is hard to realise through a website, but with the corresponding activations (which, for example, were implemented by Unilever Company – questionnaires, surveys, interactive maps) that, too, is possible to accomplish.

Social networks allow a high level of interaction with the stakeholders and provide opportunities for the company to promote its CSR strategy, goals, and results to the wide auditorium. In other words, social networks are ideal for storytelling, i.e. representing the company story about social responsibility. Thanks to a well told story about CSR, companies can raise interest and establish much better communication with the interest groups, than it would be the case with using dull facts and messages.

Through the corporate blog the company shows that it is open to discussion with the stakeholders on the subjects in the area of corporate social responsibility in a way which is more personal, transparent, and interactive than reports, press releases, and other more formal communicational channels.

And finally, an adequately presented CSR report is the best indicator of the company's dedication to corporate social responsibility, as well as transparent conducting of business and comprehensive communication. An online report which the company can communicate through all digital communication channels offers the stakeholders an experience and the content with added value. Through integration of interactive functionalities, turning statistical data into dynamic visual infographics and monotonous textual statements into video representations, and the browsing which is made easier by hyperlinks, the stakeholders are not only allowed to get the wanted information in a more simple and quick way, and absorb a larger amount of data from the reports, but also to share the newly acquired knowledge with their friends and business partners via various digital communication channels.

Via the internet, the stakeholders do not only download CSR reports and get the information about the corporate social responsibility strategy, but also comment, criticise, and express their opinion on socially responsible activities of a company on different channels. This can be beneficial for the company and its business development, but also a great risk at the same time. The company can easily loose control over the message it sends via digital media channels, as it was the case with Starbucks Company #raceTogether campaign, and significantly damage the reputation of the company. Managing the digital media channels is essential for avoiding the risks. That includes a good communication policy and a timely reaction to the critical content. Irregular maintenance, content which is not up to date, and not responding to the users' questions can cause negative users' reactions, and create an image of an irresponsible, disinterested company in the eyes of the stakeholders important for the company business, or a company which hides something from the curious citizens.

MANAGING DIGITAL MARKETING COMMUNICATION IN ORGANIZATIONS IN SERBIA

Tamara Veselinović[1], Tamara Vlastelica*[2], Danijela Lalić[3]
[1]Victoria Group AD
[2]University of Belgrade Faculty of Organizational Sciences
[3]University of Novi Sad Faculty of Technical Sciences
*Corresponding author, e-mail: tamarav@fon.rs

Abstract: *The aim of this paper is to examine how digital marketing communication is managed in organizations in the Republic of Serbia. The empirical study employed questionnaire as a research tool on a randomly selected sample of 231 private and publicly owned organizations, and examined different aspects of digital communication management: strategic planning, monitoring, community management, content management, online advertising, search engine optimization, human resources and training. The findings indicate that the majority of organizations use digital communication within marketing communication mix and confirm efficiency and cost-effectiveness of its usage. The results showed that its activities are most frequently executed in-house, with a high percentage or organizations having one employee dedicated to these tasks. For further improvement in this field there is a need for more investment in education of employees.*

Keywords*: digital communication, marketing communication, online advertising, search engine optimization, community management, content production*

1. INTRODUCTION

The information and communication technology (ICT) development and expansion contributed to changes in all the areas of business, including marketing and public relations. The ICT helps the consumers connect and communicate with each other, and at the same time allows establishing a connection between a company/brand and the consumers (Kitchen & Burgmann, 2010; Hall-Phillips et al., 2016; Hudson et al., 2015).

Digital communication is an indispensable part of the integrated marketing communications, within which, through coordination of promotion and all the other marketing efforts, a maximum informational and persuasive effect on the consumers is achieved (Pride & Ferrel, 2014).

Digital communication tools enable two-way communication with the consumers and multimedia content transmission (Bauer, 2013). This communication can be initiated through different digital channels from any location at any time (Yadav et al., 2015). Digital communication tools also enable distribution of personalized content based on the consumers" needs (Chan & Yazdanifard, 2014).

Rapid development of digital technology has resulted in diverse platforms, among which Weintraub Austin & Pinkleton (2015) list services that enable customer relations management, search engine optimization, trackable analytics, social media engagement and networking, online advertising, digital direct mail, content-based applications etc. According to the same authors, the consequence is that marketing communications and public relations changed their „top-down" model to real-time conversations, stakeholders" engagement and establishing relationships.

Internet technologies, social media and mobile technologies have had a large impact on businesses (Dong & Wu, 2015). A website, as a basic instrument of web communication and presentation of an organization on the Internet, enables informing, promotion, sales and customer support (Tate, 2010). Blogs are efficient in managing the online reputation (Cho & Huh, 2007). With the growing popularity of social media, companies are actively engaging consumers through social media sites (Bagozzi et al., 2012).

Considering increasing level of usage and important role of digital communication in different business processes and potential benefits which their adequate usage bring to the organizations, there is a need for exploring different segments that digital communication management encompasses (Vlastelica Bakic, 2012). The goal of the research presented in this paper is to provide a systematic insight into the current state of the

digital communication in Serbia and with the aim of acquiring scientific and practical knowledge and its application in real systems.

2. DIGITAL MARKETING COMMUNICATION MANAGEMENT

An especially significant change in communication practice was brought about by social media through enabling the highest level of interaction between communication participants (Tiago & Verissimo, 2014). According to Sidjanin (2012), social media management encompasses marketing campaigns coordination, creating content that is of interest for the consumers and prompts them to further sharing, managing customer relations and sales on these digital communication channels. The same author also states that social media managing includes the following activities: managing social networks profiles, presentation, offers, advertisements and branding, creating content and responding to the received messages, preparing social media guidelines, reporting and analytics.

In the past few years, content marketing strategy became an integral part of digital communication management. Content marketing is the process in which relevant and valuable content is produced and distributed to attract, acquire, and engage a clearly defined target audience with the objective of driving profitable customer action (Pulizzi, 2012).

In a research conducted by Content Marketing Institute and Marketing Profs about the usage of B2C content marketing in North America, 76% of the marketers said that they used content marketing in their organizations. Among the possible tactics at the disposal of the marketers, this research quotes the following digital tools: social media content, blogs, website articles, microsites, online presentations, webinars/webcasts, e-newsletters, illustrations and photos, videos, infographics, branded content tools and mobile applications.

Nevertheless, compared to global trends organizations in Serbia are behind in digital communication usage. The results of a recent research (Veselinovic, 2015) indicate that a majority of organizations do not use blogs, Twitter, photo sharing SNSs, YouTube, LinkedIn and do not have online sales. Dominant digital tools are website and Facebook; whilst dominant activity is online advertising. The percentage of organizations that do not practice e-mail and mobile marketing is very similar to the percentage of those that actively use it.

However, in Serbia, according to annual statistics of the Statistical Office of the Republic of Serbia regarding the usage of information and communication technology between 2011 and 2014, the usage of digital media rises each year, and the number of Internet users, as well as the extent of its usage continually rises. Realizing that the Internet users represent a valuable target market, organizations in Serbia dedicate more and more attention to digital communication, but for further progress in this field, managers‟ education is necessary.

The growing significance of digital communication for organizations in Serbia is also expressed through the data of continual growth of digital advertising market. The research about digital and interactive advertising in Serbia AdEx2014, which was conducted by IAB Serbia (Interactive Advertising Bureau Serbia), concluded that the digital advertising market in 2014, compared to 2013, rose by 11.82%, reaching the overall value of over 18 million Euros, and the further growth of this market has been predicted. The largest share in 2014, as well as in the previous years, had display advertising (47.14%), but mobile advertising realized the largest growth the second year in a row (108%). A significant growth was recorded in social media advertising as well (21.15%). This data indicate that digital communication managers are slowly including newer, innovative formats of online advertising.

3. RESEARCH METHODOLOGY

The aim of this paper is to examine how digital marketing communication is managed in organizations in the Republic of Serbia. The research presented in this paper is a part of a larger study conducted for the purpose of the doctoral dissertation (Veselinovic, 2015). The empirical study was based on primary data and employed questionnaire as a research tool, using both paper-and-pencil and computer assisted approaches.

The questionnaire was distributed in the period July-December 2014 on a randomly selected sample of 231 private and publicly owned organizations (companies, institutions and banks) in Serbia. Companies were chosen from the “Biznis Top”, the rankings of the most successful Serbian companies, according to the turnover and profit, published by magazine “Biznis & Finansije”. Banks were chosen from the “Finansije Top”, the rankings of the most successful banks, insurance companies, brokerage companies, private investment

and pension funds and auditing companies, based on official financial analyses and analyses of each sector, published by magazine "Biznis & Finansije" as well. Institutions were selected from the administrative register on the website of the Statistical Office of the Republic of Serbia.

The study was focused on managers of different managerial levels. The precondition was that they were familiar with the digital communication in their organization. The aims and purposes of the study were firstly explained to all examinees that participated in the study and their involvement was on a voluntary basis.

The examined organizations were stratified based on the 4 features: size, industry, business maturity and geographical coverage. The examined organizations sample structure is presented in Table 1.

Table1. Sample structure

Organization features	Absolute frequency	Relative frequency
Size		
Micro-organizations (less than 10 employees)	44	19.0
Small organizations (11-50 employees)	47	20.3
Medium sizes organizations (51-251 employees)	54	23.4
Large organizations (more than 251 employees)	86	37.2
Industry		
Manufacturing	51	22.1
Services	150	64.9
Manufacturing and services	30	13.0
Business maturity		
Up to 5 year	41	17.7
From 6 to 15 years	93	40.3
From 16 to 25 years	23	10.0
From 26 to 35 years	24	10.4
More than 35 years	50	21.6
Geographical coverage		
Local level	60	26.0
National level	37	16.0
Regional level	37	16.0
Multinational level	97	42.0

The questionnaire examined different aspects of digital communication management in organizations. The scale and purpose of research were firstly explained to the respondents. Respondents were asked to rate the following statements on a five-point Likert-type scale, where „1" stands for „strongly disagree" and „5" stands for „strongly agree":

- Digital communication is being used in marketing communication mix of my organization
- My organization strategically plans digital communication activities
- My organization monitors digital communication activities
- My organization practices online advertising
- My organization practices search engine optimization
- My organization organizes trainings and education on digital communication tools
- The usage of digital communication tools and activities made my organization"s overall communication more efficient and cost-effective.

Additionally, the respondents were asked about internal organization, responsibilities and processes of digital communication management. This part of the questionnaire included 3 multiple-choice questions:

- My organization employs at least one person responsible for digital communication management
- My organization manages digital communication (publishing and community management) in-house, without outsourcing to agencies
- My organization produces digital communication content (text, graphics, audio, video etc.) in-house, without outsourcing to agencies

4. RESULTS

Descriptive statistics results on the digital communication management in organizations in the Republic of Serbia are shown in Tables 2 and 3.

Table 2. Digital communication management in organizations in Serbia - activities and characteristics (absolute and relative frequencies)

Statements	Frequencies	1	2	3	4	5
Digital communication used in marketing communication mix	Absolute	27	19	28	29	128
	Relative	11.7	8.2	12.1	12.6	55.4
Strategic planning of digital communication	Absolute	29	18	42	43	99
	Relative	12.6	7.8	18.2	18.6	42.9
Monitoring of digital communication activities	Absolute	36	5	36	43	111
	Relative	15.6	2.2	15.6	18.6	48.1
Online advertising in digital communication activities	Absolute	27	15	30	63	96
	Relative	11.7	6.5	13.0	27.3	41.5
Search engine optimization in digital communication activities	Absolute	61	52	30	26	62
	Relative	26.4	22.5	13.0	11.3	26.8
Trainings for employees on digital communication tools	Absolute	42	33	50	41	65
	Relative	18.2	14.3	21.6	17.7	28.1
Digital communication efficiency and cost-effectiveness	Absolute	21	4	60	47	99
	Relative	9.1	1.7	26.0	20.3	42.9

Table 3. Internal organization of digital communication management in organizations in Serbia (absolute and relative frequencies)

Statements	Frequencies	Answers		
Employee responsible for digital communication management		None	Combined*	DC** manager
	Absolute	37	68	126
	Relative	16	29.5	54.5
Online publishing and community management		Outsourced	Combined	In-house
	Absolute	42	34	155
	Relative	18.2	14.7	67.1
Content production for digital communication channels		Outsourced	Combined	In-house
	Absolute	59	31	141
	Relative	25.5	13.4	61

*Employee has other responsibilities besides digital communication management
**Digital communication

The results of the empirical study in Serbia indicate that more than half of organizations use digital communication in the marketing communication mix. With this claim strongly agree 55.4% of questioned organizations, which together with 12.6% that agree makes up 68%. Only 11.7% of the organizations do not use digital communication at all.

Strategic planning and monitoring of digital communication are processes which recorded similar results, and more than half of the organizations include them as obligatory in digital communication management (42.9%, i.e. 48.1%, for „strongly agree"). Online advertising is very present in organizations in Serbia – 68.8% practice it (41.5% - mark „5" and 27.3% - mark „4").

The situation is significantly worse when it comes to search engine optimization, an activity practiced by 38.1% of the organizations (marks „4" and „5"). Marks for the practice of search engine optimization activities are most equally distributed on the Likert scale. The education in the field of digital communication is at a low level. The highest attention to education dedicates only 28.1% of the organizations, and for another 17.7% this is an important subject.

Only 10.8% of the questioned organizations marked efficiency and cost-effectiveness of digital communication with the lowest marks („1" and „2"). Although there is 26% of those neutral on this question, very positive data is that as much as 63.2% (marks „4" and „5") confirm benefits of the digital tools and activities usage.

When it comes to the internal organization of digital communication management, more than half of organizations (54.5%) have at least one employee who is dedicated exclusively to the digital communication

activities, whereas in 29.5% of organizations, the employee in charge of digital communications does other work as well.

For complementary processes of online publishing and community management on one side, and content production on the other, the results are similar. In both cases, the majority of organizations manage these processes in-house (67.1%, i.e. 61%), whereas 18.2%, i.e. 25.5% always outsource them. The least number of organizations use combined model where a part of the activities is outsourced, and a part is done in-house (14.7% for administration, 13.4% for content production).

5. DISCUSSION AND CONCLUSION

The growing usage of digital communication tools worldwide and numerous case studies published by organizations that have successfully implemented them and documented the increase in reputation and/or sales results due to their usage, indicate various possible benefits for business.

The research presented in this paper had the goal to identify the level of digital communication usage in overall communication mix in organizations in Serbia, to explore different aspects of digital communication management (strategic planning, monitoring, community management, content management, online advertising, search engine optimization, human resources and training), but also to determine if the usage of digital communication gives positive results in terms of efficiency and cost-effectiveness of communication.

The important findings are that the majority of organizations, significantly more than half, use digital communication together with online advertising, as well as that in the similar percentage of the questioned organizations, the usage of digital communication brought to more efficient and cost-effective communication. This data indicates a significant penetration of digital communication in the business use in Serbia and understanding of their benefits. With the new tools that allow micro targeting, a very precise result measuring, and detailed performance analysis, we can expect further growth in this segment.

The sample analyzed in this research has also shown other positive tendencies in the form of high percentage of the organizations that strategically plan their digital communication activities and monitor them. Strategic approach to digital marketing is very important, since it is the only way to track its performance and to check if the set goals, both communication and business, have been achieved. In that way, efficiency and cost-effectiveness of digital communication can be demonstrated, which would again make possible an increase of the marketing budget meant for these activities.

Encouraging as well is the high percentage of the organizations which have at least one person in charge of digital communication, which suggests that top management recognizes its significance. Also, it is in accordance with the findings that digital communication is most frequently done in-house, both for administration and content production for digital channels. That can be explained by the fact that large organizations have internal human resources at their disposal, whereas the cost of hiring an agency is often a problem for small organizations. We can expect that in the period to come, digital marketing agencies engagement will increase together with the market development, an enlarged scope of digital communication activities and their complexity, following the global trends, and implementing new tools. Together with showing the efficiency and cost-effectiveness of digital communication in the practice of organizations in Serbia, it can be expected that the number of organizations which have an employee on the position of digital manager will also increase.

According to the research there is a clear need for improvement when it comes to search engine optimization activities and providing education in digital communication tools usage and application for employees. These results show that, in practice, it is necessary to focus on these neglected segments.

It is especially important to coordinate marketing efforts in digital environment with offline marketing activities. Only through their integration organization can obtain a synergetic effect of the marketing messages and strengthen the influence on the consumer who, in all communicational points in which he meets the brand/organization, gets unique, consistent, and stimulating user experience. In order for marketers to get this result in practice, it is necessary to significantly raise the level of education, as well as the awareness that in a fast-moving area, such as digital marketing, it is necessary to continually improve knowledge and acquire new skills demanded by frequent innovations of digital tools.

SOCIAL MEDIA AND PUBLIC SECTOR - THE EXPERIENCE OF THE USE OF SOCIAL MEDIA IN STATE ORGANIZATIONS AND SERBIAN DEFENSE STRUCTURE

Đurić-Atanasievski Ksenija[1], Bobar Zoran[2]
[1] Department of Management, Military Academy, University of Defense , ksenija.djuric@mod.gov.rs
[2] Public Relations Department, Ministry of Defense of the Republic of Serbia, zoran.bobar@mod.gov.rs

***Abstract**: Social media have changed the way of communication in 21st century and made specific interactions among users possible. The participation of the public sector in social media may improve the communication with citizens and improve the relation government-citizens. The use of social media is of particular importance to the defense structure.*
This paper presents specific ways the social media is used by the public sector. It outlines the aims and communication procedures that military organizations utilize in global social networks and the use of social media by the Ministry of Defense and the Serbian Armed Forces in relation to the other government bodies in Serbia. The paper also analyzed the content and efficiency of the announcements of Ministry of Defense and the Serbian Armed Forces according to their types and content in 2015.

***Key words**: social media, social network, public sector, defense structure, use of social media in defense structure*

1. INTRODUCTION

The public sector around the world has started using internet sites for its public relations more than thirty years ago. The world wide web has offered the public easier access to information, while sequentially, an informed public contributes to greater citizens' participation. It has also improved lobbying for the interest of the majority of social groups which led to better functioning of democratic processes. This was enabled by internet communication which limits the censorship, regulation and commercialization, like no other medium before. (McNair, 2005)

Information technologies and internet communication have facilitated formation of electronic government (eGov). E-government can be defined as 'the use by government agencies of information technologies that have the ability to transform relations with citizens, businesses, and other arms of government. These technologies can serve a variety of different ends: better delivery of government services to citizens, improved interactions with business industry, citizen empowerment through access to information, or more efficient government management' (World Bank, 2011). However, major activities of electronic government aim to educate and inform the public with possibility for some feedback mechanisms.

Only with the application of Web 2.0 and the creation of numerous collaborative and social media platforms, was it possible for the public sector to create genuine interaction. Social media encourage citizens to take part in decision making and enable government agencies to create two-way communication. Gov2 was created once new technologies were integrated together with a change in organizational culture, to increase openness, participation, transparency and collaboration in the public sector (Mergel, 2012) Although the term of Gov2 has often been used as a synonym for open government, there is a difference. Open goverment stresses on data openness and citizen engagemnet and the OECD (2009) defines it as a 'transparent, asccessible and responsive governance system, where information moves freely both to and from govermnet, through a multitude of channels'.

The capabilities of social media are evident in the way they support development of the public sphere and civil society. To support the democratic process, it is of crucial importance that political institutions become more transparent and accessible to the public which can follow, support or lodge complaint on institutions' functions and work.

The democratic potential of virtual communication is reflected in the fact that it overcomes the traditional status of unequal participants. For organizations that want to improve their democratic character, it is important to enable any citizen to directly and easily contact any elected political representative. (Đurić-Atanasievski, 2013). Today, the majority government initiatives focus mostly on participation and transparency and less on collaboration (Karakiza, 2015)

Institutions and organizations in the public sector can have different communication objectives related to social media, but their basic purposes are:

1) To increase transparency;
2) To support interagency and internal collaboration; and
3) To enable innovative forms of participation and engagement.

The increased level of transparency of public administration also creates higher accountability of government organizations.(Bonson et al. 2012) For this reason, many communication experts regard social media to be a powerful tool which improves the relationship between a government and the public and can result in increased public trust and satisfaction with the work of government organizations. In addition, use of social media improves communication between government institutions and agencies, or internal communication within a single organization. Using social media, the public sector can initiate discussions on an important social topic, ask for community input, prevent incorrect information from being disseminated or to estimate general public opinion on certain issues. Creating a message and content that can be shared with the wide public network creates an opportunity to build an on-line community that has the same or similar interest in regards to certain issues.

In this context, social networks are especially important. Personal communication with a high number of contacts and topics that are sent through the web increases the number of users that can be informed or are willing to participate. Although the users do not need to submit their personal details to the government agency, they can sign up or 'like' the pages with government publications. This is useful to government bodies as the information they publish on social web becomes available to huge number of people.

The use of social media in the public sector also has other advantages compared to other ways of public relations and communication. Mergel (2013) has noticed that operating outside their protected public relations and public affairs context gives the public sector more freedom to choose platforms where they see the most of their audience members congregate. Besides, the use of social media by government bodies requires less of a traditional decision hierarchy, as this use has the perception of less formal modern technology. Furthermore, the use of social media does not necessitate purchase of special equipment for its implementation as all tools and applications are easily available.

Practical use of social media in the public sector is aligned with existing theories on public administration, e-government and management communication. However, good implementation strategy is necessary to realize benefits and to avoid risks. (Picazo-Vela S et al, 2012). The implementation of social media highlights the importance of updating laws and regulations, and of promoting changes in government culture and organizational practices. Nevertheless, it is evident that very often government organizations have not adopted communication strategies for social media. Also, the public sector needs organizational change, developing a culture of trust and openness that will allow public servants to take advantage of the benefits that social media offer. (Fyfe, Crookall, 2010). The use of social media requires proper staff training based on plans and guidelines for efficient promotion. If staff in the public sector has not been properly trained for interactive communication, increased public participation can produce unwanted tension between the organizations and targeted groups. This can lead to undesirable and unexpected outcomes.

2. USE OF SOCIAL MEDIA AND SOCIAL NETWORKS IN THE DEFENCE STRUCTURE

Ministries of defense and armies around the world increasingly use social media. The decentralized platform and networking of people through social media enable more informed public support in the area of defense. The aim is to give voice to the citizens that will make them a part of a community formed on common values and interest.

Social media substantially changes the way information is transferred and thus changes conditions of military operations. This is the reason why many armies develop strategies to consider the influence of social media as one of the keys to success of future operations.

Because Facebook, Twitter, Instagram, LinkedIn and other social networks are ever-present in our lives, the potential for their use by the military is nearly limitless. Furthermore, communication systems in the defense structure that use social media can be successful and credible only if it is based on well established, professional manners that are inherent to the defense structure.

Perhaps the biggest benefit for the military in using social media is to be aware of national or international public opinion. Social media can contribute to better understanding of the environment and help create more accurate images of the factors that influence civilians. For example, sentiment analysis is used to establish what is the prevailing feeling towards a certain topic amongst users. The military can implement this analysis in the case of preparing for implementation of a reform, deploying in a peacekeeping mission abroad, recruiting new members and for any other operation when it is useful to know what are public sentiments towards certain issues. The degree of success of a psychological and intelligence operation is defined, above all, by an overall sentiment of public interest in it. Insight into public opinion, gathered through social media, is broader and more authentic than the information collected by other methods of gauging public opinion. However, the downside is that anonymous opinion expressed in social media does not always reflect community standards. So, it is possible that some of the opinions are antisocial, anarchical, morally dubious and essentially, do not represent prevailing public opinion.

In the case of military forces, some specific ways of social media use make them being identified as the newest international battle field. An increasing number of armies in the world use social media for announcing operations in their zone of responsibilities or their propaganda campaigns. Maintaining a social media presence in deployed locations allows commanders to understand potential threats and emerging trends within their AOR – zone of operation (Mayfield, 2011). Using social media supports their fight for 'hearts and minds' in multinational operations or make them win a 'media war' by being seen as proactive and able to tell their truth in a battle against negative and false reports.

Social media has been used as a psychological weapon against enemies in the always growing domain of cyber space. This is one of the reasons behind Facebook supporting multiple languages. Social media are forums where victories are declared, public perception of the conflict is formed and public opinion, own or foreign, can be influenced. Military experts also follow any criticism of a conflict that users of social media express, whether they are domestic or from the enemy side. The British military has admitted that in 2015 they formed a special unit consisting of reservists and soldiers with journalist skills who are familiar with social media. The new unit, based in Berkshire is called the 77th brigade and employ a new tactic – psychological operations using social media. One of the armies that pioneered the use of social media in unconventional warfare in the information age is the Israeli Defense Force. Since 2008, Israeli Defense Forces have been active on 30 social media platforms including Facebook, Twitter, Instagram and YouTube in 6 different languages. Some defense forces, especially of the most powerful countries, have been trying to directly influence and channel conversation in social media. These armies employ methods such as setting up of false individual profiles and others in their psychological operations around the world.

Social media creates opportunities for intelligence functions as well. Infiltration into open and closed social networks provide important intelligence to counteract 'enemies' and their propaganda, or can be used effectively to locate a person of interest. Military intelligence instigates research and development of various software applications and currently the USA is a world leader in this type of software.

Last, but not least, social media is useful in establishing partnership and unity with collaborative organizations, such as other institutions or foreign armies employed in the same operations.

3. PUBLIC GOVERNANCE IN SOCIAL MEDIA IN THE REPUBLIC OF SERBIA

The UN E-Government Survey (2012) has indicated that Serbia has created a positive environment for the development of e-services which can further contribute to increased transparency in the public sector and more efficent democratic processes. The Survey finding is that 'particularly notable is Serbia's performance, which advanced 30 positions to arrive at 51st in the world rankings. In Serbia, the Digital Agenda Authority is responsible for introducing online services to improve economic efficiency and citizens' quality of life, and for implementing e-government in accordance with a "one-stop-shop" principle'.

In order to encourage and increase the use of internet and social media in the public sector, making it the official government channel of communication with its citizens, Directorate for Digital Agenda of the Ministry of State Administration and Local Self-Government prepared the following documents:

- *Guidelines on web presentations of government services, agencies of territorial autonomy and local self-governing units; and*
- *Guidelines on the use of social network in State and autonomus regions public agencies and local self-governing units.*

The performance of eServices web sites is measured against the critera set out in the Guideline. There are specific requirements that assess web pesentations of public authorities at State and local self-governing level. A yearly assessment report is submitted to the Government of the Republic of Serbia. Key criteria for assessmant is how relevant published material is in informing the public on the functions and work of public bodies and institutions. According to the Directorate's assessment for 2014, the average success of this criteria was 56.6%, while the real results were at the level of 54%. (Report, May 2015)

Analysis of online communications with the public on the eServices portal in 2015 provides some insight on how the advantages of a global network and social media are used to secure a visible public presence of governing bodies in the Republic of Serbia. The analysis also estimates what would be the future characteristics of the online relationship between the Government and the public. The results of the analyses have shown that the web presence of all levels of State bodies that provide basic information to the citizens is 83%; relationship with media through various forms of newsrooms is around 40%; while the presence on social media is lower, such as Facebook (19%) and Twitter (15%). However, the analysis of the level of interaction between the public e-Service and targeted groups are low. (See Table 1 below)

Table 1: State Government on internet in the Republic of Serbia

Level of governance	**Public management**	**Sample**	**Presence**	**Newsrooms or Pressrooms**	**Social rooms or links to the Social Media**		**FAQ**
					FB	TW	
State Government	Ministries	17	17	11	5	3	9
	Agencies	10	7	4	1	2	2
Regions and Districts	Regions	1	1	1	1	1	0
	Districts	10	5	1	0	0	1
Local self-governance	Local government	10	10	2	2	1	6

Publication of Frequently Asked Questions (FAQ) is a mandatory requirement in '*Guidelines on web presentations of government services, agencies of territorial autonomy and local self-governing units*'. However, the analysis of all relevant web sites confirmed that only 38% of public sector bodies have published their FAQ. The majority of published FAQs are at the first level of sophistication (72%) according to the criteria developed by company called Capgemini (2007). This assessment tool of the company is adopted as the official criteria for benchmarking the sophistication of public sector electronic services in the European Union (EU).

The analysis of the Serbian Government online services has also shown that there is no clarity on who administers social media, while finding online pages to enable communication with public service is unreliable and uncertain.

The analyses have revealed that compliance with the critera for quality online relationships between the public sector and citizens is differnete. (Table 2)

Table 2: Compliance with hte criteria

Criterion	Public managment bodies which met the criteria (in percentages)
Two way communication with citizens	98%
Dissemination of information via DM	64%
News on latest initative and events	79%
Contact email provided	96%

Two way communication is enabled mostly using emails. Profiles and pages on social media are used for dissemention of news and multimedia content. In other words, online relationship with public are mostly at the level of publishing information on activities of government agencies.

4. SOCIAL NETWORK USE IN THE MINISTRY OF DEFENSE AND SERBIAN ARMED FORCES

The Ministry of Defense and Serbian Armed Forces (MoD & SAF) has had an online presence since 1997. The Army web site was launched to the public on 15 December 1997. That is also the day of the first independent appearance of the Army on the internet, on its own official domain. The Army web site has become a part of the comprehensive display of affirmative information on the armed forces in public. The structure of the web site reflects the intention to incorporate both dissemination of information and the need for presentation (Bobar, 2009).

A sharp increase in the number of users, especially younger generations, was evident during 2008 when the Ministry of Defense opened their pages on YouTube (2 September 2008), Facebook (22 December 2009) and Twitter (1 June 2011). The aim was to enable direct, two way communication with young people, who are an extremely important demographic group for the MoD & SAF. (Đurić-Atanasievski, Bobar, Krivokapić, 2012)

The main MoD & SAF's objectives for the use of the global network and of social media have been to ensure public support for the activites of the defense system; to reach out to young generations and increase their interest in the military profession and possible recruitment into the professional armed forces and to enable communication in crises situations. An important objective was also to prevent false representation of the MOD & SAF in social media, that is, directing users of the network to offical sources of information. These objectives and methods are of lesser scope and not that sophisticated compared to the internet activities and social media engagement of other military forces.

Strategic presentation of MoD & SAF in social media depends on changes initiated by Defense Strategy and available resources in the defense structure.

The anaylsis of the Directorate for Digital Agenda that focused on the use of social media in State bodies and institutions, concluded that the Ministry of Defense is the most successful in all aspects: frequency of announcments, interactions with their audience and the extent of their reach. In the '*Guidelines on the use of social network in State and autonomus regions public agencies and local self-governing units'* the profile and web pages of the Ministry of Defense are listed as an example of good practice.

The analyses of the MoD & SAF' presentation in social media in 2015 has come up with the following statistics:

Ministry of Defense published 2205 news and announcement, sorted and adjusted to available profiles and pages on social media.

Facebook page of the MoD & SAF got 182.000 approvals ('likes'). On the Facebook page of DM & SAF visitors publi(sh on average more than 5.000 likes, 150 comments and 120 'shares' per day. Announcment on the participation of the Serbian Guard at the military parade in Moscow is a textbook example of the viral trend on social network. This announcment was viewed by 800.000 Facebook users.

Twitter profile of the MoD & SAF has accumulated 4.050 followers and published 2.830 short messages. Each messsage published on Twitter was resent multiple times, for example, information on a Tank biathlone in the Russian Federation or preparation for the military parade in China. The reach of short messages is much larger than what the available statistics can record and impact on journalists and experts is bigger than the standard exchange of information.

YouTube profile of the MoD & SAF has more than 25.000 views and more than 34.000 minutes of video material is viewed per month. The most popular clips are the opening ceremony of Tank biathlon in Russia, finals of the armoured vehicles competition, new recruitment video, *Be a professional,* offering jobs with the Army, video about shooting the film *Cizmas*i (Footsoldiers) and a report on the Guard preparation for the parade in Moscow.

Profiles on social network such as Facebook, Twitter and YouTube have been recognised by the public as an official and reliable source of information. That is of crucial importantce as the public sector often has to deal with the problem of reliability and authenticity of the source in social media, that is, to confirm if the source is official or fake.

4.1. Content analyses of MoD & SAF presentation on social media

The analyses of the profiles and pages of armed forces of EU countries indicate that the common theme is that of solders. Solders have the central role and the content published on social media reflects that (NATO Public Affairs Handbook, 2010)

Using available statistical tools on the profiles and pages of the social media of the Ministry of Defence, we have analysed the efficency of material published in 2015, according to the type and their content. Content analyses has been undertaken following two criteria: reach of the targeted public and engagement. Collected data was interpolated taking into consideration relative nexus according to the type of content. The results are presented in Table 2 and 3 below.

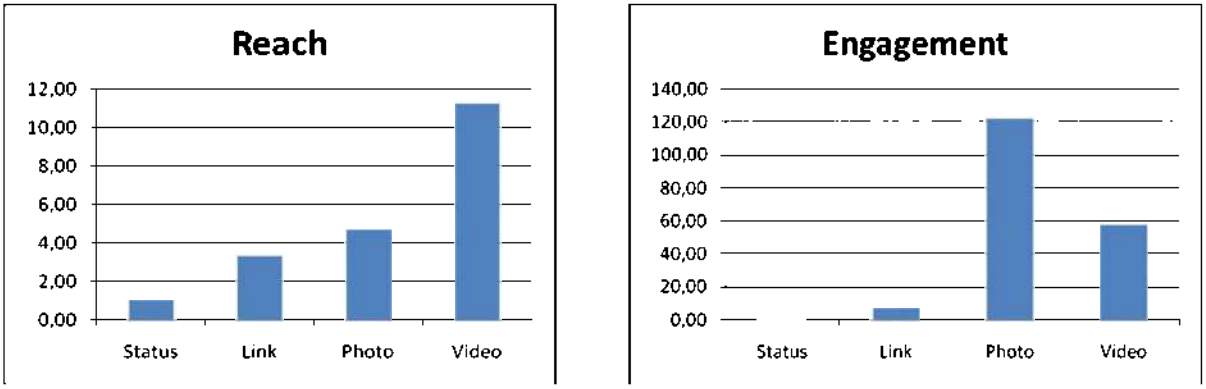

Figure 1&2: Interrelation of the announcement and its type to the reach and engagement of MoD & SAF social media

The finding of this analyses is that the most visited pages on MoD & SAF's social media are with video content, but photos initiated much higer engagement of the visitors to these pages compared to other types of content.

In order to still provide an answer to what content is the most suitable for publication on various social media, we have analysed the content on profiles and pages of MoD & SAF published during 2015. All content was put into following categories: training, practice, peacekeeping operations, natural disasters, promotions and defense politics.

Following the minimal and maximal values for each of the categories in 2015, we have defined relative relations, based on categories, for the maximal reach and engagement of each announcement. See table 4 below:

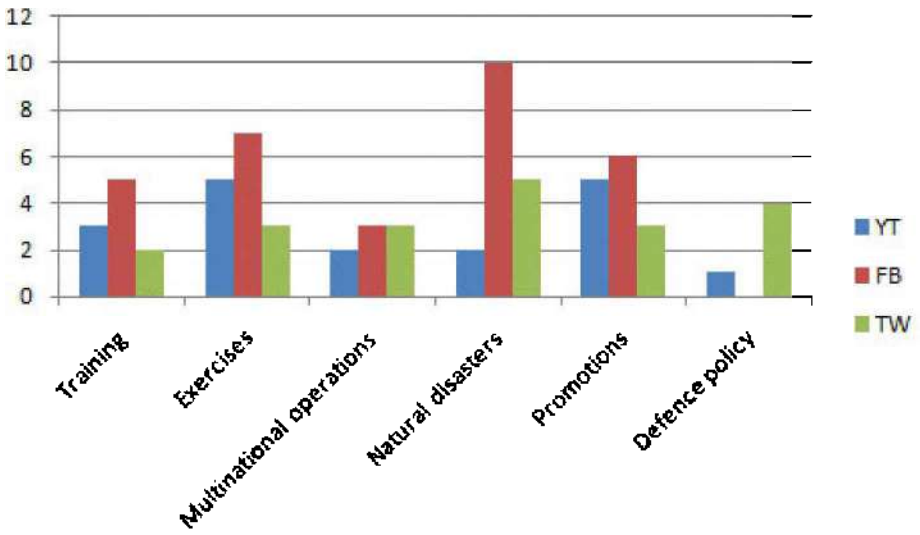

Figure 3: Categories of announcement on various social media and their relative relation

Results of these analyses confirmed that engagement of users point towards certain trends for each type of media. YouTube users most often follows clips which have content that is focused on training, practice, promotions. This is content where a soldier is a central figure.

Facebook pages initiated the most reaction when the army was involved in assisting crises during natural disasters or on their military drills. This type of content usually attracts a lot of positive comments and emotions.

The MOD & SFA Twitter profile initiates fairly equal reactions. It has also presented well as a medium useful for the distribution of information that have defense doctrine content.

5. CONCLUSION

Relevant research indicates that the public sector has not yet used all capabilities provided by social networks for the improvement of inclusive or consultative role of citizens anywhere in the world. In addition, the real effects of communication with the citizens has not been defined yet. However, existing survey of public workers, reveals that the participation of the authorities in social media may improve the communication and participation of the citizens, create greater transparency and transfer of the best practice between government agencies.

On the basis of previous experience in the implementation of social media as channels of communication of the Ministry of Defense and the Serbian Armed Forces, it can be concluded that the contents which are published on social networks are being followed by different social groups. The results of the 2015 analysis in the MoD and the SAF confirm that the editorial policy of the profile and the pages on the social networks must be well planned and based on evaluation of the publications in the previous period. This is especially related to the type of content and the content itself, i.e. suitability of the content for the specific type of social network. The analysis of the content of the MoD and the SAF confirm that the Youtube channel is a media suitable for promotional appearances, Facebook for communication with youths, and Tweeter for informing the public about the defense politics. Taking into consideration public accessibility of social media, it is expected that the announcements efficiency will not considerably change in the next period. Further improvements of the Ministry of Defense and the Serbian Armed Forces presentation can be achieved in direct communication with members of the public in social network. It is also important to prepare a good analysis of the influence that certain public media can have on the shaping of public opinion.

***Abstract**: This paper aims to clarify the notion of CRM, as well as the influence of this system on how communication with customers will be shaped in the future. Through CRM and systems used to facilitate CRM, companies find out more about their target audiences and the best way to meet their requirements, so that they may improve communication with existing and potential customers. Operational CRM consists of three main components: sales automation, marketing automation and service automation. Therefore, this paper will focus on better explaining these concepts, as well as on examining the future of CRM and the way this system may contribute to the better placement of products or services of certain companies on the market. The influence of CRM systems on customer satisfaction is also explained, as well as the future of communication between the companies and the customers.*

***Keywords:** CRM, communication, customer, marketing*

1. INTRODUCTION

The speed at which the client is approached and meeting the demands of clients have become the key parameters of a company's successful management, where the most significance is placed on recognizing the needs of clients and fulfilling them as quickly as possible. *Severovic (2013) point out that: "companies meet the demands of a competitive market by constantly reaffirming their position when compared to their competition" (p. 143).*

The concept of customer/client relationship management is essential in contemporary business practices. Customer relationship management directly correlates with marketing, i.e. sales. Satisfied customers are the instrument through which successful contemporary business subjects are realized, especially in today's modern terms of business, where the competition is undoubtedly stronger than ever before. There are numerous definitions of the concept 'customer relationship management'. Although customers are in fact managed by having their needs satisfied, and thereby building a long-term partnership between the customer and the provider, there are also some authors who speak of managing buyer relations, rather then managing customer relations.

Severovic (2013) point out that: "customer relationship management (CRM) represents the company's approach to managing and interacting with existing and future customers" (p.157). The CRM approach sets out to analyze data about the clients, in order to improve the company's business relations with them, with a particular emphasis on keeping a customer in order to boost sales

While developing customer relationships, technology, i.e. communication technology based on the support of the internet, has a significant role. It not only makes communicating with potential customers possible, but it also allows companies to develop long-term relationships with them, based on constantly monitoring their needs (Yeung., M . & Ramasamy., B., 2008).

One important aspect of the CRM approach is that CRM systems integrate information from a variety of different sources, including the company's website, telephone line, e-mail, live chat, marketing materials, social media, and many others. Through the CRM approach and the systems used to facilitate CRM, companies find out more about their target audiences and the best way to satisfy their needs. However, adopting the CRM approach may from time to time lead to favoring certain

categories of customers, which in turn may cause dissatisfaction in many other customers and defeat the purpose of CRM in general.

CRM system's primary goal is for the company to integrate sales automation, as well as marketing and customer support. This is why these systems usually have a control panel which allows them to have a general overview of the three functions on one page, for each customer that the company may have. Control panels provide information about clients, sales, previous marketing activities and more, by summing up all relationships between the clients and the company (Kostic-Stankovic, M. & Filipovic, V., 2014).

Operational CRM consists of three main components: sales automation, marketing automation and service automation. Here we will aim to explain these notions more closely, as well as to examine the future of CRM and the way in which this system may contribute to the better placement of products or services of certain companies on the market.

2. SALES AUTOMATION, MARKETING AUTOMATION AND SERVICE

Sales automation occurs in all stages of a sales cycle, from the initial contact to the moment in which a potential client becomes an actual client. For example, in August 2000, Oracle came out with a CRM software package, OracleSalesOnline.com, that made contacts, schedules and performance monitoring available online, so that the required information about customers was easily accessible to all employees working in an office or in the field.

Sales automation conducts an analysis of sales for promotional purposes and it automates monitoring clients with a history of repeated and potential future sales. It also coordinates sales and marketing departments, call centers and retail stores. This helps prevent a double effort in order to establish communication between the sales representative and the customer, and it also automatically tracks all communication on both sides (Kumar, V. & Reinartz, W. 2012).

Marketing automation is focused on modifying the entire process of commerce, in order to make it effective and efficient. For example, by keeping scores of the customer's behavior, Salesforce Marketing Cloud allows for the marketing campaign to adapt to the customer's engagement in the transaction.

Kostic-Stankovic (2013) point out that: "CRM marketing automation tools can automate repeating tasks, such as sending out e-mails to customers at a certain time or posting marketing-related information on social media" (p. 113). The goal of marketing automation is to turn a sales advantage into the largest number of active new buyers possible. CRM system works on engaging customers through social media even today.

Service automation is a part of the CRM system focused on the direct technology of the customer service. Thanks to service automation, buyers receive support through multiple channels, such as a telephone line, e-mail, knowledge base, ticket portals, frequently asked questions section, etc. For example, Microsoft's Dynamic CRM Software monitors the time and the resolution of calls in order to improve the efficiency of particular customer services.

Analytical CRM. The role of analytical CRM systems is to evaluate customer data gathered through a variety of sources, so that business managers can make informed decisions. The analytical CRM system uses techniques such as data mining, correlation and shape recognition, in order to analyze customer data. This sort of analytics helps the company improve its services by identifying minor solvable issues in the marketing sector, which are in relation to different kinds of customers who need to be approached in different ways.

For example, by analyzing the customer base, which is in relation to customer behavior while shopping, the company can see if a certain buyer has not been buying a lot of products recently. After this sort of data is scanned, the company may choose to take a different approach to that particular

group of customers, so as to present its products or services more effectively and show the customer what may be of use for them (Keller, L. & Kotller, Ph, 2006).

Mutual Fund CRM. The third primary goal of the CRM system is to include external partners, such as suppliers, salespersons and distributors, and then share customer information throughout the organization. For example, the feedback may be received through technical support, which deals with customer calls, and could help to give instructions in relation to the placement of products and services to that particular customer in the future (Draganic, D., 2013).

3. CRM SYSTEM'S MAIN COMPONENTS

CRM system's main components are building and managing customer relationships through marketing, observing these relationships in various stages, managing these relationships in every phase and recognizing the fact that the distribution value of this relationship of the customer towards the company is not homogenous. When building and managing customer relationships through marketing, companies may benefit from using different tools that facilitate the organizational design, stimulating programs, recognizing customer structures, all with the goal of optimizing the reach of their marketing campaigns. By acknowledging different CRM stages, companies can benefit from perceiving multiple interactions as linked transactions. The final CRM factor emphasizes the importance of CRM by calculating the profitability of client relations. By studying the particular habits of customers, the company will be able to dedicate various resources and attention to certain kinds of customers (Kracklever, A. H., 2004).

Relational intelligence, i.e. the consciousness about different relationships that the customer may have with a company, is an important component of CRM's main stages. Companies can be successful in recording demographic data, such as gender, age, income and education, and then integrating them into the information regarding purchases, so as to categorize clients by levels of profitability, but this is only a company's mechanical view of client relationships. This is a sign that companies always see customers as resources that can be used in up-sell or cross-sell situations, and not as people in search of interesting and personalized interactions.

Figure 1: *Components of CRM. (2016, May 15)*

4. THE INFLUENCE OF CRM ON CUSTOMER SATISFACTION

Customer satisfaction has significant implications for the economic performance of a company, as it can increase the loyalty of customers and reduce their complaints, as well as the possibility of losing a customer. Implementing the CRM approach is likely to have a positive influence on customer satisfaction and client knowledge in relation to the offer on the market and the purchase for various reasons.First of all, companies are able to accommodate their offers to each customer. By accumulating information through client interaction and the processing of this type of information, all with the goal of discovering different patterns, CRM implementation helps companies adapt their offer so as to suit individual tastes of their clients. This kind of adjustment improves the client's impression regarding the quality of the product and the service, and since it is that impression about the quality of the product that determines the level of customer satisfaction, it thereby follows that CRM implementation has a positive influence on customer satisfaction indirectly.

CRM implementation also enables companies to process buyer and client requests and demands precisely and in a timely manner. For example, Piccoli and Applegate discussed how Windham uses IT tools to deliver consistent service experiences to customers. Both companies improved their ability to adapt and decreased the variability of the customer's experience in relation to their view of the quality of the product (Kotler, Ph., Wong, V., Saunders, J. & G. Armstrong., 2006).

5. ADVANCING CRM SYSTEMS

The consulting firm Bain & Company claims that it is important for companies to establish strong CRM systems in order to improve their relational intelligence. According to this argument, a company has to admit to people having different kinds of relationships to different brands. One study analyzes relationships among customers in China, Germany, Spain and the United States to over 200 brands in 11 industries, including airlines, automobile factories and the media. This information is valuable because it provides insight into the demographic data, different behaviors and values on the basis of customer segmentation. These types of relationships can be both positive and negative. Some customers view themselves as being brand-friendly, others feel repulsion towards brands, while some have mixed feelings about them. These relationships can be distant, intimate or something in between (Maggon, M., Chandhry H., 2015).

6. INFORMATION ANALYSIS

Based on this information, managers should understand the various different reasons behind a particular kind of relationship and provide the customers with what they are asking for. Companies may gather this type of information through polls or interviews with existing customers. For example, Frito-Lay conducted numerous ethnographic interviews with its clients, in an attempt to understand their relationships to companies and brands. One of the things they discovered was that the majority of grown-up customers use their products in order to feel playful. They may have enjoyed the orange lighting of the company or some interesting shapes. Companies have to improve the relational intelligence of their CRM systems. These days, companies gather and receive large quantities of data through e-mail, online sessions, telephone calls, etc. Many companies handle these large quantities of data incorrectly. These are all signs of the type of relationship that the customer wishes to have with a company, which is why companies should consider the possibility of investing more time and effort into developing their relational intelligence further.

Companies may use the data mining technology and internet searches to understand the relational signals. Social media such as Facebook, Twitter, blogs, etc. are also a very important factor in gathering and analyzing information. Understanding existing clients and gathering this kind of data allows the companies to understand the desires of potential customers and their relationship to the brand (Kostic-Stankovic, M., 2013).

It is also very important to analyze all this information in order to establish which relationships have proven to be most valuable in terms of certain categories of customers. This is helpful so as to turn

the gathered data into profit. Stronger relationships to customers contribute to a company's better placement on the market. By managing different portfolios for different segments of a client base, i.e. client category, a company may achieve its strategic goals.

7. EMPLOYEE TRAINING

Many companies also conduct training programs for their employees, whose main goal is to teach them how to identify and efficiently create reliable customers, i.e. brand relationships. For example, Harley-Davidson sent its employees on a trip with clients, all motorcycle lovers, in order to strengthen their relationship to them. Other employees receive training in the areas of social psychology and social sciences, so as to help consolidate client relationships. Representatives of a customer service have to be educated and able to appreciate client relationships, but at the same time, they need to be trained so as to understand the profiles of existing customers. Even financial and legal services should undergo training about the way in which relationships with existing and potential customers should be managed and built.

8. EVALUATING PRECESSES AND PLANNING NEW PROCESSES

Many companies that do not have a well-thought-out and logical process cannot be successful in achieving their goals. Companies have to define their business goals and evaluate their CRM processes in order to improve and expand the business so that it may suit their needs. The implementation of new technologies is also useful because the use of CRM systems requires changes in the infrastructure of the organization, as well as the development of new technologies, such as business rules, databases and informational technologies (Buckingham, R., 2011).

9. CONCLUSION

Customer relationship management (CRM) represents a company's approach to managing and interacting with current and future clients. The CRM approach aims to evaluate client data so as to improve business relations with customers, with a particular emphasis on retaining old customers in order to boost sales. An important aspect of the CRM approach is the fact that CRM systems integrate information from a range of various different channels, including the company's website, telephone line, e-mail, live chat, marketing materials, social media, and many others. Thanks to the CRM approach and the system used in order to facilitate CRM, companies discover more information about their target audiences and the best ways to meet their requirements.

The primary goal of CRM systems is to integrate and automate sales, as well as marketing and customer services.

By acknowledging different stages of CRM, companies will be able to benefit from perceiving various different interactions with customers as linked transactions. By studying the particular habits of customers, companies will be able to dedicate different resources and attention to certain kinds of customers.

Many companies also conduct training programs for their employees, so as to teach them how to recognize and efficiently encourage the increase in the number of their customers, i.e. brand relationships.

Companies should define their business goals and evaluate their CRM processes in order to improve and expand business so that it may suit their needs. The implementation of new technologies is also useful because the use of CRM systems requires changes in the infrastructure of an organization, as well as the development of new technologies, such as business rules, databases and informational technologies.

BRAND DESIGN IN FUNCTION OF SUSTAINABLE CUSTOMER COMMUNICATION DEVELOPMENT

Milica Kostić-Stanković*[1], Valentina Vukmirović[2]
[1]University of Belgrade, Faculty of Organizational Sciences, e-mail: milicak@fon.rs
[2]University of Belgrade, Faculty of Organizational Sciences, e-mail: valentina.vukmirovic91@gmail.com

Abstract: *Even though it should be logical that process of product selection while purchasing is based on simple ratio of price and quality, practice indicates that, in numerous cases, brand design and communication with customers are decisive factors in product purchase decision making. Reasons are very logical and connected with human psyche, as well as manner of perception and notion of different messages sent by brand itself. This is exactly the reason why, while creating brand identity,its aspects such as visual identity, image, brand tone and message, are thoroughly examined and why customers are consulted before and after creating conceptual solution. Based on above mentioned observation, this paper considers significance of branding concept and role of design as a source of sustainable communication development. Research on significance of these components was conducted in paper by applying quantitative method (questionnaire). Research is presented through result analysis and conclusions of primary study, which verify above mentioned claims.*

Keywords*: Brand, design, added value, emotional benefits, product visual identity, customers, sustainablecommunication.*

1. INTRODUCTION

Leading companies worldwide have been paying great attention to the design of their products with the aim of creating successful commercializationon the global market. (Novaković, 2002)In modern world, no company can succeed unless it is in constant touch with the outside world through design and brand. Brand purpose is to create unique rational and emotional associations among customers since they are of great significance when it comes to making decisions about purchasing products. (Cicvarić, 2006) Innovative design is becoming more and more influential on customer's desire to purchase a product as well as on loyalty to a company. The ability to solve problems in communication, including problem identification, research, analysis, solution generation, prototype creation, consumer testing and results evaluation, represents the significant contribution of the design in creating a special connection between producers and customers. (Kuzmanović, 2008)

The broader comprehension of the issues related to customers' expectations regarding cognitive, social, cultural, technological and economic contexts of the design is becoming a prerequisite for creating higher quality communication capacities of the brand. Therefore, the aim is to establish the significance and influence of the design, as a key brand component, on the creation of sustainable communication and its constant promotion in the process of brand creation. The fact that this issue has not been addressed properly in our society, compared to more developed ones, adds significance to this research. Design innovations have recently had great influence on increasing brand value as well as product's competitive advantage. Since brand represents an instrument of competitiveness, which has an important role for gaining leadership position on the market, it is vital to constantly introduce innovations in all business processes. (Kotler, 2005) In that way only can the costs be reduced and revenues augmented, with the aim of improving business results and increasing the competitive capacities of a company. Branding strategy based on future goals which include final customers, raising awareness of the brand, its positive image creation and building a loyal relation with the brand, is of great importance. Standard scientific research methods such as inductive, deductive, analytical and synthetic methods, as well as statistical and comparative analysis were used in this paper. Domestic and foreign references, as well as electronic resources will be critically analyzed, with the aim of gaining new scientific and expert knowledge on business practice. Empirical research was conducted by using methods of surveying, interviewing and effect measurements.

2. DESIGN AS A BRAND FACTOR

Design, viewed in its broadest meaning, represents visual, functional and qualitative modelling of the overall life conditions of the society.(Filipović, Kostić-Stanković, 2009) Design is supposed to contribute to creating functional aesthetically acceptable products of high quality, while at the same time achieving optimal cost-effectiveness and productivity in business. Design was made because of the need to create visual identity of the product which is the sum of different means that in artistic and graphical way create unique representation of a product, or a whole brand to which several lines of products belong, or even a certain corporation and its activity. The process of designing is realised through problem definition, relevant information gathering, generation of several preliminary designs, final design analysis and selection, and finally its testing and implementation. The aim of every company is to get public favour with its unique visual identity, and then to take its place on the market through consistency in representation of its advantages and quality. It is very important to pay close attention to cosistent use of the carefully designed visual identity components, with which wide recognition and differentiation on the market is achieved. The search for media values forced the companies to rely less on conventional means of advertising and to accept other communication forms: design, sales promotion, direct marketing. (Lamb, Hair, McDaniel, 2005) Nowadays, the focal point of innovation in the design section is a human – or, to put it differently, design should question human needs and, accordingly, ensure functionality, possibility of marketing positioning, product usability and sustainability. The visual identity of a product and visual elements of a brand have become only one of its dimensions nowadays. The strict division of technical disciplines into industrial and graphical design has been replaced by interdisciplinary practice of strategic design which uses new forms of design with the aim of creating a product as the means of communication with the customers.(Lamb, Hair, McDaniel, 2005) Design is supposed to create and develop a visual solution for problems in communication between the brand and customers, including the comprehension of typographical and aesthetic elements, their composition and structure. Mass messaging is being transformed into narrower communication forms intended for specific audience, i.e. special interest design, which is supposed to provide the insight into the target customer groups, is developing. Additionally, new concepts of marketing strategy are about including customers in the brand values creation and the products that it covers. In business, innovative design can provide long-term competitive advantage sustainability and quality communication between brand and customers which leads to the creation of superior organization performances. (Kotler, 2005) Designing a product is a dynamic process constantly being updated with new innovative ideas in order to satisfy customers' needs and requests as well as to build long-term relations. Therefore, design is becoming a strategic resource form which is important for value creation since it has a decisive influence on the initial concept and the delivery of product and services which fulfill customers' needs and aspirations. The aim of the design is to connect the brand with the customer in a visually sophisticated way, thus separating it from the competition and differentiating its offer. Brand has to induce satisfaction in customers. Therefore, motivational researches are being carried out, and they are supposed to provide the answers to the question of customers' needs, desires and aspirations, based on which a design for a specific target group is created. Considering the fact that the visual elements language is understood much faster and easier than a verbal language is, visual elements of the brand identity are applied to all the components through which a company communicates with the general public. The color of the brand represents the mark of its visual identity which contributes to the higher level of recognition of the brand name and sign in relation to the competition. The purpose of the color is to communicate the essential information to the customer; it triggers certain reactions and stimulates thoughts, memories and different perceptions. (Gobé, 2006) The color has the crucial role in the process of brand evaluation and customer's final decision making whether or not to purchase a product. In brand creation, the knowledge and proper usage of colors is demanded, as they have highly associative and symbolic meaning. We are talking about visual, aesthetic and identification element that can cause different associations in different countries. (Rakita, Mitrović, 2007) Companies pay close attention to colors while designing brand elements, especially if they are present on the international market. Brands use different colors and nuances as standards for their visual application, all of which contributes to brand consistency and recognition. In the process of brand management, the packaging has an extremely significant role since it stimulates associations with the brand. Furthermore, the packaging design represents visual means of communication with the customers which makes it easier for them to recognize the products of certain purpose, kind and price.(Cicvarić, 2006)As well as having a practical value, design of the packaging has an emotional value. Actually, it is supposed to have a strong visual influence on the customer. The packaging directly influences brand image creation and therefore represents an important instrument for communication in marketing. (Filipović, Kostić-Stanković, 2009) As an instrument for communication with the customers, the packaging is used as a transmitter of the message about brand value, emphasising its recognition elements and attractiveness. The packaging design and the way of marking a brand influence the process of brand identity creation so that the original packaging will draw the customer's attention and stimulate impulsive purchasing. (Mandarić, 2012)

3. THE ROLE OF BRAND IN MODERN BUSINESS

In order for it to be successful, a company has to differentiate its offer and to position itself in relation to the competition so that the customers would perceive the difference between its and competitor's offer.(Milisavljević, 2013) Market trends which are conditioned by quickened development of technology, such as the mass production of the products having the similar or even same purpose, shortening product life-cycle, as well as accelerated product obsolence have resulted in the inefficiency of the marketing concept based solely on emphasising the functional advantages of the product and rational reasons for the purchase. Therefore, a company ought to strengthen its advantage in the intangible market-based assets. It led to the necessity for brand creation and the development od its management concept. The purpose of this form of communication is creation of atmosphere, emotions and associations with the customers related to a certain brand, no matter if it is a company, product, service idea or person. (Vlastelica, 2007) Brand has a deep set of thoughts and associations within itself; it has to provide some kind of additional value to the consumer. So, it may be said that the brand represents the way in which customers experience, perceive and understand a specific brand in all its dimensions.(Veljković, Đorđević, 2009) Brand can be defined as a recognizable group of elements: name, logo, design, person and message. The aim of all these is to identify and differentiate organizations, products, services, places and ideas.(Cicvarić, 2006) Unique combination of basic brand elements causes rational and emotional associations, beliefs and expectations in consumers / buyers / users. Brand elements are the basis for product identification and differentiation. However, the most important thing here is to establish emotional connection with the buyer. The fact that the famous designer Marc Gobébelieves that we live in the age of "emotional economy" whose vision is to "make the surroundings more pleasant, exciting and precious place for us all“ only proves this statement. (Gobé, 2001). Brand is a very important source of competitiveness because it enables keeping the existing buyers and attracting new ones. In modern business conditions, general public is faced with different manifestations of brand. It can be represented in the form of product branding, service branding and corporate branding, as well as co-called private branding or trademark, with the obligation of observing the image of the country of origin, or should we say its influence on the brand. (Veljković, Đorđević, 2009) Persons, places and organizations, sports, art and entertainment, countries and different geographical locations, information, ideas can all become a brand. (Filipović, 2008) From all the above said, it can be concluded that nearly everything can be branded, which is viewed as a chance for achieving better business results because brands enable the consumers to develop higher level of loyalty and affection for certain products and services. The value of the brand is based on the difference in consumers' reactions which represent the result of consumers' knowledge on the brand comprising of thoughts, feelings, images, experience, beliefs etc. Different consumers' reactions, which actually create brand value, reflect in perceptions, preferences and behavior in accordance with marketing aspects of a specific brand. (Novčić, Damnjanović, Filipović, 2012) Brand is thought to have a positive value based on customers if the customer has a positive reaction on the brand and the way it is launched in the situations when it can be recognized, unlike in those when it cannot. The benefit of brand existence can be considered from the customer's and organization's point of view. The advantages that the brand offers to customers are multiple. Brand identifies the source of the product, and it provides the customer with the possibility of allotting it certain responsibilities. Brand also facilitates the process of decision making on the selection of the product and it reduces the research costs related to product internally, through time needed to be spent on thinking, and externally, through time needed to be spent on product search. From the aspect of organization, a properly created brand will promote the company into a recognizable player on the market in relation to other business partners. Also, a certain degree of differentiation is achieved in relation to the competition, which can be seen as an indicator of high quality by customers. Provided that brand characteristics satisfy customers' needs and desires, customers will certainly opt for different products of the same brand thus building loyal customer – brand relation. On the basis of loyalty, a constant need for the product is developed, which is how brand proves to have economic benefits. According to the above mentioned facts, the following conclusion can be drawn: brand has economic and social contribution. The social contribution is perceived through generating customers' loyalty which leads to producing a stable revenue for the company, or in other words, economic contribution. Regular and steady revenue generates steady income for all the company's employees which is an extremely valuable social contribution.

4. SUSTAINABLE COMMUNICATION AND BRAND IN FUNCTION OF CREATING RELATIONSHIP WITH CUSTOMERS

Sustainable communication is firmly connected with strategic customer relationship management, which can be defined as a marketing approach towards managing company's interaction with current and potential customers. (Hasty, Reardon, 2007)Sustainable communication implies long-term coordination of organizational structure business strategies and corporate culture with customer data and information

technology with the aim of satisfying customer needs and achieving business profit. (Shimp, 2003) Therefore, sustainable communication implies gathering information from all sources inside the company, as well as outside the company, which implies customer feedback and activities of competitive companies. This enables company's marketing experts to make proper decisions rapidly and effectively to fulfill customer needs, due to the fact that satisfied and loyal customer is far more interested in creating long-term relationship with certain company and its products. Communication specialists agree that, besides costs reduction, there should be three new priorities in creating relationship with customers: a) increasing services level and quality; b) increasing competence level, in order to provide business partners and customers with quality responses to additional requirements and c) active usage of social networks in communication with clients. (Levine, 2007) Due to the fact that their consumers are becoming more demanding, better informed, and in a certain manner even suspicious about the quality of a product or service, successful companies are trying to improve their relationship with customers by providing them with extra value, such as different personalized gifts, for example multipurpose loyalty cards, different discounts for special occasions, or providing customers with post sale activities such as servicing. (Filipović, Kostić-Stanković, 2009) However, by conducting this kind of activities, company is gathering valuable information about demographic structure as well as preferences, interests and life styles of their customers, which are of outstanding significance in product development. Other authors suggest that sustainable communication has five crucial tasks: a) encouraging new forms of customer behavior, b) placing customer in center of marketing activities, c) combining different messages and media for achieving desired communication effects, d) developing strong and unique brand image, e) developing long-term relationship with customers.(Hasty, Reardon, 2007)

In the conditions of modern market environment, one of the main prerequisites for a successful business is to establish high quality communication with the target groups, particularly with the buyers or service consumers. The understanding of the growing importance of the communication for the company's market success has contributed to positioning this business function amongst the top priorities of the company's organizational structure and affecting its strategic decisions.(Mitić, Ognjanov, 2013) Brand creation is one of the ways to establish and maintain communication between a company and the customers since brand is not only about a product's or a company's name but it also includes a complex functional end emotional structure. Nowadays, consumers are overcommunicated as a large number of information is directed towards them on a daily basis, they are exposed to information from 40 billion webpages and hundreds of television channels as well as thousands of newspaper headings. (Cicvarić, 2006) Thus, the process of perceiving and processing different information is greatly facilitated with the existance of brands. Even though the purpose of the brand is to identify products and services, as well as their producers, it can also be used to identify customers which enables the establishment of communication system and connection wiht other people who are the consumers of the same brand.

Brand is created through different communication forms which is a key factor in establishing a connection between brand and customers. Firstly, it is necessary to define and adopt brand identity which is followed by the analysis of the manner of communication with the customers. The communication on brand – customers relation begins from the moment the customer becomes aware of the brand and that communication is maintained through marketing and corporate communication activities. (Cicvarić, 2006) With the aim of achieving the desired brand communication effects, it is necessary to create communication programmes from customers' or target groups' point of view, in accordance with their needs, desires and characterisitcs. Successful brands communicate with their customers, listen to and learn from them preserving the possibility to transform and adapt to different target groups segments. While planning sustainable communication between brand and target groups, it is important to devise a certain creative style of sending the desired messages to the customers, which will depend on identified target groups' characteristics. The aim of the communication activity is to inform the customers and other groups of interest and to draw customers' attention which will stimulate them to purchase and create a long-term position of the brand in customers' consciousness. Communicational brand mixture comprises elements of integrated marketing and corporate communications.(Cicvarić, 2006) The same author states that the aims of marketing communication are to inform the customers about the products, services and sales conditions, to assure the customers to choose a certain product and to stimulate the customers' reaction to their organization's products. For successful realization of integrated marketing communication it is necessary to determine goals to be achieved, define program and financial funds needed for its realization, to observe the achieved results and to take the corrective action if necessary. Integrated marketing communication is realized through combined and coordinated usage of marketing activity instruments, such as: advertising, sales promotion, personal sales, packaging design, sales environment etc. (Vasiljev, 2001) Corporate communication, as a significant business function within modern companies, is comprised of activities directed towards creation of organization's corporate identity, corporate brand and company's reputation. Due to its complexity, brand development is an important element in the process of creating corporate reputation. The reason for that is the fact that the mere implementation of promotional activities is not sufficient for building a quality and long-term relation between an organization and the customers, since they are already exposed to a large number of information and they trust less to the content placed by mass media. (Macura, 2001) One of the most straightforward ways of establishing an immediate dialogue with the customer is to revive and humanize the

brand, i.e. to create brand personality as an integral part of communication strategy. (Starčević, 2012) The idea of brand personality creation was formed on the basis of the understanding of the interpersonal relations significance. The brand personality is its important aspect and has a crucial part in creating the relation between brand and customers since it provides basis to the customers to easily connect to and even identify with. Customers purchase a certain brand to express their own identity or image through it.
Numerous researches have shown that creation of a proper brand personality leads to establishing strong relation between customers and brand, as well as to other significant marketing outcomes such as easier brand recall, stronger and more positive attitudes towards brand, stimulations of purchase intentions, consumers' increased brand loyalty and augmented brand market value. (Starčević, 2012) The message of the brand comprises all ideas, concepts and symbols which an organization sends to chosen target audience. Its primary mission is to draw attention to the brand, to attract the customers who will become and remain loyal to the brand. If a product and its packaging are used as a means of communication, it is necessary to harmonize the typography, color, illustrations, shape and material in order to make a compact unit which transmits a unique message. (Kotler, 2003)

5. EMPIRICAL RESEARCH

The aim of the research conducted in the period between March and April 2016 was to determine the influence of brand design and its communicational capacities on the decision making about purchasing a product. 230 customers were surveyed on the territory of City of Belgrade, out of whom there was a higher percentage of women (63%) than men (37%).
The research was conducted using a personally delivered questionnaire. During the survey, some useful additional information was gathered through personal communication between the surveyor and the interviewee. The aim of the research was to determine which brand elements have the crucial influence on the decision making about purchasing a product.
In order to obtain the wanted results, the interviewees were offered two competing products – instant coffee by two renowned producers: *Nescafé*and *Grand* coffee. The reason for choosing this product is the fact that it is in every-day use and that it is bought because of habit. Additionally, this category of product is interesting because the Serbian market in the segment of traditional coffee brands is a certain phenomenon – annual coffee consumption is 4.5 kg per capita. Over 33 000 tons of this beverage are sold in Serbia (http://marketnetwork.rs/). The above mentioned brands are chosen because they have been listed as the favourite ones in the various opinion polls conducted in Serbia. Serbian consumers perceive *Nescafé* brand as the highest quality producer in the category of instant coffee on the Serbian market for which they would opt if the finances were not an issue (ICERTIAS – International Certification Association GmbH, 2015). *Grand* brand is chosen because it has been at the top of the list of domestic coffee producers on the Serbian market. The research according to which every other cup of coffee that is consumed in Serbia comes from the factory of the company that owns this brand, only proves the statement above (http://www.profitmagazin.com/). Also, *Grand* coffee is the winner of *Best Buy Award 2015/2016 Millenials Serbia* in the category of instant coffee, as a producer with the best rate of price and quality on the Serbian market (http://www.advertiser-serbia.com/).
The questionnaire includes questions about brand design, visual characteritics of the products that this brand has under its umbrella and the interviewees' aspirations towards creative participation in the promotion of the brand (the suggestions were mostly related to the promotion of packaging shape and functionality, ant its aesthetic elements).
The results of the research showed that 80% of those who were surveyed consume a brand of coffee, 48% of whom do it more than one time per day. Coffee consumers are mostly up to 45 years of age. The consumers mostly consume black coffee or the so-called Turkish coffee (53%), which is probably caused by Serbian cultural heritage. The information that 92% out of 25 000 tons of coffee sold last year is "Turkish coffee" supports this claim. Instant coffee is in the second place with 34 %, while other kinds of coffee (cappuccino, espresso and a decaf) take only 13 %. Instant coffee is consumed mainly by younger population, usually at work, college or university or on the go.
The research has also shown that the consumers are generally loyal to brands, that they notice changes regarding prices or design, and emphasise that recommendations by friends and family members about which brand to use are important to them. Also, the interviewees stated that coffee consumption provides pleasure; it is a habit and a part of their lifestyles.
The results of the research have shown that consumers take care of which coffee brand they choose, because the majority of the interviewees express partial to complete loyalty to one coffee producer. Design of the brand elements greatly affects its position in the consumer's consciousness. Those who were surveyed emphasize that brand symbol generally causes specific feelings and associations. *Nescafé* brand symbol is perceived as modern, innovative, and well-adjusted to the contemporary man who chooses his coffee on the go in accordance with his lifestyle. This brand's logo appears stable and strong, and yet subtle enough to reflect its essence. *Grand* coffee brand's symbol is perceived as creative imitation of the *Nescafé* logo, primarily because of the white serif font on the red background. A portion of the interviewees noticed a

golden detail in the logo and understood it as an aspiration to visually stress and support the brand name, as well as to draw attention to the premium quality and brand's superiority over its competition. The interviewees think that most of the domestic and foreign coffee producers keep up to date with the latest trends when it comes to product's visual identity which positions *Nescafé* as the global market leader with the idea that they will thus increase the competitiveness of their products on the market.
For 32% of those who were surveyed, the color is of utmost importance when creating a brand and products under its umbrella, because for most people it is the sign of recognition, i.e. it facilitates detection among numerous competition products. Consumers are also sensitive to sudden and drastic changes in the design of brand elements and its products. This is proven by the results of the research according to which 36% of the interviewees completely agree that the change in their favorite coffee brand packaging design would affect their buying decision, since they are used to having some kind of certainty and constant values offered by the brand. Although the interviewees do not have doubts about the quality of domestic or regional brands, the foreign ones are preferred. Thus, as much as 78% would opt for *Nescafé* instant coffee than for the same product of the *Grand* Company. A portion of the surveyed consumers believe that foreign brands have better competitive position on the market because considerable funds are invested in the promotional activities and thus increase their visibility. They also think that *Nescafé* sets the trends when it comes to both product quality and its packaging design. According to the gathered data, it can be concluded that *Nescafé* is making competitive advantage on the market and is gaining its share of the market all thanks to its brand strength, quality and tradition, superb design and well-conceived strategy of communication with the consumers. The confirmation of this claim is the fact that 39% of the interviewees point out that the image of *Nescafé* brand is its primary advantage in relation to competition, to which visual characteristics of this brand products contribute greatly. When it comes to packaging design, the interviewees emphasize that they prefer lighter ergonomically designed *Nescafé* cans, as well as the fact that different kinds of coffee have different can color which makes the selection of the product easier. Those who participated in the survey often mentioned that red *Nescafé* mug associated them with the ritual of coffee drinking which they relate to relaxation and pleasant moments. It can be said that this creation of the *Nescafé* brand is itself some kind of a brand. On the other hand, quality and reliability are generally emphasized in relation to *Grand* brand, since it is, particularly among older generation, known as renowned coffee producer on the Serbian market. It is considered that this brand's and its products' visual identity should not be drastically altered since, as a part of the legacy of the old times, it adds to the product value. When the interviewees were shown the *Grand* instant coffee packaging they said that it greatly resembles the *Nescafé* product of the same category. In accordance with the above mentioned, 23% of the interviewees think that *Grand* company ought to decide on giving a specific identity to its products' packaging in order to be different from *Nescafé,* while only 7% of the enthusiastic consumers would participate in the creation of the product's design.
When it comes to communication with the consumers via traditional media, the interviewees think that *Grand* coffee has the best commercials on the domestic market because they are fine-tuned to specific target groups within consumer structure. Thus, the company creates the specific visuals for customers who recognize and choose premium quality, followed by a higher price of the product. The consumer structure is mainly comprised of younger female population for whom the messages have been created as well as the tone of communication, and of consumers who rely on traditional values and who pay special attention to commercials during New Year's holidays. Those commercials usually feature famous people or portray scenes from every-day life while family, neighbors and friends are having conversation with a cup of coffee at their side.

6. CONCLUSION

In order to achieve success in contemporary business environment, which is increasingly globalized, oversaturated and shaped by demanding customers with high expectations, company needs to establish and retain successful communication and long-term relationship with their target groups. Gaining and retaining confidence of target groups is a key to achieving business success, since customers create value for a company by choosing its products or services. Creating corporate or product brand could be an efficient method of establishing firm and long-term relationship with customers, due to the fact that brand is perceived as a guarantee of quality which shortens decision making process, but also as a manner of customer self-expression. By choosing certain brand, person can send specific message to the environment about his/her life style, preferences, interests, system of values, beliefs, etc. By giving the opportunity to send a message about who they are to the public, brand creates very deep emotional bond with customers which will ensure their affection for the brand and its products.
Since company's product is one of the most important means of communication with selected target groups, visual identity of a product, i.e. its design,is used in the process of brand creation.By creating unique brand and product design, company can provoke different emotions and imaginations among customers, but also send specific messages about brand essence and its identity. Main aim of design in process of brand development is to connect customers with the brand, and provoke their interest for the brand, which is the

first step towards creating loyal customer base. In circumstances of mega competition, innovative design can be a powerful asset for brand differentiation.

Based on above mentioned claims, it can be concluded that brand development, with process of design developmentas its core component, should be used as a strategic asset in process of creating sustainable communication with customers. This recommendation is based on results of theoretical and empirical research which was conducted by the authors of this paper.Research conclusions, which were presented in this paper, indicate that customers in Serbia significantly appreciate aesthetic and emotional brand components, and therefore perceive products of certain brands as high-quality ones. Due to the fact that domestic practice has, to a large degree, unfairly neglected brand and product design as a core element for accomplishing business success, authors recommend that aesthetic andemotional components in production sphere should gain adequate affirmation. Developing brand design could be a solution for better positioning and competitiveness of domestic brands and its products in Serbian and foreign markets.

EFFECTS OF BUNDLING NON-COMPLEMENTARY PRODUCTS – COMMUNICATION PERSPECTIVE

Vera Aćimović*[1], Slavica Cicvarić Kostić[2], Tamara Vlastelica[3]

Abstract: *Product bundling is a very common marketing strategy. Bundles composed of similar, related products are prevalent in the market. However, there is a growing trend of bundling non-complementary, unrelated products. This paper aims to explore the ways of product bundling, with the emphasis on bundling unrelated products, and to identify possible effects from the communication perspective. We employed qualitative analysis of both secondary and primary data, gathered from specific campaigns in which one of the authors was engaged as account director for the projects presented as a case. One would expect that bundling benefits directly from higher degree of complementarity, but there are some circumstances where asymmetric bundles with lower degree of complementarity can help in reaching more consumers.*

Keywords*: bundling, product complementarity, communication channels, target audience, consumer electronics*

1. INTRODUCTION

Bundling of products by independent companies is nowadays a very common marketing strategy in several industries (Brito and Vasconcelos, 2014). Bundled products provide customers an opportunity to obtain a pair of products for a price lower than that of individual purchase. Examples of bundles can be, among others, found across following industries: telecommunications (handset and GSM package), food (coffee and concert tickets), electronics (microwave and recipe books) etc. (McCardle et al., 2006). Furthermore, there are examples within the service industry as well, such as bundling between hotels and restaurants, airlines and car rentals, public transport with museums (Armstrong, 2012). Michelin is considered to be a pioneer of bundling. When they launched the Michelin guide with information about petrol stations, accommodation and food, maps and directions, they bundled it with a tyre offer (Yan and Bandyopadhyay, 2011).

Sometimes manufacturers employ bundling strategies that are contrary to common practice. For example, inexpensive products (e.g. household cleaning products) are bundled with high-end products such as washing machines, vacuum cleaners or refrigerators (Samsung, LG), or dinners in restaurants with premium dinner-ware (Villeroy and Boch, Christofe, Wedgwood). Marketers can bundle an unknown product with a well-established one as a product launch strategy. Strong brands are an extremely valuable asset in bundling strategy, since their attractive attributes can affect quality perception of weak or new brands (Sheng and Pan, 2009). According to these authors, if a bundle contains a strong brand, the weak or new brand is most likely to be seen as representative of same category group as the strong one, for example “high end”, “quality” or “premium”.

Stremersch and Tellis (2002) provided comprehensive literature overview on the topic, indicated inconsistencies in definitions and terminology and presented a classification of various types of bundles with emphasis on the legal aspect of bundling. Gans and King (2006) describe the bundle as widely used business strategy where firms tend to obtain customers’ loyalty by offering interlocking discounts between particular brands or what seems as a pair of unrelated products. Bundling has also been identified as a tool for price discrimination, increasing market share and sales, product differentiation and competition reduction (Girju et al., 2013). Furthermore, bundling can help save transaction, packaging and advertising costs (Sheikhzadeh and Elahi, 2013) and serve well as mechanism for market entrance; all of this leads to increased profitability. The trend of using bundles increased over time due to an apparent emergence of packages consisting of a product and a service (Dukart and Swartz, 2000). Estelami (1999) researched bundle benefits and found out that the average saving when purchasing bundles goes up to 8%, affecting customers’ perception and evaluation of the bundle’s individual components. Bundling of products can also serve as a tool for new product introduction (Simonin and Ruth, 1995). An example of this is the launch of Samsung Galaxy S5 phone exclusively with Telenor, a mobile communications operator in 2014 on the

Serbian market. Bundling also occurs in mergers or strategic alliances, where firms can improve profits by bundling after integration (Mialon, 2014).

Apart from the benefits bundling strategies provide to companies, they are valuable for consumers as well. From consumers' perspective, bundled products provide the chance to pay less for a pair of products than the sum when purchased separately. Consumers then have a choice between meeting all of their requirements, which is rarely accomplished in the bundle, or purchasing items individually for a higher price (Brito and Vasconcelos, 2015).

Despite the fact that product bundling is a widespread business practice, there are a few researches and articles that deal with bundling unrelated products between two independent firms, especially when it comes to promotion. In this article, authors examine bundling of non-complementary products and its effects from the communication perspective. We employed qualitative analysis of both secondary and primary data of bundled offerings of electronics on Serbian market from February 2014 till February 2015. We examined bundles composed of product pairs. We consider that bundling of products of same quality is a natural scenario (Brito and Vasconcelos, 2014). Even when successful examples could be found on the market, it was most unlikely that a high-quality producer would be interested in making an alliance with a low-quality producer that would have likely harmed their reputation. We restricted research to two-item bundles, since they are most common on the market (Harlam et al., 1995). We considered two broad groups of products: consumer electronics and personal care. The results provide insights into good practices of bundling these classes of products.

This article is organized as follows: the next section presents definitions of bundling and introduces product complementarity in bundling. The following section develops a set of key propositions for bundling non-complementary products. The final section presents our conclusions, implications, and limitations.

2. BUNDLE COMPOSITION

In this section we investigate bundle components, types of bundles and product complementarity, whereas last has not received proper attention in existing academic literature, but may have major impact on bundle promotion.

2.1. Bundle terminology and definitions

According to Stremersch and Tellis (2002) there is no consistent, universally accepted definition of bundling due to lack of consensus in literature and proper use of terms, as well as vague distinction between important formulations and ambiguous domain of application. Adams and Yellen (1976) define product bundling as selling goods in packages. Guiltinan's (1987) definition considers bundling as a practice of marketing two or more products and/or services in a package for a special price. Recent literature still sticks to Yadav and Monroe (1993) definition, similar to the previous one, and sees bundling as a selling of two or more products in a package, at a special price. In this paper, we use the latter definition. Yet, due to a lack of literature consensus on a precise definition, practical implications of product bundling are still imprecise as well. Some of the basic terms that are present in literature are described below.

Bundling. Bundling is the sale of two or more separate products in one package. The term "products" refers to both goods and services. If there are separate markets, or at least some customers want to buy products separately, we can legitimate the term "separate products" (Stremersch and Tellis, 2002).

Bundling focus. There is a significant difference between product bundling and price bundling, though sometimes literature lacks clear distinction between the two. Price bundling is the offer of a package of two or more separate products at a discount. Since products are not otherwise integrated, bundling itself does not create added value. There are many examples for this, for instance: McDonald's Big Mac meal. Product bundling integrates two or more independent products at any price. This generally brings significant added value to customers, think of convergence (mobile phone and TV), convenience (cable TV, internet and landline), performance (proteins plus personal fitness plan), and reduced risk (car insurance and life insurance). It is important to differentiate price and product bundling, whereas price bundling is a pricing and promotional tool, while added value provides more strategic dimension to product bundling. Price bundling can be used on short notice, while product bundling demands long-term planning (Ulrich and Eppinger, 1995).

Bundling form. Bundling may occur in one of following forms: pure or mixed. Pure bundling offers only bundled products for sale while mixed bundling is a strategy where firms offer both the bundle and each

individual product separately. Pure bundling is preferred whereas pure bundling and mixed bundling are proportionally profitable (Hui et al., 2012).

2.2. Complementary and non-complementary bundles

In this study, we focus on functional complementarity, where bundle components are dependent or functionally related (Ahluwalia, 2008). This concept is based on a wide scope of relations between bundled products: target audience overlap, convenience and usage situation, functional similarity, timing, image, occasions, seasonality, distribution, promotion, demand (Varadarajan, 1986). Guiltinan (1987) states that the degree of product complementarity is a crucial factor to the success of bundling strategy.

Complementary bundles are those in which individual products are functionally related (Sheng et al., 2007) and can be used together as a system in order to perform certain activity (for example: hotel and rent-a-car, razor and blade). In a perfect setting, one of the products creates the need for consumption of its complement - for example, demand for cheeseburger creates parallel demand for soda, ketchup, mustard etc. It is widely accepted that level of complementarity affects and enhances consumer perception of bundle components (Meyers-Levy at al., 1994). Complementarity of the bundle can offer economies of scale, and demand for one product creates a demand for its complement. Firms can thus gain more marketing effects through bundling, and moreover, profit - since consumers are more likely to purchase both products if the price is reasonable (Yan and Bandyopadhyay, 2011).

Non-complementary bundles are composed of products that are not functionally related to one another, have weak associations and are less likely to be used in common usage situations (for example: washing machine and make-up, mobile phone and sunscreen). With lower degree of complementarity, there is asymmetrical equilibrium, and majority of consumers opt for the dominant product (in terms of brand, price or demand) while fewer consumers decide to buy both (Yan and Bandyopadhyay, 2011).

Although complementary bundle seems like a reasonable, obvious and somewhat logical choice, there is an increased number of non-complementary bundles on the market, and in the next chapters of this paper we will try to find a reason why firms are doing so.

3. RESEARCH METHODOLOGY AND RESULTS

Our study employed examples of real brands in the marketplace in order to ensure the relevancy for managerial implications. Methodology used for illustrating the practice of bundling products is a case study analysis. We employed qualitative analysis of both secondary and primary data, gathered from campaigns in which one of the authors was engaged as account director for the projects presented as a case. Campaigns refer to bundled offerings of electronics and were executed on Serbian market, from February 2014 till February 2015. We examined bundles containing pairs of products of same quality, as we identified it as natural scenario (Brito and Vasconcelos, 2014). We considered two broad groups of products: consumer electronics and personal care. Samsung was chosen as a focal brand, while Sephora, Nivea and Braun were chosen as non-complementary brands. Bundles were assembled the following way: one consumer electronics product and one personal care product, as shown in table below:

Table 1: Product bundles used in desktop research

Bundle	Focal Brand	Non-complementary brand
Washing machine and make-up	Samsung “Black lady” WM	Sephora make-up
Mobile phone and sunscreen	Samsung Galaxy S5	Nivea Sun Protect 50
Microwave and razor	Samsung MWO	Braun shaver

All three bundles were launched on the market during 2014, and to make things more interesting all three bundles were used to support product launches of respective products.

We explored communication of all three bundles using secondary data sources that include retailers’ and manufacturers’ websites, social network channels and available web archives. Furthermore, we used primary data gathered from the campaigns (web banners, social media posts, web site, OOH, leaflets, wobblers, window graphics), as one of the authors works at advertising agency Leo Burnett and was engaged as account director for the projects presented in the paper. These examples are published in consideration of both the agency and the retailers (Homecenter, Positive line) who launched the aforementioned bundles, with the acknowledgment of Samsung.

In order to prove our findings, we used what we considered the control bundle, composed of complementary products – Samsung UHD TV and Pickbox, also launched in 2014, on the same market and at the same time as non-complementary bundles that were investigated.

On the basis of theoretical background and direct author's involvement in planning and executing bundle offerings, we compared the span of target audiences and the number of communication touch points in order to identify the effects from the communication perspective. Results are given below.

3.1. Effects of bundle offerings

When the level of complementarity is high, the associations between two products are strong (Khandeparkar, 2014). Therefore, it's likely to assume that target audience will be more compact and similar in consumption. Bundles composed of complementary products tend to have significant target audience overlap (in our example, a consumer who purchases a Samsung UHD TV is more likely to have interest in a Pickbox, since both products can work as a system, and are fulfilling very similar needs, due to functional relations). With the low level of complementarity, products are addressing different and broader target audiences, with lower overlap. In the presented case, analysis showed that the lower level of complementarity between the bundle components reaches the broader target audience.

The rationale for this lies in the fact that consumer electronics products and personal care products have low degree of overlap of desired target audiences. On one side, we have consumers who are motivated to buy e.g. washing machine, while on the other side we have consumers who are not considering purchase of white goods before they are addressed with joint communication. The presence of both products works as added value for the first group (since the price of make-up is considerably lower than that of washing machine), and for the other group, interested in cosmetics, this type of bundle manages to raise awareness of non-complementary bundle component. Therefore, we have a broader target audience we are addressing, with a potential - raised awareness will create prompted interest in purchasing bundled products. If the products are complementary (UHD TV and Pickbox), this type of bundle raises interest within a homogenous target audience, with low or no potential to induce purchase intention within other target audiences.

Furthermore, from our experience, the lower level of complementarity of bundle components provides more communication touch points. This proposition indicates that bundling of non-complementary products has a considerable effect on the number of communication touch points. Let's examine a bundle composed of a Samsung washing machine and a piece of Sephora make-up. In this example we have joint communication channels, such as mass media (OOH, print, web, TV), social network channels (Samsung, Sephora and Homecenter respectively), retail (Homecenter). When comparing it to a bundle consisting of complementary products (Samsung UHD TV and Pickbox), we noticed that that number of communication channels was lower, since Homecenter is a retailer of both Samsung and Pickbox, due to the similar product categorization. This is a potential task for further examination: what is happening if products of same category, but with low level of complementarity are sold in bundle by different retailers? For example, supermarkets have a broad scope of product categories, and this type of bundle is more likely to happen in such retail environment.

4. CONCLUSION AND MANAGERIAL IMPLICATIONS

Previous researches investigated bundles from different perspectives. Determining which products should be bundled in order to maximize communication effect is a challenging issue when deciding about bundling strategy. In this paper we analyzed examples of bundles composed of a pair of otherwise unrelated, non-complementary products, and identified that they can serve as important communication tool that could provide a broader target audience and - under certain circumstances - engage more communication channels. Our findings indicate that firms should join in bundle arrangements of unrelated products if and when they want to penetrate into secondary target groups and decrease the level of advertising investment.

There are several limitations to our research: it was conducted specifically for consumer electronics products combined with personal care products with a specific retailer. Further research should explore a more complete information setting, at least more different industries and bundled products.

A manager can use our insights in order to decide on an optimal bundling strategy. If their major goal is to maximize profit, they can combine highly complementary products and charge them at a relatively lower price (Yan and Bandyopadhyay, 2011); or if they are undertaking activities that affect market size in terms of broadening the scope of target audiences, they can combine non-complementary bundles in partnership with unrelated companies from different industries.

CORPORATE RESTRUCTURING

DMS AS A PROACTIVE APPROACH IN RESPONSIBLE RESTRUCTURING

Slobodanka Stanojević Terzić
University of Belgrade, Faculty of Organizational Sciences
e-mail: bobanas@gmail.com

Abstract: *The world economy has been and will be seeing a great number of corporate restructuring due to the environmental changes which require radical actions. This research has been guided by the idea of analysing manners in which a responsible operational restructuring could be achieved by emphasizing standardization, reliability and flexibility. DMS directs a company towards a disciplined approach, shaping operational restructuring as a proactive process, while supplying decision makers with relevant and accurate information necessary for making a call for significant changes in processes and responsible elimination of excess capacity.*

Keywords*: DMS, operational restructuring, proactive approach, responsible restructuring*

1. INTRODUCTION

Corporate restructuring is usually the most common logical step when a company faces some serious difficulties in keeping its position on the market. The first association with corporate restructuring is a severe type of crisis which results in distress and bankruptcy. Such crisis is then correspondingly solved by merger or acquisition or takeover. However, corporate restructuring is also applicable as reasonable means for keeping pace with changing environment when company faces constant underperformance for a remarkable period of time, failing to remain as competitive. And the environmental changes are grand, frequent, and very often unpredictable. If a company could know what was coming ahead it would have planned its optimal moves and the impact of the environment would be directly related to the company's level of proficiency.

According to Pomerleano and Shaw (2005), ~~-~~addressing [corporate restructuring] problem requires the complementary efforts of policymakers, regulators, lawyers, insolvency experts, corporate restructuring specialists, and financiers" (p. 436). Pomerleano and Shaw are making that statement in relation to severe corporate crisis. It is an utmost complex and painful process. Up until that point, a company should act on the very first signs of decline and take necessary actions in operational restructuring towards achieving overall business improvement and avoiding the distress scenario. Since redesigning business processes implies strategic actions, which ~~-~~require consistency between the company's business strategy and vision" which further ~~-~~require understanding the company's strengths and weaknesses, and the market structure and opportunities", it indirectly provides grounds for well driven and detailed analysis and insight into the existing conditions (Attaran, 2004, p. 7). Process based restructuring helps in identifying critical business activities, providing flexible distribution of accountability and responsibility, thus affecting organizational performance.

Burchell (2011) adduces that Information Technology (IT) is involved in any major organizational change; be it a major business process re-engineering project or a merger or acquisition, in order to consolidate the system(s), current IT infrastructure must be evaluated (p. 20). It gives insight into current portions of work. ~~-~~In this case, because many major change initiatives can occur in stages, the IT portion of the merger may be treated as its own IT change project occurring after the physical merger has been completed" (p. 20).

Standardization, in general, helps to ease existing disturbance present in different segments of the company dealing with the same set of data or activities. While improving quality and predictability of business deliverables, it also reduces cost and boosts efficiency. It further helps defining a unique routine when it comes to evaluating cross-organizational portions of business, thus providing means for defining and generating appropriate indicators which will be used for analysis and decision making when it comes to building the operational restructuring strategy.

While standardization helps setting relevant and uniform base for work, pursuing thoughtful process management will improve optimization, collaboration and harmonize overall efforts. According to Becker et al

(2013), unstructured processes are difficult to be adopted due to the fact that there is no control of the side effects, further stating that ~~c~~learly structured processes show interdependencies with other processes and can therefore be changed in partial sections without losing the overall context" (p. 7).

As Attaran (2004) suggests, the most effective enabling technology for Businesses Process Reengineering (BPR) is Information Technology, which is present through the phases ~~b~~before the process is designed, while the process design is underway, and after the design is complete" (p. 7), helping in meeting the objectives of reengineering in three ways: ~~B~~By providing information across functional levels and establishing easy communication, improving the process performance and finally by helping the reengineering effort by modeling, optimizing and assessing its consequences." (p. 21).

The usefulness of Document Management System (DMS) in companies is multifaceted. This paper will address how DMS could help in analysis and valuation process aiming at finding the optimal operational restructuring strategy, as well as support its implementation. It also gives a brief overview of some restructuring approaches in recent practice, and further discusses the importance of flexibility of the system needed for addressing the issue with respected company's specifics. The aim of the paper is to provide an overview of key DMS aspects and how they influence restructuring process.

Assumptions on which this discussion is based on are that DMS is being implemented according to results of a well driven analysis, thus structured and customized in a way that it reflects the true state of the needs and the work at the company. Furthermore, the term of DMS concept is used in its general and most comprehensive form; the term corporate restructuring is mainly referring to organizational restructuring as a strategy to respond to both decline and new opportunities.

2. A COMPREHENSIVE DMS CONCEPT

The term and functionality of DMS is inconsistent both in literature and in practice. As stated in ISO/TR 22957:2009, ~~T~~erms and acronyms associated with various aspects of EDMS technologies commonly change over time, as technology developers and vendors update product lines and solutions to address customer requirements." Due to that fact, the concept of DMS has evolved and judging by certain customized implementations can be said to have most of the functionalities commonly related to Content Management Systems (CMS), Electronic Records Management Systems (ERMS), Business Process Management (BPM) and Enterprise Report Management (ERM).

Each of the various segments of such comprehensively defined DMS supply the company, in different proportions albeit jointly, with an expedient manner for defining, changing, controlling and improving the overall performance of the company.

3. TAKING A LOOK AT THE FIELD OF PRACTICE

In practice, companies have been orchestrating and pulling off some major restructuring plans. With big corporations in question, they have almost by the rule been oriented towards both operational and financial restructuring.

Some of most recent examples include Advanced Micro Devices, Inc. (AMD), an American multinational company, which has in the third quarter of 2015 implemented a restructuring plan with focus on simplifying the business and aligning resources. Some of the action steps included a workforce reduction of approximately 5% and outsourcing certain IT services and application development. While taking their actions they were, at the same time, aware of the fact that restructuring actions could have an impact on decreases in employee morale and possibility of failing to meet operational targets due to the loss of employees (AMD Annual Report 2015, 2016, p. 22). However, while being aware of the risks, along with realized ~~o~~operational savings, primarily in operating expenses, of approximately $8 million in 2015", they ~~e~~xpect the 2015 Restructuring Plan to result in operational savings, primarily in operating expenses, of approximately $48 million in 2016" (AMD Annual Report 2015, 2016, p. 42). [Note: forward looking statement.]

Another example is Samsung, a South Korean multinational conglomerate company, which along with its annual reorganization (Samsung Press Release, 2015), has decreased its workforce and cut down research and development investment. The most recent restructuring plan that significantly reduces the number of employees belongs to Intel Corporation, an American multinational company, reducing global workforce by up to 12,000 jobs, which is approximately 11 percent of employees (Intel Corporation News Release, 2016). The restructuring initiative aims ~~t~~o accelerate its evolution from a PC company to one

that powers the cloud and billions of smart, connected computing devices." Aside from improving efficiency, Intel plans to increase investments in the products and technologies.

On the other hand, a Japanese conglomerate company Sony, striving to reinforce competitiveness and enhance effectiveness and efficiency, is undergoing splitting out of business as well as realigning their platform functions that support each of its business units (Sony Corporation Press Release, 2016). In conjunction with this structural realignment, where the responsibilities are transferred from Sony Group to its affiliates, additional changes are to be made to Sony's executive assignments ~~-in~~ order to further clarify lines of responsibility and assignments within each business and the headquarters organization" (Sony Corporation Press Release, 2016). The number of ranks in the organization is cut from eight to six, thus fostering better communication with upper management.

One of the most magnificent examples, if not the most magnificent one, is the corporate restructuring that has taken place at the Renault-Nissan Alliance. Resulting in best performance makes it a finest example of sustainable entrepreneurship in practice, in the related industry. As stated in Hughes et al (2003) case study, back in the 90's, Nissan's problems were summed by having too many plants, too many car platforms, too many suppliers and too many dealers in Japan (p. 2).

Today, the Renault-Nissan Alliance is boosting efficiency and revenue by strengthening synergies in four core divisions and launching new convergence projects, where ~~—c~~nvergence includes integrating divisions, creating common processes, exchanging talent and other significant sharing of resources", also stating that ~~-c~~onvergence helped Renault and Nissan generate more than €4 billion in annualized synergies in calendar year 2015" (Renault-Nissan Alliance Press Release, 2016). As an example of a company not being in crisis nowadays but rather following an evident need for keeping pace with the changing environment, their restructuring is a remarkable state-of-art in taking a proactive approach in accordance with the fact that ~~-g~~lobalization is happening; no matter you want it or not, if you think there's a risk or not, you need to play by it" (Ghosn, 2016).

In other practices, some companies are experimenting with different approaches, be them referred to as reorganization, restructuring or different.

An American company Amazon.com, Inc. (Amazon) decided to have three CEO's – CEO of the entire company, CEO of Worldwide Consumer and CEO of Amazon Web Services, ~~-n~~ot as a reorganization but rather a recognition of the roles they've played for a while" (Amazon.com, Inc. Press Release, 2016). Another American company, Google Inc, created a parent company, actually restructured to a new holding company Alphabet Inc. with Google being its largest subsidiary (Alphabet Inc. Certificate of incorporation, 2015).

Lin et al (2006) point out that ~~-r~~estructuring plans take many forms, such exiting a line of business, closing or relocating a facility; though can be a broad company-wide reorganization that impinges upon nature and focus of operations.", following with emphasizing that ~~-d~~difficult decisions must be made" that ~~-c~~an affect business strategies, operations, organizational functions and existing management structures" (p. 655).

4. HOW CAN DMS ASSIST

Holmstrom (1999) observes, discussing operational restructuring of more than half of all Fortune 500 firms that has taken place in 80's and 90's in the US, that they have had a focus on their core competencies (p. 408-409). Those concurrently reflect both internal and external triggered issues, i.e. the ones coming from over stuffing or under stuffing, inconsistent and inefficient communication, outdated technology or work procedures, inadequate performance indicators, loosely defined accountability for outputs, poor management, as well as lack of compliance regarding existing market needs, underdeveloped and unaffordable outputs, poorly managed partners' and suppliers' relationships, and others. DMS could assist in identify roots of company decline, and visualize some of the actions to be taken towards regaining its strength.

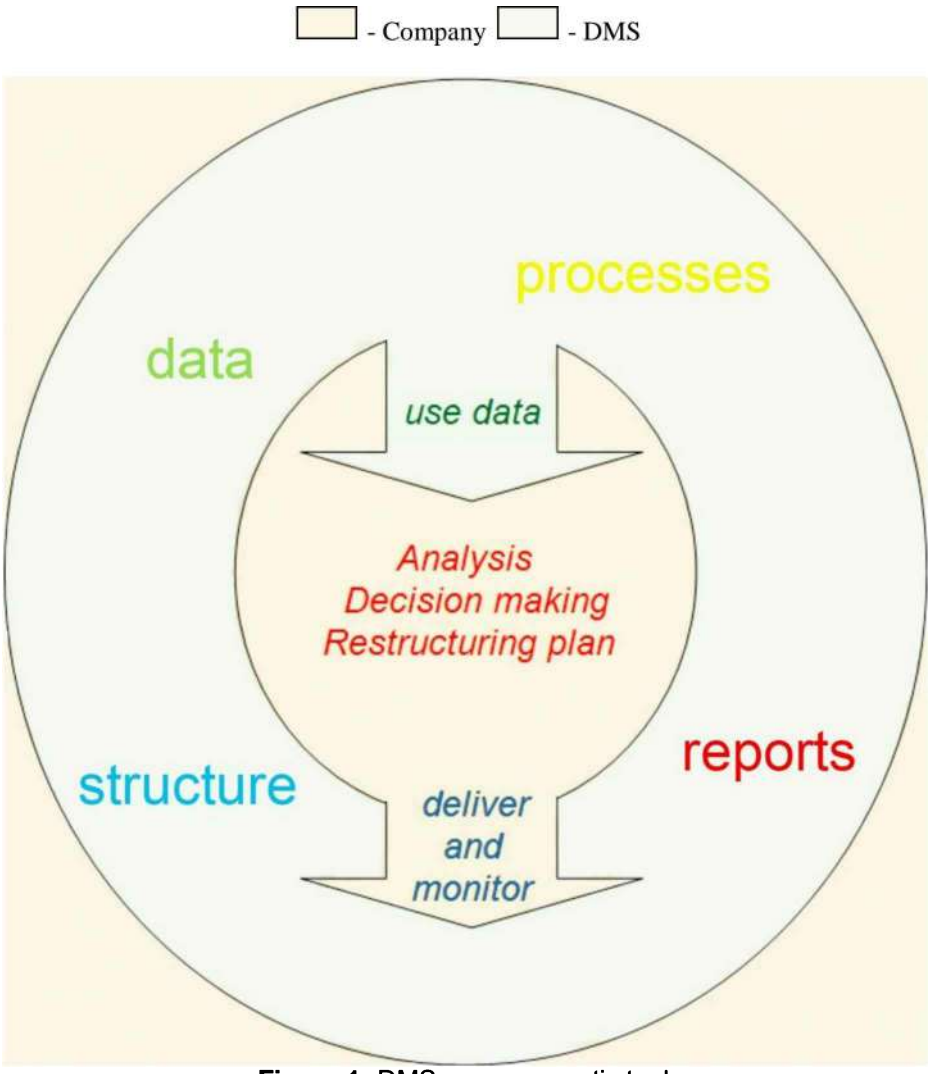

Figure 1: DMS as a pragmatic tool

4.1 The importance of analysis and valuation

It is a great challenge when it comes to valuing declining companies. According to Ruiz (2014), regarding traditional valuation methods in companies in decline and distress, their applicability is limited due to the fact that the fundamental assumptions of these methods are violated by the characteristics of these companies, consequently leading practitioners to incorporate new approach —based primarily on personal assessments to value distressed securities" (p. 6). The use of personal judgment and new paradigms instead of the traditional theoretical approach resulted in high variation in the estimates (Damodaran, 2009).

For a company, in order to define guidelines for future actions, it is necessary to find an adequate series of methods for capturing possible causes of underperformance as well as to conduct a valuation of the company, and finally architect a restructuring plan. There are no universal methods that would deliver a finest precision in all scenarios of underperforming companies. Practitioners are guided by traditional methods supporting them with personal approach addressing each individual company in accordance with its specifics.

If a company is facing a decline, it should be put through the analysis to find the possible reasons for it. The company's performance is to be evaluated and it is to be estimated whether the decline is reversible or not, and hence the relevant issues should be addressed. One of the assisting tools for that kind of analysis is DMS which supplements managerial efforts in identifying key business areas which are underperforming and consequently listed for cut-off, as well as those prosperous enough but needing adjustments in order to provide expected level of performance. It enables a company to spot emerging sections of work and to accelerate decision making process.

4.2 Tracking the cause

After having in depth analysis and evaluation, it is of great importance to the analysts to track the cause for the decline in performance. It is one of the prerequisites in regaining the stability and achieving velocity, and eventually ultimately accomplishing a firm management of change in velocity. It is not only about gaining the speed, the direction matters as much, if not more. While evaluating various elements in search for possible causes for the corporate decline, analysts will determine a range of those that are to be tracked within the business and work processes, as well as those related to the environment, such as strengthening of a competitor or shift in consumer preference. Each of the factors related to the environment should be reviewed and a judgment should be made on the persistence of designated changes. With a clear vision of the framework that the company was to work within, the fields and scope of the flexibility that it was to deliver, a list of actions is to be presented which will make grounds for restructuring plan.

Performance evaluation is lead by taking a closer look at the outputs of the business processes. A detailed analysis of relevant outputs throughout a certain period is taken into account along with relevant conditions that influenced and accompanied them. What gives an extra perspective is analyzing those processes in depth, with their corresponding activities and the employees conducting them, which can be retrieved from DMS data. Such analysis would result in possible work spots that underperformed, leading to a set of required actions based on that finding. Another perspective that could be looked from is cross engaging relevant responding managers who were business process owners at the time of each of the periods analyzed. All of these analytical actions based on the information that could be found in DMS could result in a conclusion that the company decline is a reversible one while pointing out the specific causes and issues requiring adjustments.

4.3 Communication and collaboration

By its definition and one of the key functionalities, DMS helps in relaxing congested communication channels, implementing clearly attributable and transparent communication, and finally setting clearly attributable accountability and responsibility.

The core values of the processes are imposed through its structure and algorithm, boosting efficiency by optimal collaboration practices. DMS also assists in introducing new business processes added as a result of restructuring, in a smooth way. It further helps managing diversity of business processes setting the ground for it in the main DMS structure, allowing adjustments that would affect all or some processes previously implemented.

Guided by the nature and the extent of projected business processes, it eases delivering an adequate training for existing or new employees. It is by far much easier to develop and realize a successful training with known and acceptance-proved tailored methods, previously defined and performed for earlier similar processes.

4.4 The importance of clear and reliable information

As Peter F. Drucker observed in his famous quote: „Whenever you see a successful business, someone once made a courageous decision". It takes clear, reliable and accurate information to make such kind of decision. Finally, it takes well captured and flexibly implemented IT infrastructure to successfully deliver it.

Quality of the information is primarily based on the quality of the data within DMS. However, having an accurate and relevant set of data is not enough, it has to be classified and categorized in a useful manner. Furthermore, it is important to have the information presented in a useful form.

Quality of data within DMS is imposed by various aspects of implementation of the system. Predefined input formats are set whenever possible, mandatory entry rules defined at all levels of processes, data set available for input or edit only to the desired work spots or employees, necessary logical entry or forward/pass item checks are implemented throughout the system, and others. There are numerous implementation instruments insuring best quality of data possible.

With the quality being assured, information is put in a series of synthetic forms, supplying decision makers with a spectrum of needed views.

4.5 Reporting and decision making

Having daily reliable reports allows the company to be able to exercise better control over monitoring and decision making in face of the volume of both the employee and the process diversity.

Aside from various predefined reports, custom-made ones are designed to address a specific business need. Furthermore, the whole set of information can be additionally empowered by integrating DMS data with other available system.

After perceiving all business processes, it is to be decided which ones will be discontinued, which are to be intensified, which are to be modified, what new processes are to be introduced. It is very common for a corporate restructuring plan to involve a significant headcount cut. Based on the results of the analysis it is crucial to make reasonable projections concerning optimal employee selection, both in number and reliable required knowledge and skills.

It is of great importance for decision makers to find the optimal set of operational restructuring actions as not to unsettle current business. What triggers the distortion of business processes does not necessarily have to be the volume of operational restructuring actions but rather their incompatibility and unbalanced range. Thus a cyclic and continuous observance of different aspects of business using different relevant reports is necessary, this making DMS a pragmatic business tool.

Deploying in accordance with previous discussion enables company to develop better performance management system, adequately accessing lagging indicators thus assessing important key factors and developing new leading indicators.

5. CONCLUSION

DMS can assist a company in a major part of restructuring process, from detecting a need for a radical change, conducting the analysis and tracking the critical issues, providing information needed for decision making and designing a restructuring plan, providing a business IT infrastructure in which to implement the changes while having employees work within the known system, providing grounds for designing and generating suitable reports which will enable continuous monitor over the realization of the process.

Back in 1877, Leo Tolstoy observed that ~~h~~happy families are all alike; each unhappy family is unhappy in its own way". That applies to companies as well which is why each company needs to have its own tailor made approach when it comes to restructuring. There is no unique kind of approach that would suit every possible scenario, not even within a single company let alone having a global market in mind. By using DMS, a company achieves a great level of flexibility in redesigning business process structure, as well as in strong communication and collaboration capabilities throughout the restructuring process.

Moreover, while supporting the implementation of operational restructuring it is providing means for designing a sustainable concept of continuous improvement. No matter how grand and well conducted the change is, their effects are not everlasting and the company remains sensitive to environmental changes, thus a continuous improvement is forced upon.

MODEL FOR RESTRUCTURING PUBLIC PROCUREMENT SYSTEM IN SERBIA

Ivan Todorović*[1], Stefan Komazec[1], Ondrej Jaško[1]
[1]Faculty of Organizational Sciences, University of Belgrade
*Corresponding author, e-mail: ivan.todorovic@fon.bg.ac.rs

Abstract: *Models for organizing public procurement systems tend to find the compromise between the efficiency and the control of budgetary funds utilization. Centralization of public procurements at local level can provide significant benefits for local self-governments. It is present at certain form in almost all EU countries. However, users of local budgetary funds in Serbia perform completely independently, which causes irrational behavior and financial losses. Belgrade is the only local self-government where the body for centralized procurements was formed. This paper provides the model for restructuring public procurement system in Serbia by introducing centralization of public procurement at local level, considering the existing organizational models of local administrations and their current capacities.*

Keywords*: public procurement, restructuring, centralization, local self-government, public administration, organizational structure, body for centralized procurement*

1. INTRODUCTION

One aspect in the centralization of public administration is the centralization of public procurements (Brezovnik & Oplotnik, 2015). It considers the introduction of the Central Purchasing Body at the level of local self-government. Such entity either acquires works, goods and services for the needs of one or more purchasers from the public sector, or concludes the contracts for the works, goods and services for the needs of one or more purchasers from the public sector, or concludes the framework agreements for works, goods and services for the needs of one or more purchasers from the public sector (European Union No. 2004/18/EC). Besides this, Central Purchasing Body should also have advisory and control functions. Public procurements have a very major impact on public finance and the budgets of local self-governments (Jansen, 2012). Their centralization can provide significant benefits, especially in terms of financial savings, due to economy of scale, and increased control, because of decreased number of individual procurements. However, it is important to find the ballance between the efficiency and control (Pegnato, 2003), since the centralization at local level complicates the procurement process and carries certain risks (Dimitri, Piga & Spagnolo, 2006; Albano & Spar, 2010). The purpose of this paper is to determine the capacities of local self-governments for performing the functions of the body for centralized procurements and to propose the model for centralizing public procurements at local level in Serbia, which is applicable considering existing organizational models and current process flow.

At present, in Serbia there are more than 12,000 purchasers obliged to apply the Law on Public Procurements (2015). According to the Standing Conference of Towns and Municipalities (SCTM) data they are territorially arranged in 168 local self-government units (excluding Kosovo) or 197 local self-governments including Kosovo (Mapping municipalities, SCTM). The largest number of purchasers conduct public procurement procedures independently. The city of Belgrade is the only local self-government in Serbia which formed the body for centralized procurements. The service for the centralized public procurements and control of procurements is an independent and autonomous organizational unit and for its work reports directly to the mayor (Official Gazette of the City of Belgrade, 2014). This raises the question of their ability to appropriately and at the best conditions procure the necessary goods and services. This is primarily related to personnel, organizational and technical capacities of the local self-governments to implement public procurement procedures in full compliance with the Law on Public Procurements (2015), and in accordance with EU directives (Arrowsmith, 2009). Findings related to these issues will be presented in paragraph three, after the methodology description in second part. Fourth section will provide the proposal of the model for centralizing public procurements at local level in Serbia, while final chapter will point out the conclusions and directions for further research.

2. METHODOLOGY

The findings presented in this article were generated during the United Nations Development Programme (UNDP) project performed by the authors during the year 2015. Analysis of EU directives and relevant literature provided the theoretical background and framework for the proposed centralization model. The capacities of local self-governments in Serbia for performing the functions of the body for centralized procurements were determined using the questionnaire that was created for this purpose, while certain conclusions were extracted from the interviews with the representatives of SCTM and Public Procurement Office. Proposed model was based on research results and authors' previous expertise in the field of organizational design and restructuring.

3. CAPACITIES OF LOCAL SELF-GOVERNMENTS IN SERBIA FOR PERFORMING THE FUNCTIONS OF THE CENTRAL BODY

3.1. Human resource capacities

The results showed that personnel capacities represent one of the main problems in local self-governments for the implementation of the Law on Public Procurements (2015). As without adequate personnel capacities, it is impossible to ensure transparent and efficient public procurements (Sakane, 2009), a special attention should be given to this issue. Based on the conducted research, it is possible to draw certain conclusions about the human capacities of the local self-governments in the area of public procurements.

Unlike the results of similar research conducted immediately after the introduction of the new Law on Public Procurements in 2012, which was organized by the Standing Conference of Towns and Municipalities (SCTM), where one of the main identified problems was the lack of public procurement officers (Komazec, Todorović, Krivokapić & Jaško, 2013), the situation in this segment is significantly better today. Current situation regarding the number of certified officers for the public procurements in the analyzed municipalities has drastically improved. Although there are still cases of municipalities where certified procurement officers are working on the jobs have no even indirect connection with public procurements, such examples are rare, and in all those municipalities more than 50% of employees on public procurement jobs have the status of certified officers for public procurements, while in some local self-governments that percentage exceeds 80%. This fact demonstrates the strengthening of the capacities of local self-governments for planning and implementing public procurement procedures.

At the same time, a part of this research was related to the workload of employees engaged on public procurement jobs. Data on the number of public procurement procedures and contract values were analyzed for the previous three years, in order to determine the trend and eliminate any variation in the number or value and determine realistic, expected number of procedures on the level of one year. Since such variations were not determined, number of procedures and contract values referred to the year 2015 were used for the analysis. Differences in the workload of employees on public procurement jobs per various local self-governments, expressed in a number of procedures that they carry out during a year, are very visible, so the number of procedures per employee varies from 6 to 26, which indicates the overload of employees in some municipalities, or underutilized human capacities in others. Also, it is important to emphasize that in almost 100% of cases the type of procedure was either the open procedure or the procedure for the public procurement of small value, which indicates that the opinions of employees that they are able to conduct all types of procedures should be accepted with the reserve.

Another parameter that needs to be considered in terms of workload is the total contract value per employee on public procurement jobs. In 2015 it was ranged from 13,843,054 RSD (around 115,000 €) to 89,081,492 RSD (around 740,000 €). By comparing this data, the differences in the public procurement structures can easily be spotted. Namely, it is evident that in the local self-governments where there is relatively similar workload of employees in term of number of procedures, drastic differences in the value of public procurements per employee can be identified, which can lead to the conclusion that some of the local self-governments are better prepared for the public procurements centralization, having in mind that the employees on public procurement in those municipalities implement the procedures of higher values.

By observing the future public procurements centralization, control of public procurements was identified as a critical part of the public procurement process, in term of personnel capacities for conducting it properly. The subject of the analysis was the control of local self-governments regarding the implementation of public procurements in the institutions that are budget beneficiaries within the territory of local self-government. While in some local self-governments certain scope of control is done, in most of them such control is not

performed at all. However, the problem increases when we look at the answers on the question: "Do you think that you have personnel and technical capacities for the implementation of the public procurements CONTROL on the territory of your local self-government? Why?" More than 80% of the municipalities responded that they do not have personnel capacities for the proper implementation of control activities. Even in some of the municipalities where the control is carried out, above mentioned problem with personnel capacities refers to the fact that such control is performed by the employees who have no experience in the public procurement realization. Based on these observations, it is clear that during the public procurements centralization special attention must be paid to the development of control function. The development of the body for centralized procurements should include a gradual increase of the control function, especially in term of control objects and phases of a process that are controlled.

Finally, we also examined the situation in local self-governments related to education and advisory. First of all, it was necessary to study the existing need for education and advisory at the local level, and later the current situation in that area. On the question "How often do the budget users address with the requirements related to the public procurements (opinions, advices etc.)?" employees from 3 of 5 analyzed local self-governments responded with "very often", which confirms a clear need for constant advisory to budget users in the field of public procurements, or the necessity to develop the advisory function in the body for central procurements at local level. It can be assumed that the need for the education of budget users is also present, in order to decrease advisory requests over time. At the same time, despite the continual need for advisory, in only two municipalities were organized trainings from the field of public procurements for budget beneficiaries (by local self-government employees), and only twice in past three years. Local self-governments must find a way to provide education and advisory to employees on public procurement jobs at public sector entities which are based on their territory, since they are not often able to attend seminars from this field. In daily work they do not meet new challenges, but perform mostly routine procedures, which are repeated from year to year. For this reason they do not have the opportunity to develop themselves within the workplace.

Based on the foregoing, it is clear that in case of public procurements centralization local self-governments are currently best qualified for the function of planning and implementing the procedures, and the level of this function can be satisfactory from the very beginning of the centralization process. On the other hand, the further institutional development of the body for central procurements at the level of local self-government should be followed by the appropriate development of advisory and in particular of control function, which requires hiring additional employees and development of existing ones through specialized training.

3.2. Organizational capacities

Since public procurements, of all the activities carried out by public entities, are the most vulnerable to corruption (European Parliament - Directorate General for Research, 1998), a special attention should be paid to the control of planning, implementation and realization of public procurement procedures. The EU directives related to the public procurements contribute to the fight against corruption through two sets of measures. First, through its very nature, or through a legal framework, and second, specifically through promoting fairness among the entities that appear in a public procurement process (Bovis, 2006).

Based on research results, it is evident that only in Belgrade and Kragujevac can be identified separate organizational units for the control of planning, implementation and realization of public procurements. However, in the municipalities where there are no such organizational units, neither the employees who are assigned on these activities exclusively cannot be identified, although in larger municipalities number of employees on public procurement jobs leaves the possibility for introducing such position. The largest problem related to the jurisdiction over the control of planning, implementation and realization of public procurement procedures, in general, appears in smaller municipalities where there is no separate organizational unit for public procurements. In such municipalities it is not clearly defined who is responsible for the control, or in other words, which employees among the other tasks controls the planning, implementation and realization of public procurements. In larger local self-governments, head of the organizational unit for public procurements carries out the control activities. Due to extremely high level and extent of corruption in the Republic of Serbia, comparing to the EU member states (Transparency International, 2012), and because of the highlighted importance of the fight against corruption in the EU directives, local self-governments in Serbia should pay particular attention to the public procurements control and find adequate organizational solutions for solving identified problems in this field. They should strive for the separation of planning and implementation from the control of public procurement procedures, in several ways. Smaller municipalities, where the scope and number of public procurements does not allow organizational separation and the establishment of an independent organizational unit only for control of planning, implementation and realization of public procurements, should form a special position with

responsibilities related exclusively to the control. Regardless the model of public procurement centralization, with or without the establishment of the central body for procurements at the local level, this principle of separating organizational units or workplaces for control activities should be applied.

Within the organizational capacities, special attention should be paid to the proven capacities of certain municipalities to implement integrated public procurements, which are substantively similar to the future centralized procurements. Namely, in the last two years a unified public procurement for energy products, insurance and school furniture for elementary and secondary schools was implemented in Niš, while a unified public procurement for mobile services was implemented in Zrenjanin in 2015.

3.3. Technical capacities

In the EU regulations there are several directives which generally promote electronic procurements (e-trade) (Pearce & Platten, 2000). The European Commission in 2004 published an action plan for the implementation of electronic procurements, which is accompanied by the document that explains the rules of the e-procurement implementation (Commission of the European Communities, 2005). One of the most important segments of the framework for public procurements in the EU is related to the conducting of electronic auctions, which is covered by the Articles 1(7) and 54 of the Directive 2004/18/EZ (Arrowsmith, 2005). However, the results of earlier research showed that in most municipalities, regardless of size and level of development, there are no adequate technical capacities for the implementation of electronic auctions, neither for the implementation of other activities in domain of electronic procurement (Komazec, Todorović, Krivokapić & Jaško, 2013). On the other hand, all local self-governments are expected to significantly improve their technical capacities for implementation of all procedures provided by the Law on Public Procurements (2015), since the need for them will certainly be increasing as the Republic of Serbia gets closer to the EU. Centralization of certain activities in the field of public procurements at the local level emerges as a potential solution to this problem, since current situation suggests that smaller local self-governments for some time will not possess the technical capacities to independently conduct electronic procurements, so they will not have the ability to provide them independently.

Improvement of technical capacities can positively influence the expansion of personnel capacities of local self-governments in the field of public procurements. Implementation of software solutions for conducting public procurements can significantly reduce the participation of labor work in these activities.

4. MODEL FOR PUBLIC PROCUREMENTS CENTRALIZATION IN SERBIA

As mentioned previously, Belgrade is the only example of public procurements centralization at local level in Serbia. In many municipalities conducted situational analysis has identified significant space for personnel, organizational and technical capacity improvement in this area. Considering the expected effects of public procurement centralization and examples of good practice, such problems can be overcome by centralizing public procurements through the introduction of centralized procurement bodies at the local level. The body for the centralized public procurements should perform following functions:

1) Planning, implementation of procedures and realization of contracts,
2) Controlling public procurements,
3) Providing advisory services to purchasers.

Newly formed bodies for the central public procurements should act as mediators between the purchasers covered by centralization and suppliers, or to conclude framework agreements. Centralization of public procurements in Serbia should be conducted through the steps shown on the following figure.

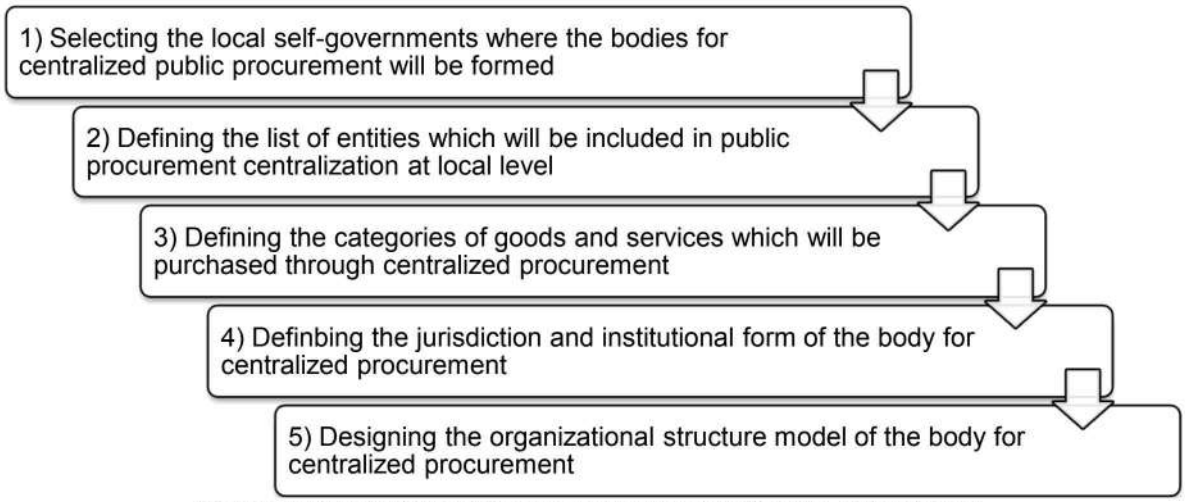

Figure 1: Model for public procurement centralization at local level

4.1. Selection of the local self-governments where the body for centralized procurement will be formed

As a first step there is a selection of the local self-government units in which centralization will be implemented. Criteria to be considered are: size of the local self-government, in terms of surface area of the territory, size of the budget and the number of budget beneficiaries. Based on situational analysis and interviews with the representatives of SCTM and Public Procurement Office, following 10 local self-governments should be included in the first phase of public procurement centralization in Serbia: Belgrade, Novi Sad, Niš, Kragujevac, Čačak, Kraljevo, Subotica, Zrenjanin, Užice and Pirot.

4.2. Defining the list of purchasers which will be included in the public procurement centralization at local level

Local self-government bodies should, by appropriate decision, define the list of the purchasers included in the centralized public procurements. Categories of institutions, enterprises and organizations that may be covered by such a decision are:

- City authorities (Assembly, Mayor, City government - organizational units etc.),
- Cultural institutions (theaters, museums, libraries, cultural centers etc.),
- Facilities for physical culture,
- Health care facilities (health centers, pharmacies, local institutes etc.),
- Child care institutions,
- Social welfare institutions,
- Public utility companies,
- Other companies and organizations founded by the local self-government.

List of entities which will be included in an annual plan of centralized public procurements is determined by numerous different factors, from which the most important are the number of institutions, companies and organizations in the local self-government territory, as well as the current capacities of local self-government to centralize public procurements.

4.3. Defining the categories of goods and services which will be purchased through centralized procurement

One of the basic decisions that should be adopted during the public procurements centralization is the subjects of centralized procurements. Based on years of experience in implementation of the central public procurements, and the best practice in this field in EU, it is possible to identify a list of products and services categories that are suitable for the public procurements centralization. With very few exceptions, by watching centralized procurements at all levels, the list of products and services is as follows (SIGMA/OECD, 2011):

- ICT products and services (computers, copiers, printers, servers, software, additional equipment),
- Products in telecommunication areas (networks, mobile phones, fixed phones),
- Office furniture,
- Travel services,

- Stationery (office supplies),
- Vehicles and transport services,
- Energy products (for heating and transportation, electricity),
- Food (groceries and meals),
- Employees' development services.

It is important to note that not all categories are equally suitable for the inclusion in the system of centralized public procurements at the same time of the centralization development at the local level. Enclosure of some categories (ICT – software, for example) can assume the existence of experience, primarily in conclusion of the framework agreements, possibly with multiple suppliers, and it cannot be the subject of centralized procurements from the very beginning of the centralization process. On the other hand, it is important to emphasize that, in terms of volume and contract value, the field of information and communication technologies is the most significant area of centralized public procurements in the EU states. Also, centralized procurements do not necessarily need to be limited to standardized and simple products and services. Central bodies for procurements in the EU have developed expertise for the centralized procurement of complex, advanced information systems, that takes into account the specificities of each order, that uses a technique of concluding a framework agreement with several suppliers, with a mini tender, which should enable subsequent necessary adjustments to the needs of purchasers (SIGMA / OECD, 2011). In addition, centralization of some of these categories may have limited effects at the local level (travel services, for example) due to probable small total value of such purchases. Therefore, the list should be seen as a framework for the initial selection of categories, or specific products and services that will be established by the certain regulation as objects of centralized procurements.

4.4. Defining the jurisdiction and institutional form of the body for centralized procurements at local level

As previously was mentioned, the body for centralized public procurements, in addition to planning, implementation and realization of procedures, also needs to control public procurements of all purchasers, as well as to provide advisory services and education to all users of budget resources at the local level. Accordingly, it is necessary to, at the highest level of abstraction, define the activities that this body performs, as well as its relations with other participants in the process of centralized procurements. For these purposes, the swim lane diagram presented on next figure was prepared, which shows the process flow through its core activities, and the participants who are responsible for carrying out each of them.

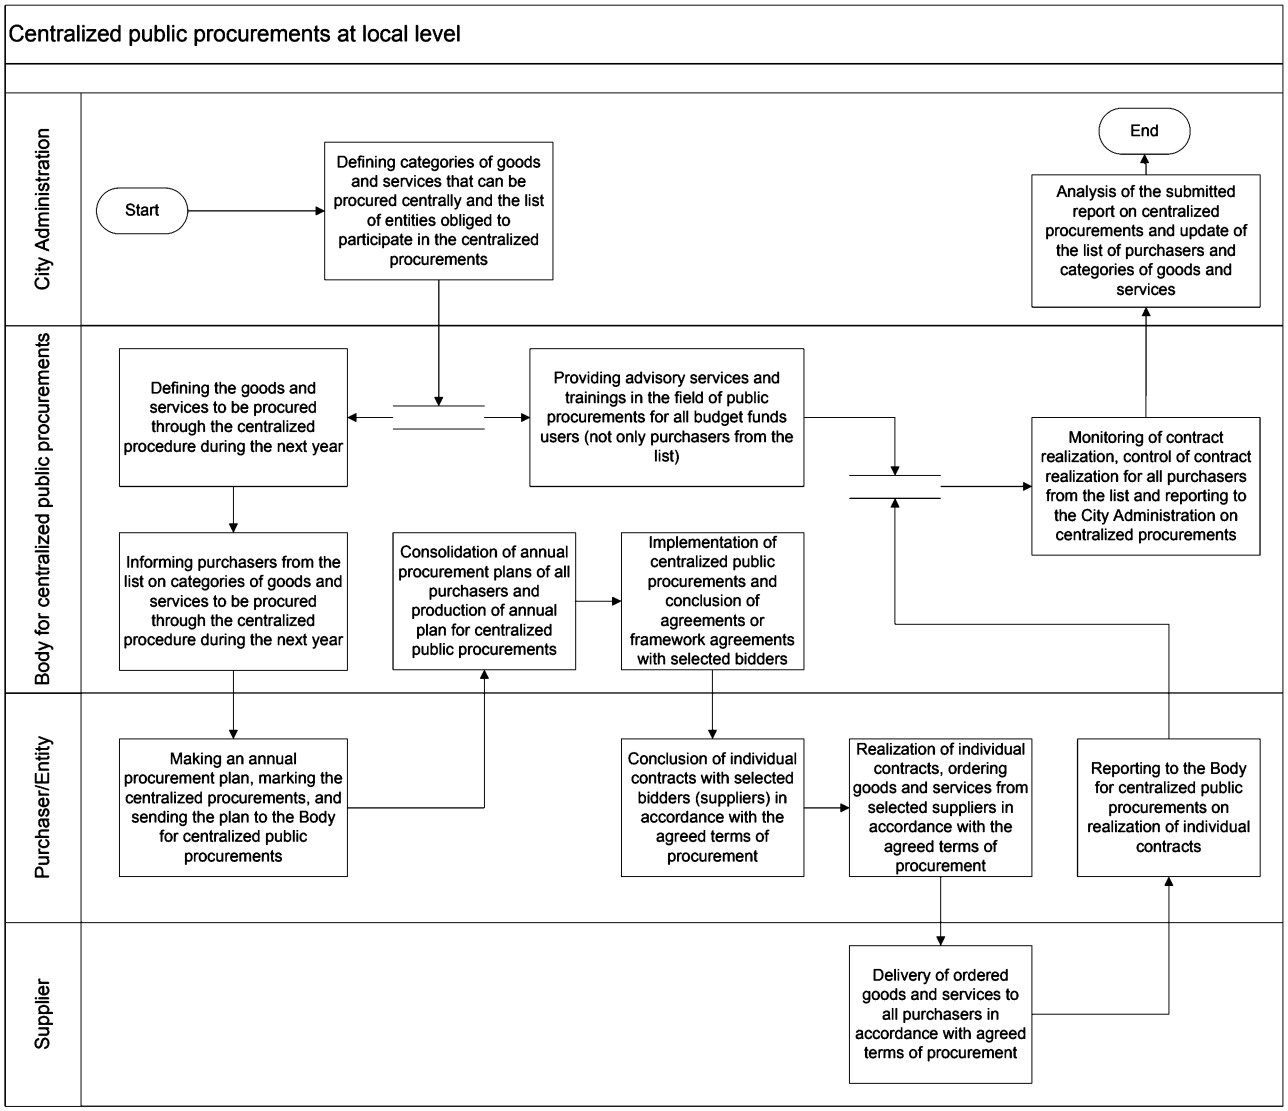

Figure 2: Process of centralized procurement at local level

The body for centralized procurements, at the beginning of each year, should make a plan of categories of goods and services which will be procured through centralized procedures in the coming year, to define the planned duration of the contract or framework agreement for each procedure, and in a timely manner notify all purchasers that are required to implement centralized procurements. Goods and services for which will be implemented centralized procurement must be included in the decision adopted by the city government, while the list of purchasers is also previously defined by the city authorities. Purchasers from the list, during the preparation of the annual procurement plan, should indicate the procedures relating to goods and services which are planned to be processed by the body for centralized procurement in the following year. After its adoption at organizational level, the procurement plan should be submitted to the body for centralized procurements. Through unification of the individual annual public procurement plans of all the purchasers from the list, the body for centralized procurements produces an annual plan for centralized procedures and defines the required attributes for each procedure, which will be implemented centrally.

After that, the body for centralized procurements implements centralized procedures for the relevant goods or services, according to the needs expressed by the purchasers in the annual procurement plan, and concludes the contracts or framework agreements with the best bidders. It is recommended that each procedure should lead to the conclusion of the framework agreement, especially in the initial phase of public procurements centralization, for the purpose of easier implementation and delegation of significant part of responsibility for realization to the purchasers. After completed procedure the purchasers who participated in it, conclude a joint contract with a selected bidder, or individual contracts if the framework agreement was concluded.

This is followed by the realization of contracts, during which each purchaser communicates directly to the supplier and orders the contracted amount, under the centrally conducted terms. Suppliers deliver the goods and services directly to the purchasers. During realization of the contract, all documentation is needed to be

prepared in two copies, as one could be delivered to the body for centralized procurements. Purchasers monitor the implementation of the agreement and submit a report on the implementation to the body for centralized procurements, together with the supporting documentation. The Body for centralized procurements monitors the implementation of contracts at the aggregate level, through the individual reports submitted by the purchasers. It is recommended that to perform various analyzes during this phase, in order to assess the effects of public procurements centralization and identify the savings. The body for centralized procurements simultaneously, through regular and ad-hoc revisions, controls the public procurement operations of purchasers, as well as of all other budget beneficiaries at the local level.

At the end of year, the body for centralized procurements reports to the city government on implemented centralized public procurement procedures. It also provides the results of conducted analyzes and the estimated savings. Based on this, the city government decides on any changes in the list of purchasers and categories of goods and services that must be procured centrally.

In parallel with the described activities, the body for centralized procurements consistently provides advisory services and education to all budgetary beneficiaries at the local level. They can be arranged at specific request of any purchaser, but also through organized seminars and trainings.

The body for centralized procurements should have the jurisdiction to conduct all required functions, which includes implementation, control and advisory. For this reason it is necessary to find a suitable organizational position in the city government for such entity, which on the other hand does not require significant structural changes that would slow down the implementation process at the very beginning. Taking into account the existing organizational structure of the city administration in mentioned cities, it is recommended that the body for centralized procurements, in the beginning, should be a specialized department within the organizational unit for public procurements. In further stages of public procurements centralization development at the local level, special attention should be paid to the institutional form and status of the body for centralized procurements.

4.5. Designing the organizational structure model of the body for centralized procurements

After defining the jurisdiction and the activities that an independent department for centralized procurements within the city service for public procurements should perform, it is necessary to define an appropriate model of organizational structure which will be applied to it. This includes the division of work and definition of typical workplaces within the department. Proposal of a typical organizational model of the department for centralized public procurements at the local level is shown on the following figure.

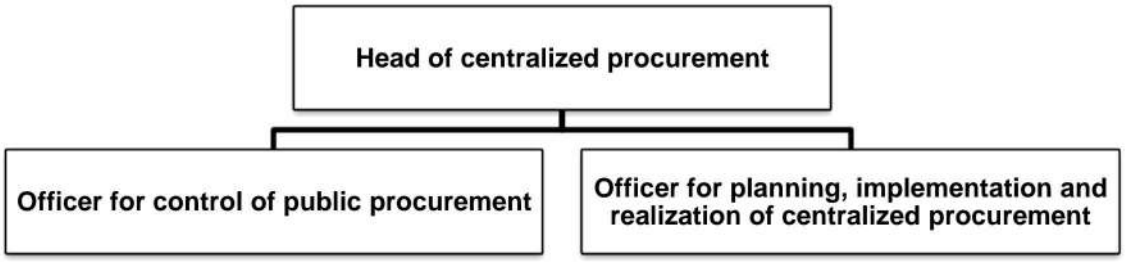

Figure 3: Organizational structure of the body for public procurements at local level

Number of employees on these workplaces should be adapted to the particular units of local self-government. It primarily depends on the municipality size, number of purchasers and number of procedures.

Head of centralized procurements is a typical workplace that should perform the following tasks:

- Governs the affairs of centralized public procurements at the municipality level,
- Annually proposes the categories of works, goods and services for which will be implemented centralized procedures,
- Proposes the annual plan of centralized public procurements at the municipality level,
- Appoints members of the commission for centralized public procurement procedures,
- Reports to the municipality administration representatives on implemented centralized procurements,
- Reports to the municipality administration representatives on the carried out controls of budget funds users in the area of public procurements.

Officer for control of public procurements is a typical workplace that should perform the following tasks:

- Controls the planning, implementation and realization of the centralized public procurement procedures,
- Plans and implements regular controls of all the municipality budget beneficiaries in the field of public procurements,

- Performs controls of the municipality budget beneficiaries in the field of public procurements,
- Provides advisory services to the municipality budget beneficiaries in the field of public procurements,
- Organizes and conducts trainings and education on public procurements for employees in the municipality budget beneficiaries.

Officer for planning, implementation and realization of centralized procurements is a typical workplace that should perform the following tasks:

- Collects annual procurement plans of the purchasers participating in the centralized procurements at the local level,
- Participates in preparation of the annual plan of centralized public procurements at the local level,
- Implements centralized procurement procedures in accordance with the approved annual plan of centralized public procurements,
- Monitors realization of the implemented centralized procurement procedures,
- Collects reports from purchasers on the implementation of individual contracts within the centrally contracted procurement procedures,
- Prepares reports on implemented centralized procurements,
- Provides advisory services to the municipality budget beneficiaries in the field of public procurements,
- Organizes and conducts trainings for employees on public procurements at the budget beneficiaries of local self-government.

5. CONCLUSION

Taking into account the examples of good practice regarding the public procurements organization at the local level, as well as the current situation in local self-governments in Serbia, public procurement centralization at the local level emerges as a logical improvement of the public procurements system in Serbia. The restructuring model presented in this paper is based on current personnel, organizational and technical capacities of local self-governments for performing functions of the body for public procurements, which makes it applicable. On the other hand, it incorporated the advantages of the public procurements centralization, while at the same time the potential risks were taken into account.

It is recommended to form the bodies for centralized procurements in selected cities in Serbia. They should play the intermediary role between the purchasers and the suppliers, and thus implement centralized procurement procedures for certain types of goods and services and for defined categories of budget beneficiaries at local level. In addition, the body should have an advisory function, and provide support in the field of public procurements to all budget beneficiaries on the territory of local self-government. Also, it needs to control non-centralized procurement procedures that budget beneficiaries conduct.

Described model should be seen only as a first stage in the public procurements centralization in Serbia. In later stages, bodies for centralized procurements should grow into the independent organizational units at the local level, which will create the basis for the formation of the regional centers for centralized public procurements and inclusion of a greater number of purchasers through joint procurements. Besides dealing with this issue, further research should also show the concrete benefits of the proposed public procurements centralization at the local level in Serbia, primarily in terms of actual economical savings and increased level of control.

PUBLIC PROCUREMENT CENTRALIZATION – FUNCTIONS OF THE CENTRAL BODY FOR PUBLIC PROCUREMENTS

Stefan Komazec*[1], Ivan Todorović[1], Miloš Jevtić[1]
[1]Faculty of Organizational Sciences, University of Belgrade
*Corresponding author, e-mail: komazec@fon.bg.ac.rs

Abstract: *In recent years, there have been major changes in the Republic of Serbia public procurement system. A new Public Procurement Law, which is completely in accordance with the legislation of the European Union in this field, was adopted in 2013. However, previous studies have shown that the contracting authorities do not use all the opportunities provided by the Law. The aim of this paper is to look at all the benefits and the risks of public procurement centralization at the local level, as one of the possibilities allowed by the Law. Also, the paper will propose functions and activities that should be done by the centralized procurement body, which represents a basis for later defining organizational models.*

Keywords: *public procurement, public procurement centralization, centralization model, central procurement body, functions of central procurement body*

1. INTRODUCTION

The issue of centralization of public procurement is a part of the wider issue of (de)centralization of the public administration, where, in the broadest sense, decentralization means any weakening of direct impact of a organized system centre to the parts of the same system (Brezovnik, Oplotnik, 2015). One of the main tasks of public administration organization is finding the balance between centralization and decentralization. However, unlike the other elements of public administration, flexibility in organizing public procurement process at various levels, or relatively simple ability to change the level of (de)centralization, keeps this area constantly in the focus of researchers. Centralization of public procurement at various levels, from local to national, is subject of constant reviews. In addition, organizational models which should support different degrees of centralization are also often in the focus of research.

On the other hand, despite the undoubted importance for the functioning of local government, public procurement is still characterized by ambivalences. Specifically, question whether the public procurement is the issue of regulations or a good governance is constantly raised among theorists and practitioners (Jovanović, 2015). The attitude that public procurement is a subject of regulation involves the focus on clearly defined procedures and rules for public procurement implementation. This approach to public procurement can easily limit the efficiency of processes, and achievement of the public procurement objectives. On the other hand, the attitude that public procurement is the subject of good governance presupposes that it is necessary to set up only a legal framework for implementation of the procedures within which it would be possible to achieve public procurement efficiency and effectiveness. However, not so strict rules for implementation of procedures, often lead to the occurrence of anomalies in the system, growing corruption, and the focus shifts towards regulation. When the system becomes too regulated and begins to "suffocate" efficiency, initiatives to reduce the regulation in this area are being re-implemented. It can be clearly seen the cyclicality in development of the public procurement system (Pegnato, 2003).

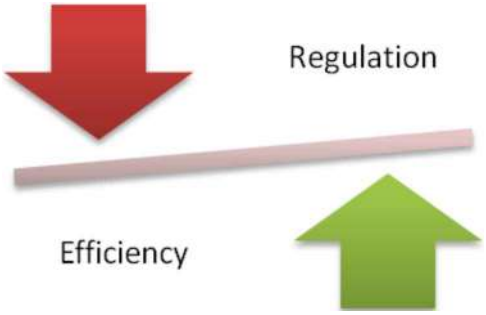

Figure 1: Strategic goals of public procurements

It can be said that there are two seemingly conflicting strategic objectives of public procurements, one is introduction of a higher degree of control, or regulation in area, while the other aims to attain efficiency and

effectiveness of procedures. However, by narrowly observing public procurements at the local level, it can be assumed that the centralization of public procurements at the local level can significantly contribute to the simultaneous fulfilment of both strategic objectives of public procurements, which will be described in detail bellow.

Special importance of public procurements at local level illustrates assessment that the share of public procurements in the local government budgets in Serbia, amounted an average 20-25% in 2011. It is obvious that public procurements have enormous significance in the management of public finances at the local level (Jansen, 2012). According to the Ministry of Finance and the Public Procurement Office data, the share of public procurements, which were undertaken by the city and municipal administrations in the value of local budgets amounted 7.2% in 2014 (Jovanović & Benković, 2012).

2. ADVANTAGES OF PUBLIC PROCUREMENT CENTRALIZATION

We will use the definition of the Central Purchasing Body - CPB from the Directive on the public sector of the European Union No. 2004/18/EC, in order to illustrate what the concept of centralized public procurements can relate on, regardless of the level of implemented centralization. The Central Purchasing Body is the authority which:

- Acquires goods and services for the needs of one or more purchasers (entities) from the public sector; or
- Concludes contracts for works, goods and services for the needs of one or more purchasers (entities) from the public sector; or
- Concludes framework agreements for works, goods and services for the needs of one or more purchasers (entities) from the public sector.

Benefits of the public procurements centralization are, in essence, common to all three forms of centralization, as will be explained below. In most cases, as the basic benefit of public procurements centralization at any level, reducing of the purchasing prices due the realization of economies of scale is emphasized. Enlargement of demand, by merging (joining) needs of more purchasers (entities), strengthens the negotiating power of a buyer, and creates the basis for achieving the lower prices of goods and services in public procurement procedures. Public procurements become more attractive to bidders, not only because of its size, but also because of the public sector nature and the payment security. On the other hand, on the supply side, certainty of large quantities sale creates the possibility for lower prices through reduction of the fixed costs share in total costs, but also through surely administrative costs reduction in contracting job, and possibly other costs in the process of product delivery (depending on the structure of delivery). All of the above circumstances, primarily on the supply side, are very clear when it comes to direct, centralized public procurement, in which the centralized body for public procurements directly buys goods or services from suppliers. In addition to direct price reductions, mentioned bargaining power may lead to better payment terms, price of the subsequent maintenance in terms of better organization of services, standardization of spare parts, specialization of repairers etc.

However, it is extremely important to pay particular attention on the framework agreements, as the most common output from the process of centralized public procurements. When concluding the framework agreement, the final quantity of goods or services to be delivered is not known, but possibly only an estimated amount. Automatically, it makes difficult for the bidders to assess their costs, and could become an obstacle to achieving the desired price reduction. On the other hand, the framework agreement will certainly lead to a greater number of smaller deliveries, which increases the bidders' costs and certainly reflects negatively on the economies of scale and the price reduction. Similar to the bidders, centralization of public procurements leads to cost reductions at the purchasers (entities). In any procedure, there are activities that must be carried out, starting from the eventual market research, to the conclusion of contracts in public procurement. Sometimes, the values of public procurements are so small that the question of cost effectiveness is being asked when compared to the value of acquisition and transaction costs, or expenses required to realize the process (Jovanović, 2015). Given that the public procurements centralization replaces more procedures with one, it is clear that it terminates repetition of the same activities at purchasers (entities) and reduces the transaction costs in the system. It is clear that the transaction costs of centralized procurement procedure will be greater than the costs of each procedure, but they will be less than the sum of costs of all replaced procedures. Reduction of transaction costs is primarily reflected in time release of certain employees for performing other activities. Conclusion of a framework agreement certainly brings higher transaction costs, especially if it comes to a framework agreement with several suppliers.

Establishment of the centralized procurement body, either at the national, or at the level of local government, leads to concentration of knowledge and skills in one place. The most experienced procurement officers should be employed in the body of that type, which opens up numerous opportunities for improving the

public procurement system. First of all, formation of this kind of expert centre will also enable implementation of the more complex types of procedures for purchasers for which such a type of procedure otherwise would be inaccessible due to lack of employees' knowledge. At the same time, concentrated knowledge in the expert center can easily be offered to purchasers, for implementation of procurements that are not centralized, whether through formal training or through the opening of a permanent communication channel. In addition, advisory services may also be required from purchasers who are not covered by centralization of public procurements at all, which strengthens capacity of the public procurement system.

In this regard, concentration of knowledge and skills in one body can overcome the lack of capacity of the individual purchasers for implementation of specific procedure types, or the specific public procurements. Many purchasers have a problem with implementation of procedures for goods, works or services that have been never purchased before. Another problem is the choice of an appropriate type of procedure, preparation of technical specifications etc.

In addition to experience and knowledge that the procurement officers "enter" into the body for centralized procurements at the local government level, the basis for use of these advantages creates formation of the **knowledge base** on public procurements. The knowledge base will be formed through work of the body, and will contain models of tender documentation, contracts, lists of suppliers, prices, product codebooks, technical specifications etc. Putting such a knowledge base available to all potential purchasers leads to the full utilization of public procurements centralization in terms of capacity improvement for the public procurements implementation at the local level.

Advantages arising from concentration of the best officers for public procurements and formation of the knowledge base will significantly reduce the risk that the public procurement procedure could be cancelled due to an error of employees. With regard that centralized procurements, as a rule, are implemented by the most qualified experts, the chances are greater that tender documentation will be better prepared in terms of quantification of quality criteria and other elements, and that the process will be well managed, unlike if it works each purchaser for itself (Jovanović, 2015).

Procurement subject standardization is often named as one of primary benefits that can be gained through public procurements centralization. Procurement subject standardization increases compatibility between institutions and opens possibilities for achieving better coordination and cooperation among the purchasers at the local level. It can be particularly important to emphasize standardization in the field of information systems. It is clear that the purchase of databases and other components of information systems from the same supplier facilitates the exchange of information and knowledge between the purchasers, but also facilitates control of purchasers by local government. On the other hand, standardization of procurement subjects among purchasers is one of the foundations for the later realization of economies of scale, where local government through the body for centralized procurements can eliminate unnecessary variations between the needs of purchasers.

Centralized procurements facilitate achievement of the public procurement policy objectives (SIGMA/OECD, 2011). The very nature of centralized public procurements, or a procedure that replaces procedures at more purchasers, represents an ideal basis for implementation of the public procurement policy, such as environmental, social responsible, etc.

The second strategic objective of the public procurements is to increase the control system, which is usually achieved through introduction of additional regulations in the system. However, centralization of public procurements at the local level in several ways contributes to improvement of the public procurement system control, without introduction of additional regulations and rules.

Centralization increases the transparency of procurements because several dozens of smaller purchases are replaced with a large one, which, due to its value and importance, attracts attention not only from suppliers, but often from the wider public (Jovanovic, 2015). In this regard, the relevant regulatory institutions much easier control a centralized procedure, instead of multiple processes at different purchasers, thereby significantly reducing the possibility of corruption and achieving the desired effect of introducing regulations. At the same time, capacity for control of individual public procurements at purchasers is being created in the expert centre, primarily in terms of knowledge, and possibly in terms of number of employees.

Centralization of public procurements contributes to reducing the risk of favouring pre-selected bidders. Customization of specifications and criteria in order to favour a particular bidder is usually based on local specificities in terms of delivery specifications, features etc. "Adjusting" specifications, criteria and requirements to the certain bidder is easily revealed on the centralized level than when the majority number of smaller purchases is being realized (Jovanović, 2015).

The following figure shows the positive impact of public procurements centralization at the local level for achievement of a strategic objective of public procurements – efficiency.

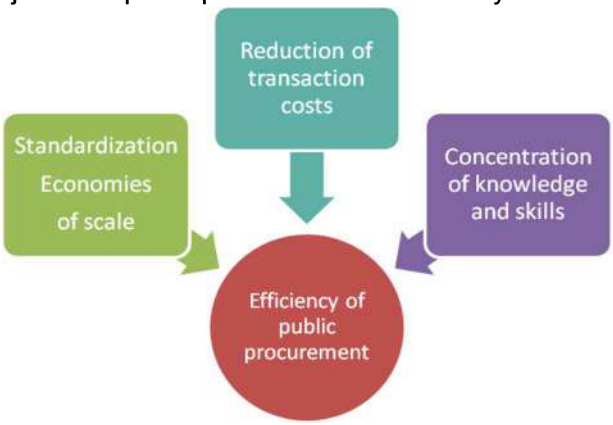

Figure 2: Public procurement centralization effects on public procurement efficiency

At the same time, public procurements centralization at the local level leads to increased control of public procurements, and to the fulfilment of the second strategic objective of public procurements - regulation.

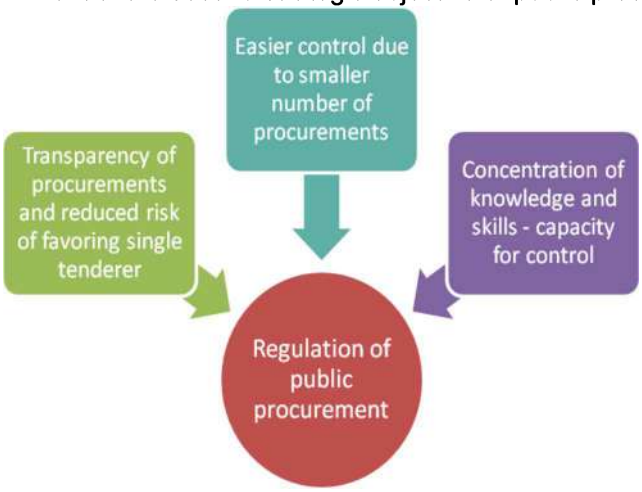

Figure 3: Public procurement centralization effects on public procurement regulation

3. RISKS OF PUBLIC PROCUREMENTS CENTRALIZATION

Public procurements centralization generally carries certain risks. However, the risks of centralization are directly linked to the level at the centralization is being carried, and the risks may be considerably smaller when it comes to the public procurements centralization at the local level.

3.1. Concentration of offers market

The main risks related to the public procurements centralization arise from the very essence of centralization and the basic advantages it offers, related to the integration of demand. There is certainly the risk that the higher purchased volumes will exclude a part of suppliers from competition, which could cause neutralization of opportunities for lower prices. Risk is particularly evident if only one bidder is able to meet mentioned needs, but even if it is not a single, but a small number of suppliers, there is always possibility of an agreement on the offered prices. In each of these situations, the bargaining power of suppliers is extremely high, which could be reflected on the other procurement conditions.

Generally, due to the mentioned characteristic of public procurements centralization, it can often be found the state that such a way of organizing public procurements, represents an insurmountable obstacle for small and medium-sized enterprises, because they cannot, primarily quantitative, respond to demand. More broadly, especially in the case of signing long-term contracts, this way of organizing public procurements can inflict some damage to the entire sector of small and medium-sized enterprises, because in addition to being unable to participate in large procurements, reduces the market of smaller purchases, on which they are

competitive . Consequently, this risk can get a certain political connotation, in terms of endangering an extremely important economic sector.

However, the smallest risks of this type occur during the public procurements centralization at the local level, because that is the lowest level of centralization within the public sector, and the value of procurement in most cases will not be a factor that limits competition. In addition, forward mentioned conclusion of the framework agreements can open the space for participation of small enterprises, provided they are price competitive, since the framework agreement does not involve one huge supply, but "withdrawal" of goods or services by the purchasers as required.

On the other hand, also in the case of complete public procurements decentralization there is no guarantee that the job will always get small or medium-sized enterprises, although statistical studies show that their chances in this case are higher (SIGMA/OECD, 2007).

3.2. Procurement of inadequate goods and services

Some risk is associated with the necessary standardization of goods and services in a procurement and possible inadequacy of the subject of procurement for all purchasers. Simply, during a centralized public procurements there is a risk that the specificities of the individual purchasers will not be fully taken into account. This type of risk is most pronounced when the body for centralized public procurements carries out procedures and buys goods or services from suppliers and sells them to purchasers. Then the risk may be manifested in the way that the purchasers do not want to buy inappropriate (inadequate) products and services from the central body, which threatens its financial stability and functioning. This risk is one of the main reasons for changing the basic role of the central body through the time, from the body which acquires products or services, and then sells them to purchasers, to body which concludes framework agreements for the needs of purchasers. Framework agreement defines the prices and estimated quantities of products or services, while the structure of each procurement (and later delivery) may be the subject of contracting directly with purchasers.

Also, attempts for reduction this kind of risk led to the limited list of purchase subjects that can be procured centrally, which will later be analyzed in more details. Viewed by the EU countries, centralized public procurements do not exceed 10% of the total value of public procurements (SIGMA/OECD, 2011). One of the reasons is that the integration of procurements does not apply to works that, in most countries, have a significant share in the total value of purchases. Also, the list of goods and services which may be subject of centralized procurements is very limited (Dimitri, Piga & Spagnolo, 2006; Albano & Spar, 2010).

3.3. Other risks

Centralized procurements are certainly more complex than decentralized. Their successful implementation presupposes well done market and potential bidders research, as well as regulations governing the areas relevant to the subject of procurement. This gives rise to a few risks. The first risk is the longer duration of the procurement procedure. The main difference in time for the centralized procurements implementation occurs in part of the process relating to the collection and aggregation of purchasers needs. Later, during the procedure, increased number of requests for protection of bidders (suppliers) could occurs in centralized procedures, because of a larger amounts of public procurement contracts and also because of long-term contracts.

On the other hand, experience from countries in which the framework agreements are used for a longer time has shown certain risks associated with this type of procurement procedure. Namely, in many cases, framework agreements have been concluded for a period of 2 to 4 years, which brings the risk of insufficient flexibility of the agreement, that can cover very difficult all the changes in the market or in technology that may arise during that period. As a tool for reducing this risk, concluding the framework agreements with multiple suppliers has appeared, where mini tender is organized only for the previously qualified bidders.

Also, during the public procurements centralization the risk of hidden corruption at the high levels increases. Decision about what will be the subject of centralized public procurement can favour a particular bidder or exclude its competitors.

One of the risks of public procurements centralization is increase in the costs of delivery, which affect the fact that the purchasers individually, locally can achieve lower prices outside the centralized public procurement. Therefore, the public procurements centralization at the local level imposes as an optimal solution for

reducing these types of risks, because location of purchasers within one local government cannot play a crucial role in the pricing of goods or services.

Specialists are needed for centralized public procurements. They will not only be familiar with a legal procedure, but also with the economy (market), and they should have a solid knowledge relevant for procurement subjects (Jovanović, 2015). Due to this, major risks arise in the case of centralized public procurements without previous education for staff.

4. MODEL FOR PUBLIC PROCUREMENTS CENTRALIZATION

An analysis of the situation in the member states of the European Union was conducted in order to define the optimal organizational model for the public procurements centralization at the local level. Activities the newly formed entity should deal with are also defined. One of the most important conclusions from the analysis of the situation in a part of the member states is that there is no standard organizational form of institutions (agencies) for the centralized public procurements (SIGMA/OECD, 2000), regardless of the level (national, regional, local). However, it is clear that the different forms and techniques of public procurements centralization are increasingly used in the European Union countries.

Definition in the Directive 2014/24/EU states: "The central purchasing authorities, with or without payment are responsible for, acquisition, dynamic purchasing systems management or public procurement awarding/conclusion of framework agreements for other public clients. From the very definition of the central procurement entity derives several possible models of public procurements centralization.

One of the models of centralization is the so-called "monopoly" model, in which the body for centralized procurements conducts public procurement procedures, purchases goods or services, and later sells them to institutions. In fact the body for central procurements acts as a wholesaler, with developed activities of purchasing, storage and eventual sale. This model of centralization involves great risks, particularly regarding the procurement of products which do not meet the needs of purchasers, and is rarely used in the member states of the European Union.

Essentially a different approach to centralization implies that the central bodies for public procurements act as intermediaries by awarding public procurements contracts to the bidders, also by management of dynamic purchasing systems, or by conclusion of the framework agreements used by public purchasers. In some cases this intermediary role can be carried out independently, by performing the appropriate procedures, without detailed instructions by the public purchasers, and in other cases by performing the corresponding public procurement procedures in accordance with the instructions of public purchasers, in their name and on their behalf.

Figure 4: Organizational models for centralized procurements

The model for centralization can be recommended, based, on the one hand, on reviewing the advantages of public procurements centralization and identified risks, and on the other hand on experience of the European Union. Centralization of public procurement at local level should be based on the model of organization in which the central body for procurements serves as a mediator.

Also, in order to maximize utilization of advantages offered by public procurements centralization, and eliminate identified risks, it is proposed the wider use of framework agreements with suppliers. This model can significantly reduce the risk of: buying inadequate products/services, lack of access to small and medium-sized enterprises on the centralized procurements market, inflexibility of public procurements and others. And Directive 2014/24/EU recognizes the framework agreement as an effective technique for conducting public procurements and recommends its wider use in Europe.

Introduction of new forms of centralized public procurements includes the following two things: firstly, institutional relations between organizations within the public sector, and secondly, establishment of appropriate organizational forms within the administrative departments of the state and local communities and outside that frame, or even outside the public sector with the aim of more efficient public procurements execution.

5. FUNCTIONS OF THE CENTRAL BODY FOR PUBLIC PROCUREMENTS

Once the basic modality of the body for central procurement functioning is determined, it is necessary to clearly define the functions that body is supposed to perform. The functions will clearly identify activities that should be performed within the body for central procurements. That will be set up the basis for designing optimal organizational structure.

Of course, achieving the basic purpose of the centralized public procurements, regarding reduction of public procurements cost through achievement of the economies of scale but also through reduction of transaction costs by replacing multiple processes with a unique procedure, the body for central procurements at the local level must implement public procurement procedures for the needs of as many purchasers. Purchasers' their procurement quantities should be sufficient to justify their inclusion in the process for central procurements. Procurement procedures should be completed by conclusion of the contracts with suppliers, or conclusion of the framework agreements with them.

On the other hand, to fully benefit clearly highlighted advantages that bring the concentration of knowledge and skills within one body at the local government level, the body for central procurement at the level of local government should have a clearly defined advisory function. Advisory function should be developed in several directions. First, communication channels must be developed which will provide that the employees experience and the knowledge base that is formed over time will always be available to all clients from the centralized system, in order to increase their ability of carrying out procedures that are not centralized. Secondly, the trainings held by employees of the central procurement body to the employees who are engaged in public procurements at the purchasers, should be formalized. And lastly, concentrated knowledge in the body of central procurements should be available to all direct and indirect budget users at the local level, thus strengthening the capacity for the public procurements implementation at the whole local government level.

Although it was said that the level of control in the public procurement system will increase by the centralization itself, because procurement enlargement facilitates control and increases transparency of procedures, one of the body basic functions at the local level should be public procurements control. However, the scope of public procurements control which should be implemented by the central body for procurements at the local level, cannot be defined a priori, but depends on the human and technical capacities of the body, number of budget users, number and value of procurements. Control function should be developed with the strengthening and development of the body for central procurements. Developing of the control function within the central procurement body of local governments should create the capacity for control of individual public procurements of direct and indirect budget users on the territory of a certain local government.

Taking all this into account, the basic functions of the body for central procurements of the local government are shown in the following figure.

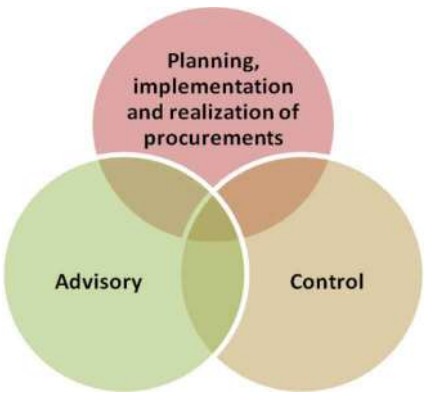

Figure 5: Main functions of body for centralized procurements

6. CONCLUSION

Based on the all written above it is clear that centralization of public procurement at the local level brings many advantages. However, any centralization carries with it certain risks. The paper noted that the risks of public procurement centralization slightest if it is implemented at the local level, but they cannot be ignored. Therefore, this paper proposed that the body functions of centralized procurement should be done in such a way to take advantages that centralization provides, but at the same time to minimize identified risks. It was suggested that the central procurement bodies at the local level should act as brokers and that should carry out public procurements in order to conclude framework agreements. Also, there is a need for development of advisory function in order to strengthen the whole system of public procurement. Over time, the bodies should strengthen the supervisory role in terms of the number of contracting entities which are controlled, but also in terms of the nature of checks they perform.

Further research should be focused on establishing the human, technical and organizational capacities of local governments in Serbia for the centralization of public procurement. Also, by highlighting functions of the central public procurement body should perform, the basis for the definition of potential organizational structure models has been created.

Abstract: *The paper will seek to familiarize the fundamental conceptual framework for understanding modern systems for decision support such is data warehousing, and present this concept through its application in the airline industry, certainly one of the most challenging business areas. The additional aim is to emphasize once again the usefulness of data warehouse as the basis for business intelligence solutions in competitive global environment. This presentation includes all necessary steps taken in the design and implementation of data warehouse. By relying research on the one of the major public data sources, the idea is to generate an intuitive system designed for wider audience to serve as a business intelligence tool – for making decisions regarding the choice of the optimal time, airport or airline for travelling. In the final part of the paper, the results of the data warehouse usage will be delivered in the form of presentations created in "Tableau Desktop" data visualization software.*

Keywords*: data warehouse, business intelligence, decision support, airline, on-time performance*

1. INTRODUCTION

Today is often referred to as the age of the information crisis which is related to the over-saturation of data, followed by the simultaneous lack of information in spheres of business and science *(Jennex, 2013).* This phenomenon reflects a situation in which organizations have a vast amount of data in their possession while at the same time the management have difficulty accessing the information they need for decision making. As for the individual companies, there are two main factors that cause the occurrence of this information gap. Due to the piecemeal systems implementation, data are often heterogeneous and inconsistent (*Hoffer, 2007).* In addition, these systems are designed primarily with the aim to satisfy the operational objectives. Data warehousing systems have announced a revolution in the way business organizations implement business analytics and strategic decision making in almost all industries. Data warehouse is the database designed for data analysis and as such still an indispensable and significant platform for developing business intelligence solutions *(Hawking, Paul, Sellitto, Carmine, 2010).*

As the phenomenon of large amounts of data and their immediate uselessness particularly affects industries that are global by its very nature, the problem of modern airline industry is therefore particularly striking. In times when the quality of customer services is in the focus of competitive business model, the impression is the general dissatisfaction of passengers who have an increasing freedom to choose from and immediately punish for failures by deciding to fly with another company *(Vasigh, Fleming & Tacker, 2013).* While traditional companies continue with confusing customers with various limitations, delays and with generally poor service, passengers are increasingly choosing new model of low cost airlines which offer transparent policy and affordable rates.

US Bureau of Transportation Statistics (BTS) collects data about domestic and international air transportation transactions. Thus, BTS is in possession of vast quantities of data that are publicly available for analysis and are significant source of knowledge about the global airline market. However, its datasets are difficult to manipulate by informal users which are assumed to be airline managers, the press, or ordinary passengers. The aim of this paper is to build an intuitive analytical system in order to ease working with data, so that users can gain the useful information faster and more easily. This would remarkably help pattern identification and process of creating influential reports *(Larsen, 2013).* As a result of that, gaining insights into traffic flows, flights statistics, most common delay reasons and the best time for trip would be instantly available. The limitations of reporting from BTS public data sets as well as the key advantages achieved by the implementation of data warehousing system will also be highlighted.

- Data are stored in huge datasets in CSV file format, and there is no easy and systematic way to obtain and compile the needed data. Accessing the data requires intensive and time consuming manual processing.
- There is no ability to perform custom analysis and drill down capabilities.
- There is no central place to view the data required for analysis and reporting.
- There is no automated way to get reports and quick predictions.

On the other hand, the data in the data warehouse are organized in a form that provides users with access to needed information through a minimal amount of effort and time. For this purpose is built a dimensional model that is largely intuitive and whose key benefit is data transparency. In addition, it provides a tool that guarantees the quality, accuracy and consistency of delivered data. These benefits generate the opportunity of better decision-making on the basis of theinformation not previously avaliable to the ordinary passenger.

Data warehouse for air transport data analysis ought to organize data retrievied from the web site Statistical Computing on page ASA Data Expo in a way which would provide an overview and insight into the on time arrival performance of passenger flights. The emphasis is thus on the key factors that influence the image of airline quality services such as reasons for delayed, diverted or cancelled flights.

2. DESIGNING THE DATA WAREHOUSE

The process of data warehouse development includes taking data from various sources and integrating them during which all inconsistencies are eliminated and data is transformed and archived in a way that best suits the needs of the end user.

2.1. Selecting and filtering data for analysis

On Time Performance Database contains on-time arrival data for non-stop domestic flights by major air carriers, and provides such additional items as departure and arrival delays, origin and destination airports, flight numbers, scheduled and actual departure and arrival times, cancelled or diverted flights, taxi-out and taxi-in times, air time, and non-stop distance.
Data are collected by BTS and consist of flight arrival and departure details for all commercial flights within the USA, from October 1987 to April 2008. There are nearly 120 million records in total, which take up 12 gigabytes when uncompressed. For obvious technical inability to process the amount of data, two annual files have been provided for the purposes of this work , more specifically, the subset of data covering the 2007 and 2008 calendar year.
When it comes to additional files supplied on the website, such as codebooks for airports, airlines and aircrafts, many irregularities have been observed: The table that provides data about the aircrafts and classifies them according to the model, age and the manufacturer has too many missing values, so it is estimated that this table is not useful at the moment, but is interesting provided that additional efforts are made for gathering data on aircraft registration codes and their origins. Afterwards, it was discovered that Airline codebook which ought to identify airline companies according to their IATA codes is not valid, i.e., contains information about fictive airlines, and is even not compliant with IATA coding system of two-letter codes. Similar is the case with the Airport codebook table, noting that the so-called IATA codes are actually mislabelled ICAO codes.
It was hence decided that new codebooks will be created according to the original data available on the IATA's website. Two tables have been generated in Microsoft Excel, for both the airline and the airport. The information these tables provide are details on two categories, custom facts about the flights dating from the period between 1998 and 2008. Therefore, the newly created table Airline based on the specific airline IATA code retained the information about its full name and USDOT (United States Department of Transportation) number based on its specific IATA code. Based on the particular airport IATA code, the Airport table returns the full name of the airport, latitude and longitude, the city and the country of airport.

As the data gathered and loaded into data warehouse come from different sources, the most demanding part of the entire project of data warehouse development is a process of data integration where the substantially different data from codebooks need to be associated with the transactional data in a single system. The whole set of procedures that collect and prepare data for loading in the final repository is referred to as ETL (Eng. Extraction, Transformation and Loading) processes. Prior to ETL processing the preparation of data is performed, which involves standardizing data in terms of unifying forms where the records of different backgrounds provide the necessary uniformity. On the other hand, data cleansing should be performed to remove all records that occur as a result of past mistakes. Possible cases of errors are incorrect, incomplete or inconsistent data.

2.2. Extracting data into staging database

After the process of data selection and preparation, in the first stage of the ETL process data are extracted into the staging database from which the data warehouse is being built. The packages populating the tables in the staging database are prepared in SQL Server Integration Services (SSIS) 2012. Database with transactional flights data is available in the separate annual CSV files. Each of the files contains approximately seven million rows. Using SSIS Platform for ETL processing, the available operator Union All combines multiple inputs into a single output data. Thus are the large annual files forwarded for further

processing. One of the problems that can occur when importing data from CSV to SQL Server is the issue of having to convert data types from Unicode data types to types of SQL Server. Through SSIS it is possible to enter the different types of data into the server. However, SSIS treats strings in CSV file as Unicode, while tables in SQL Server, are defined as non-Unicode. Microsoft services for data integration provide operators for conversion that are used in this step. The following operators have been applied: Data Conversion operator, whose role is to carry out the transformation of data types of corresponding columns and Derived Column that generates a new column or replaces the old one, by performing the transformation based on the given formula for the input column or more of them.
The package with which the annual files for 2007 and 2008 were extracted and loaded into the staging database Flights is shown in the following figure:

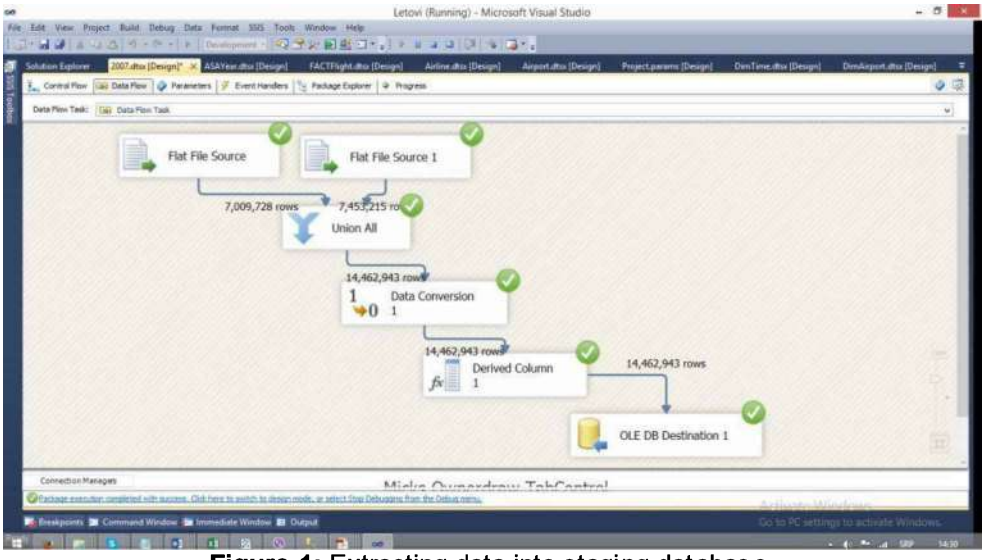

Figure 1: Extracting data into staging database

2.3 Dimensional modelling

At dimensional modelling this stage of a data warehouse it is necessary to determine how to logically group extracted data. The first step after selecting the grain of data warehouse is to choose the fact table, then the dimensions and schema of future data warehouse. When data is transferred from a source into the dimensional model, this means that we have one central fact table and a group of dimensional tables that are directly related to the fact table *(Kimball, Ross, 2013).* Facts are generally associated with numerical properties called measures. Dimensions are actually features that the client wants to analyze. The additional type of data stored in the fact table are codes, i.e. key attributes of dimensional tables by which these supporting tables are associated with the central table. The simplest and most often implemented schema is the Star schema *(Kimball, Ross, Thornthwaite, Mundy, Becker, 2010).* The Star schema is the core of Kimball methodology and because of its simplicity is closest to achieving a paradigm of business intelligence based on which its systems should be as intuitive as possible with the purpose of providing the end-user with the independent usage *(Adamson, 2010).*
The information we have in staging database Flights are records of individual flights in 29 columns concerning their timely performance or schedule deviations. More detailed information on the origin and destination of the flight as well as the airline that performed the flight are available in Airport and Airline tables.
The original dataset is extended by generating the table to which the role of time dimension will be assigned. Time dimension is one of data warehouse key components, as it provides its historicity. Firstly, columns Year, Month, and DayofMonth from the Flights table are unified into column that makes a specific date. Based on the date, Time dimension ID is generated to correspond with the same column in the fact table, with the role of key.
Selection of fact table in this case is unambiguous. Database Flights is the only one that records the transactions, and by its structure and composition is perfectly suited for the role of the fact table. In addition to a numerous measures and time determined facts it contains aggregated attribute and ID codes for airlines, airports and aircrafts. One of the most relevant measures is column ArrDelay that records the delay in minutes. Attributes that cover its special cases i.e. different reasons for the flight delay are also interesting. Database furthermore contains distance between the two airports, time spent in the air and other attributes that measure delay on the separate phases of flight. FactFlight contains 1448980 records and covers two calendar years starting from January 2007 and ending December 2008.

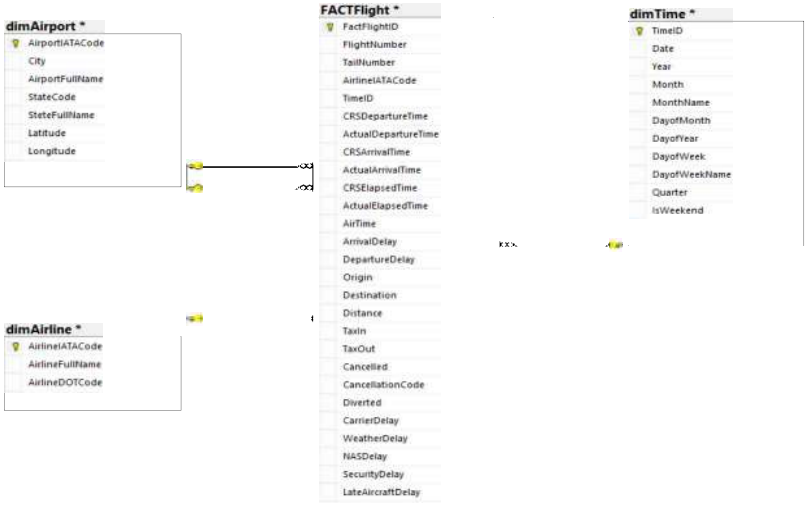

Figure 2: Data warehouse model diagram

Based on the information available in supporting tables, dimensional tables dim.Time, dim.Airport and dim.Airline are created. As IATA code uniquely identify a specific carrier and airport, there was no need for the implementation of the surrogate key on these dimensions, while the dim.Time ID is implemented in the form of a primary key that is similar to the timestamp, just as in the format YYYYMMDD as the most common practice (if there was necessity for greater level of granularity, it would contain hours, minutes, etc.).

Practically each of the dimensions contains a data hierarchy. The hierarchies are highly desirable because they allow users to analyze data aggregations in a very straightforward manner using the OLAP or data visualization software functions. Dim.Time appears to be self-explanatory and its hierarchy goes from year to the day of the month level of detail. Due to a particular nature of transactions, the columns quartile and weekend are also included because it is expected that the percentage of flights over the weekend as well as in particular seasons of the year will increase, rather than in others. Dim.Airport hierarchy simply allows individual airport data to be rolled up from IATA code, the full name of airport and the cities of origin/designation, to the names of the country.

2.4. Data warehouse implementation

The implementation of data warehouses marks the phase of physical design of the data warehouse and involves the whole process of data migration from operational or staging database into a central repository, including all necessary operations to be executed on the data, thereby customizing them for the future structure and purpose *(Sarka, Lah, Jerkič,* 2012). When the logical model is made, creating the database and its objects commences. Microsoft's SSIS tools for data integration are essential ETL tool and a platform for loading the traditional data warehouses.

Most of the data is loaded directly into the database tables, as is the case with the dim.Time which has already been prepared as being self-generated for the purposes of a specific data warehouse. The remaining dimensions, dim.Airline and dim.Airport are populated with necessary data in a similar manner. The column names are adapted semantically for the intuitive usage without a detailed introduction to metadata. Nevertheless, some transformations were necessary.

Similar problem that occurs when importing data from a CSV file in SQL server happens with transfering data from Excel tables. In SSIS some necessary conversions were made in order to store data in SQL Server tables. An additional problem occurs when transferring data from Microsoft Excel files. Because of the way that strings are stored in Excel cells, it is necessary to coverse data in WSTR form into SSIS. While it is possible to change the length of the string SSIS, Excel still keeps it in the internal form as if it were larger. As the SSIS string has the length of 50, one was to make a compromise and leave in the SSIS the column populated with the length of 50, all of which had no consequence on the query level. Same as before, to change the data type in SSIS package data flow pipeline, Data Conversion operator's functions has been used.

FactFlight is implemented according to the presented database model diagram in such a manner that the FlightNumber column was taken as the primary key , an attribute that uniquely identifies a particular flight. As mentioned earlier, the dimTime ID is made in the form of a date, and it was necessary to adjust the current

time attributes in the fact table to correspond the column in the time dimension as a foreign key. Columns for the year, month and day of the month have been integrated in the appropriate column that corresponds to the date in the dim.Time. For this purpose, the SSIS toolbox operator Derived Column Transformation creates new column or replaces the old one according to given formula.

Among the ArrDelay attribute records the extensive presence of NULL and 'NA' values was noticed where attribute values are less than or equal to zero. These are the cells that should not contain the values because it is the record of the flight for which the delay has not been recorded. The values in columns that indicate the reasons for the delay (WeatherDelay, SecurityDelay, LateAircraftDelay, CarrierDelay, NASDelay) for the flight codes which recorded t no delays, have been recognized in some places as a NULL, and in others are populated with 'NA'. It was necessary to make changes to the data, in order to make the string 'NA' recognized as a NULL in SSIS. By using the Derived Column Transformation operator, these particular values ought to be replaced. Within the Derived Column Transformation editor window it is possible to select the needed functions from the NULL functions folder, and in this case, the function that converts the DT_STR string values into NULL is chosen.

3. DATA DELIVERY

The work below illustrates data warehouse usage for the business intelligence solution development with the purpose of delivering useful information in the area of air transportation. For the purpose of this study and the particular data warehouse, the data visualization software Tableau is chosen.
1. What time of the year and days of the week are best to travel in order to minimize the likelihood of flight delay? – Presentation of flight delays by days of the week, months and seasons.

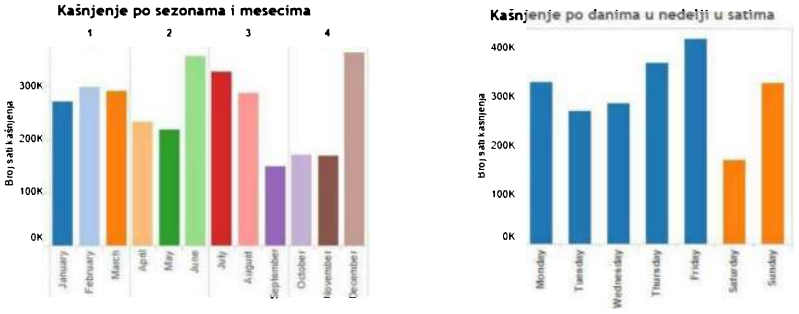

Figure 3: Flight delays per months, seasons and days of the week

Figure 3 represents the arrival delay measured in hours querying by time dimension. The first graph represents the total delays in hours per quarters and months. Filtered by months, each is marked with a different colour. Using the data hierarchy in Tableau is achieved by simply dragging the columns and is visible at the level of the data source.

In the second graph, the total delay per day of the week is presented. Bar colours indicate if it is weekend or working day. The vertical axis shows arrival delay measure values. As ArrivalDelay column records arrival delay in minutes, there are lots of negative values and delayed flights do not include the flights whose delay is less than 15 minutes, and the attribute is filtered to include only those values that are greater than or equal to 15. Similar data filtering could be done at the source level as Tableau allows connecting to the custom SQL query results.

2. What are the most common reasons for flight delay? - Presentation per months and in percentage.

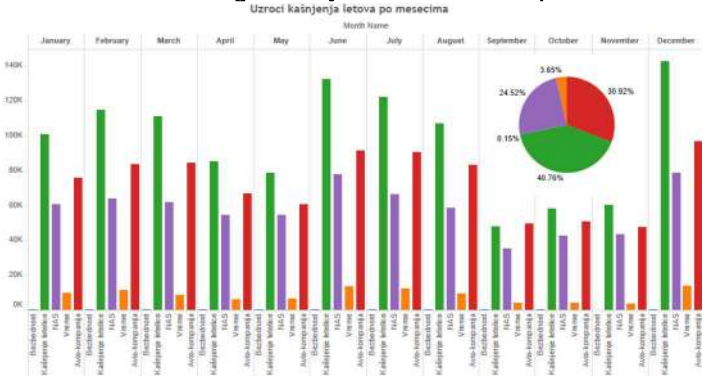

Figure 4: Presentation of specific delay reasons

As in the previous examples, when one wants to compare multiple categorical values, the best solution for graphical representation is a bar chart diagram. In the following diagram, the time axis is partitioned by months where for each month the most influential factors on flights delay are comparatively observed. Different colours mark individual delay reasons. The measure expressed by a total number of delay in hours records the values in the range from 189 to 142.433.

Pie chart graph shows the delay reasons in percentage. Comparable distinctive measures of the same category analysis in the Tableau is solved by filtering the field Measure Value. When connection to the data source is made, Tableau automatically generates fields Measure Values and Measure Names which are the parameter of all available measures, and inside of which the selection of any required measure is performed.

3. How does the weather affect the flight delays? – Presentation showing the correlation of total arrival delay and delays caused by weather conditions.

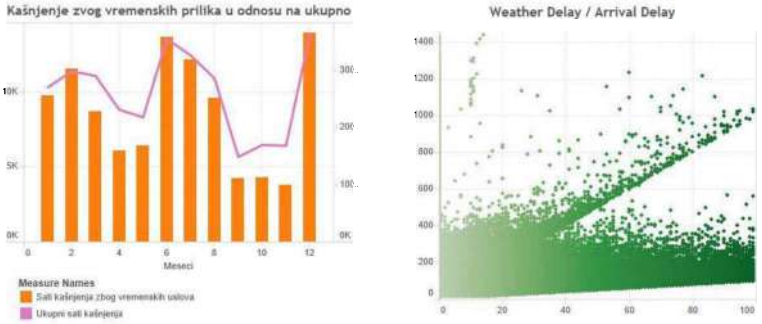

Figure 5: Weather delay and total arrival delay correlation

Although the previous analysis has shown that weather conditions have a small percentage in the total amount of flight delays, drawing the diagram in which it is possible to examine comparable trends of two dimensions, indicates strong correlation between these two measures. The impact of weather on total delay is shown by scatter plot graph where the weather is placed on the horizontal axis, whereas the vertical axis represents the total delay in hours. Pie chart graph shows the percentage of flight cancellation caused by weather in the total amount of cancelled flights. Database records are filtered keeping the cancelled flights, and this value is further broken into subcategories where each of the separate reasons is presented by different colour.

4. Which airports and airlines are more prone to delays than others? – Presentation of airports and airlines with the highest delay rate.

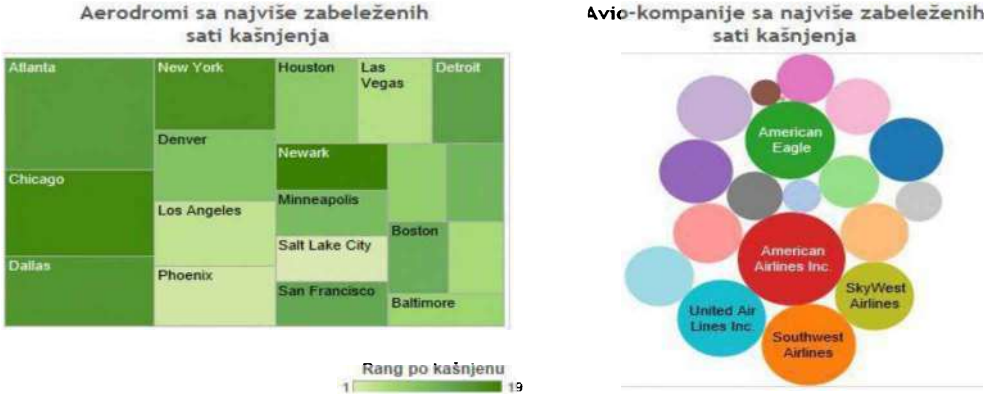

Figure 6: Airport and airlines

Airports are at first examined through the tabelar presentation where the calculated field that counts the amount of delay by the number of reported flight for an individual airport is generated. Thus are the airports that are most prone to flight delays discovered. These are then ranked and shown in a more intuitive way by drawing heat map chart where you can best see thescale and they were ranked according to arrival delay frequency. In the first graph in Figure 6. shows the airports using their full names, where the intensity of the color displays the values from 1 to 19, in a manner that the largest number is assigned to the airport with the highest delay level expressed in hours by number of records for the particular airport.

When it comes to airlines, the following graph in Figure 6. presents airlines with full names, marked with different color, and the size of the airline displays the total amount of delay for the airline expressed in hours. Thediagram does not show the airline with a negative value of the total delay. Further analysis has shown that it is Aloha Airlines.

5. What air lines include the highest traffic density? – Presentation of city pairs that represent most frequent routes.
Tableau allows for the possibility to analyse paths between two geographical points. To visualize these patterns, special data structure is required. Table Route is generated from the data warehouse as a SQL query result, and contains information about all routes realized between any two airports. As Tableau for this kind of analysis requires a specific data structure, Route table was not necessary to link with others in the data warehouse schema. For every data pair the unique key is made that identifies them as a pair. Each path takes two rows in the table, one for both of the directions, so a column was created in the table to define the path order according to latitude and longitude of the origin airport.

Table 1: Route Table

Column Name	Description
Origin	Origin airport IATA code
Destination	Destination airport IATA code
OriginAirportfullName	Origin airport full name
DestinationAirportfullName	Destination airport full name
Latitude	Origin airport latitude
Longitude	Origin airport longitude
PathOrder	Path order number (1 or 2)
RouteName	Route full name

By connecting Tableau to the Route table a map is generated showing a network of all itineraries shown in Figure 7. Different color is assigned to each route. The thickness of the lines represents the number of flights realized between the two airports of the particular route. Ability to filter itineraries is made possible by generating the parameter, according to the number of realized flights based on which they are ranked. It is possible to locate the intersection nodes of two airlines on the map.By filtering the map of the 30 most frequent routes, their names will appear.

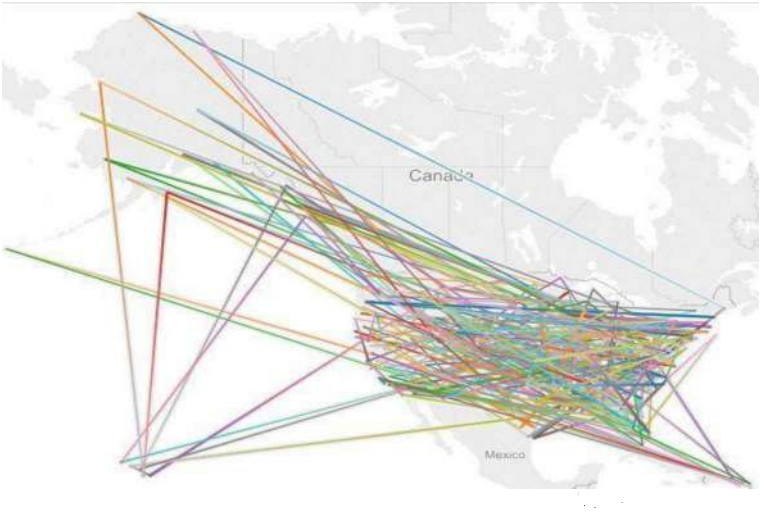

Figure 7: Route network

4. CONCLUSION

Business intelligence has evolved because the grow of data altering how organizations and individuals use information (Larson 2016).The subject of the paper was designing and implementation of the data warehouse for the air transportation data analysis. In the times when the informed customer is on the very first place of a succesful business model, the lack of quality information is visible when it comes to air transport services quality*(Davenport, 2014)*. Although there are some sources of open data in the area of flight performance, they are useless in a straightforward manner and require time consuming and manual processing effort in order to get and compile data. There was no automated and systematic way for the

simplest analysis to be done. A data warehousing system is a platform for business intelligence solutions development, and enables what was not possible before – to organize data from various sources in a thematic and intuitive way, therefore providing the users with an integrated tool for performing the most demanding analytical operations on data in a fast and easy way.

The aim of the study was the use of publicly available data for creating business intelligence solution that would provide assistance to passengers in the choice of time, place and the airline for trip, in order to avoid long waits, jams and other air traffic inconveniences caused by delays. As the schedule deviation is one of the key reasons that influence the airline quality valuation by the passengers, it is necessary to emphasize the importance of the availability of data as the basis for making decisions of this kind, which would be grounded upon the reliable knowledge.

AUTOMATIC CREATION OF CLINICAL PATHWAYS – A CASE STUDY

Kathrin Kirchner*[1], Petar Marković[2], Pavlos Delias[3]
[1]Berlin School of Economics and Law, Germany

Abstract: *In hospital environments, treatment processes, respectively clinical pathways, are adopted based on the health state of a patient. Modeling of pathways is time consuming and due to the involvement of many participants, the introduction of clinical pathways is cost-intensive. A possibility for automatic or semi-automatic creation of clinical pathways is process mining. But such algorithms usually have problems to discover such processes from log data that are recorded during process execution in information systems. In this paper, we discuss the application of a spectral clustering algorithm to cluster process flows that can provide clearer process maps. We apply this method on an anonymized real world clinical dataset and discuss challenges and first results.*

Keywords*: clinical pathway, process mining, spectral clustering, flexible process, case study*

1. INTRODUCTION

A clinical pathway is defined as a structured, multidisciplinary care plan which defines the steps of patient care for a certain disease in a specific hospital (Rotter et al., 2010). They can improve the efficiency and transparency of patients" treatments: Length of stay in the hospital as well as cost can be reduced, patient safety is increased and new medical personnel can learn more quickly how a certain treatment process is executed.

A clinical pathway is usually developed manually by the medical personnel which is costly and time consuming. A once modeled pathway has to be updated regularly so that it is always following new regulations. An automatic support of clinical pathway creation would therefore be helpful (Rebuge & Ferreira, 2012).

A possibility for automatic or semi-automatic creating clinical pathways is process mining. Process mining is an emerging field that connects business process management and data mining (van der Aalst, 2012). It has three general purposes: as-is business process discovery from data, conformance checking of detected processes with pre-designed process models, and enhancement of the process model. In this paper we concentrate on the first topic. Process mining is used in industrial and administrative processes. Mans et al. (2012) applied process mining algorithms in a dentistry case, and found that it was difficult to handle flexibilities in the pathways. Poelmans et al. (2010) used process mining on breast cancer data and faced problems with data quality.

In process mining the structuredness of processes can vary between the so-called: “Lasagna processes” - simple in structure, consist of a relatively small number of activities and have a consistent flow, and the other side of the spectrum, which corresponds to “spaghetti processes” - with a very diverse and inconsistent process flow, and a large number of activities. Thus, the first are easier to analyze using standard process mining algorithms and techniques, whilst the second are more challenging.

One problem for process mining of clinical pathway data is the amount of flexibility in patient treatment which leads to spaghetti processes. An approach proposed by Delias et al. (2015) suggests applying clustering algorithms to group similar traces before applying a process mining algorithm, and this way reduce the high amount of different traces.

In this paper, we apply this approach by Delias et al (2015) on data collected from a clinical information system (Kirchner, 2015). We investigate whether spectral clustering can solve the problems with process flexibility in our case study. Challenges are discussed, and ideas of further improvement are developed.

Thus, our paper is structured as follows: In section 2, we describe the medical data that we analyze in section 3. Section 4 discusses our findings. In section 5, we summarize our results and give an outlook on future work.

2. DATA AND METHODOLOGY

During the research project PIGE (Kirchner et al., 2013), a clinical pathway for living liver donors was modeled in BPMN together with the medical personnel. This process was modeled by hand within a team of physicians and process modeling experts. Afterwards, data from a clinical information system was added to the process steps. This data contained timestamps and the name of the treatment procedure for a certain patient.

The process can be roughly described as follows: A healthy person can donate a part of her/his liver to a near relative. Before one becomes a living donor, she or he must undergo testing to ensure that the individual is physically fit. Sometimes computer tomography (CT) scans or magnetic resonance tomography (MRT) are done to image the liver. The pre-examinations are predetermined, but can change in the sequence depending on the availability of necessary resources. During and after operation, complications can occur that lead to additional interventions or even an additional operation. The data set was extracted from a clinical information system. All patient data which were marked as living liver donors in a time period of 3 years were selected. The resulting data set contained 50 living liver donors with 331 events. Not all patients went through all process steps. If the pre-examination found the person not suitable for donating the liver, an operation is not done. Therefore, the number of process steps for patients was different. Patients that were already in a later process step in the considered time period were also in the data set. Thus, not all pathways had the same start- and endpoint. Furthermore, the timestamp for all events were only dates, and several events can be done on a day.

Data was analyzed in a first step using Fuzzy miner algorithm in the version implemented in Disco software (www.fluxicon.com). Fuzzy miner uses correlation metrics to simplify the process model at a certain level of abstraction. To solve problems with flexible pathway execution, it can ignore less important activities or cluster them (Günther & van der Aalst, 2007). Figure 1 shows our first obtained process map that we obtained as a spaghetti process. The map comprises 45 process variants for the 50 patients. The shortest pathway contained only one event, the longest one 26 events. Filtering out seldom used pathways, as it is possible with Fuzzy miner, would delete also pathways with interesting characteristics (e.g., complications after operation).

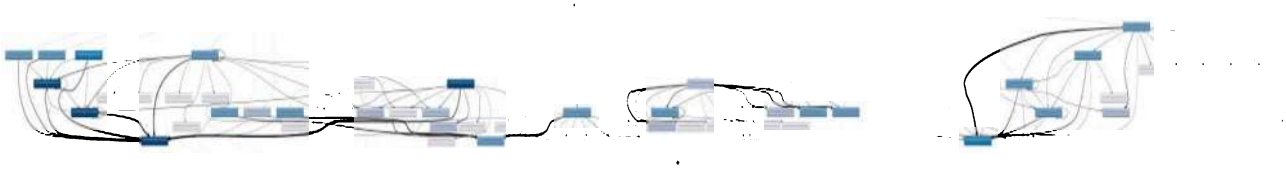

Figure 1: Original Process Map for living liver donors discovered by Disco-Fluxicon

For successfully analyzing such spaghetti processes, some form of data preprocessing is necessary. The most common approaches are filtering of activities and/or traces (cases) or clustering of activities and/or traces (cases). Some of the widely used clustering approaches can be found in (Veiga & Ferreira, 2010), (Song, Günther, & van der Aalst, 2009), (Jung, Bae, & Liu, 2009), (Bose & van der Aalst, 2009), (Luengo & Sepúlveda, 2012). Besides this, there is a group of robust algorithms such as (Delias et al, 2015), that efficiently resolve spaghetti processes in the domain of healthcare without any filtering, and which we chose to apply in this paper.

Our methodology applied in this paper is based on the methodology proposed by Delias et al. (2015). Thus, the following five steps were applied:

1. Creation of Event log from the hospital information system
2. Traces generation from the Event log
3. Calculation of traces" similarity using cosine similarity and robust similarity concept
4. Spectral clustering
5. Visualization of obtained clusters

3. DATA ANALYSIS

The first step in the implementation of our methodology is the creation of an event log, which is a starting point in any process mining analysis. Data were created from the hospital information system. For that purpose, a query was defined on the information system, selecting all patient treatments for patients marked as possible living liver donor. In order to follow the data security requirements, no personal information was extracted and patient identification numbers and dates were anonymized. The structure of the resulting event log used is shown in figure 2. Mandatory fields for further analysis are: Patient ID, Activity (Treatment Procedure) and Timestamp. The rows in the event log represent occurrence of a single event in the system (e.g., patient is sent to do the „CT of Abdomen" or the patient is sent to the „Operation room").

Patient_ID	OPS Code	Treatment Procedure	Day of treatment	Admission day	Discharge day
12345678	3-225	CT: Abdomen	10.10.2014	10.10.2014	12.10.2014
12345678	3-226	CT: Pelvis	10.10.2014	10.10.2014	12.10.2014
....					
23456789	3-225	CT: Abdomen	08.02.2015	08.02.2015	10.02.2015
....					

Figure 2: Event log structure

In order to reduce the complexity of the data, we analyzed which activities are often executed together on the same day. We calculated the co-occurrence matrix (Fig. 3). It consists of 32 activities, whilst the values of cells represent the average number of appearance of activities A and B in days where there were at least two activities per case. The matrix is symmetrical, as ordering of activities is not important (e.g. it is irrelevant if A follows B, or vice versa). The most frequent co-occurring activities in the heatmap are represented with red color, medium co-occurrences with black, whilst the least frequent combinations are colored with green. From the matrix, we derived that six activities, namely CTs and MRTs of different parts of the body (activity numbers 5, 6, 7, 19, 20 and 21), are often (at least in 20% of all cases) done on the same day. Therefore, we grouped them into a new activity named "CT/MRT diverse". Selection of merging candidates was done by reading the heatmap values, but the domain knowledge was the main criterion used for final decision. Therefore, e.g., activity number 9 (partial resection of liver) as part of operation of patient was not merged with pre-operational steps like activity number 5 (radiopaque CT abdomen). The steps that are described in the next section were applied on this modified data set.

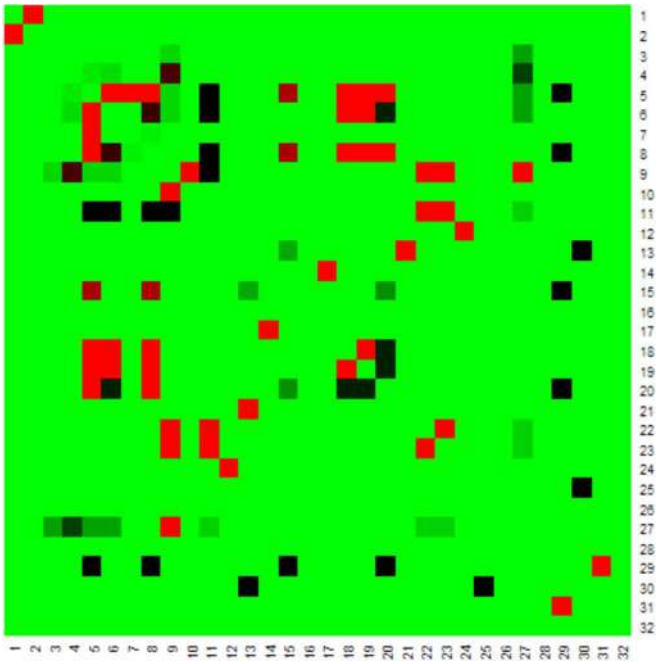

Figure 3: Co-occurrence matrix for the data set

When the structure of the event log is known, traces are generated from it. Traces represent process paths of each recorded case (patient). In other words, traces can be observed as chronologically ordered vectors of patients" activities. They are obtained from the event log, when activity fields, from all recorded events in

the event log, are ordered chronologically and grouped by case ID. The example of a single trace is given in the figure 4.

Patient ID 12345678: <CT: Abdomen, CT: Pelvis>

Figure 4: A single trace (example)

After all traces are created, it is necessary to calculate their similarity in order to find the groups of patients" process paths that have high intra-group similarity, but are very different compared to the groups. In terms of process mining, two popular criteria for process similarity are: activity similarity and transition similarity both represented with corresponding vectors and defined with formulas 1 and 2, respectively.

$$SIMtransitions(T_i, T_j) = \frac{a(i) \cdot a(j)}{|a(i)||a(j)|} \frac{\sum_k t_k(i) \times t_k(j)}{\sqrt{\sum_k t_k(i)^2 \times \sum_k t_k(j)^2}} \quad (1)$$

$$SIMactivities(T_i, T_j) = \frac{a(i) \cdot a(j)}{|a(i)||a(j)|} \frac{\sum_k a_k(i) \times a_k(j)}{\sqrt{{}_k a_k(i)^2 \times {}_k a_k(j)^2}} \quad (2)$$

The first formula (1) presumes that two cases (patients) are similar if they undergo the same medical procedures, whilst the latter presumes that two cases are similar if they undergo those procedures (activities) in the same order. These two types of similarity are combined into overall similarity, represented with their convex linear combination - formula 3.

$$s(T_i, T_j) = S_{ij} = W_a \cdot SIMactivities(T_i, T_j) + W_t \cdot SIMtransitions(T_i, T_j) \quad (3)$$

Weights of the overall similarity components are determined based on expert judgement. Due to data quality issues we preferred to give more weight to transition similarity. All similarities are cosine similarities of corresponding vectors.
Lastly, the robust similarity is calculated using local densities concept (Chang & Yeung, 2008). The reason for using this approach is to enable low-frequent, outlier traces, to be spotted and prevent their influence on the clustering process. The idea behind the robust similarity concept is that an object, surrounded with more objects, should have higher chances to be grouped together with his neighbors. The measure used for estimating local density is given in formula 4 as s'_{ij} l_i represents local density of the object.

$$l_i = \sum_{j \in N_i} S_{ij} \text{ where } N_i \text{ is neighborhood of an object } i$$
$$s'_{ij} = s_{ij} l_i l_j \quad (4)$$

This overall robust similarity is represented in the form of similarity matrix and represents the entry point for the spectral clustering step. Visualization of similarity matrix is given in the Figure 5 in the form of a heatmap, where the most similar cases/traces are colored with red, cases with medium similarity colored in black, and the least similar cases colored in green.

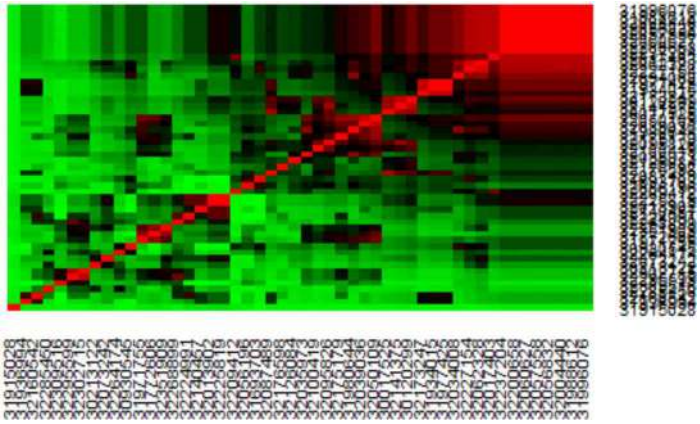

Figure 5: Heatmap of traces" (cases/patients) similarity

Spectral clustering (von Luxburg, 2007) is the following step, and consists of two substeps. First, the Laplacian matrix, which is derived from similarity matrix obtained in the previous step, is analyzed using its eigenvectors and their corresponding eigenvalues in search for the optimal lower-level subspace representation of the starting matrix. This is achieved through selection of first k eigenvectors of the Laplacian matrix which capture the highest variability in the data. They can be observed in the figure 6 as the eigenvectors after which exists a significant drop in the eigenvalues. Afterwards, the number of first n eigenvectors from the previous substep is used as a parameter k (number of clusters) in the K-means clustering algorithm. For our experiment, we selected k=2 as the number of clusters. Final results are discovered clusters consisting of similar traces. Each case"s corresponding cluster number is added into the event log.

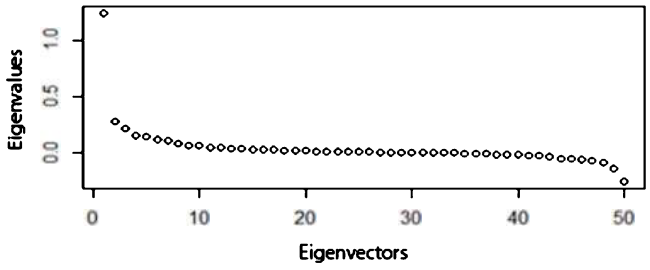

Figure 6: Eigenvectors and eigenvalues for the similarity matrix

The final step consists of visualizing obtained process maps using Fluxicon Disco process mining tool, and it is described in detail in the following chapter.

4. DISCUSSION OF RESULTS

After a careful interpretation of the heatmaps and the eigenvalues, we tried several numbers of clusters as well as different weights for the activities and transitions similarities. We then analyzed the resulting clusters and tried to identify the cluster solution that fits the best from the application point of view.

We achieved the best results with activity similarity of 0.1 and transition similarity of 0.9. Two clusters were identified, one of them (cluster 1) being illustrated in figure 5 contains 28% of cases and 30% of events. The longest path has 8 events, the shortest only three events (Figure 7). In principle, three types of clinical pathways can be derived here:

1. Patients that undergo the usual treatment: A pre-evaluation phase to check whether they can become a living liver donor and the operation phase.
2. Patients that undergo the usual treatment, but have complications after the operation
3. Patients who undergo just the pre-evaluation phase, but are not considered as living liver donors, so the treatment process finishes earlier.
4. Furthermore, there were also 2 patients that were already in the operation phase in the time period that was considered for the data collection. Therefore this pathway starts immediately with the operation.

The second resulting cluster was similar to the first one, but consisted of 72% of the cases. Here, cases having several process steps processed on one day are included. Because of data issues (date format) the process discovery algorithm cannot have a clear picture of what the sequence of events on a specific day was, therefore, the process execution seems to be very flexible. We could reduce this flow variability through a preprocessing step that merges the frequently co-occurring process steps (i.e., steps occurring frequently on the same day). More than 80% of cases are unique, and half of the cases have less than 5 events. Therefore, it is impractical to discover a process map that summarizes the behavior of the second cluster. Other techniques that could describe marginal aspects of the process (e.g., association rules) could add some value in process comprehension, yet they are out of the scope of this paper.

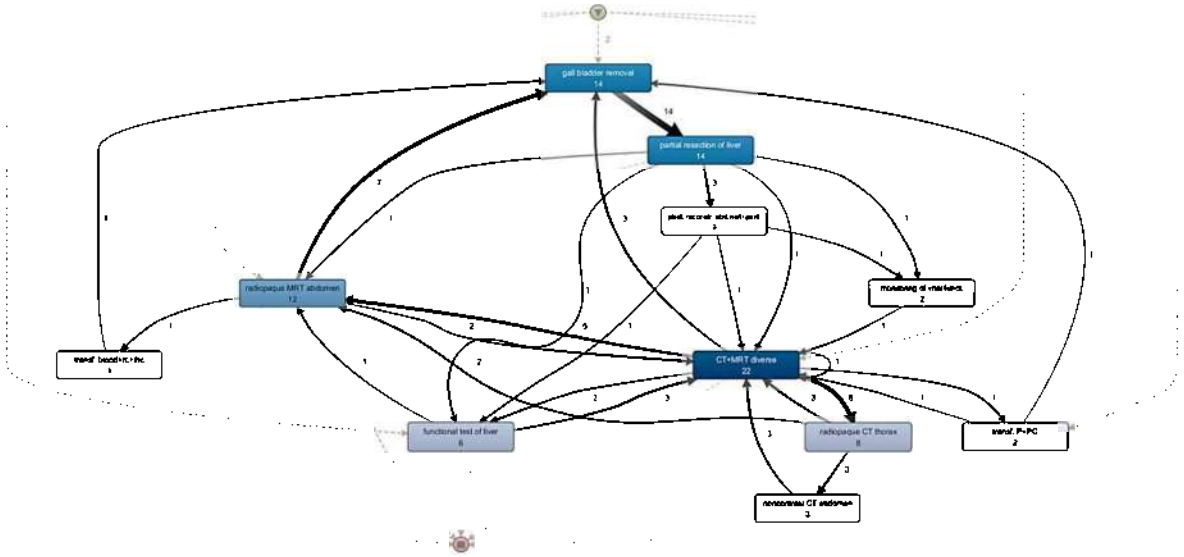

Figure 7: Resulting process map for cluster 1 of the data set (Visualization created with Disco-Fluxicon, 100% activities - 100% for transitions)

5. CONCLUSION AND OUTLOOK

In this paper we tried to discover patterns of process behavior for a particularly flexible environment: the living liver donors" treatment process. Since variability of flow is commonly expected in such a healthcare setting, we applied a trace clustering approach to summarize the flows.

The case study posed some additional challenges, because of the coarse timestamps, the small size of sample, and the large deviation of the pathway sizes. However, we were able to reach two significant results: First, there is a cluster of cases that exhibits some strong patterns, and we were able to plot them with a process map. Medical personnel could benefit from such a map by gaining a quick yet comprehensive understanding of the process. Second, trace clustering approaches are inappropriate to deal with the remaining population.

It is within our future plans to elaborate on the more idiosyncratic part of the population by applying different approaches (e.g., declarative/hybrid models, association rules, using patients" characteristics to correlate them with flows, etc.), to mine for any possible hidden underlying patterns.

Abstract: *The business problem has been elaborated by analyzing data through methods and techniques of business intelligence, with emphasis on association rules. In this paper attributes in the air traffic field have been analyzed in order to determine the conditions for landing of the aircraft. Based on the applied data model it could be determined if an aircraft can land on predefined conditions, or not. The business problem has been elaborated in real-world setting. Evaluations of landing conditions and prediction through association rules have big relevance because the safety of the landing of the aircraft with crew could be significantly improved. Research in this paper shows the potential and significance of business intelligence application in air traffic management.*

Key words*: business intelligence, association rules, sustainable business development*

1. INTRODUCTION

Suknović (2001) defines ˝Decision making is the selection of one from the group of available alternatives" (p. 14). It is a very complex process that should result in getting appropriate managers' decisions. Therefore, it is necessary to continuously research and improve methods and techniques of modern decision making. Perfect solution for the defined problem does not exist. The highlight should be on the most acceptable solution. Managers should know well the Theory of decision making, as well as how to use practical experience to get the business decision that will result with maximization of profit.

Suknović (2001) discusses the three dimensions that determine the complete development of this discipline. These are: qualitative, quantitative and information-communication aspects (p. 13). These three aspects implicate all concepts of development of modern decision making, on both theoretical and practical level. ˝Quantitative approach in modern decision making defines the basic formalism of general decision making problem˝ Suknović and Delibašić (2010) point out. Suknović (2001) defines ˝the decision making problem is a five item problem $(\mathrm{A}, \mathrm{X}, \mathbb{F}, \Theta, \succ)$ where (p. 13):

A: represents a definite set of available alternatives (actions) ranked by a session participant in order to select the most acceptable one;

X : represents the set of possible outcomes as a consequence of selecting an alternative;

Θ: represents a set of world states, and depends on the unknown state $\theta \in \Theta$ because the consequences of selecting alternative $\alpha \in \mathrm{A}$ may differ;

$$\mathbb{F}: \mathrm{A} \times \theta \rightarrow \times \tag{1}$$

for each world state ϖ, and for each alternative α, determines the resulting consequence $\mathrm{X} = \mathbb{F}(\alpha, \varpi)$

$\succ$: weak order relation on X, i.e. a binary relation that satisfy the two following criteria:

i) Completeness: either $\mathrm{X} \succ \gamma$ or $\gamma \succ \mathrm{X}, \forall \mathrm{X}, \gamma \in \mathrm{X}$;

ii) Transitivity: if $\mathrm{X} \succ \gamma$ and $\gamma \succ \mathrm{Z}$ then $\mathrm{X} \succ \mathrm{Z}$, $\forall \mathrm{X}, \gamma, \mathrm{Z} \in \mathrm{X}$.

Relation $\succ$ features the decision maker and is called a preference relation Two other important relations can be derived from the preference relation. The first is the strict preference relation where $\mathrm{X} \succ \gamma$ if and only if both $\mathrm{X} \geq \gamma$ and not $\gamma \geq \mathrm{X}$. The second is the indifference relation where $\mathrm{X} \sim \gamma$ if and only if $\mathrm{X} \geq \gamma$ and $\gamma \geq \mathrm{X}$. The most often way of solving decision making problems is the transformation of weak order $\succ$ to X into normal order $\geq$ over the field of real numbers by the means of utility functions. *Authors Anderson, Sweeney, Williams, Camm and Cochran (2015) describe quantitative methods of decision making (p. 154).*

Recommendation is that manager posess relevant experience, knowledge and wisdom in using the techniques and methods of modern decision making. *Behaviour of managers has been described by authors Bazerman and Moore (2012) on (p. 103).* Intuition is also important in the decision making process, as well as the proactive approach of solving problems. Intersection of different scientific disciplines points out to interdisciplinary framework of modern decision making.

Recommendation is that strategic positioning of business entity is oriented towards life-long learning and application of methods and techniques of modern decision making. The goal is achieving business excellence and leadership position in business environment. *Organizational decision making has been described by author Pettigrew (2014) in book (p. 229). Authors Power, Sharda and Burstein (2015) describe the latest tendencies in business decision support system (p. 20). Efficient strategies for mining association rules have been described by the authors Nguyen, Vo and Le (2014) in their research (p. 4716). Authors Howson and Hammond (2014) discuss the benchmarking of companies from the field of business intelligence with latest business solutions (p. 57). Latest tendencies of decision support system have been described by author Sauter (2014) on (p. 35).*

˝Association rules are useful tool for extracting new information from raw data described in comprehensive manner for decision makers" is defined by authors Ruiz, Gómez-Romero, Martin-Bautista, Sánchez, Vila and Delgado (2015) in their research (p. 247). Concept of association rules and datasets has been discussed by authors Simovici and Djeraba (2014) in their research (p. 647). Mining of association rules through new statistical method has been described by authors Zhang and Shi (2016) on (p. 10). *˝Analysis of relations between different technologies could result with maximization of profit. Association rules have been suggested for determination of dependencies between technologies", Altuntas, Dereli and Kusiak (2015) on (p. 249). Ding, He and Liang (2015) show the comprehensive system of evaluation of association rules (p. 304).*

*Humphrey (2005) describes SWOT analysis (**S**trengths, **W**eaknesses, **O**pportunities & **T**hreats Analysis) as technique of strategic management where strategic choices that connect and evaluate internal strengths and weaknesses of companies with opportunities and threats of external environment˝, (p. 7). SWOT analysis application was described by authors Ayub, Razzaq, Aslam and Igtekhar (2013) in their research (p. 92).* Table 1 shows the overview of significance of SWOT analysis of business decision making for business entity. Internal strengths and weaknesses of the business entity have been analyzed that relate to the process of business decision making. Based on the shown SWOT analysis, it is concluded that strengths and opportunities of the concept of business decision making are much better and more prosperous than the weaknesses and threats.

Table 1: SWOT analysis of significance of business decision making for business entity at the market

Strengths	**Weaknesses**
Higher effectiveness of managers' decisions. Strengthening of process of decision making. More effective management team. Educated human resources with knowledge and experience in decision making. Systematic positioning of concept of business intelligence in decision making process.	Continual costs of training and education of managers. Waiting time to see the effects of decisions. Uncompetitive management. Unavailable high-quality literature of topic of business decision making.
Opportunities	**Threats**
Better positioning at the market. Maximization of profit. Growth and development of business subject as consequence of taken suitable manager's decision. Taking leadership position at the market. Improved communication. Transparency of business.	Poor business of company as result of wrong manager's decision. Bad choice of strategic partnerships that leads towards bankruptcy of the company. Wrong choice of information from external sources that leads towards wrong decision making. Resistance of the environment towards changes.

2. RESEARCH FRAMEWORK

This paper describes the process of data mining concept implementation by creating model of association rules. CRISP-DM methodology and software Orange have been used in the research. *More details about*

phases of CRISP-DM methodology can be seen in research of Suknović and Delibašić (2010). Business problem consists of analyzing data of an air traffic field by methods and techniques of business intelligence, with highlight to association rules. Attributes and conditions for landing of an aircraft have been analyzed. Based on the applied data models it will be evaluated if an aircraft could land or not, taking into account weather conditions.

Evaluation of landing conditions and predictions through association rules have big significance because based on this the safety of an aircraft with crew has been evaluated. Datasets from real-term business settings have been used. There were 253 data iterations processed. Attributes that are being researched are: stability, consistency, magnitude, wind, altitude and visibility. Numerical values have been shown in database with *tab (tab delimited file) format, which is suitable for processing in software Orange.

After software evaluation, it was concluded that data in this format were prepared for modeling phase. Modeling is the central and the shortest phase of the process and it is done by numerous software solutions for data mining through algorithms. In further research of database of an air traffic, Apriori algorithm has been used. *More about Apriori algorithm can be seen in book by Adamo (2012) on (p. 33).* Solution will be effectively applied in real-term business settings. Association rules have been generated. (p. 47).

Figure 1 shows desktop of an open-code software Orange, which was used during the research. On the left-handed side there is menu with options for data processing and tools of business intelligence. On the right-handed side there is desktop space where models of business intelligence are being created. Icons are being connected on the certain pattern and therefore models of different purposes have been created. *Authors Rouhani, Ashrafi, Ravasan and Afshari (2016) describe the influence of model of business intelligence to decision making and organizational benefits (p. 19).* Figure 1 shows the model of association rules application that has been used during the research.

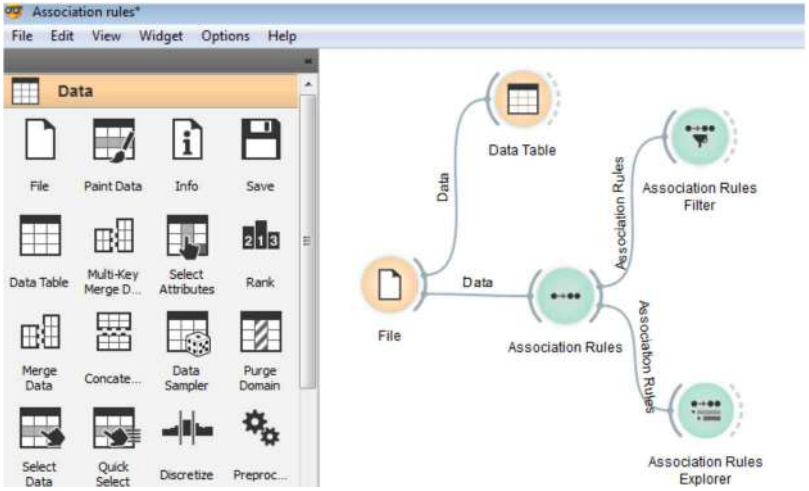

Figure 1: Desktop of software Orange

Further analysis provides overview of data without missing values. The iterations of data are clearly shown, as well as the visibility and data value of the collected data for the research (Figure 2). *Authors Fan and Bifet (2013) describe mining of big databases, as well as future tendencies in this field (p. 3).* After data preparation and immediately before modeling, these characteristics have been shown:

- Database on Figure 2 contains 253 data iterations. Taking into account that data are from real business settings and that it is very difficult to get data from the real business system of air traffic, it is concluded that database is on satisfactory level for the analysis.

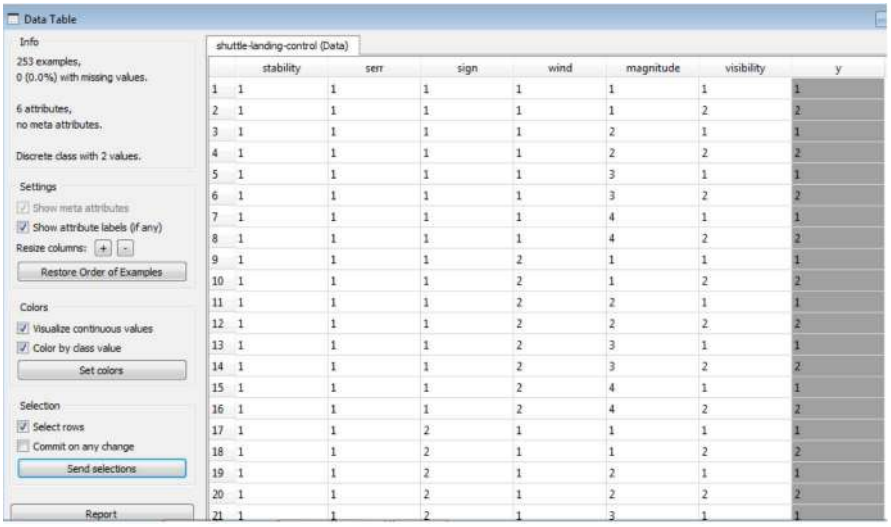

Figure 2: Overview of project data

- After an extensive research of domestic search engines and databases, it is evident that there is no scientific paper that is dealing with the application of association rules as part of business intelligence applied on the real data in air traffic field. Therefore, there is need and interest for research of this field.
- It rarely happens that when preparing data from database there is no missing values. However, when it is case, then further prepare data before processing is needed by special algorithms and processes.. It is concluded that existing database is very suitable for further research.
- Six attributes present the important items that analyze parameters necessary for evaluation of landing the aircraft.

Figure 3 shows list of five association rules by using generic model.

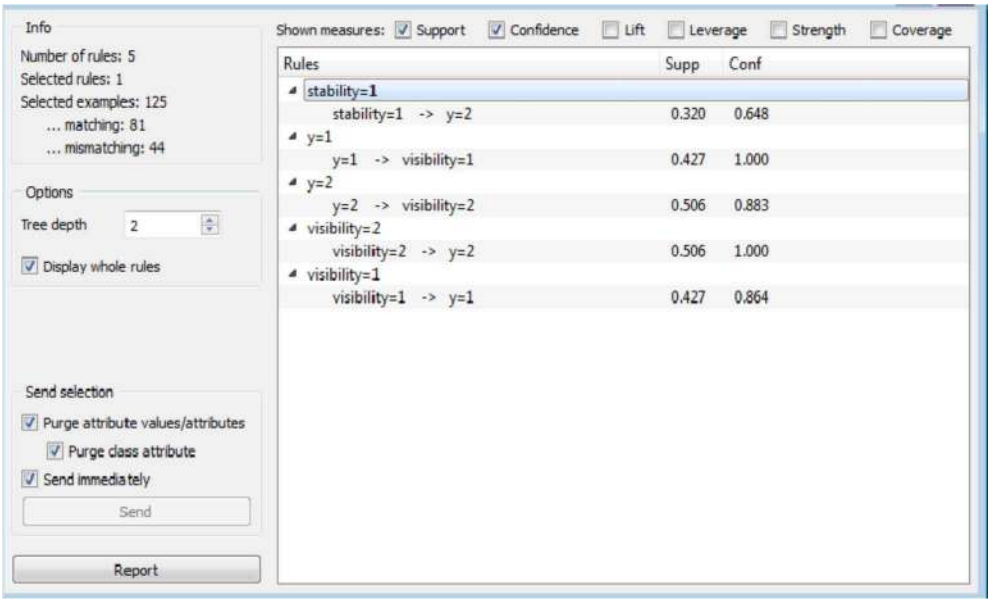

Figure 3: Overview of association rules

For each association rule there are quality measures shown: support and confidence. The first association rule has been highlighted. It can be seen that from 125 selected examples, 81 data examples do not match with first association rule. Further it can be seen that 44 examples do not match with gained association rule.

3. DISCUSSION

There are five association rules:

1. If attribute stability has numerical value 1, than it follows that iteration belongs to class Y 2, which is marked with landing confirmation, with support of 0.320 and confidence of 0.684.
2. If an iteration belongs to class Y 1 (landing rejection), than visibility has been marked with numerical value 1, with support of 0.427 and confidence of 1000.
3. If an iteration belongs to class Y 2 (landing confirmation), than it follows that visibility belongs to numerical value 2, with support of 0.506 and confidence of 0.883.
4. If visibility is marked with numerical value 2, than it follows that iteration belongs to Y 2, than it is recommended to land (confirmation), with support of 0.506 and confidence of 1000.
5. If visibility is marked with numerical value 1, than iteration belongs to class Y 1, as rejection for landing the aircraft, with support of 0.427 and confidence of 0.854.

Analyses of gained association rules have shown that rules number 2 and number 4 have biggest values of quality measures of confidence. It is determined that these two rules have biggest possibility to belong to certain class (for rule number 2 it is class Y 1, and for rule number 4 it is class Y 2). Analyses of support have shown that rules number 3 and number 4 have biggest possibility to fulfill conditions from the IF –part of the rule. Biggest possibility is that attribute belongs to class that is confirmed for landing (rule number 3) and that visibility has been marked with numerical value 2 (association rule number 4).

Based on the practical application of association rules it is determined that there is potential and confidence in calculations with parameters for more precise determination if landing conditions are suitable or not. Significance of gained results is obvious in the possibility of systematic overview of conditions in air traffic and based on that getting appropriate decisions on landing that were helped by this tool of business intelligence.

4. CONCLUSION

Presented model of decision making is helped by the methods of business intelligence of tool of an open-code software Orange has shown application in high effectiveness and accuracy in real-term settings of air traffic. It is recommended to further research and apply the model in the field of air traffic because this field has big potential and it is still relatively unresearched area. Model can be tested and developed in other similar fields of interest. In industry accent is on practical application of sustainable business development. For instance: evaluation of working of cars and conditions for driving; evaluation of various machines in factories; education of managers. In Academia the application of model can be used for the improvement at different levels of studies; use of case studies in the laboratories; students' education and the use of their knowledge and skills for different kinds of application and creation of new model. In public institutions the use of this model can be in Civil Aviation Directorate, also in different agencies for market analysis, etc. Civil society can use the model for personal non-commercial purposes for the research and application of model, in order to gain knowledge and education.

PREDICTING RISK OF BUYING LOW QUALITY CAR WITH RAPID MINER

Nemanja Mitic[1], Ana Jankovic[1], Milan Vukicevic[1]
[1]Faculty of Organizational Sciences University of Belgrade, Belgrade, Serbia
Corresponding author, Milan Vukicevic e-mail:vukicevicm@fon.bg.ac.rs

Abstract:*In this research, we build and evaluate several models for prediction of risk of buying alow quality used car. Highly accurate predictive model can serve as a decision support for car resellers and private users. Data is provided from the Kaggle.com challenge "Don't Get Kicked" hosted by Carvana.We followed CRISP-DM methodology for building and evaluation of predictive models. Special attention was given to automatic feature selection and algorithm parameter optimization.Complete experimental evaluation is conducted in Rapid Miner – one of the most popular open source Data Science environments.*

Keywords*:Car buying, Predictive modeling, Rapid Miner, CRISP-DM, Feature selection, Parameter optimization*

1. INTRODUCTION

One of the biggest challenges today is to find right product with good quality that fits all our needs. This problem becomes greater when aproduct that we want to buy is already used. In nowadays car market of used automobiles is very rich. And when we go to theauto dealership with the intent to buy a car, we want to make a good selection and to be able to trust the condition of the car that we want to buy. The output of this buying is agreat risk that the vehicle might have serious issues like mechanical issues, tampered odometers etc. The auto community calls these unfortunate purchases "kicks".

In this paper, we are building models that can predict and quantify the risk of buying a car that has low quality. We based our work on CRISP-DM methodology. CRISP-DM methodology is Cross Industry Standard that addressed parts of problems by defining a process model which provides a framework for carrying out data mining projects which are independent of both the industry sector and the technology used.(Wirth andHipp, 2000). Using this methodologywe have followed next steps:

- Business understanding
- Data understanding
- Data preparation
- Modeling
- Evaluation
- Deployment

Every phase of this process is important but crucial steps are business and data understanding and preparation of data which took most of the time in our process. We used Rapid Miner for creating our model. Rapid Miner is a software platform developed by the company of the same name that provides an integrated environment for machine learning, data mining, text mining, predictive analytics and business analytics.(Hofmann andKlinkenberg, 2013).RapidMinerwas used for building several processes for automatic building and evaluation of the models, but also feature selection and algorithm parameter optimization. Our main goal was to investigate theperformance of single and ensemble predictive models and to try to further improve them with feature and sample selection techniques. Winner of this competition focused his efforts on feature construction and building of different ensemble models, that are mostly based on LogitBoost and Decision stump models. These algorithms are evaluated in this research. However, we couldn't make a direct comparison with the winner of Kaggle competition, since the exact experimental setting is not published. Some details of winning model can be found in following the blog: http://blog.kaggle.com/2012/02/06/kicking-goals-an-interview-with-marcin-pionnier-of-the-winning-team-in-dont-get-kicked/.

2. DATA UNDERSTANDING AND PREPARATION

Our first major challenge was the preprocessing of data. We obtained our data set from the Kaggle.com challenge "Don't Get Kicked" hosted by Carvana(https://www.kaggle.com/c/DontGetKicked/data). The dataset contained 32 unique features with 72,983 samples along with a labeling of 0 for good car purchases

and 1 for "kicks".Some of themain attributes include odometer readings, selling prices, vehicle age and vehicle model.

We observed that output class was highly imbalanced8976 (12%) cases were labeled with 1 (badbuys) while 64007 (88%) cases were labeled with 0 (good buys). Figure 1 shows a number of good and bad buys (y-axis) over different car ages (x-axis). It can be seen that the best selling cars are aged between 2 and 6 years. Additionally, we can see that larger percentage of bad buys occur for older vehicles.

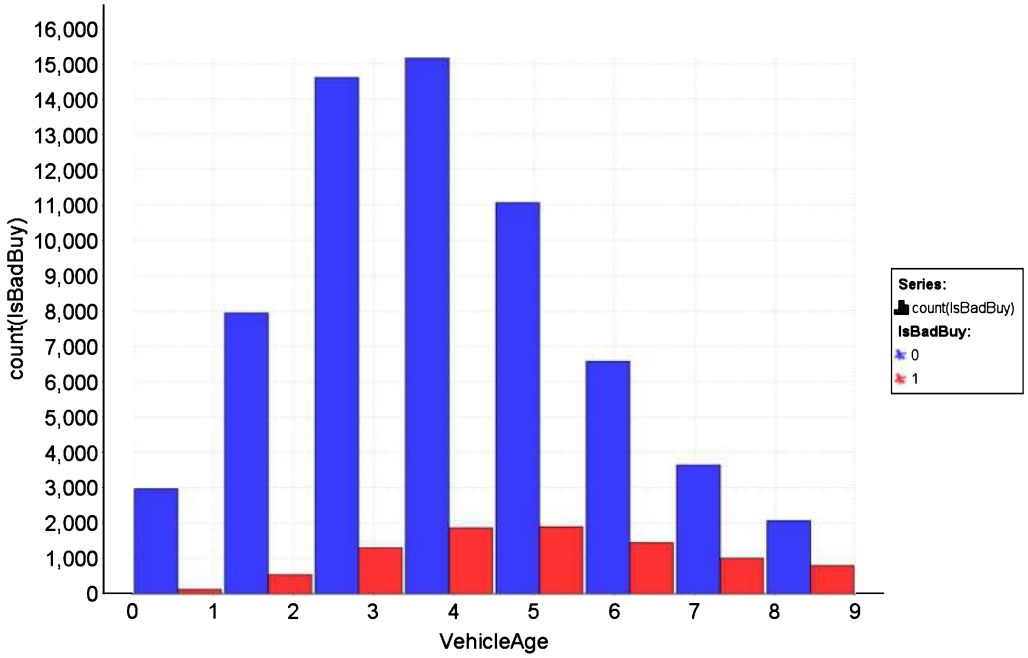

Figure 1: Histogram of good and bad buys over vehicle age

Further, we wanted to investigate theimportance of input features for predicting theoutput.For that purpose, we used three feature weighting techniques available in RapidMiner: Weight by Information Gain, Weight by Information Gain Ratio and Weight by Gini index. Detailed inspection of the results showed that all three feature weighting techniques had a consensus about 5 least important features ("Purch date", "IsOnlineSale", "Transmission" , "Nationality" , "Auction" , "VNZIP 1" and "Colour"). This is expected result since these features should not have relation with the car quality. Training data contain 2,674 missing values. Something we have observed immediately is that "good cars" are the most common in this set of data and make 87,7% of the examples and thus we replaced missing with average values. However, we acknowledge that some other type of imputation could lead to better predictive results.

3. MODELING

In this section, we briefly describe predictive models and feature selection techniques used in this research.

3.1. Naïve Bayes

The Naive Bayesian learning uses Bayes theorem with "Naive" assumption of independence between predictors (Russell and Norvig, 2003). Examples are classified based on the posterior probability that an example should be assigned to class.Even though independence assumption is violated in most real world applications, Naive Bayes often demonstrated satisfactory performance in practice (Rish, 2001), and was classified as one of the top 10 algorithms in data mining (Wolfson et al., 2014). Additionally, Naive Bayes models are easy to construct, without any setting or adjusting of complex parameters, computational and time effectiveness. Naive Bayes have the ability to work with large datasets (big data) and provide good interpretability (Hand and Yu, 2001).

3.2. Decision trees

Decision trees (DT) are predictive algorithms based on “greedy”, top-down recursive partitioning of data. DT algorithms perform an exhaustive search over all possible splits in every recursive step. The attribute (predictor) demonstrating the best split by some evaluation measure is selected for branching the tree. Regularly used are information theoretic measures (e.g. Information Gain, Gain Ratio, Gini etc.) or statistical tests quantifying the significance of the association between predictors and class. The procedure is recursively iterated until a stop criterion is met. Greedy strategy for DT building is often criticized, but the ability to build straight forward and the highly interpretable rules on massive data led to many successful applications in medical applications (Chao et al., 2014; Ting et al., 2014). They are also attractive classifiers due to their high execution speed. However, trees derived with traditional methods often cannot be grown to arbitrary complexity for the possible loss of generalization accuracy on unseen data. The limitation on complexity usually means suboptimal accuracy on training data. The essence of this method is to build multiple trees in randomly selected subspaces realize their classification in complimentary ways, and their combined classification can be monotonically improved (Ho,1995). This finding was used for efficient ensemble algorithms that will be described in the further text.

3.3. Ensemble algorithms

Ensemble algorithms combine multiple models in order to provide more accurate or more stable predictions. Ensemble models can aggregate the same model that is built on different subsamples of data, different models built on the same sample or a combination of the previous two techniques. Ensemble methods are often used to improve the individual performance of algorithms that constitute ensembles (Kuncheva and Whitaker, 2003) by exploiting the diversity among the models produced.

3.4.Random Forest

Random Forest (RF) is an ensemble classifier that evaluates multiple decision trees and aggregates their results, by majority voting, in order to classify an example (Breiman, 2001). There is a two level randomization in building these models. First, each tree is trained on a bootstrap sample of the training data and second, in each recursive iteration of building a DT (splitting data based on information potential of features), a subset of features for evaluation is randomly selected. This strategy allows efficient model building, and despite its random nature often provides highly accurate predictive models. In this research, we grew and evaluated Random Forest (RF) with 10 trees (with the default parameters of Weka’s implementation of Random Forest).

Random forestsis a notion of the general technique of random decision forests that are an ensemble learning method for classification, regression,and other tasks, that operate by constructing a multitude of decision trees at training time and outputting the class that is the mode of the classes (classification) or mean prediction (regression) of the individual trees. Random decision forests correct for decision trees' habit of overfittingto their training set.(Hastie et al., 2008)

Random forests are a combination of tree predictors such that each tree depends on the values of a random vector sampled independently and with the same distribution for all trees in the forest. The generalization error for forests converges as to a limit as the number of trees in the forest becomes large. The generalization error of a forest of tree classifiers depends on the strength of the individual trees in the forest and the correlation between them (Breiman, 2001).

3.5. Boosting

Boosting is an ensemble technique developed in order to improve supervised learning performance of weak learners (models whose predictive performance is only slightly better than random guessing). Boosting algorithms are built on a principle that subsequent classifiers are adapted to improve predictive performance on those instances that are misclassified by previous classifiers. In this research, we use Logit Boost (Friedman et al., 2000) technique and decision stump (weak learner) as suggested by thewinner of this competition.

3.6. Forward selection and backward elimination

The Forward Selection technique starts with an empty selection of attributes and, in each round, it adds each unused attribute of the given dataset. For each added attribute, the performance is estimated using the internal validation (usually cross-validation). Only the attribute giving the highest increase of performance is added to the selection. Then a new round is started with the modified selection. Backward elimination is using opposed strategy: it starts with all features and removes one by one until stop criteria are met.

4. EXPERIMENTAL EVALUATION

In our experiments, we wanted to compare the performance of several algorithms, and further to try to improve benchmark performance with algorithm parameter optimization, feature selection, and sample selection. RapidMiner process/sub-process structure and highly flexible process control, allowed us to define a process for automatic evaluation ofa number of algorithmsin one execution. Figure 2 shows one part ofthe automatic process. The upper part of the figure shows inner operators of “Validation” operator. “Validation” splits the data on training and test set (in our case 70% and 30% of the initial dataset). Further, In training part of “Validation” we used “Select sub-process” that allows iterative execution of a number of different algorithms (lower part of the figure). Finally, upper-right part of the figure shows part of testing, where models produced by the algorithms are applied and evaluated on the test set. This process also contained a procedure for decision tree optimization. We used grid optimization strategy that is available through “Optimize Parameters” operator. Decision Tree algorithm is optimized based on splitting criterion (gain ratio, information gain, gini index, accuracy) and stop criterion (maximal depth with possible values of 5,10,15,20,25, respectively).

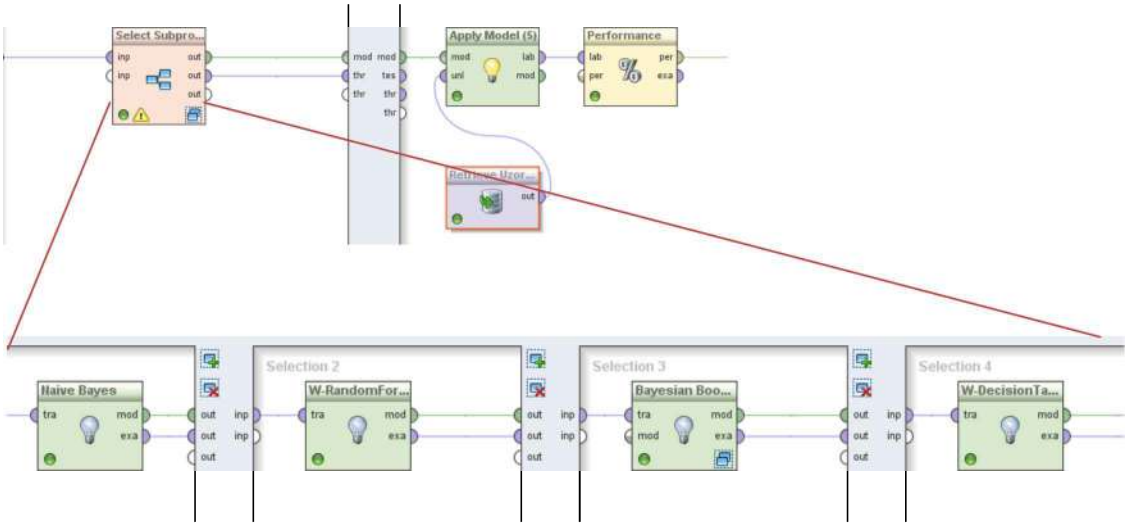

Figure 2: Process for automatic algorithm evaluation

4.1. Evaluation

All experiments are evaluated with three performance measures: Accuracy, F-measure, and Area Under Curve (AUC). Accuracy represents the percentage of testing set examples thatare correctly classified by the model. Even though this measure is frequently used in data mining research, it often results in misleading conclusions if it is not used along with some other evaluation measures. Namely, in the case of imbalanced output data, F-measure (also called F-score) is a measure of a test's accuracy. It considers both the precision p and the recall r of the test to compute the score: p is the number of correct positive results divided by the number of all positive results, and r is the number of correct positive results divided by the number of positive results that should have been returned. The F1 score can be interpreted as a weighted average of the precision and recall, where an F1 score reaches its best value at 1 and worst at 0.AUC is defined as the Area Under the Curve of the Receiver Operating Characteristics (ROC) and allows comparison of the general performance of binary classifiers, regardless of threshold selected for predictions. This is why it is often better for model evaluation than F-measure or Accuracy. Additionally, it does not give misleading results for imbalanced data.

4.2. Results

In the first part of the experiment, we evaluated benchmark models that are described in the previous section. Additionally, we also evaluated models that are built on balanced data. We undersampled majority class (leaving 6000 of positive samples and 12000 of negative samples) since this technique often leads to improvement of predictive performance of the models in cases of imbalanced data (He and Garcia, 2009). The results are showed in Table 1. On the left side of the table, we showed model performances for original and on the right side for balanced data. It is important to note that data balancing was conducted only on the training set. However, results show that performance by all evaluation measures and for all algorithms is decreased. This can be attributed to much smaller sample that was available with balanced data. t can be seen that best performance by all measures was achieved by Logit Boost (in both balanced and unbalanced cases). Further, decision tree (with and without optimization) showed the worst results. This is expected since it is widely known that these models have poor performance on imbalanced data.

Table 1: Performances of algorithm

Algorithm performance - training on unbalanced data				Algorithm performance - training on balanced data		
Algorithm	**AUC**	**Acc**	**f measure**	**AUC**	**Acc**	**f measure**
Naïve Bayes	0.682	0.751	0.848	0.680	0.699	0.807
Random Forest	0.696	0.874	0.931	0.663	0.785	0.874
Logit Boost	0.740	0.899	0.943	0.740	0.893	0.941
Decision Table	0.713	0.897	0.944	0.715	0.891	0.940
Decision tree	0.501	0.877	0.934	0.501	0.877	0.934
Decision tree (opt)	0.501	0.877	0.934	0.501	0.877	0.934

Additionally, it can be concluded from the results, that decision trees predicted only negative class since they had accuracy exactly the same as the percentage of the negative class in thetest set (and initial set). Since balancing the data showed adecrease in performance for all models, we excluded this dataset from further experiments.We additionally tried to improve thepredictive performance of our benchmark models by forward selection and backward elimination (described in theprevious section). The results are presented in Table 2.

Table 2: Results of algorithms using optimize selection

Algorithm performance –forward selection				Algorithm performance – backward elimination		
Algorithm	**AUC**	**Acc**	**f measure**	**AUC**	**Acc**	**f measure**
Naïve Bayes	0.658	0.885	0.937	0.751	0.711	0.808
Random Forest	0.658	0.885	0.937	0.751	0.792	0.895
Logit Boost	0.658	0.893	0.941	0.755	0.899	0.971
Decision Table	0.658	0.885	0.937	0.748	0.876	0.945
Decision tree	0.501	0.877	0.934	0.501	0.877	0.934
Decision tree (opt)	0.501	0.877	0.934	0.501	0.877	0.934

It can be seen that forward selection slightly decreased performance and backward elimination slightly increased theperformance of all models except decision tree.

5. CONCLUSION AND FUTURE RESEARCH

There has been a rapid growth of data mining in different application areas like business, healthcare etc.In this research, we exploited RapidMiner's possibilities for making flexible and automated process. We evaluated several single and ensemble predictive models and tried to improve their performance with feature selection, class balancing, and parameter optimization. In general, ensemble algorithms gave the best performance. Predictive performance on unseen cases is additionally improved by backward elimination procedure for feature selection. Undersampling of majority class did not give satisfactory results, most likely because of arelatively small sample of the data. In general, results obtained from presented experiments, show that they could be useful as a decision support for car buying. However, there is still a lot of room for further investigation and model improvement.

As a part of our future work, we plan to pay more attention to data pre-processing. We will try different sampling techniques (such as cluster sampling or systematic sampling), feature construction and selection techniques (i.e. PCA). Additionally, we will pay more attention to handling missing data. Finally, we will try to exploit more available ensemble algorithms as well as Support Vector Machines, Neural Networks etc.

PREDICTIVE MODELLING FOR CLAIMS PROCESSING – CASE STUDY OF BNP PARIBAS

Stefan Sreckovic[*1], Milija Suknovic[1], Milan Vukicevic[1]
[1]University of Belgrade, Faculty of Organizational Sciences
[*]Corresponding author, e-mail: vukicevicm@fon.bg.ac.rs

Abstract: *With the rising amount of business operations, claims management became an issue in insurance companies in order to process them accurately and fast at the same time. In this paper, a model is proposed for classifying new claim requests in BNP Paribas Cardif to ones that meet requirements for faster payments, and others that need some additional information before further processing. Training data set contained over 5000 instances, which represent claim requests, and more than 130 attributes. The data set was provided by www.kaggle.com as a part of 'BNP Paribas Cardif Claims Management' data mining contest. Using different algorithms, accuracy of 78.47% and AUC of 69.93% was achieved.*

Keywords*: predictive modeling, classification, insurance, claims management, ETL*

1. INTRODUCTION

BNP Paribas Cardif is a subsidiary of BNP Paribas Group based in France, which specializes in life and property insurance. It was founded more than 40 years ago and today operates in 36 countries while employing about 9000 people. Over 90 million people trusted BNP Paribas Cardif with insurance of their life and property, mainly in Europe, Asia and South America.

With the growing volume of business and rising amount of claims received, there is an issue of documentation processing speed required for the payment of insurance premiums. It is necessary to accurately process a lot of papers in a short period of time. With this in mind, people from BNP Paribas Cardif decided to set up their business problem to Kaggle platform in the hope of finding a model that will most accurately predict whether the claim contains a complete documentation so it can be processed faster or customers may need additional information before insurance company approves it.

The goal was to develop a model which precise predict the new claims requests, whether they are complete or not, depending on various attribute parameters. That model would speed up the claims management processes in an insurance company, reduce costs and would also allow the company to serve better customer experience to the customers and thus increase their satisfaction.

To develop a prediction model, software called RapidMiner was used, which is one of the leading freemium solutions on the market for predictive analytics. It supports the entire ETL (extract, transform, and load) process, pre-processing and visualization of data, statistical data processing, development of predictive models and much more. It supports various add-in extensions including Weka, R, Python and other which even more expand its possibilities.

2. STATE-OF-THE-ART

(Smith et al., 2000) were one of the first to publish a case study that involves data mining in the insurance industry. Their paper presents a case study involving two such problems and solves them using a variety of techniques within the methodology of data mining. The first of these problems was the understanding of customer retention patterns by classifying policyholders as likely to renew or terminate their policies. The second was better understanding claim patterns, and identifying types of policy holders who are more at risk. Each of these problems impacts on the decisions relating to premium pricing, which directly affects profitability. A data mining methodology was used which views the knowledge discovery process within a holistic framework utilizing hypothesis testing, statistics, clustering, decision trees, and neural networks at various stages. (Derrig and Ostaszewski,1995) have also provided an overview of fuzzy pattern recognition techniques in their paper and have used them in clustering for risk and claims classification

Some authors (Della Rocca, Johnson, 2010) were pointing out that increasing consistency in the claim-handling process not only improves policyholder satisfaction but also delivers measurable results to enhance

a carrier's bottom line. Advanced analytic technology and data-collection techniques can help an insurer settle similar claims in similar ways, leading to an adequate claim reserves, improved loss cost management, and more equitable settlements.

(Lentz, 2013) was pointing that some publications and vendors appear to promote predictive modeling as a way to automate decisions and allow a claim department to do more with fewer people. However, the principal goal of carriers using this technology is a better allocation of time and talent of claim professionals. Its purpose is to assist the claim professional through the course of a claim and provide supplemental information to be used in the decision-making process. While predictive modeling may enhance good claim handling, it cannot rectify poor claim handling. It is not a substitute for proper claim management methods and does not take the place of individual claim handling analysis.

(Rose, 2013) proposed that there are six areas where analytics can make a difference in claims management: fraud, subrogation, settlement, activity and litigation. He stated that adding analytics to the claims life cycle can deliver a measurable ROI with cost savings and that just a 1 percent improvement in the loss ratio for a $1 billion insurer is worth more than $7 million on the bottom line. (Derrig and Ostaszewski, 1995) have provided an overview of fuzzy pattern recognition techniques in their paper and have used them in clustering for risk and claims classification

Regarding fraud in claims management, it was discussed in many papers. (Phua et al., 2010) made a comprehensive survey that has explored almost all published fraud detection studies at the time, including claims. It was found that (Von Altrock, 1996) was able to achieve better claims fraud detection performances with his algorithms than the experienced auditors, while (NetMap, 2004) reported that visual analysis of insurance claims by the user helped discover the fraudster. (Huang, 1997) was using K-means algorithm for clustering large categorical data sets in his study and states that same technique can be used for detecting under-represented concepts like a fraud in a very large number of insurance claims (Ngai et al., 2011) made an exhaustive review of application of data mining techniques in financial fraud detection. (Sundarkumar and Ravi, 2015) proposed a novel technique for predictive modeling on imbalanced datasets in banking and insurance. This technique is based on under-sampling of training data with majority class. (Shi et al., 2015) proposed a series of multivariate negative binomial models for insurance claim counts.

(Frees and Valdez, 2008) were using negative binomial regression model for assessing claims frequency in automobile insurance records. Besides their second model was a multinomial logit to predict the event of a claim and severity component as a third one. When taken together, the integrated model was allowing more efficient prediction of automobile claims compared with than traditional methods. Using simulation, they demonstrated that by developing predictive distributions and calculating premiums under alternative coverage limitations.

A Towers Watson survey of Property and Casualty claim officers (Towers Watson, 2012) found that 63% of respondents have started to explore the use of predictive modeling in their claim operations. The survey further stated that 7% have already been using claim analytics for more than three years. (Lentz, 2013) proposed that the use of predictive modeling tools in claims is not meant to supplant the claim handler's own thought process; its purpose is to provide decision support for his or her individual analysis. As with other forecasting tools, predictive models indicate probabilities, not certainties.

At BNP Paribas Cardif Claims Management competition, training data set given to data analysts to create predictive classification models. (Lentz, 2013) was pointing that claim records with missing, incomplete, or erroneous data have a negative impact on the accuracy of the predictive model. As such, efforts to ensure clean and accurate data must be undertaken. This process may be long and costly for some insurers and more so for those with multiple legacy systems.

3. DATA

The data sets for this paper have been taken from the online predictive modeling and analytics competitions platform called Kaggle (https://www.kaggle.com/) and the theme was called "BNP Paribas Claims Management". Data sets are divided into training and test set. Training data had over 114.000 instances and 131 attributes. Besides them, there are two special attributes, ID or row number and Target, which represents output attribute or label with the values 0 and 1, where 0 means that claim documentation is not complete and thus needs further verification before payment, while 1 means that the claim documentation is complete and can be processed faster. There was a slight class imbalance, considering that there were 87 000 instances of class 1 and only 27.000 cases of class 0. In Figure 1 class distribution is shown.

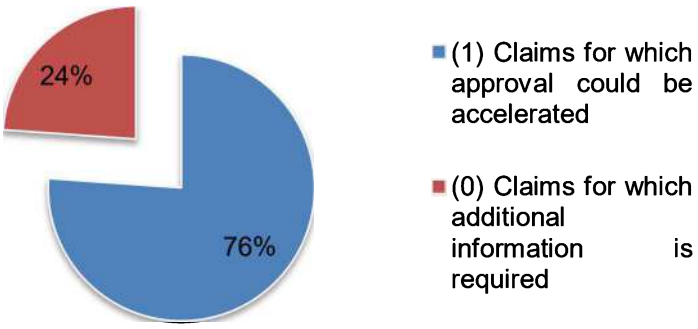

Figure 1: Class distribution

The attributes are of type integer, real or polynomial, which represent the vast majority. Also, attributes are unlabeled and marked with "v1, v2… v131" so I was denied of the meaning of each of them. On one hand, it prevents us to become more familiar with the data and eventually gather some insight of the problem, while on the other hand, compels us to focus on the very construction of the model predictions.

After loading the data, the first thing noticed was that there are a lot of missing values. Exactly 102 attributes have more than 40 percentage of missing values. As a result, almost 50.000 instances, or more than 40 percent of all user cases have around 70 percent of missing values. As the database contained over 100.000 instances and over 130 attributes, due to hardware limitation, experiments are conducted on 5.000 randomly sampled.

4. EXPERIMENTAL SETTING

In order to develop a highly accurate model for claim requests classification, we used the following predictive algorithms: Neural Net, Decision Tree, K-NN, W-Random Forest, Logistic Regression and Bayesian Boosting. Before the initial commissioning test, all the missing values were replaced with median values of attributes. It is important to note that other types of imputation techniques could be used for missing value imputation (i.e. model-based imputation) and possibly improve the final predictive performance of the models). Since we aimed to compare the performance of different predictive models and different feature selection techniques on a specific problem, detailed analyses of models for missing value imputation was out of the scope of this paper.

Polynomial attributes were converted to binominal given that Logistic Regression and Neural Net do not work with categorical values. Bearing this in mind, the attribute v22 was removed from further testing due to the fact that there are more than 17.000 categorical values and trying to convert its type to numerical or even binominal, each time the computer ran out of memory, the process froze and the operation could not be executed. Because of complexity and memory requirements of the algorithms (and optimization procedures) used in this research, original training set that contained 100.000 impressions, was reduced to 5.000 instances. In order to preserve distribution of the output class in the training set, stratified sampling technique was used.

In order to prevent overfitting that could be caused by extensive optimization of algorithm parameters and feature sets, inner validation has been used. Each model was trained on 70 percent of training data and validated on 30 percent. Finally, estimation of the future performance of optimized models was conducted on a complete test set that contained over 110.000 instances.

To measure the quality of selected models, I have decided to use accuracy and AUC. Accuracy as a measure represents the proportion of truly predicted cases over the entire data set. In this case, it is calculated as the sum of the number of predicted insurance claim requests that contain complete documentation which they truly do and the number of claims that do not have complete documentation which they truly don't, in relation to the number of the sum of all correct and incorrect predictions of a model.

$$Accuracy = \frac{TP + TN}{TP + TN + FP + FN}$$

The area under the curve, known as AUC, presents a measure of the discriminatory power of classifiers. It is very good for measuring performances of binary classifiers and it takes values from zero to one. When the value is above 0.5 it is a positive class prediction, and when is between 0.7 and 0.8 it is a good classifier, between 0.8 and 0.9 very good, and above 0.9, it is excellent.

5. RESULTS

A comparative review of the performance of the algorithms is shown in Table 1. Results are obtained through testing the model of the initial set and then adding weighting to the attributes with operators "Weight by Gini" and "Weight by SVM ".

Regarding the initial model, only necessary changes of obtained training data set were carried out, so that all algorithms work properly. All categorical attributes were converted into numerical because Neural Net and Logistic Regression do not work with categorical ones, the missing values have been replaced with average values of specific attributes and already mentioned attribute v22 was removed from the training set.

Best performance was achieved with Bayesian Boosting model. It is based on Bayesian theorem and it is used to improve the performance of other algorithms, in this case, W-Decision Table. The accuracy obtained with this model was 78.00%; however, the Neural Net and W-Random Forest were not far behind with 76.13% of accurate claims predictions.

Table 1: Initial performances of algorithms

	Initial model		Weight by Gini		Weight by SVM	
Algorithm	**AUC**	**Accuracy**	**AUC**	**Accuracy**	**AUC**	**Accuracy**
Neural Net	68.76%	76.13%	71.08%	76.13%	66.43%	76.67%
W-Random Forest	61.01%	76.13%	65.49%	76.47%	63.86%	76.13%
Bayesian Boosting - W Decision Table	69.91%	78.00%	69.93%	78.47%	68.93%	78.00%
K-NN Classification	50.00%	67.47%	50.00%	68.07%	50.00%	65.80%
Logistic Regression	69.63%	75.40%	68.17%	64.47%	69.90%	66.80%
Decision Tree	50.00%	75.73%	50.00%	76.00%	50.00%	75.93%

Additionally, we compared model performances in synergy with feature weighting and selection scheme. Weighting factors have been assigned to attributes via operator "Weight by Gini". After assigning weights, by the operator "Select by weight" I have influenced the selection of attributes which will be used in modeling algorithms.

The best performances were achieved by filtering the attributes that had normalized weight value greater than 0.26. Again, Bayesian Boosting algorithm gave the best results of all algorithms, and its performances were slightly increased compared to initial model: accuracy at 78.47% and AUC 69.93%. Other algorithms have also made a small progress in their performances, as it is shown in Table 1. The exception is Logistic regression which showed significantly poorer performance after this process.

By assigning weighting coefficients to the attributes using operator "Weight by SVM" and afterward filtering them, only Neural Net model showed improved accuracy (76.67%). However, AUC was only 66.43% comparing to satisfying 71.08% when the attributes were selected after weighting them using "Weight by Gini".

Further, parameter optimization is conducted. Starting from K-NN algorithm, k parameter and distance measure were optimized using validation so that model would not over fit. With values k=9 and using "Mixed measures" as distance measures to nearest neighbors, accuracy was 77.20% and Area under the curve was 66.07%, which is far better than the performance that I have got in previous interactions.

Optimizing Logistic regression and its parameter C, I have also been able to get better performance of the algorithm. In this case, accuracy was 77.20% while AUC was at 67.88%.

When it comes to Decision tree algorithm, by optimizing depth of the tree at 17, minimal gain at 0.03 with Gini index, criterion and turned off pruning option, results became much better. The accuracy of the model was 78.33% while the AUC was 67.54%, which is significantly better than the original 50.00% gained with the initial model parameter settings.

Table 2: Final performances of algorithms

Algorithm	AUC	Accuracy	Obtained by
Neural Net	71.08%	76.13%	Weight by SVM
W-Random Forest	65.49%	76.47%	Weight by Gini
Bayesian Boosting - W Decision Table	69.93%	78.47%	Weight by Gini
K-NN Classification	66.07%	77.20%	Optimize parameters
Logistic Regression	67.88%	77.20%	Optimize parameters
Decision Tree	67.54%	78.33%	Optimize parameters

Best performances by algorithms that have been obtained in this paper are shown in Table 2. By optimizing parameters of the algorithms, we were able to improve results compared to the initial model settings, especially with the Decision tree. Although all algorithms have approximately same performance, the Bayesian Boosting ensemble stands as the best algorithm outs with an accuracy of predicting new claim requests at BNP Paribas Cardif at 78.47%.

Predictive models for claims management that were obtained in this paper could be used by insurance organizations employees that deal with claims on daily basis in order to classify new requests; whether the claims payout process could be speed up, leading to higher customer satisfaction and cutting the costs of employees efforts analyzing requests, or the claims documentation should be revised. It could help employees make faster and more accurate decisions, leading to lower costs and higher efficiency.

6. CONCLUSION

In this research, we compared the predictive performance of several predictive models for classification of new claim requests in BNP Paribas Cardif. Development of accurate predictive model could serve as decision support for claims approval: weather approval could be accelerated, leading to faster payments, or it requires additional information before payout. Development of highly accurate predictive model could help the BNP Paribas Cardif insurance company to faster cultivate claims, reduce costs and increase the satisfaction of its clients. In order to improve predictive performance of the models, we conducted a number of experiments that include optimization of model parameters as well as feature sets. The results that were obtained in this research were satisfying, but there is certainly space for improvement. In our future work, we plan to conduct experiments on the larger training set, to investigate the performance of different methods for missing value imputation and to use advanced predictive methods like Support Vector Machines and Deep Learning based on Neural Networks.

Abstract: *The purpose of this paper is to introduce a novel logical classification (LC) method and further evaluate its application for bankruptcy prediction. Logical classification is based on nearest prototype classifier that employs a novel similarity measure and logical aggregation based on interpolative Boolean algebra (IBA). In this research logic-based classifiers are compared to Altman Z score as a benchmark model for bankruptcy prediction. Their classification performance is evaluated on Serbian middle-sized companies. The analysis shows that LC models are reasonable good classifiers and that they outperform Altman Z score.*

Keywords*: logical classification, similarity, IBA similarity measure, bankruptcy, company*

1. INTRODUCTION

Bankruptcy prediction is one of the main issues threatening many companies and governments. Bankruptcy is the inability of debt repayment to creditors. According to Chaudhuri (2013) financial distress begins when an organization is unable to meet its scheduled payments or when the projection of future cash flows points to an inability to meet the payments in near future. Chaudhuri (2013) also describes bankruptcy prediction as a complex process that consists of numerous inseparable factors. The causes leading to business failure and subsequent bankruptcy can be divided into economic, financial, neglect, fraud, disaster and others (Chaudhuri, 2013). With more accurate bankruptcy detection techniques, companies could take some preventive measures in order to minimize the risk of falling to bankruptcy.

Developing different methods for bankruptcy prediction is a popular subject among different authors who addressed the problem of finding the more accurate technique for this problem. There are two dominant approaches when it comes to predicting bankruptcy. The first one is based on statistical methods and was pioneered by Beaver (1966) and Altman (1968) who used multi-discriminant analysis. Beaver (1966) used univariate approach and found that net income to total debt had highest predictive ability. Olson (1980) and Zmijewski (1984) developed stochastic models such as logit and probit. As parametric models dominated the research focus at beginning, studies using non parametric models started to develop in late 1980s. Besides classical methodology many researchers have started introducing numerous alternative methods to predict bankruptcy. In the past decade, three important models namely Bayesian, Hazard and Mixed logit have been applied to bankruptcy prediction (Chaudhuri, 2013). According to Chaudhuri (2013) these models have subtle theoretical advantages over previous ones. He also points out that prior knowledge, practical estimates and subjective preferences are easy to incorporate into the model, either simultaneously or separately. The advantage of Hazard model over logit is that the former explicitly models bankruptcy not as process that happens at a point in time, an assumption made by all previous models, but as process that lasts for period of firm's life (Chaudhuri, 2013). Hazard model is preferable as it incorporates time varying covariates. The improvement of mixed logit model over logit is that it takes into account both observed information and unobserved information. Under this setting, there are two means to model unobserved information. Second approach utilizes artificial intelligence (AI) and adapts it for predicting bankruptcy. Min and Jeong (2009) described AI methods which include a decision tree, fuzzy set theory, case-based reasoning, genetic algorithm, support vector machine, data envelopment analysis, rough sets theory, and several kinds of neural networks such as BPNN (back propagation trained neural network), PNN (probabilistic neural networks), SOM (self-organizing map), Cascor (cascade correlation neural network). Kumar and Ravi (2007) has given an extensive review of bankruptcy prediction in banks and firms via statistical and intelligent techniques studies. Comparative analysis of data mining methods for bankruptcy prediction is given in (Olson, Delen, & Meng, 2012).

In many applications a good classifier should not only offer superior class predictions but also interpretation and understandability of the classification results. For instance, a manager wants to understand the characteristics of the situation that led to the decision proposed by the model (Kriegel, & Schubert, 2006). In this paper, we propose a novel similarity-based classifier - logical classification (LC). LC algorithm is based on the nearest prototype (centroid) classifier with a difference that it employs a similarity measure based on

interpolative Boolean algebra (IBA) (Radojević, 2000) and pseudo-logical aggregation (Radojević, 2008) for measuring similarities. The proposed classifier has strong mathematical background and is computationally efficient technique. It can also provide semantic information about classification results which is another important aspect of designing a classification algorithm. Further in the paper, the proposed logic-based classification approach is evaluated in bankruptcy prediction of Serbian middle-sized companies.

The paper is structured as follows. First of all, in Section 2 we present briefly theoretical concepts and methods used in this paper – Altman Z-Score model, IBA similarity measure and logical aggregation. In section 3 a novel logical classification method is presented. Further, Section 4 describes our company dataset and how the experiment is conducted. Here we also present and discuss results. In the final section we conclude the paper.

2. THEORETICAL BACKGROUND

2.1. Altman's Z-Score model

The first multivariate model for bankruptcy prediction of companies was Z-score (publicly traded firms) by Altman (1968). This model has proved to be the most efficient and has been in use for more than four decades. In determining the Z-score model it is necessary to divide sample into two groups, one group for bankrupt and the other for the non-bankrupt companies. For his research Altman divided 66 companies into two groups and used five out of 22 financial indicators for multivariate discriminant analysis. Altman (2000) found that the following five ratios provide the best results of Z-score model:

$$Z = 1.2X1 + 1.4X2 + 3.3X3 + 0.6X4 + 0.999X5 \quad (1)$$

Where:
X1 = Working Capital / Total Assets;
X2 = Retained Earnings / Total Assets;
X3 = EBIT (Earnings before Interest and Taxes) / Total assets
X4 = Market Value of Equity / Book Value of Total Liabilities
X5 = Sales / Total Assets

1) The Working capital/Total assets ratio (X1) is a measure of the net liquid assets of the companies relative to the total capitalization.
2) The Retained Earnings/Total assets ratio (X2) refers to the earned surplus of a company over its entire life.
3) The Earnings before interest and taxes/Total assets ratio (X3) is a measure of the true productivity or profitability of the assets of a firm. It is not affected by any tax or leverage factors. It reflects the earning power of the assets that determines the value of assets.
4) The Market value equity/Book value of total liabilities ratio (X4) shows how much the assets of a firm can decline in value (measured by market value of equity plus debt) before the liabilities exceed the assets and the firm becomes insolvent.
5) The Sales/Total Assets ratio is the standard capital-turnover ratio illustrating the sales generating ability of the assets of a firm. It refers to the capability of management in dealing with competitive conditions. This ratio was dropped in the Z"-Score model.

Altman's Z-score lower than 1.81 indicates that the company is heading for bankruptcy. Companies with scores above 2.99 are unlikely to enter bankruptcy. Scores between 1.81 and 2.99 mean that the company is in a gray area.

2.2. IBA similarity measure

Similarity between two objects is perceived differently when diverse similarity measures are applied (Poledica et al., 2015). From the standpoint of logic, similarity may be perceived by means of logical relations e.g. bi-implication and equivalence. In (Poledica et al., 2015; Poledica et al., 2013) IBA equivalence is introduced as a logic-based similarity measure where similarity is measured using [0,1]-valued realization of equivalence relation in interpolative Boolean algebra.

Interpolative Boolean algebra (Radojević, 2000) is [0,1]-valued realization of Boolean algebra (BA). It is a consistent framework in the sense it preserves all Boolean axioms (e.g. excluded middle, contradiction, etc.). In IBA logical Boolean functions are uniquely mapped to corresponding generalized Boolean polynomials

(GBP). Introducing intensity of relation, i.e. gradation of Boolean variables and functions, IBA is suitable for many real problems thanks to the descriptiveness of gradation.

When it comes to modeling similarity, logical relation of equivalence in its original form treats only two values: 0 and 1. However, human perception of similarity is rather graded. To calculate the degree of similarity between objects on the whole [0,1] interval, the GBP for logical expression of equivalence is first determined. Finally, its corresponding realization on the valued level is:

$$S_{IBA}(a,b)=1-b-a+2\cdot a\otimes b=1-b-a+2\cdot\min(a,b) \tag{2}$$

Radojević (2000) defined the mapping procedure of Boolean functions into GBPs, and the software support is provided in (Milošević et al., 2014).
In (Poledica et al., 2015; Poledica et al., 2013) it is also shown that the previous expression satisfies all properties for similarity measure: non-negativity, symmetry and limited range. In addition to strong mathematical background, IBA similarity measure is valuable from the aspect of interpretation. When comparing two objects it measures the degree to which a certain quality is present but also includes the degree of the absence of that quality as equally important. The graphical interpretation of similarity based on IBA equivalence is also provided in (Poledica et al., 2015). In Figure 1 $\min(a,b)$ describes how much two objects are the same with respect to a certain feature, and $1-a-b+\min(a,b)$ defines how much two objects are the same regarding the absence of that feature.

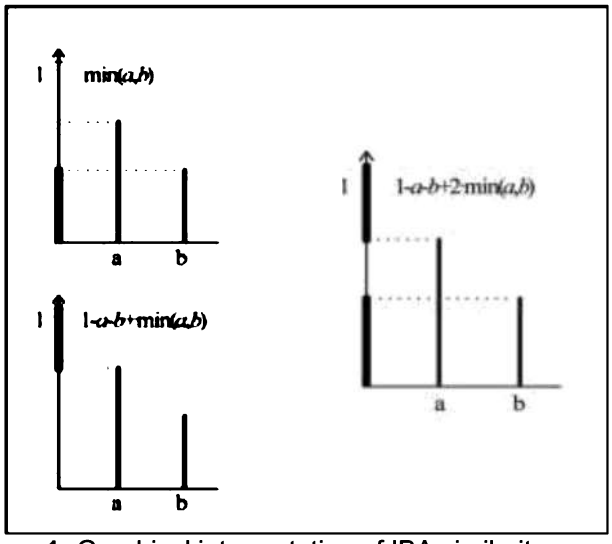

Figure 1: Graphical interpretation of IBA similarity measure

Additionally, similarities based on IBA equivalence may be further aggregated with logical aggregation (Radojević, 2008) which is also based on IBA.

2.2. Logical aggregation

Logical aggregation (LA) is a consistent and transparent procedure based on IBA for aggregating factors (Radojević, 2008). The main idea is to create aggregation functions in form of logical expressions which are used to aggregate primary/combined attributes into a single resulting value. It has two steps:

- Normalization of attributes' values:

$$\|\bullet\|:\Omega\rightarrow[0,1] \tag{3}$$

- Aggregation of normalized attributes' values into one resulting value by logical or pseudo-logical function used as a LA operator:

$$Aggr[0,1]^n\rightarrow[0,1] \tag{4}$$

Pseudo-logical function, called pseudo GBP, is a linear convex combination of generalized Boolean polynomials. Logical aggregation depends on choosing: the measure of aggregation (structural function of pseudo-logical function) and operator of generalized product. As a special case, LA operator can be expressed in form of other well-know aggregation operators such as weighted sum, arithmetic mean, min or

max function, discrete and generalized Choquet integral, etc. Logical dependence between aggregating factors may also be taken into account (Radojević, 2008). Being an expressive aggregation tool, LA is able to build various aggregation functions that depend on the nature of a problem (e.g. Milošević et al., 2013; Poledica et al., 2010).

3. LOGICAL CLASSIFICATION METHOD

In this paper, we propose a novel similarity-based classifier - logical classification (LC) method. It is based on nearest prototype (centroid) classifier in sense that it assigns to an instance the class of training set whose prototype is the closest to the instance. The proposed method is 'logical' as it employs logical relation of equivalence for measuring similarity. More precisely, multi-valued [0,1] realization of equivalence - IBA equivalence and LA tool are used to calculate similarities in the classification model. Thus, it is possible to build classifiers that provide semantic information about classification results.

Logical classification is a straightforward procedure and has the following steps:
- Scaling between [0,1] of training and test dataset
- Calculation of prototypes for every class
- Calculation of similarities between test set and prototypes
- Assigning class to test set

The problem is to classify dataset X into n different classes $C_1, C_2, ..., C_n$. Every data instance is described by different m attributes $a_1, a_2, ..., a_m$ that can be expressed or normalized in values between 0 and 1. This is a mandatory condition in IBA framework that is for IBA similarity and logical aggregation. Prototype vectors p_i for each class are represented by aggregated attributes for all instances in the training set of size dim.

$$p_i(a_1, a_2, ..., a_m) = \left(Agg_{j=1}^{\dim}(a_{1j}), Agg_{j=1}^{\dim}(a_{2j}), ..., Agg_{j=1}^{\dim}(a_{mj}) \right), \quad i = 1, ..., n \tag{5}$$

In this paper, to obtain attributes of prototype vectors for each class we used simple mean aggregation, as a special case of LA aggregation. Further, we calculate similarities of corresponding attributes for all instances of test data and prototype vectors by means of IBA similarity measure:

$$S_{IBA}(x, y) = Agg_{k=1}^{m}\left(1 - x(a_k) - y(a_k) + 2 * \min(x(a_k), y(a_k))\right), \quad x, y \in [0,1]^m \tag{6}$$

In the next step, based on maximum similarity between test instances and prototypes, test instances are assigned to appropriate class. Formally, if test instance $x \in C_n$ then:

$$S_{IBA}(x, p_n) = \max_{i=1...n} S_{IBA}(x, p_i) \tag{7}$$

In the algorithmic form LC classifier is as follows:

```
Algorithm: Logical classification
      input: trainData and testData with i=1…n classes,
             size of testData d,
      output: class
begin
1  scale trainData between [0,1]
2  scale testData between [0,1]

3  for i=1 to n do
4    p[i]=computePrototype(trainData[i])
5    similarity[i]=S_IBA^(j=1…d)(p[i],testData[j])
6  end

7  class=argmax_i similarity[i]
end
```

In this experiment we used different logical aggregation functions that are further presented:
- LC_1 classifier uses simple average as a special case of pseudo LA operator:

$$S_{IBA}(x,y)=\sum_{k=1}^{m}\left(1-x(a_k)-y(a_k)+2*\min\left(x(a_k),y(a_k)\right)\right) \quad (8)$$

- LC_2 classifier aims to include interaction in the data and uses common product for operator of generalized product in LA aggregation between all attributes:

$$S_{IBA}(x,y)=\prod_{k=1}^{m}\left(1-x(a_k)-y(a_k)+2*\min\left(x(a_k),y(a_k)\right)\right) \quad (9)$$

- LC_3 classifier is similar to LC_2 but attempts to treat similar nature in the data:

$$S_{IBA}(x,y)=S_{IBA}(x,y)_{1,2}\cdot\prod_{k=3}^{m}\left(1-x(a_k)-y(a_k)+2*\min\left(x(a_k),y(a_k)\right)\right) \quad (10)$$

where $S_{IBA}(x,y)_{1,2}$ is used to calculate similarities only for the first two (highly correlated) attributes in our data set. Minimum is applied for the generalized product in LA because these attributes are similar by nature.

$$S_{IBA}(x,y)_{1,2}=\min\left(1-x(a_1)-y(a_1)+2*\min\left(x(a_1),y(a_1)\right),1-x(a_2)-y(a_2)+2*\min\left(x(a_2),y(a_2)\right)\right) \quad (11)$$

4. EXPERIMENT AND RESULTS

4.1. Data and experiment

In the experiment we used a database provided from “CUBE Risk Management Solutions” a company that operates in the field of business information and credit risk services. The database contains financial data on 1020 middle-sized companies from Serbia. The companies are selected according to Accounting and Auditing Law ("Off. Gazette of RS", no. 46/2006, 111/2009 and 99/2011) which treats classification of legal entities in Serbia. The financial dataset include figures from annual financial statements balance sheet, income statement and statistical annex for 2014 and 2015. There are 984 companies which are active and 36 in the process of bankruptcy or liquidation. For each company we calculated five financial ratios used in Altman Z score model described in the second chapter (Eq. 1). The financial ratios for year 2014 are used as inputs in logical classification model. The predicted output is company status in year 2015: active or bankrupt.

In the experiment we compared Altman Z score as benchmark model with three LC models described in previous section: LC_1 (Eq. 8), LC_2 (Eq. 9) and LC_3 (Eq. 10, Eq. 11). The idea was to use the same ratios from linear Altman model as inputs in LC classifiers to test whether we can improve classification performance. The experiment was conducted on a non-balanced dataset.

To enable fair comparison of the models, it is important to consider various factors in the dataset that may have an effect on classification performance. In case of Altman's Z score model these factors are year of bankruptcy, company size, company age, industry and country of origin (Altman et al., 2014).

For his model Altman suggested utilizing data as near to the present as possible in order to develop more accurate bankruptcy prediction model. Also, significant impact on the performance of the model has size of companies. To eliminate this weakness, our analysis is focused only on middle-sized companies. Altman noticed that the age of the company may have an influence on bankruptcy risk. In particular, very young firms typically show a very high risk of failure. However we used middle-sized companies that are considered to be long-term and stable. Another important factor is country of origin. Different economic and culture factors, financial markets, legislation and accounting practices affect the financial behavior of companies. The Altman model is not adapted for Serbian economy.

In order to test the influence of data normalization to LC performance we scaled data on [0,1] interval using three standard normalization functions:

$$N_1=\frac{x+\min(X)}{\max\left(X+\min(X)\right)} \quad (12)$$

$$N_2=\frac{x}{\max(X)} \quad (13)$$

$$N_3 = \frac{x - \min(X)}{\max(X) - \min(X)} \tag{14}$$

where $x \in X$, and $\min(X)$ and $\max(X)$ represent minimum and maximum value of X, respectively.

In this paper, cross validation is used to evaluate the performance of the LC models. The cross validation was run 100 times. Each time data set was randomly portioned in two parts for training and testing 50-50 or 70-30. Slightly better results were achieved when we used 70% of data for training and 30% for testing.

4.2. Results and analysis

In this section we compare classification performance for Altman Z score and three LC models. For the dataset of Serbian middle-sized companies, Altman Z score achieved **73.24%** accuracy. In the following table (Table 1) classification results for LC models are presented, where all three LC models shows better accuracy than Altman benchmark model.

Table 1: Bankruptcy prediction results for LC classifiers

Normalization	LC_1		LC_2		LC_3	
	Accuracy	**Variance**	**Accuracy**	**Variance**	**Accuracy**	**Variance**
N_1	0.6999	0.0017	0.7126	0.0013	0.7239	0.0015
N_2	**0.7436**	0.0009	**0.7567**	0.0010	**0.7800**	0.0009
N_3	0.6959	0.0018	0.7002	0.0021	0.7226	0.0016

In Table 1 we can see that the best classification accuracy is achieved with normalization function N_2 (Eq. 13) for all three LC classifiers. Variance is very low for all three models and all normalization functions so we can conclude that LC models give quite stable results.

As expected the first LC1 model has the lowest accuracy, because it employs simple and linear classifier function (Eq. 8). LC2 model is developed to capture interaction in data by means of nonlinear aggregation function (Eq. 9). And the last LC3 model (Eq. 10, Eq. 11) aims to additionally include the same or similar nature of data, so that it shows the best accuracy.

The classification performance is also presented by confusion matrices in Figure 2 below. It is important to note that the results in confusion matrices are average values for 100 iterations. Confusion matrix consists of the accuracy (green fields) and error rates (red fields):

- TP true positive defines active (non-bankrupt) firms that are classified as active.
- TN true negative indicates bankrupt firms that are classified as bankrupt.
- FP false positive indicates bankrupt firms that are classified as active.
- FN false negative defines active firms that are classified as bankrupt.

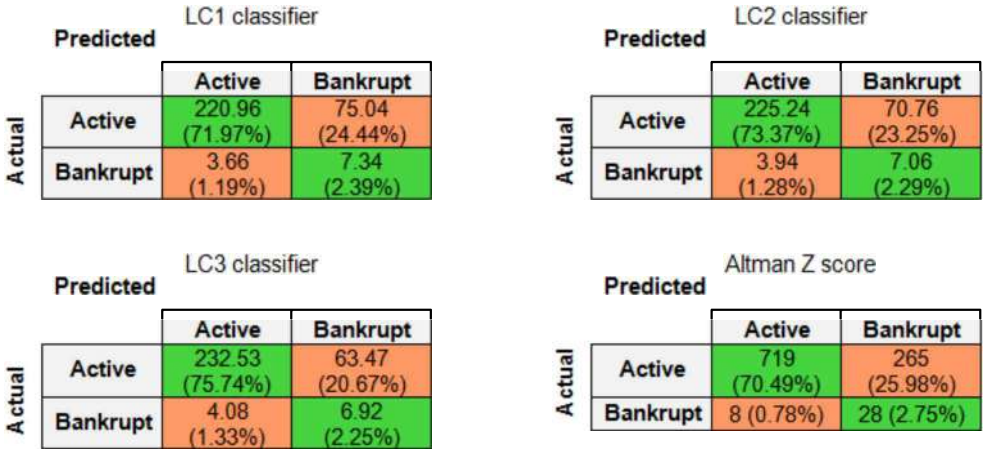

Figure 2: Confusion matrices for LC models and Altman Z score

When type I and type II errors are considered, LC classifiers have better error rates than Altman Z score for active firms that are classified as bankrupt but they provide somewhat worse error rates for bankrupt firms classified as active. Even though that difference is rather small, it can be indicator for further analysis and LC models improvement.

5. CONCLUSION

The aim of this paper is to propose new logical classifiers and evaluate their classification performance in bankruptcy prediction. Three LC models are tested whether they are able to improve Altman Z score as a benchmark model for bankruptcy prediction. In case of Serbian middle-sized companies LC classifiers outperformed Altman Z score. Even though LC method shows more accurate results, Altman model behaves slightly better for grey-zone companies, where it is important to reduce number of bankrupt firms identified as active. However there are still room left for improvement of LC model.

For further research, we suggest adding another class in the output that will identify these particular companies in pre-default state that are critical to fail in near future but still active. We also intend to consider additional variables that may help boost the classification performance to a higher level. One of the ideas is to analyze LC models on small-sized companies and try to identify other appropriate logical classifiers.

In a nutshell, the analysis in this study shows that LC model is reasonable good classifier for predicting company default. It is a rather stable classification model with low variance. In particular, LC method makes possible to understand the reasoning behind classifier function, which is important for decision making that is based on the classification models.

BUILDING A DATA-ENRICHED DEX-BASED DECISION SUPPORT SYSTEM FOR EARLY WARNING ON INCREASED RISK OF SKIING INJURY OCCURRENCE – FIRST RESULTS

Petar Marković*[1], Boris Delibašić[1], Milija Suknović[1]

[1]University of Belgrade, Faculty of organizational sciences, Serbia
*Corresponding author, e-mail: markovic26110mo@fon.bg.ac.rs

Abstract: *In this paper we present first results of building a decision support system for early warning on increased risk of skiing injury occurrence. We utilize the power of recently proposed DEX-based data-enriched modeling technique, showing that, on average, there is an evident supremacy of such models compared to the ones obtained using traditional data-mining and machine learning techniques in terms of prediction accuracy, consistency and interpretability. We argue the reason for such outcome lies in fact that traditional machine learning models are unable to explain the high variability in data, as it is known that skiing injuries are very rare events (only a 2.5 per mille of skier visits gets injured) and their spatio-temporal distribution in ski resort is very variable due to difference in skiing regions nature during different time periods (different popularity and difficulty of the slopes, weather conditions, skiing style of skiers, etc.) which also leads to high class imbalance problem. Thus, machine learning algorithms do not have enough data-based evidence to create strong rules for making a stable decision. On the other hand, traditional decision support systems, which are strictly expert-made, do not incorporate data-based knowledge within themselves. However, ski resorts safety experts are able to handle uncertainty and based on their experience recognize the patterns which lead to increased risk of injury, and express them in the form of a decision rule. Therefore, we effectively combine the best from both approaches to overcome this problem. For the purpose of this paper we used data from largest Serbian ski resort at Mt. Kopaonik from representative season 2010. Dataset was obtained through integration of three different data sources: weather data, ski lifts gates entrance data and injury records from the rescue service. The results are 22 location-specific models, plus 2 global models used for benchmark purposes. We compare the experimental results obtained with 7 most commonly machine learning algorithms used, tested on the same data with 10-fold cross-validation applied.*

Keywords*: DEX, decision support system, increased risk of ski injury, early warning, machine learning, Mt. Kopaonik ski resort*

1. INTRODUCTION

Skiing injuries are rare events. On average, only 2.5‰ of ski visits get injured (Conn et al, 2003). However, consequences of these events have strong impact both to skiers and ski resorts, as injuries are usually very severe which can generate high costs of medication (Warme et al, 1995). Report of Vanat (2014) states that the number of skiers around the world is around 400 million, which means that around 10,000 people gets injured, which makes skiing accidents prevention in ski resorts the topic of the utter importance on the global level (Nerin et al, 2007).

Until present, there were only a few papers which address this problem (Bohanec and Delibašić, 2015), (Dalipi et al, 2015), (Delibašić and Obradović, 2012).

This paper is an extension of recent paper of Bohanec and Delibašić (2015) which proposes a decision support system for skiing injury prediction using data-based knowledge and DEX decision support methodology. The methodology used in this paper is based on the same idea, but with major improvements on the modeling with respect to time and location. In original paper, the ski resort was observed as a whole, and the predictions were made on the daily level, which is in contrast to this paper, where the ski locations are modeled separately, and the time frame was a half of a skiing day.

Mt. Kopaonik is the largest Serbian ski resort. In the representative skiing season 2010, resort consisted of 14 skiing locations equipped with RFID ski gate scanners on lifts (SUN – Suncana dolina, MAR – Marine vode, DUB - Duboka, GOB - Gobelja, GVO - Gvozdac, JAR - Jaram, JEZ - Jezero, KAR - Karaman, KGB – Karaman Greben, KNE – Knezeve bare, MAK – Mali karaman , MAS - Masinac, PAN – Pancicev vrh, KRS - Krst).

Observing the integrated data from three different sources (ski gate entrance data, rescue service injury records and weather data) 11 locations were found eligible for further analysis, since KRS did not have any injuries recorded, whilst JAR had a 100% rate of injuries, and GVO had too few readings (Figures 1 and 2).

On average, on Mt. Kopaonik, injury rate is 1.5‰, which is in accordance with literature. Figure 1 shows that locations DUB, KGB, MAK, MAR are especially dangerous. On the other hand, figure 2 shows that the part of the day is an important factor for predicting injuries, as not all tracks are equally dangerous in the morning and in the afternoon. For example, GVO is much safer in the afternoon, as its percent of injuries drop from 78% in the morning to 57% in the afternoon.

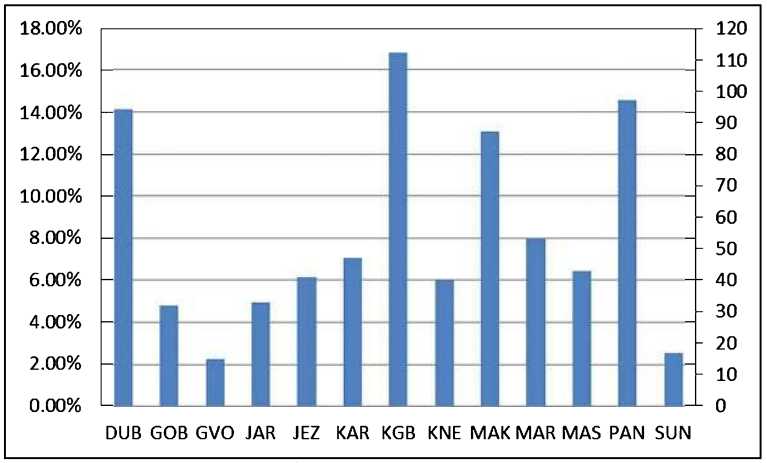

Figure 1: Distribution of skier days with at least one ski injury, per location (skiing region)

2. METHODOLOGY

The core of methodology is based on previous research of Bohanec and Delibašić (2015) where data-enriched DEX-based decision support system was created for the ski resort as a whole, on the daily level. However, as our approach presumes independent location-time modeling, we adjusted the methodology so that attribute selection for each model is done separately, whilst the following steps are repeated iteratively for each of the models built. In short, the benefits of such modeling approach come from the fact that DEX models are transparent and consistent, whilst the knowledge which cannot be found in the data is complemented with the expert knowledge.

DEX models (Bohanec et al, 2013) represent a class of qualitative multi-criteria decision-making models. These models have hierarchical structure of attributes, where the attributes on the higher level of hierarchy are decomposed by set of attributes on the lower level. The attributes are defined using qualitative scales, ordered from the worst to the best values. Attributes on the lower level are aggregated to the higher level

attributes through utility functions (tables of elementary decision rules) where each combination of values of input (lower level) attributes are mapped to the corresponding value of the output (upper level) attribute. Consistency in model is achieved through presumption of utility function monotonicity, which means that for two combinations of non-decreasing input attributes' combinations, the consecutive output attribute value could not be lower than the previous. Thus, DEX model can be used as a classifier, as it actually represents a hierarchically ordered set of IF-THEN rules. For in-depth explanation on DEX models please consult the original reference.

The first step in methodology is discretization and attributes selection. This step is done in Orange data-mining software (Demšar, 2013), using interaction graphs. Interaction graphs (Jakulin, 2015) show which input attributes observed together, rather than separately, bring additional information for class determination. Therefore, the attributes with positive interaction values are good candidates for grouping, whilst ones with negative values should be disregarded from the model. Also, the attributes that do not have any information gain are excluded from the model. For the discretization sub-step, according to the previous paper of Bohanec and Delibašić (2015), 3-bins (low, medium, high) equal-frequency discretization was used, as it initially gave better results than the 5-bins version.

Second step is DEX modeling phase: attribute hierarchy creation, attribute scales determination based on relative frequencies observed in data, and definition of decision rules for utility functions. It is presumed that total ski injury risk can be decomposed into risk from crowding, risk from skiing style and risk from weather conditions. Therefore, in each model, the target attribute Total risk (on the first level of hierarchy) is decomposed into previously mentioned subgroups of attributes, which consist of belonging attributes selected in the previous step. When attribute hierarchy is created, the attribute scales for the elementary attributes (attributes on the lowest level of hierarchy) are defined by observing relative frequencies of class attribute in the data; whilst for the aggregate attributes the scales are always defined manually as H-M-L (as the lowest values of risk are the best in this case). The procedure is the same when determining decision rules for the aggregate attributes. Utility functions of aggregate attributes consisting of elementary attributes are defined by reading relative frequencies distributions of class attribute from data, whilst missing rules are defined by experts. On the other hand, utility functions of aggregate attributes consisting of other aggregate attributes are completely defined by experts (e.g. high risk of skiing style & high risk of crowding & high risk of weather conditions lead to high level of total risk of injury). In-detail explanation of attributes used is given in the following section.

Third and final step is Machine learning modeling phase where the machine learning models were created for the same groups of attributes used in the step one; 10-fold cross-validation was used. Classification tree, Logistic regression, Majority, CN2 rules, k-NN, SVM, Naïve Bayes classifiers were used, as they represent the most commonly used algorithms for this purpose. Due to space restrictions we skip detailed parameters settings.

3. EXPERIMENTAL SETUP AND MODELING

Original paper (Bohanec and Delibašić, 2015) presumed that all locations behave the same way, or in other words, it observed a ski resort in whole, and did not presume that different parts of the day have significant impact on levels of ski injury risk. However, observing the data from the representative skiing season (figures 1 and 2), we noticed that different locations have different injury rates at different period of day, thus we modeled them independently. This presumption was also proved when interaction graphs from the step 1 of methodology were created, which showed that not all attributes were important for predicting the injury on specific locations. Therefore, two types of models are created: location-specific models (represented as DEX in results), and global models (represented as DEX_all in results).

Due to space restrictions, we provide only a short preview of attributes (and their corresponding groups) used in models, whilst the true hierarchical structure between them is not presented. Figure 3 shows attributes used for the before noon models, whilst figure 4 shows attributes used for the afternoon models. There are three major groups of attributes: crowding-related, skiing-style-related and weather-related attributes.

Detailed explanation of each attribute is provided in the Table 1.

	Before noon	JEZ	MAS	SUN	PAN	DUB	KGB	KNE	MAK	GVO	MAR	KAR	GOB	JAR	DEX_all	SUM (w/o DEX_all)
crowding	noSkiers									/				/		8
	noRuns									/				/		9
	utilizationNorm									/				/		9
skiing	avgElevation									/				/		8
	avgTimeRun									/				/		4
	avgTimeSki									/				/		6
	minElevation									/				/		3
	minTimeRun									/				/		1
	minTimeSki									/				/		5

	cloudiness									/				/		5
	windSpeed									/				/		9
	snowNewCM									/				/		9
	geoAspect									/				/		0
	geoAspect2									/				/		0
	geoAspectNonBin									/				/		0
	geoAspectNonBin2									/				/		0
	SUM	12	13	9	11	11	5	11	9	/	12	11	11	/	19	

Figure 3: Attributes used for the morning models

On average, 11 attributes were needed for modeling. From figures 3 and 4 it is observable that in the afternoon, weather-related attributes and skiing-style-related attributes are more significant, compared to the before noon, where crowding-related attributes are more important. Both in the afternoon, and before noon, there are locations that can be modeled quite well with small number of attributes (such as KGB and DUB).

The number of attributes used potentially could be even smaller, if the data was more precise, as from the previous figures it is observable that some of the attributes in the same group are significantly less frequently used than the others, and probably are highly correlated to the most frequently used ones (e.g. minTimeRun, maxTimeRun, etc.).

	afternoon	JEZ	MAS	SUN	PAN	DUB	KGB	KNE	MAK	GVO	MAR	KAR	GOB	JAR	dex_all	sum (w/o dex_all)
crowding	noSkiers									/				/		8
	noRuns									/				/		5
	utilizationNorm									/				/		9
skiing	avgElevation									/				/		7
	avgTimeRun									/				/		5
	avgTimeSki									/				/		2
	minElevation									/				/		0
	minTimeRun									/				/		8
	minTimeSki									/				/		9
	maxElevation									/				/		4
	maxTimeRun									/				/		4
	maxTimeSki									/				/		5
	avgSpeedRun									/				/		7
weather	tempAvg									/				/		9

	geoAspect									/				/		0
	geoAspect2									/				/		0
	geoAspectNonBin									/				/		0
	geoAspectNonBin2									/				/		0
	sum	12	13	11	11	8	15	12	11	/	9	12	10	/	19	

Figure 4: Attributes used for the afternoon models

In table 1 we provide the detailed information on all attributes used. The attributes in italic are used for the modeling purpose.

Table 1: Explanation of attributes used

ID	Attribute group	Attribute	Description
1.	geo-spatial	date	
2.		region	
3.		dayPeriod	
4.	crowding	noSkiers	Number of skiers observed
5.		noRuns	Number of ski lift transportations observed
6.		utilizationNorm	Normalized ski lift capacity utilization
7.	skiing	avgElevation	Average height difference during skiing
8.		minElevation	Minimum height difference during skiing
9.		maxElevation	Maximum height difference during skiing
10.		avgTimeRun	Average time on slope (including lift transportation time)
11.		minTimeRun	Minimum time on slope (including lift transportation time)
12.		maxTimeRun	Maximum time on slope (including lift transportation time)
13.		avgTimeSki	Average time of skiing (without lift transportation time)
14.		minTimeSki	Minimum time of skiing (without lift transportation time)
15.		maxTimeSki	Maximum time of skiing (without lift transportation time)
16.		avgSpeedRun	Average skiing speed
17.	weather	tempAvg	Average daily temperature in ski resort
18.		tempMin	Minimum daily temperature in ski resort
19.		tempMax	Maximum daily temperature in ski resort
20.		cloudiness	Daily cloudiness level
21.		windspeed	Wind speed
22.		snowNewCM	Height of new snow in CM
23.		geoAspect	Impact of geographical aspect of slope, three categories
24.		geoAspect2	Impact of geographical aspect of slope (alternative), three categories
25.		geoAspectNonBin	Impact of geographical aspect of slope, two categories
26.		geoAspectNonBin2	Impact of geographical aspect of slope, two categories
27.	injury	injury	Absolute number of ski injuries per ski lift transportation
28.	injury	manyInjuries	If there is an above-average level of injuries takes value 1, otherwise 0

4. RESULTS

The classification accuracy was used as a main criterion of a model quality. The overall results are presented with two violin-plots in figures 5 and 6, respectively. Mean is marked with red dot, whilst the median is represented with white dot.

Figure 5 shows distribution of classification accuracy for the morning models. It is noticeable that mean values of location-specific model are much higher than other algorithms (Classification tree, Logistic regression, Majority, CN2 rules, k-NN, SVM, Naïve Bayes) and a-priori class probability. However, due to skewness of distributions it seems that median values are not so high, but still, for some of the locations such as KGB and DUB where it significantly dominated other models, and on the locations GOB and SUN was equal with the first-ranked algorithm. On other locations, on average, it was second-ranked with not very high difference in values of accuracy.

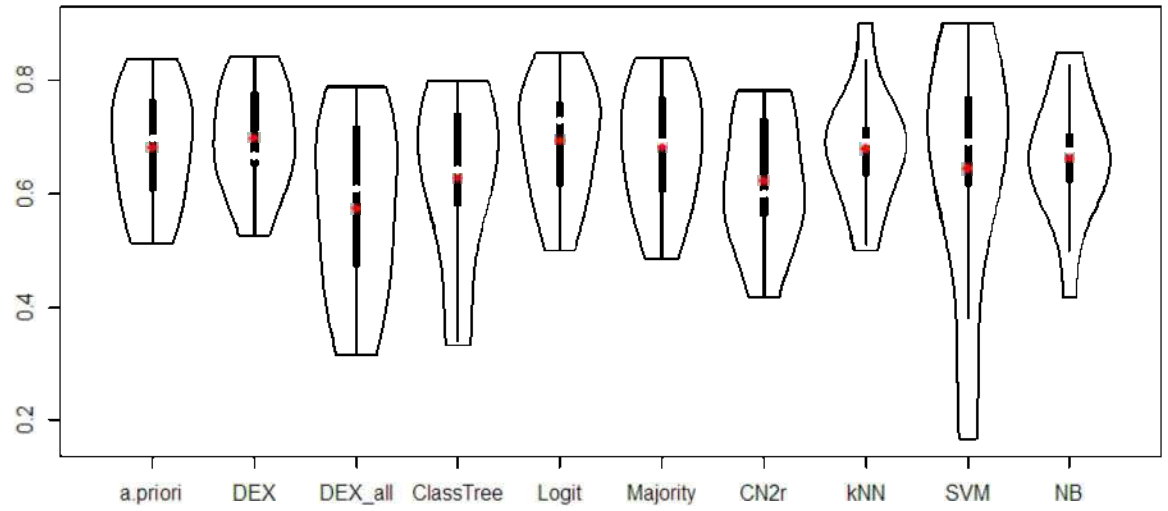

Figure 5: Violin plot of classification accuracy for the morning models

Figure 6 shows distribution of classification accuracy for the afternoon models. Here, the situation is even clearer than in the first part of the skiing day. We see that location-specific DEX model is superior to all others. Especially good results are achieved on locations SUN, MAR, MAK, MAS, PAN where our DEX model strongly outperformed other models.

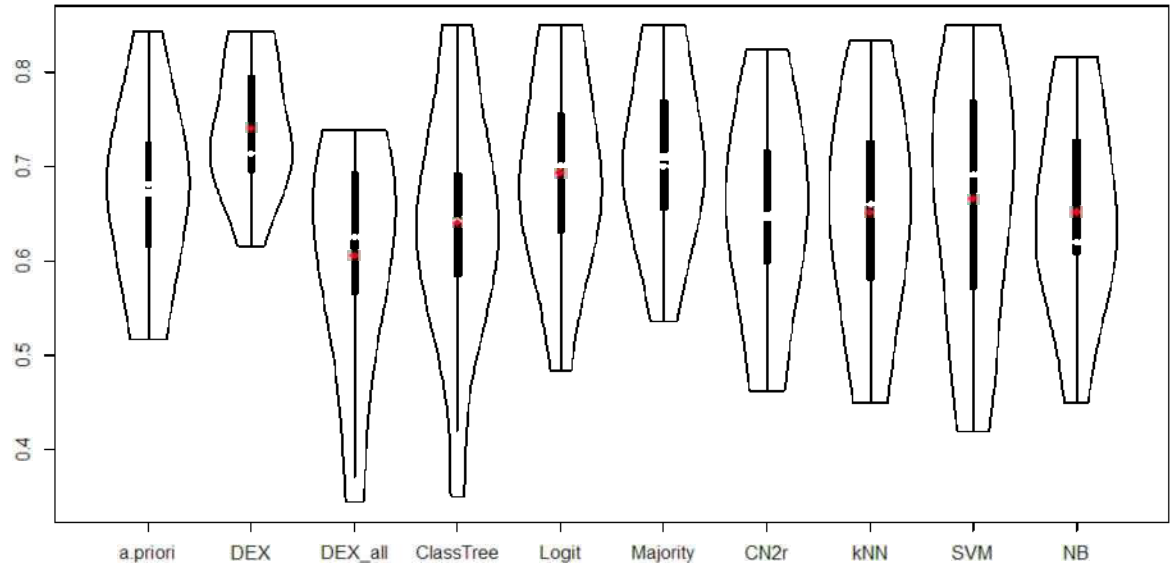

Figure 6: Violin plot of classification accuracy for the afternoon models

We conlude that our approach is major improvement to the previous research of Bohanec and Delibašić (2015) as DEX_all models showed much lower accuracy rates, both compared to location-specific DEX models, and other ML algorithms.

5. CONCLUSION

In this paper we created a near-real-time decision support system for early warning on skiing injury accident occurrence using recently proposed data-enriched DEX-based modeling approach.

The first results show that our approach, on average, reaches or outperforms traditional machine learning algorithms in terms of classification accuracy, whilst models obtained using proposed approach are consistent and easy to understand.

Further research should focus on adapting the methodology to fit the hourly time bins, which should finally lead to a real-time decision support system.

Abstract: *In 2010 the European Union (EU) and Member States started a strategy for sustainable growth for the next ten years – the strategy "Europe 2020". Strategy is focused on three mutually reinforcing priorities: smart growth, sustainable growth and inclusive growth. It establishes five major goals for the EU: employment, research and development, climate change and sustainable energy, education and combating poverty and social exclusion. The European Commission has identified thirteen indicators divided into five groups based on which it will measure the success of the Europe 2020 Strategy. The I-distance method is applied on the above indicators. The aim of this paper has been to present one synthesized indicator that is able to quantitatively demonstrate any country's development. The I-distance method is thoroughly explained and has been applied to 28 EU countries. Crucial indicators for ranking are also elaborated.*

Keywords*: strategy Europe 2020, European Union, I-distance method, indicators, ranking*

1. INTRODUCTION

The global economic crisis has wiped out years of economic and social progress and pointed to the structural weaknesses of European economy. In 2010 the European Union (EU) and Member States started a strategy for sustainable growth for the next ten years – the strategy "Europe 2020". This strategy is a continuation of the Lisbon Strategy announced at the beginning of this century, which was aimed at improving conditions for sustainable economic development (Balcerzak, 2015). In contrast to the Lisbon Strategy, Europe 2020 Strategy does not any more insist on global competitiveness, but on the creation of a "new economy" to solve primarily European economic problems (Hoedl, 2011). It is dedicated to short-term challenges associated with the crisis, but also the need for structural reforms by means of measures to encourage the growth needed to prepare the EU for the future. The implementation of the strategy Europe 2020 takes place in a rather difficult and turbulent period marked by the particularly the negative impact of the global financial crisis, which significantly affected the further development of the project to build economic and monetary union in the European integration space (Terem et al., 2015).

The aim of the Europe 2020 Strategy is not only to overcome the crisis, but also to address the shortcomings of the existing model of growth and to create conditions for smart and sustainable growth and development. Europe 2020 Strategy is focused on three mutually reinforcing priorities (European Commission, 2010): smart growth (developing an economy based on knowledge and innovation), sustainable growth (promoting a more resource efficient, greener and more competitive economy) and inclusive growth (fostering a high-employment economy delivering social and territorial cohesion).

It establishes five major goals for the EU by the end of 2020. They include: employment, research and development, climate change and sustainable energy, education and combating poverty and social exclusion. The objectives of the strategy are supported by seven flagship initiatives (Innovation Union, Youth on the Move, A Digital Agenda for Europe, Resource efficient Europe, Industrial policy for the globalization era, Agenda for new skills and jobs, European platform against poverty). Together they provide a framework to enable the EU and regional centers to jointly strengthen efforts in areas that support the priorities of the Europe 2020 Strategy (Vuković 2011; Jakab and Alderslade, 2015).

The European Commission has identified thirteen indicators divided into the following five groups on the basis of which they will measure the achievements of the five main objectives:

1. Employment: (I) Employment rate (age group 20-64);
2. Research and development: (II) Gross domestic expenditure on R&D (% of GDP);
3. Climate change and energy: (III) Greenhouse gas emissions (in %, base year 1990), (IV) Share of renewable energy in gross final energy consumption (in %), (V) Primary energy consumption (in %, base year 2005), (VI) Final energy consumption (in %, base year 2005), (VII) Greenhouse gas emissions in non-ETS sectors (base year - 100 million tonnes CO2 equivalent);

4. Education: (VIII) Early leavers from education and training (% of the population aged 18-24), (IX) Tertiary educational attainment (age group 30-34);
5. Poverty and social exclusion: (X) People at risk of poverty or social exclusion (% of total population), (XI) People living in households with very low work intensity (% of total population aged less than 60), (XII) People at risk of poverty after social transfers (% of total population), (XIII) Severely materially deprived people (% of total population).

The advantage of this policy document resides in the fact that it has well-established indicators that enable measuring achievement, and thereby the possible success of the respective European policies (Bere et al., 2015). The aforementioned indicators are capable of expressing the diversities of countries and their performances.

The aim of this paper is to explore the current situation in the EU using these thirteen indicators. To this end we have used multivariate I-distance methodology to reduce the initial set of indicators and to extract and identify the most important indicators that will contribute to the achievement of the priorities and the main objectives of Europe 2020 Strategy.

2. THE I-DISTANCE METHOD

In order to create a synthesized development indicator, selected indicators are incorporated into the analysis through use of the statistical I-distance method. The analyses carried out using the statistical I–distance method are numerous. I–distance was applied in previous researches in order to evaluate the academic ranking of the world's universities (Jeremic et al., 2011; Jovanovic et al., 2012). It was also used for measuring European countries' health systems (Jeremic et al., 2012), sustainable development (Radojicic et al., 2012), public health (Seke et al., 2013) and ICT Development (Dobrota et al., 2012).

I-distance is a metric distance in an *n*-dimensional space. Ivanovic had originally devised this method to rank countries according to their level of development based on several indicators. Many socio-economic development indicators were considered and the problem was how to use all of them in order to calculate a single synthetic indicator, which would thereafter represent the rank (Ivanovic, 1973).

For a selected set of variables $X^T = (X_1, X_2, ..., X_k)$ chosen to characterize the entities, the I-distance between the two entities $e_r = (x_{1r}, x_{2r}, ..., x_{kr})$ and $e_s = (x_{1s}, x_{2s}, ..., x_{ks})$ is defined as

$$D(r,s) = \sum_{i=1}^{k} \frac{|d_i(r,s)|}{\sigma_i} \prod_{j=1}^{i-1} \left(1 - r_{ji.12...j-1}\right) \quad (1)$$

where $d_i(r,s)$ is the distance between the values of variable X_i for e_r and e_s e.g. the discriminate effect $d_i(r,s) = x_{ir} - x_{is}, i \in \{1,...,k\}, \sigma_i$ the standard deviation of X_i, and $r_{ji.12...j-1}$ is a partial coefficient of the correlation between X_i and X_j, $(j < i)$ (Ivanovic, 1977).

The construction of the I-distance is iterative; it is calculated through the following steps:

- Calculate the value of the discriminate effect of the variable X_1 (the most significant variable, that which provides the largest amount of information on the phenomena that are to be ranked,
- Add the value of the discriminate effect of X_2 which is not covered by X_1,
- Add the value of the discriminate effect of X_3 which is not covered by X_1 and X_2,
- Repeat the procedure for all variables.

Occasionally, it is not possible to achieve the same sign mark for all variables in all sets. As a result, a negative correlation coefficient and a negative coefficient of a partial correlation may occur. This makes the use of the square I-distance even more desirable. The square I-distance is given as

$$D^2(r,s) = \sum_{i=1}^{k} \frac{d_i^2(r,s)}{\sigma_i^2} \prod_{j=1}^{i-1} \left(1 - r_{ji.12...j-1}^2\right) \quad (2)$$

The entity with the minimal value for each indicator or a fictive maximal or average values entity can be set up as the referent entity. The ranking of entities in the set is based on the calculated distance from the referent entity (Ivanovic and Fanchette, 1973).

By using the calculated I^2-distance, the intensity of the observed phenomena and rank entities can be observed. When a correlation coefficient of each indicator with the I^2-distance is calculated with the ranking indicators of those values, the importance of each indicator can also be examined. As the correlation coefficient is stronger, the amount of information that is provided with the observed indicator is also greater, when the $p < 0.05$ indicator is significant. Otherwise, the indicator is not important in measuring the phenomena observed. One of two reasons might explain this: either this indicator is not relevant in measuring the phenomena observed, or its discriminate effect is already contained in previous variables. Whatever the reason, the indicator must be excluded from further analysis, since, in order to select only significant indicators, it is necessary to calculate the I^2-distance and its correlation with the indicators used several times, excluding the one insignificant indicator that has the smallest correlation coefficient (Milenkovic et al., 2014). Through use of the stepwise method, one indicator is eliminated in every calculation until the results show that all the indicators used are significant, whereupon the results are obtained.

3. RESULTS

The database used in this paper includes the values of the thirteen indicators for 28 countries of the EU. We used the data for the year 2014, since it is the last year for which all indicator values for specific countries in the EU exist. To implement I-distance methodology we used the statistical package SPSS version 22. The results achieved by the square I-distance ranking method in the first calculation for evaluating development are presented in Table 1.

Table 1. The results of the I^2-distance method, I^2-distance value, and rank – first calculation

Country	I^2-distance	Rank
Sweden	84.54	1
Estonia	49.42	2
Finland	41.09	3
Luxembourg	39.51	4
Malta	37.35	5
Austria	35.05	6
Czech Republic	32.55	7
Denmark	31.80	8
Lithuania	31.29	9
Netherlands	29.86	10
Germany	27.28	11
Latvia	30.34	12
Poland	28.72	13
Slovenia	25.74	14
France	24.06	15
United Kingdom	21.85	16
Cyprus	23.31	17
Slovakia	22.42	18
Romania	22.05	19
Belgium	18.76	20
Ireland	18.93	21
Hungary	15.97	22
Croatia	17.07	23
Portugal	13.52	24
Bulgaria	12.22	25
Spain	10.82	26
Greece	10.86	27
Italy	10.18	28

This data set was further examined and a correlation coefficient of each indicator with the I^2-distance value was determined. The results are presented in Table 2 (using the Pearson correlation test).

Table 2. The correlation between the I^2-distance and the initial indicators

Indicator	*r*
Severely materially deprived people	0.822**
Employment rate	0.695**
People living in households with very low work intensity	0.635**
People at risk of poverty or social exclusion	0.537**
Share of renewable energy in gross final energy consumption	0.529**
Primary energy consumption	0.519**
Gross domestic expenditure on R&D	0.466*
Final energy consumption	0.390*
Tertiary educational attainment	0.366
People at risk of poverty after social transfers	0.259
Greenhouse gas emissions in non-ETS sectors	0.135
Early leavers from education and training	0.115
Greenhouse gas emissions	0.039

The correlation coefficients between the I^2-distance and initial indicators demonstrate which indicators are important in analyzing a country's development. As has been noted above, the stepwise method excludes one insignificant indicator that possesses the smallest value of the correlation coefficient. Calculating the I^2-distance should be repeated stepwise until the results show that all selected indicators are statistically significant. In this case, the stepwise method eliminated those five indicators that were insignificant in the first calculation and the results achieved in the sixth calculation are those, which are final. The result need not include all indicators that had been significant in first calculation, but may include those indicators that had been insignificant in first calculation. The results are presented in the following tables.

Table 3. The results of the I^2-distance method, I^2-distance value, and rank – last calculation

Country	I^2-distance	Rank
Sweden	69.54	1
Estonia	47.18	2
Malta	38.04	3
Finland	35.33	4
Luxembourg	30.93	5
Austria	30.89	6
Czech Republic	29.42	7
Germany	29.07	8
Denmark	26.76	9
Netherlands	25.75	10
Poland	25.35	11
Latvia	24.07	12
Slovenia	20.42	13
Lithuania	19.80	14
France	19.29	15
United Kingdom	18.19	16
Slovakia	17.39	17
Romania	17.10	18
Belgium	13.52	19
Cyprus	12.32	20
Portugal	10.86	21
Bulgaria	10.09	22

Ireland	10.08	23
Hungary	7.28	24
Croatia	6.15	25
Italy	4.44	26
Spain	3.98	27
Greece	1.01	28

Once again, a correlation coefficient of each indicator was examined with the I^2-distance, the results of which are presented in Table 4.

Table 4. The correlation between I^2-distance and final indicators

Indicator	***r***
Employment rate	0.754**
Severely materially deprived people	0.737**
People living in households with very low work intensity	0.650**
Primary energy consumption	0.617**
People at risk of poverty or social exclusion	0.576**
Gross domestic expenditure on R&D	0.501**
Final energy consumption	0.488**
Share of renewable energy in gross final energy consumption	0.463*

As it could be seen, all observed indicators from the last calculation are statistically significant, meaning that this is the final calculation of the last two tables presenting the results in examining development of the countries observed. The most important indicator is Employment rate (r=0.754, p<0.01). The employment rate varies very significantly across countries and regions – the percentage of employed people aged 20-64 is reaching 68.95% on average in the EU in 2014. Sweden have the biggest employment rate of 80.00% while on the other side percent of employed people in Greece is 53.30%. The increasing share of young people neither in employment nor in education or training is another major source of concern. Next two indicators are from poverty and social exclusion group of indicators: percent of severely materially deprived people (r=0.737, p<0.01) and percent of people living in households with very low work intensity (r=0.650, p<0.01), which proves the assertion that fight against poverty is fundamental in reaching Europe 2020 Strategy goals (Jessoula, 2015; Copeland and Daly, 2014).

In Table 4 the final results of the I^2-distance Method, I^2-distance Value, and Rank are presented. The highest values of I^2-distance belong to Sweden, which tops the list, confirming previous research (Hudrlikova, 2013). It is interesting that Sweden has already reached RES (renewable energy sources) target. Estonia, which is ranked right below Sweden, has reached its overall objectives for RES-Electricity in 2013 (Cross et al., 2015).

In contrast to Sweden and Estonia, ranking at the bottom of this list are countries with the lowest development level – Greece, Spain and Italy. Previous researchers showed that in these countries the progress has not been observed or has been negligible (Klonowska-Matynia et al., 2015). Bearing in mind the values of selected indicators (especially for Greece), these results are to be expected. Investment in education has to be strengthened in particular within these Mediterranean countries, in terms of both quantity and quality (Gros and Roth, 2012).

4. CONCLUSION

The reasons for having a Europe 2020 Strategy are equally pressing in 2016 as they were in 2010. Emerging from the worst economic and financial crisis in a generation, the EU needs to strengthen its smart, sustainable and inclusive growth strategy so that it can deliver on the expectations of its citizens and maintain its role in the world. At the moment, the European Union is on its way to fulfill the objectives in the fields of education, climate and energy policy, but not in the area of employment, research and development, and poverty reduction. Furthermore, relative poverty rates are difficult to predict when employment increases and the impact is not necessarily a beneficial one (Marx et al., 2012).

In this paper, the I-distance method has been applied in order to measure the development level of EU countries, as based on Europe 2020 Strategy indicators. The research itself started with initial indicators and

several calculations led to the final set of indicators. The progress in achieving the objectives can be monitored using the described I-distance methodology, both for the EU as a whole and for each Member State individually. With this approach, not only can countries be ranked, but the differences between them can be better explored as well. In addition, the approach utilized in this paper can identify importance of each Europe 2020 Strategy indicator.

A FUZZY LOGIC-BASED SYSTEM FOR ENHANCING SCRUM METHODOLOGY

Mihailo Stupar*[1], Pavle Milošević[1], Bratislav Petrović[1]
[1]University of Belgrade, Faculty of Organizational Sciences
*Corresponding author, e-mail: stupar.mih@gmail.com

Abstract: *In this paper, we propose a decision support system for enhancing scrum methodology based on fuzzy logic. The proposed system consists of three main components: a fuzzy inference system, an aggregation operator and a feedback function. In the basic scrum, requirements which describe a certain task do not have a clear interpretation. Also, the basic model does not take into account the experience of the developers as well as the logical dependencies of input variables. Fuzzy inference systems are particularly useful for this purpose, because it incorporates logic in inference process and inputs are presented using linguistic quantifiers. Aggregation function is used to aggregate predictions in a single value that uniquely represent a specific task while a feedback is employed to adjust an input variable to improve system performance. Further, the proposed system is simulated with randomly generated inputs in order to analyze it behavior. The predictions of the system are more accurate and with less deviation in the final iterations.*

Keywords*: scrum methodology, decision support system, fuzzy logic, fuzzy inference system, aggregation operator, feedback function*

1. INTRODUCTION

Scrum as an agile methodology is very popular within the software and product developers. Scrum is ideal for project with aggressive deadlines, complex requirements, and significant degree of uniqueness (Almseidin et al. 2015). Today, development teams are often distributed all over the world, but people still use this methodology for leading the project (Sutherland et al. 2007). In the scrum, projects move forward through the series of iterations called sprints, and each sprint is typically two to four weeks long.

At the start of each sprint, a whole team of developers has a meeting (sprint planning meeting) where they decide which tasks should be included in the following sprint. They all have a list of features/tasks (made by experts) that should be implemented by the end of the project. These features/requirements are collected in the Product Backlog (Duechting et al. 2007). Each task is weighted with some number of points. In the scrum, these points are called story points. The number of story points that come into the sprint is well known, but the number of tasks entered in the sprint depends on the developers' estimation how difficult each task is. In the sprint planning meeting, they argue about these costs of the tasks, and how many tasks from the Product Backlog will be included. They all give a value (weight) to each task independently. Later, their manager (scrum master) looking at the values for the task decides (with agreement with the team) how many story points this task actually costs.

Although the scrum methodology is successfully applied in various fields, there are certain issues that should be addressed to story point estimation. Developers often think that number of story points for each task means the number of hours/days to complete this task. The first assumption with the idea bout story points is that they are just points, relative values instead of absolute values. When someone looks into the values, he could be able to compare tasks based on story points and he should not be able to say how many hours/days are needed to complete them. Another issue is related to the experience of developers. Some developers are experienced and tasks are often too easy for them. On the other hand, some of them are bad in estimation. For example, they often give smaller value that it actually is.

Scrum master needs to think about all these parameters when decides what is the final value of story points for each task. Because fuzzy logic provides a useful tool to deal with problems in which the phenomena are imprecise and vague (Lin et al. 2006), it is ideal for our purpose. Our proposed system based on fuzzy logic could enhance efficiency in scrum planning phase. The system accepts developer's task estimation and scrum master's knowledge as inputs, and the output is weight (story point value) of the observed task. Also, the system should become more and more stable over time, and get more precise prediction.

This paper is structured as follows. In Section 2 we describe fuzzy logic and FIS in general, and how is it used previously in scrum methodology. In Section 3 we introduce our fuzzy logic-based system, an aggregation operator and a feedback function that should improve accuracy of the system. Further, we

create a simulation that shows how our system works, and this is explained in Section 4. Finally, Section 5 contains conclusion and ideas for further work.

2. FUZZY LOGIC

Fuzzy logic is a generalization of classical logic in a sense that it can process all values from the interval [0,1] (Zadeh, 1965, Zadeh, 2008). It may be seen as an attempt to formalize human capability to reason and make rational decisions in an environment of imprecision and uncertainty. In fuzzy logic, operators of intersection and union are realized using different functions that are referred to as t-norms and t-conorms (or s-norms), respectively. Min operator is the standard choice for fuzzy intersection, while algebraic product and Lukasiewicznorm are also frequently used (Ross, 2010). Max operator, probabilistic sum and Lukasiewicz t-conorm are it's corresponding as t-conorms. The most common negation operator in fuzzy logic is a standard negation $\bar{x} = 1 - x$.

2.1. Fuzzy inference system

A fuzzy inference system (FIS) is a system based on fuzzy logic that utilizes a set of rules to map inputs to outputs. It is the most commonly seen fuzzy methodology. Two most important types of the FIS are Mamdani (Mamdani, 1977) and Takagi–Sugeno (Takagi and Sugeno, 1985). In the Mamdani system, both input and output are fuzzy sets and it is easier to interpret. In the Takagi–Sugeno system inputs are fuzzy sets, while the output is a linear combination of its inputs. This type of FIS is more accurately one, but more computationally expensive. The fuzzy inference systems are particularly useful in problems where inputs are expressed as linguistic expressions. The FIS is based on IF-THEN rules, fuzzy conditional statements that incorporate logic. They are a collection of linguistic statements that describe how the FIS should make a decision. Just like an algebraic variable takes numbers as values, a linguistic variable takes words or sentences as values. Their IF part is a logical condition that should be fulfilled in order to THEN part be realized. IF-THEN rules are commonly specified by a field expert.

The fuzzy inference process consists of three main steps: fuzzification, rule evaluation and defuzzification. The first step in fuzzy inference is to convert linguistic expressions to values on the unit interval [0,1] using a set of input membership functions. Further, fuzzy rules are evaluated using appropriate operators for t-norm, t-conorm and negation. Results of all IF-THAN rules are aggregated into a single fuzzy set. Finally, defuzzification is applied. It is a process that converts a fuzzy set or a fuzzy number into a crisp value, representing the final output.

2.2. Fuzzy logic in the scrum methodology

Fuzzy logic proved to be particularly useful for building expert system based on logical dependent variables. It is especially suitable when inputs are expressed as linguistic statements. Due its characteristics fuzzy logic is widely used as a tool for enhancing scrum methodology.

In (Sedehi and Martano, 2012) they introduced a new model based on fuzzy logic that is used to evaluate and monitor scrum projects. Their model has linguistic variables as inputs and output is the level of success of the (part of) scrum project. In (Kurian, 2011) is created Sugeno based fuzzy model that should determine and react to changes in an agile process, such as product/software development process. Similar approach stands in (Lin et al. 2006), where they used Mamdani based model to register changes in the enterprise world.

3. DESIGN OF FUZZY EXPERT SYSTEM

The goal of this paper is to build fuzzy expert system that can be a valuable support or even replace an expert (scrum master) during the each sprint planning phase. Rules that scrum master follow in the decision making process can be easily expressed linguistically, so the fuzzy logic system is suitable for this kind of problem (Lin et al. 2006). Proposed system consists of three components: fuzzy inference system (FIS), aggregation function and feedback function. Experts' knowledge should be used only in the first iteration in order to set up initial parameters.

3.1. Fuzzy inference system

Our fuzzy logic system has three input variables that describe the experience of developers, their estimation skills and their rating for observed task. The output is a value (story point value) of the observed task.

In case of the experience (EXP) input variable, every developer has a specific status in the company, which is based on years of experience. Instead of using four groups (junior, intermediate, senior, and expert) which is common in literature (Orlowsky et al. 2006), we decide to exclude expert group from our system. Experts are more often leaders and they define tasks that should be done instead of task implementation. So, our EXP variable consists of three membership functions, each one is for one level of experience. Every membership function in this paper is a PI - shaped function defined by four parameters. These parameters are specified by an expert using the fuzzy visualization tool in MATLAB (Sivanandam et al. 2007). In the Table 1 parameters for every membership function for EXP variable are shown. Values represent the years of experience and they are comma separated.

Table 1: Membership function parameters for EXP variable

Variable	Values of parameters
Junior	0, 0, 1.183, 2.64
Intermediate	1.52, 2.69, 3.706, 5.04
Senior	3.579, 5.18, 6.24, 8.16

Second input variable describes an accuracy/quality of developer's estimation how much the specific task is complex (EST). This variable may be of great importance for the inference process since some developers constantly miscalculate the task complexity. It is linguistic in nature and it is represented with three membership functions: Overestimated, Well Estimated, and Underestimated, while the assessments are on the interval $[1,7]$. Membership functions' parameters are shown in Table 2.

Table 2: Membership function parameters for EST variable

Variable	Values of parameters
Overestimated	-1.62, 0.779, 1.85, 3.452
Well Estimated	2.071, 3.26, 4.61, 5.99
Underestimated	4.516, 6.29, 7.3, 9.7

Bearing in mind that the accuracy of each developer's estimations may vary over time, EST values will be adjusted after each iteration. The proposed system has a sort of feedback at the end of the each iteration that should improve the validity of EST variable. Detailed explanation of feedback will be given later in the text.

Finally, the third input variable is a weight/rating that the developer gives to each task (WEI). Although human expression can be interpreted with 9 linguistic terms (Lin et al. 2006), in agreement with scrum master we decide to represent this variable with three values (easy, medium, heavy), while the expert's assessments are on the interval $[1,7]$. This task weight representation is intuitive, close to human perception and based on natural language. All these variables are PI-shaped as well, and their parameters are represented in the Table 3.

Table 3: Membership function parameters for WEI variable

Variable	Values of parameters
Easy	-1.16, 0.76, 1.75, 3.53
Medium	1.94, 3.34, 4.5, 5.93
Heavy	4.67, 6.12, 7.24, 9.16

The output of the fuzzy system is a numeric value that represents the weight of the task in story point context, and all values are split into four groups: Easy, Medium, Complex, and Very Complex. Although the valid story point values in basic scrum methodology belong to modified Fibonacci array (1/2, 1, 2, 3, 5, 8…) (Downey and Sutherland, 2013), we decided to represent output using a uniform distribution. If we use Fibonacci array, we would have a very small difference between easy and medium group and a very big gap between complex and very complex groups (see Table 4). As a result, the tasks would be weighted as a Complex or Very Complex with high probability.

Table 4: Story point distribution using Fibonacci array

Group name	Values
Easy	1/2, 1, 2
Medium	3, 5, 8
Complex	13, 21, 34
Very Complex	55, 89

It's obvious that this distribution cannot give good results because fuzzy system threats all membership functions equally and Very Complex membership function takes almost half of the full output interval. Instead of using these values, the parameters of output membership functions are rescaled (Table 5).

Table 5: Output membership functions' parameters

Group name	Values of parameters
Easy	0, 0, 2.69, 15.56
Medium	3.53, 10.92, 16.07, 25.34
Complex	16.8, 23.96, 30.02, 38.78
Very Complex	27.95, 39.98, 50, 55

Using these inputs and output we created set of rules for our fuzzy system. We follow scrum master thoughts and recommendations during the scrum planning phase. This phase is interactive and he/she leads it with his/her suggestions. These advices are transformed into the following set of rules:

1. IF (EST = WELL_EST) and (EXP is not JUNIOR) and (WEI is EASY) THEN (OUT is EASY)
2. IF (EST = OVER_EST) and (WEI is not EASY) THEN (OUT is EASY)
3. IF (EST = UNDER_EST) and (EXP is not SENIOR) and (WEI is EASY) THEN (OUT is MEDIUM)
4. IF (EST = OVER_EST) and (WEI is not EASY) THEN (OUT is MEDIUM)
5. IF (EST = OVER_EST) and (EXP is not SENIOR) and (WEI is HEAVY) THEN (OUT is COMPLEX)
6. IF (EST = UNDER_EST) and (EXP is not JUNIOR) and (WEI is HEAVY) THEN (OUT is COMPLEX)
7. IF (EST = WELL_EST) and (EXP is not JUNIOR) and (WEI is HEAVY) THEN (OUT is V_COMPLEX)
8. IF (EST = UNDER_EST) and (WEI is not EASY) THEN (OUT is V_COMPLEX)

The proposed FIS is Mamdani-type. This type of FIS ensures the necessary transparency of the decision making process. AND operator is evaluated using *min* function, OR operator with *max* function and in the defuzzification process we use centroid method.

In the Figure 1 is shown how OUT values change for different EXP and EST values and constant WEI value. If a developer is a good estimator (EST value is close to 4), the OUT value is high (since WEI is high) except in the case of inexperienced developers (EXP < 2). Since inexperienced developers do not have enough knowledge yet, they may perceive medium tasks as difficult once. On the other hand, developers who usually overestimate their tasks have OUT values smaller than predicted (about 2).

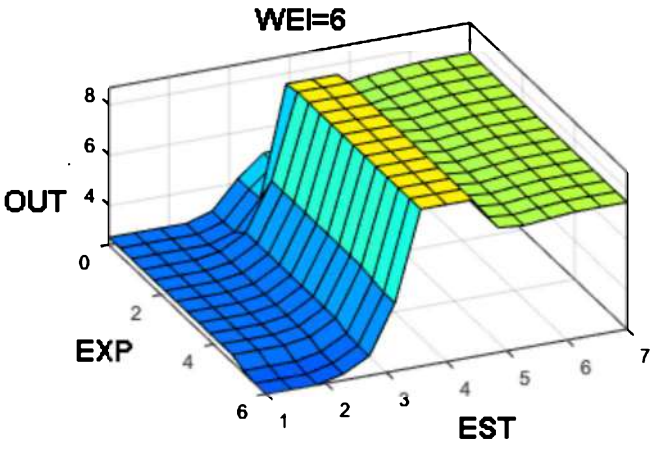

Figure 1: Output values for WEI=6

3.2. Aggregation function

Each developer has its own input vector and the fuzzy system gives a separate output for each task. In other words, for each task we get as many outputs as there are developers in our system. In second layer we aim to aggregate these predictions in a single value that uniquely represent specific task. Since characteristics of each developer are taken into account in FIS, all FIS output values should be treated equally. Therefore, we propose a simple average as the aggregation function.

Scrum master insights regarding certain team and/or project may be expressed by using various aggregation functions in this layer. For example, if the optimistic estimation is needed, the proper aggregation function is *max* function. For calculating pessimistic estimation *min* function should be used.

3.3. Feedback

The third and very important layer is feedback function which is represented in the Figure 2. At the end of each iteration/sprint we can see how difficult each task was, and this variable is represented with REAL_OUT value. Using this REAL_OUT and ESTIMATED_OUT values for the i^{th} spring we can update EST value for each developer in the $(i+1)^{th}$ sprint. For example, let assume that developer D is a good estimator and that he states that some task T is a heavy one (WEI). After the sprint if it is turned out that the task T is easy in general (REAL_OUT), developer D should not be concerned as a good estimator in the next iteration (EST).

The feedback is realized as the quadratic function of the difference between real and estimated difficulty. The function is weighted in order to get a weaker slope of the function. Using this function, we will award or penalize developer EST value if he has had a god or bad estimation.

Using this set of rules and feedback function, the system should improve itself over time and become stable after few sprints. Furthermore, we can assess developer's estimations in order to analyze their tendency to overestimate or underestimate the task over a period of time. At the beginning, we can assume that all developers are good estimators, and by the end of the project we will see how good they actually are. These (trained) values should be starting points in the next project so we could expect better results from the start.

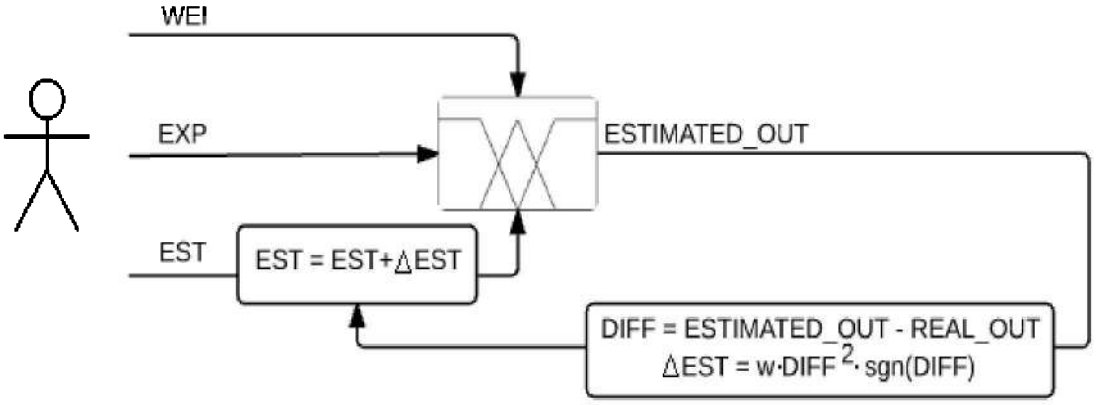

Figure 2: Design of the fuzzy expert system

4. EXPERIMENT

In this section we present the simulation in order to illustrate how the proposed system works. We will simulate the work on the project that consists of two sprints with six tasks. Five experts with various levels of experience participate in the project.

First, the initial values of the estimation accuracy EST and experience EXP variables for each developer are assigned. Further, we assign output values REAL_OUT for each task in one sprint. REAL_OUT represents the actual complexity of the task, that includes both objective circumstance and human factor. On the otherhand, it will be also used as a base for WEI value calculation in this simulation.

We are going to use these output values in order to find out the mean squared error of each task in the estimation process. EST, EXP and REAL_OUT values are taken from a uniform distribution. Finally, the weight/rating that the developer gives to each task WEI is calculated based on EST and OUT values.

WEI value calculation. Values of variable WEI cannot be randomly generated because it depends on characteristic of the tasks (summarized in REAL_OUT) and correctness of developer's estimations (explained with EST). Though, we calculate WEI in such a way that resembles a developer's evaluation.

$$OFFSET = EST - CENTER_EST \tag{1}$$

$$WEI = OFFSET \cdot c - REAL_OUT, \quad c = 0.35 \tag{2}$$

First, in (1) we calculate offset or distance from the center of all EST values. EST values are uniformly disturbed on the interval $[1,7]$, so in our case CENTER_EST is 4. Further, WEI value is calculated using the formula (2). The value of coefficient *c* is obtained through testing and set to 0.35.

FIS evaluation. Next, we use EST, EXP and WEI as inputs for our fuzzy inference system in order to get ESTIMATED_OUT as output. We are going to get as many ESTIMATED_OUT values for a single task as we have developers on the project. Note that in the first iteration we use INIT_EST value for EST variable. In further iterations, EST values are going to be calculated with feedback function.

EST value improvement using feedback. After each iteration EST value is updated in accordance with prediction accuracy. Thus, the adaptability of the system and its robustness to changes are assured.

$$\Delta OUT = ESTIMATED_OUT - REAL_OUT \tag{3}$$

$$\Delta EST = \Delta OUT^2 \cdot w \cdot \operatorname{sgn}(\Delta OUT), \quad w = 0.05 \tag{4}$$

$$EST_i = EST_{i-1} + \Delta EST \tag{5}$$

In the equation (3), we calculate the difference between predicted and real output weights. Later, we use weighted quadratic function (4) to calculate the value which will be added to the EST value from the previous iteration (5). The value of weighting coefficient *w* is set to 0.05.

The evaluation of the system. Instead of evaluating our system as a set of iterations (Sedehi and Martano, 2012), we will utilize the difference between the aggregated estimated and actual output (ΔFIN_OUT) and mean squared error (MSE) for each task as performance measures. We use ESTIMATED_OUT values from each developer and aggregate them using the average function into ESTIMATED_OUT_AVG. This value will be compared to the REAL_OUT value to obtain the difference between the estimated and actual output. MSE is used as a deviation indicator of individual prediction ESTIMATED_OUT. Firstly, we calculate mean squared error for each developer separately and then apply average function on them to get a single MSE. This value could show how stable our system is.

Table 6: MSE for Sprint 1

TASK	ESTIMATED_OUT_AVG	REAL_OUT	ΔFIN_OUT	MSE
1	3.8620	4	0.138	3.8765
2	5.1015	5	0.1015	8.8885
3	0.8593	2	1.1407	1.3015
4	1.1220	3	1.878	3.5324
5	0.8551	2	1.1449	1.3111
6	1.1198	3	1.8802	3.5687
AVERAGE			**1.0472**	**3.7465**

Table 7: MSE for Sprint 2

TASK	ESTIMATED_OUT_AVG	REAL_OUT	ΔFIN_OUT	MSE
1	3.9489	4	0.0511	1.6600
2	1.2121	3	1.7879	3.2835
3	0.8594	2	1.1406	1.3013
4	1.8630	2	0.137	0.2163
5	4.3738	4	0.3738	3.2725
6	1.1049	1	0.1049	0.1093
AVERAGE			**0.5992**	**1.6405**

In Tables 6 and 7 results for two sprints are presented together with ΔFIN_OUT and MSE. In general, the average accuracy of prediction in Sprint 2 is increased compared to Sprint 1 while the MSE value is decreased. Based on MSE values we can see that our system becomes more and more stable over time. At the beginning, even in cases when it produces a good prediction of the task complexity, i.e. for task 2 in Sprint 1, it has high deviation of individual assessments. For Sprint 2, MSE values are significantly lower. Therefore, we can state that besides greater estimation accuracy, the proposed fuzzy logic-base system improves the stability of individual assessments.

5. CONCLUSION AND FUTURE WORK

Fuzzy logic has been widely used to assist decision makers in a number of different domains. In this paper, it is utilized as a basis for building a decision support system to determine the weight of the tasks in agile methodology such as scrum. The system consists of three modules: a fuzzy inference system, an aggregation operator and a feedback function.

We consider that there is no need to use unique predefined values for estimation in the scrum (as Fibonacci series), but we can efficiently use linguistic variables to get the same goal. Using the proposed fuzzy inference systems we enhance each developer's story point estimation in accordance with their experience and previous prediction accuracy. The knowledge of scrum master is transformed is fuzzy rules that are easy to interpret and fully resemble human reasoning. The output variables are further aggregated in a final estimation using a simple average. Feedback is applied to update the variable that represents each developer's quality estimation in order to increase adaptability to changes and poor assessments. We have simulated the proposed system and shown that it becomes more stable over time and gives more accurate predictions of the tasks.

The proposed system could be more accurate if we take into account additional input variable in the FIS that represents how often requirement are going to change in the sprint. Some tasks/requirements are not fixed during the whole sprint and this may lead to breaking a deadline. The idea for future work is to incorporate that variable in proposed system and to add more rules that will treat these tasks differently from stable ones. Also, we aim to use various aggregation operators is ordered to model different problem situations.

Abstract: *The aim of the paper is to present developed AHP model for ranking city-branches of a bank. According to the number of active counters the city-branches of the bank are classified into the following three groups: group A with 1-3 active counters, group B with 2-5 active counters and group C with 4-9 active counters. The developed AHP model consists of a goal, criteria and alternatives. The goal is to rank the city-branches in the groups they belong to. The 8 criteria that are defined in the model are: denar savings, foreign currency savings, transaction accounts, exchange operations, public services, master cards, fees for payment operations (commission), and domestic payment operations. The alternatives are the city-branches that belong to each group. Developed AHP model is validated for ranking the city-branches of Commercial bank AD Skopje which are located in Skopje. The programming tool Super Decisions is used to implement the AHP model and the programming tool Expert Choice is used to perform sensitivity analysis. The obtained results are presented and analyzed in the paper.*

Key words*: multi-criteria decision-making, Analytic Hierarchy Process, ranking, sensitivity analysis, bank, city-branches*

1. INTRODUCTION

One of the key sectors that enable the economy to function is the banking sector. Banks play a vital role in the world's economy. They are authorized financial institutions that collect deposits and provide loans to individuals and legal entities, and they are largely responsible for the payment system. At the community level they do their activities through branches and city-branches.

This paper presents the applicability of the multi-criteria decision making method – the Analytic Hierarchy Process (AHP) to rank city-branches of a bank. The Analytic Hierarchy Process was developed by Thomas L. Saaty in the late seventies of the previous century (Saaty, 1977, 1980). It is designed to solve multi-criteria decision problems which can be decomposed into the following elements: goal, criteria, sub-criteria and alternatives. These elements are then structured in a hierarchy. The decision-maker makes a pair comparisons of the elements of each level of the hierarchy and provides judgments about the relative importance of each criterion regarding the goal, afterwards specifying a preference for each alternative regarding each of the criteria. The outputs of AHP are the weights of the criteria and the priorities of the alternatives. This method enables the quantitative and qualitative factors to be considered and it supports individual and group decision-making.

The AHP model for ranking the city-branches has been developed and validated on the case of one of the largest and most renowned banks in the Republic of Macedonia – Komercijalna Banka AD Skopje. The sample consists of the city-branches that are located in Skopje, while the analysis was made for 2011. In order to implement the AHP model and examine whether the ranking of the city-branches is stable, programming tools Expert Choice and Super Decisions were used.

Aside from the introduction, state of the art is given in Section 2. The objectives of the research and the research methodology are stated in Section 3. The Analytic Hierarchy Process is described in Section 4. The developed AHP model is explained in Section 5, while the validation of the model is given in Section 6. The sensitivity analysis is performed in Section 7, and the conclusion is given in Section 8.

2. STATE OF THE ART

Multi-criteria decision-making (MCDM) is a sub-field of Operational Research/Management Science, which refers to making decisions in the presence of a number of criteria that in most cases are conflicting. From the 1960-ies onwards it is considered to be an active research area and it has produced a high number of articles and books (Roy, 2005).

Velasquez & Hester (2013) give a literature review of common MCDM methods, pointing out the advantages and disadvantages of each method and their areas of application. They considered the following methods of MCDM: multi-attribute utility theory (MAUT) (see Fishburn, 1967; Keeney, 1974, 1977), Analytic Hierarchy Process (see Saaty, 1977, 1980), fuzzy set theory (see Zadeh, 1965), case-based reasoning (CBR) (see Aamodt & Plaza, 1994), data envelopment analysis (DEA) (see Charnes et al.,1978; Cooper et al., 2007; Thanasssoulis 2001), simple multi-attribute rating technique (SMART) (see Edwards, 1971, 1977), goal programming (GP) (see Charnes et al., 1955), ELimination and Choice Translating Reality (ELECTRE) (for ELECTRE I see Roy, 1968, for ELECTRE IS see Roy & Skalka (1984), for ELECTRE II see Roy & Bertier (1973) for ELECTRE III see Roy (1978), for ELECTRE IV see Roy & Hugonnard (1982) and for ELECTRE TRI see Roy & Bouyssou (1993)), Preference Ranking Organization METHod for Enrichment of Evaluations (PROMETHEE) (for PROMETHEE I and II see Brans et al. (1984)), simple additive weighting (SAW) (for SAW see Hwang & Yoon, 1981) and technique for order of preference by similarity to ideal solution (TOPSIS) (for TOPSIS see Hwang and Yoon, 1981, Yoon, 1987, Hwang et al., 1993).

Mardani et al. (2015) made a literature review for MCDM techniques and their application. They considered 393 articles, published in more than 120 international peer-reviewed journals from the Web of Science database in the period 2000-2014. The articles are grouped in the following 15 fields: energy, environment and sustainability, supply chain management, material, quality management, GIS, construction and project management, safety and risk management, manufacturing systems, technology management, operation research and soft computing, strategic management, knowledge management, production management, tourism management and other fields. The highest number of articles (109) is found in the application field of operation research and soft computing, followed by the field of energy, environment and sustainability with 53 articles, and only 5 articles are applied in the field of knowledge management. The European Journal of Operational Research has published the highest number of articles (70), followed by the Journal of Expert Systems with Applications, having published 20 articles. According to the frequency of application of decision-making techniques (AHP, ELECTRE, DEMATEL, PROMETHEE, TOPSIS, ANP, aggregation DM methods, hybrid MCDM and VIKOR), the most used one is the AHP (128 articles), followed by: the hybrid MCDM (64 articles), aggregation DM methods (46 articles), TOPSIS (45 articles), ELECTRE (34 articles), ANP (29 articles), PROMETHEE (26 articles), VIKOR (14 articles), and DEMATEL (7 articles).

When a choice of the best alternative from several alternatives has to be made, or alternatives should be ranked so that multiple criteria are taken into consideration on the basis of which alternatives are evaluated, the Analytic Hierarchy Process is one of the most commonly used MCDM methods. It can be used to solve complex problems in education, healthcare, banking, manufacturing, government, sport, etc. In the focus of this paper is the application of the AHP in banking, more specifically to rank city-branches of banks, so below we refer to the references in this field.

Javalgi et al. (1989) apply the AHP for bank management and their empirical analysis was conducted in a major metropolitan area. Arbel & Orgler (1990) apply the Analytic Hierarchy Process to bank strategic planning, i.e. bank mergers and acquisitions strategy. They developed a model that was tested in a bank holding company. Xie & Gong (2008) use fuzzy AHP and Balanced Scorecard to evaluate the performance of commercial banks. Haghighi et al. (2010) use fuzzy AHP in order to examine the impact of 3D-readiness on the development of e-banking in Iran. They have interviewed thirty bank managers and experts in Iran, and have concluded that the most important attribute of the development of e-banking is “industry e-readiness”. Onder et al. (2013) evaluate the financial performance of Turkish banks by using the methods: AHP and TOPSIS. The observed period in the study is 2002-2011. Rezaei et al. (2013) use fuzzy AHP to determine effective factors weight on optimizing the balance sheet of banks. The study is applied in the Refah bank. Nasrabadi et al. (2014) rank five branches of the Sina bank from the perspective of electronic banking by using the AHP. The following were included as criteria: efficiency and system responsiveness, quality and safety of provided data and services, customer and customer-orientation, designing and implementing e-services, and web 2.0 tools recruitment. The relative weight of the criterion efficiency and system response was the highest (0.345), followed by: quality and security of information and services (0.276), customer and customer-orientation (0.169), designing and implementing e-services (0.121), and using web 2.0 tools (0.890).

In the existing literature there was not found an article with an application of the AHP like this presented in our paper thus leading to the conclusion that this is an original application of the AHP.

3. OBJECTIVES AND RESEARCH METHODOLOGY

The objectives of the empirical research are:

- to develop AHP model for ranking the city-branches of banks;
- to validate developed AHP model by performing a ranking of the city-branches in the groups they belong to – case study of Commercial bank AD Skopje
- to perform sensitivity analysis in order to examine the sensitivity, i.e., the stability of the obtained results.

The main goal of this paper was to present developed AHP model for prioritization of city-branches of bank that is a model that can be used for comparisons of city-branches in general; to present results of the AHP model validation in comparisons of city-branches of Commercial bank AD Skopje.

In order to realize the objectives of the research, the followlwing steps were done:

- to conduct an interviews with the Manager of the Independent Domestic Payment Operations Department and with employees in this Department to define criteria for ranking the city-branches and to develop the AHP model;
- to collect judgements of respondents to assess the importance of the criteria in terms of the goal, and priorities of alternatives in terms of each criterion;
- to perform sensitivity analysis by using the programming tool Expert Choice.

In order to identify the criteria, the method of interview was used and for assessment of the importance of criteria and priorities of alternatives the results of the survey were used (it was designed a questionnaire which was distributed to respondents by e-mail).

4. THE ANALYTIC HIERARHY PROCESS (AHP)

The AHP method is one of the most widely exploited MCDM decision-making methods in cases when the decision, it means the selection of given alternatives and their prioritizing, is based on several tangible and intangible criteria (sub-criteria). The process of complex decision problem solving is based on the problem decomposition into a hierarchy structure which consists of the goal, the criteria, sub-criteria and the alternatives. Hence the AHP is a general theory of relative measurement. It is used to derive relative priorities on absolute scales from both discrete and continuous paired comparisons in multilevel hierarchic structures based on the judgment of knowledgeable and expert people (Saaty, 2001). On the basis of the pair-wise comparisons, relative significance (weights) of elements of the hierarchy structure is calculated. The AHP can combine these judgments into a single representative judgment for the group and also including the importance of the individuals themselves.

The AHP method application can be explained in four steps (Saaty & Begicevic, 2010, Begicevic et al., 2011):

1. The AHP enables decision makers to structure decisions hierarchically. The hierarchy model of the decision problem is developed in such a way that the overall goal of the decision is at the top of the model, strategic objectives in the higher levels, evaluation criteria in the middle levels, and alternative choices at the bottom.
2. After the hierarchy has been determined, the decision makers begin the procedure of prioritizing in order to determine the relative importance of elements on each level. The AHP provides a structured framework for setting priorities on each level of the hierarchy using pair-wise comparisons, a process of evaluating each pair of decision factors at a given level on the model for their relative importance with respect to their parent. On each hierarchy structure level, the pair-wise comparisons should be done by all possible pairs of the elements of this level, starting with the top of the hierarchy and working its way to the lowest level. The decision maker's preferences are expressed by numeric values on 1-3-5-7-9 scale - Intensity of Importance Scale (Table 1).
3. On the basis of the pair-wise comparisons, relative significance (weights) of elements of the hierarchy structure are calculated, which are eventually synthesized into an overall priority list of alternatives. Decision maker is allowed to change preferences and to test the results if the inconsistency level is very high. The consistency of the judgments is tracked using the rigorous math

analytics behind the AHP to validate the decision process. In cases where inconsistency is above 10% it is recommended that the criteria and judgments be revisited (Saaty, 1980).

4. Results are priorities of the alternatives and hierarchy tree with objective's relative significance. The sensitivity analysis is also carried out. Sensitivity analysis is used to determine the sensitivity of the alternatives to changes in the objectives' priorities.

Table 1: Intensity of Importance Scale (Saaty, 2012, p. 6)

Intensity of importance	Definition	Explanation
1	Equal importance	Two activities contribute equally to the objective
2	Weak	
3	Moderate importance	Experience and judgment slightly favor one activity over another
4	Moderate plus	
5	Strong importance	Experience and judgment strongly favor one activity over another
6	Strong plus	
7	Very strong or demonstrated importance	An activity is favored very strongly over another; its dominance demonstrated in practice
8	Very, very strong	
9	Extreme importance	The evidence favoring one activity over another is of the highest possible order of affirmation
Reciprocals of above	If activity *i* has one of the above nonzero numbers assign to it when compared with activity *j*, then *j* has the reciprocal value when compared with *i*	A reasonable assumption
Rationals	Ratios arising from the scale	If consistency were to be forced by obtaining *n* numerical values to span the matrix

5. DEVELOPING THE AHP MODEL FOR RANKING THE CITY-BRANCHES

The constructed AHP model consists of a goal, criteria, and alternatives. The goal is to rank the city-branches of the bank in the groups to which they belong, the alternatives are the city-branches that belong to each group, and in order to determine the criteria, the Manager of the Independent Domestic Payment Operations Department and the employees in this Department were chosen as respondents. The determination of the criteria was based on the results of interviews, questionnaires and qualitative analysis of relevant documents.

The activities which take place in the groups of city-branches are: denar savings, bank accounts, foreign currency savings, loans, transaction accounts, foreign exchange operations, other services, public services, master cards, business trip, commission, domestic payment operations, statements of transaction accounts, standing orders for utilities, issuing lists of codes, documents for bank cards, contracts for e-banking and input pensions. According to the value of each criterion for which data from internal reports of the bank departments are used, 8 activities are selected, which have the highest values in the observed period and the same serve as criteria: denar savings, foreign currency savings, transaction accounts, exchange operations, public services, master cards, fees for payment operations (commission), and domestic payment operations. The criteria are described in Table 2.

The AHP model for ranking the city-branches that belong to group A is presented in Figure 1, and in an analogous manner the AHP models for ranking the city-branches of groups B and C can be represented.

Table 2: Description of criteria

Criteria	Description
Denar savings	Deposit and money withdrawal from savings bank book, interest, authorization, representation, opening and replacement of savings book, etc.
Foreign currency savings	Deposit and money withdrawal from savings bank book, pledge of foreign currency deposit, conversion, interest, authorization, representation, opening and replacement of savings book, etc.
Transaction accounts	Cash and non-cash transfers, interests, statement of account, opening transaction account, authorization, representation, etc.
Exchange operations	Purchase/sale of foreign currency, difference in exchange rates-exchange operations, check received on encashment
Public services	Payments for public services, embassies, Western Union
Master Cards	Pay-in and pay-out (master card transfers)
Fees for payment operations (commission)	Fees (commission) calculated and charged while transaction being processed by bank clerk
Domestic Payment Operations	Cash and non-cash payments (payments-in and withdrawals) processed through payment instruments in the domestic payment operations

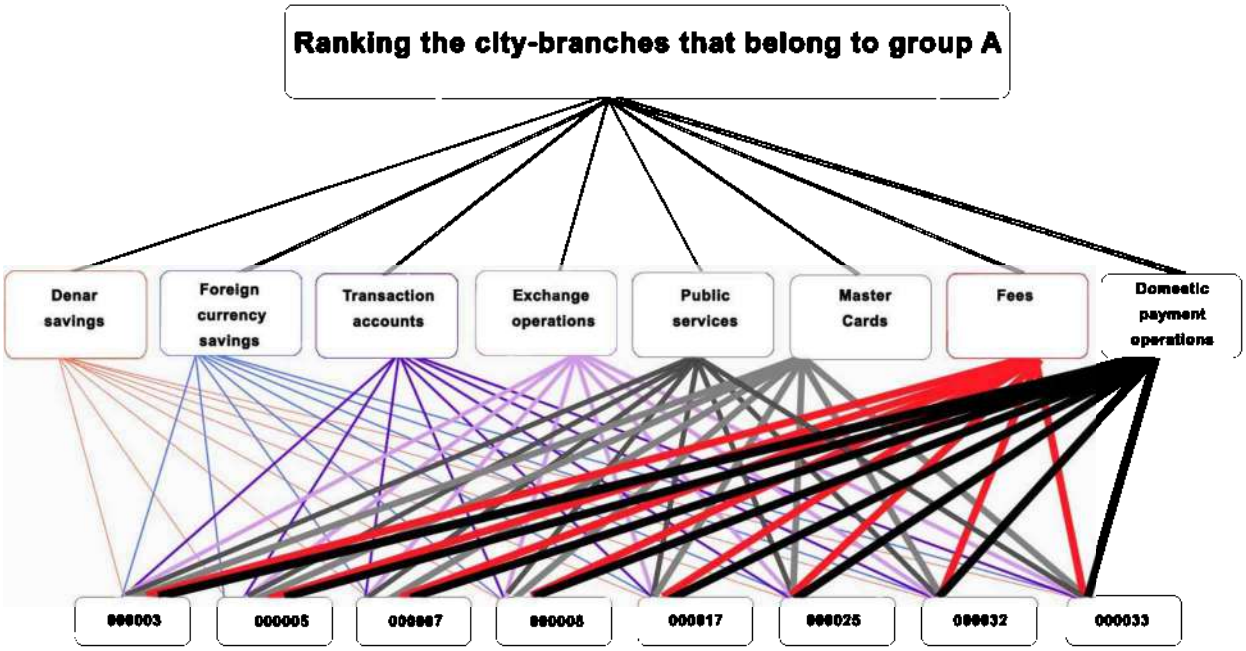

Figure 1: The AHP model for ranking the city-branches that belong to group A

6. VALIDATION OF THE AHP MODEL

The AHP is applied for ranking the city-branches of Commercial bank AD Skopje that are located in Skopje (11 Oktomvri, Avtokomanda, Biser, Buket, Bunjakovec, Butel, Vlae, Vodnjanska, GTC 1, Drachevo, Gjorce Petrov, Ekonomski fakultet, Jane Sandanski, JAT, Kapishtec, Kjubi, Leptokarija, Lisiche, Makpetrol, Madzari, MVR, Nova Makedonija, Novo Lisice, Partizanska, Rasadnik, Ruzveltova, Skopjanka, Stopanska komora na Makedonija, Sudska palata, Topansko pole, Cvetan Dimov, Centrala, Cair, Cento, Cesma, and Shuto Orizari).

Information about the profile of the bank's city-branches are obtained through the conducted interviews with the Chief Operative Officer of the bank and the Manager of the Independent Domestic Payment Operations Department.

According to the number of active counters, the city-branches are classified in the following three groups: group A with 1-3 active counters, group B with 2-5 active counters, and group C with 4-9 active counters. Groups A and B differ only in the number of employees, and group C, despite the number of employees, differs from groups A and B in that it has counters for transaction accounts and the following services can be performed: standing orders for utilities, issuing lists of codes, documents for bank cards, contracts for e-banking and input pensions.

In order to rank the city-branches of Commercial bank AD Skopje in the groups they belong to, the period from 2008 to 2011 was covered, and for an adequate comparative analysis, only the city-branches that belong to each of the groups in 2008 are taken into consideration for the entire observed period. Since the transactions which are done in the Head Office are significantly extensive, more complex and may not be comparable and placed in correlations made between the three groups of branches, they are excluded from the analysis. The research in the bank was conducted in 2011 and the data was collected in the period between 2008-2011 in which was obtained permission to use the data. The data used in the AHP model is not made public and is considered confidential, therefore it is not given in the paper, and the real name of the city-branches have been replaced with numbers. The following eight city-branches belong to group A: 000003, 000005, 000007, 000008, 000017, 000025, 000032 and 000033. Eleven city-branches belong to group B, and they are: 000006, 000009, 000012, 000016, 000020, 000027, 000028, 000030, 000035, 000036 and 000037, while the following ten city-branches belong to group C: 000004, 000010, 000013, 000014, 000018, 000019, 000021, 000023, 000031 and 000034. The city-branch 000010 has no counter for transaction accounts, and the city-branches 000013 and 000014, despite the services on the counters for transaction accounts, conduct international payment for legal entities. In this paper the focus is on the last year of the observed period, i.e. 2011.

After developing the AHP model, a questionnaire was composed in which the respondents (Officers of the Analysis, Information and Support Office) were asked to do pair-wise comparison in each level of the hierarchy and to express their preferences using the intensity of importance scale. The respondents first had to compare the criteria that were given in pairs by using the option of importance (i.e. which one of the two criteria that are compared in a pair is more important for the goal – ranking the city-branches in the groups they belong to in the observed time frame) and afterwards express their preferences with the help of the Saaty's scale. Next, in the same questionnaire, the respondents had to compare the alternatives, i.e. the city-branches that were given in pairs in regards to each criterion, and on the basis of the data for the observed period, to use the option of priority (which of the two city-branches that are compared in a pair is given priority in regards to the criterion) and to express their preferences with the help of the same scale. The prepared questionnaire was quite huge (a total of 320 pages), so it represented a fairly complex task for the respondents. The mentioned questionnaire is not added as an appendix due to its size.

The questionnaire was sent to the respondents by e-mail, and after they filled it, they submitted the quastinnaire by e-mail, determining that the questionnaires were fully completed. The values that were given in the questionnaires by the respondents were entered in the programming tool Super Decisions (Super Decisions Software, 2006) for each group of city-branches separately. There are four ways of assessing the comparisons in pairs in this software tool: graphically, verbally, through a matrix, and through a questionnaire. The data from the questionnaires that were filled by the respondents were entered in the tool Super Decisions through the choice of questionnaire. The obtained results i.e. the weights of the criteria and priorities of alternatives, are presented and analyzed below.

The weights of the criteria are shown in Figure 2. It can be seen from this Figure that only one criterion, i.e. the criterion of public services has a weight 0.045455, while the remaining seven criteria have same weight (0.136364).

The priorities of the alternatives that belong to groups A, B and C are shown in Figures 3, 4 and 5 respectively. The Consistency Ratio (CR) in all of the analyzed cases is 0.01 and it follows that the results are consistent.

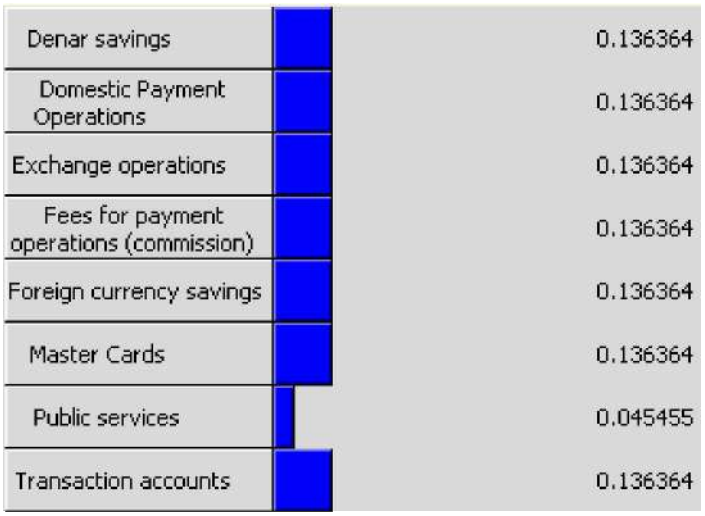

Figure 2: Weights of criteria

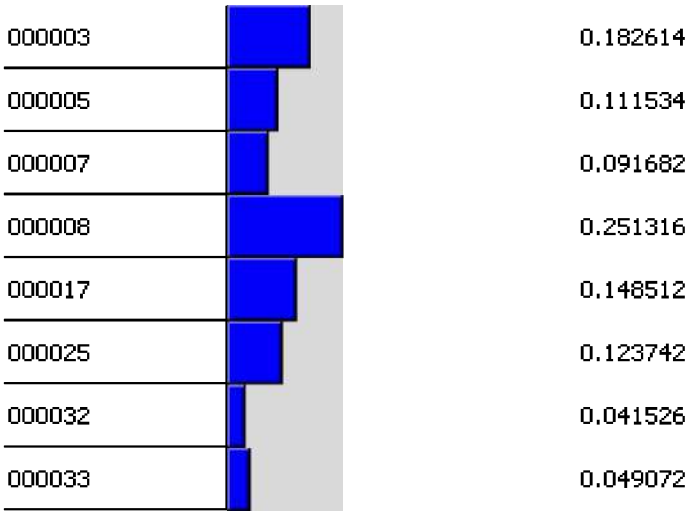

Figure 3: Priorities of city-branches that belong to group A

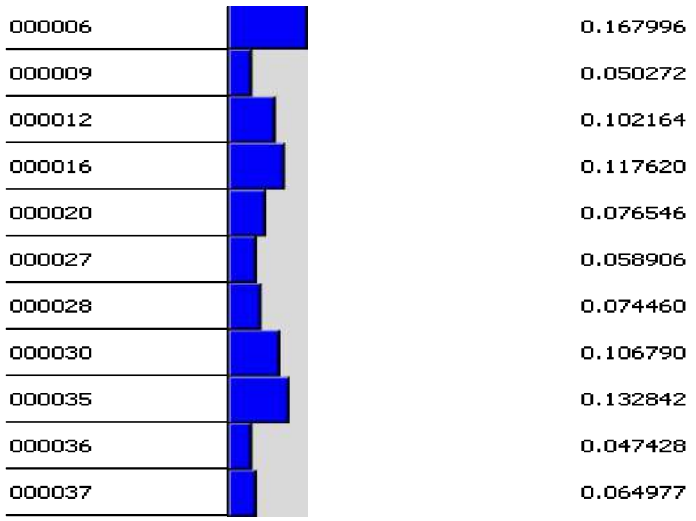

Figure 4: Priorities of city-branches that belong to group B

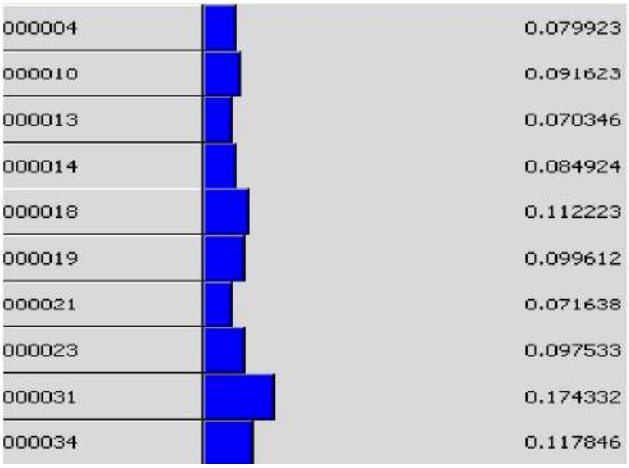

Figure 5: Priorities of city-branches that belong to group C

Based on the priorities of the city-branches their ranking is performed in the groups in which they belong (Table 3). It can be seen from this Table that in group A the highest ranked city-branch is 000008, followed by the city-branch 000003, while the lowest ranked branch is 000032. In group B, the highest ranked city-branch is 000006, followed by the city-branch 000035, while the lowest ranked city-branch is 000036. In group C, the highest ranked city-branch is 000031, followed by the city-branch 000034, and the lowest ranked city-branch is 000013.

Table 3: Rank of the city-branches of Commercial bank AD Skopje

City-branches that belong to group A	Rank	City-branches that belong to group B	Rank	City-branches that belong to group C	Rank
000003	2	000006	1	000004	8
000005	5	000009	10	000010	6
000007	6	000012	5	000013	10
000008	1	000016	3	000014	7
000017	3	000020	6	000018	3
000025	4	000027	9	000019	4
000032	8	000028	7	000021	9
000033	7	000030	4	000023	5
		000035	2	000031	1
		000036	11	000034	2
		000037	8		

7. SENSITIVITY ANALYSIS

Sensitivity analysis offers a stable solution and it enables change of inputs in order to observe the consequences on outputs, i.e. the priorities of the alternatives (Begicevic, Divjak & Hunjak, 2007). In order for a sensitivity analysis to be performed, the programming tool Expert Choice (Expert Choice, 2005) has been used. This tool contains the following five options for a sensitivity analysis: 1. Performance; 2. Dynamic; 3. Gradient; 4. Head to Head and 5. 2 D.

Most interesting for analysis are the three top ranked city-branches from each group for 2011, and also there have been chosen three criteria. Out of the eight criteria, seven of them are equally important for each model, hence resulting in a combination of three criteria (if the criteria had a different importance, then it would have been suitable to choose the three criteria that have the highest weights). Such an approach, with three criteria and three alternatives, could have been realized in the trial version of the Expert Choice software, for which access was given, while in the models that were created in Expert Choice, data from the filled questionnaires by the respondents were used.

For the first AHP model, in which the city-branches that belong to group A are ranked, the top ranked have been chosen to be the city-branches: 000008, 000003 and 000017; the criteria being: foreign currency savings, exchange operations, and domestic payment operations. For the purpose of comparing the elements of the hierarchy in pairs, the data from the filled questionnaires by the respondents were used

(explained in Section 6). The weight for each of the criteria is 0.333, while for the alternatives 000008, 000003 and 000017, the overall priorities are 0.483, 0.297 and 0.220, respectively.

Figure 6 is created through choosing the option of Performance from the menu Sensitivity-Graphs of the Expert Choice software. The weights of each criterion and the ranking of the city-branches can be seen in it. Additionally, the order of the three city-branches for each criterion can be seen through this option. In regards to the criterion on foreign currency savings, the city-branches 000008 and 000003 are equally preferred, while regarding the other two criteria, the most preferred is the city-branch 000008. In order to see how the change of the input data (criteria) will reflect on the final results, there has been made a change of the importance of the criterion of foreign currency savings (because of the above-mentioned statement for both the alternatives that are highly ranked), so its importance has increased by 20%, which has seen a slight decrease in the overall priority of the city-branch 000008, a slight increase in the overall priority of the city-branch 000003, the city-branch 000017 having no changes, and the ranking of the city-branches stays the same. In addition, the importance of the criterion of foreign currency savings has changed (from 33.3% increasing to 60%), but there have been no changes in the ranking. Figure 6 also displays the alternatives 000003 and 000017 as being equally preferred in regards to the criterion of exchange operations, and its importance has changed as well to: 40%, 50%, and 60%, but once again, the ranking of the city-branches does not change.

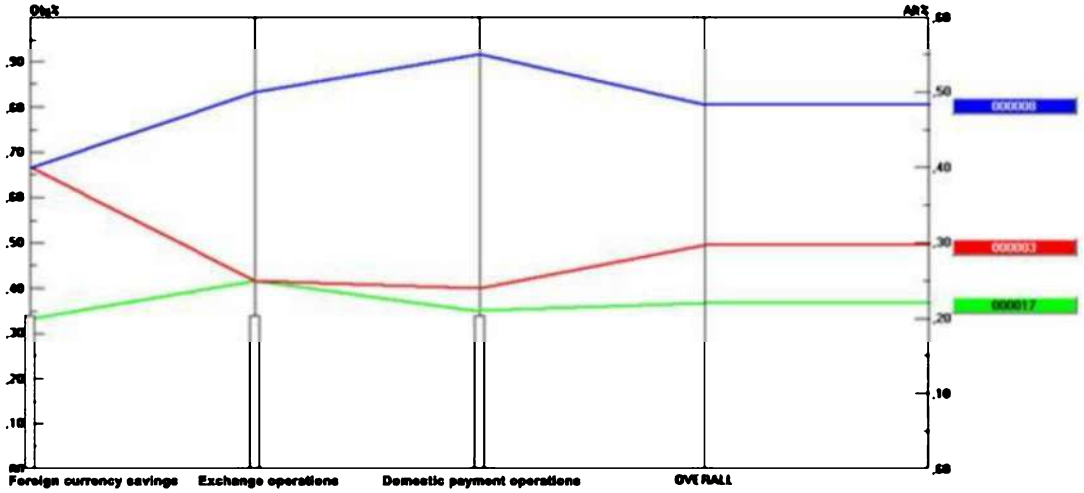

Figure 6: Sensitivity analysis - option Performance for the first AHP model

Through the option of Gradient, one can notice the sensitivity of the overall priorities of the city-branches 000008, 000003 and 000017 on the change of the importance of each criterion separately. The red vertical line shows how large the weight is for the chosen criterion. Figure 7 displays the conclusion that if the weight of the criterion of foreign currency savings increases, there is a decrease in the priority of city-branch 000008, an increase in the priority of city-branch 000003, while the priority of city-branch 000017 does not undergo significant changes.

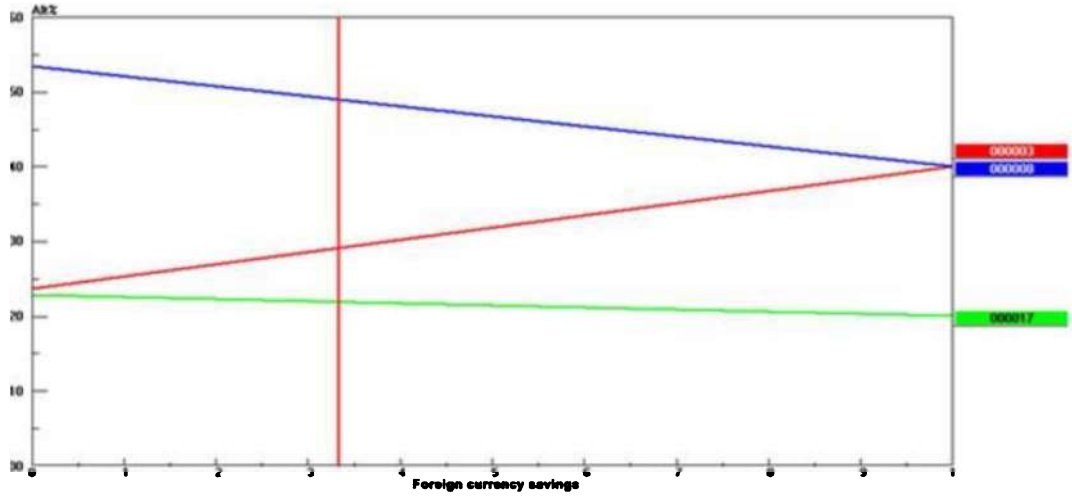

Figure 7: Sensitivity analysis - option Gradient for the criterion of foreign currency savings for the first AHP model

The option of Head-to-head is followed for one pair of city-branches (000017 and 000003). Figure 8 shows that the city-branch 000003 has an advantage over city-branch 000017, regarding the criteria: foreign currency savings and payment operations. What can be noticed in addition is that the weighed advantage of the city-branch 000003 (the gray triangle oriented towards the right) over city-branch 000017 is not considerably high.

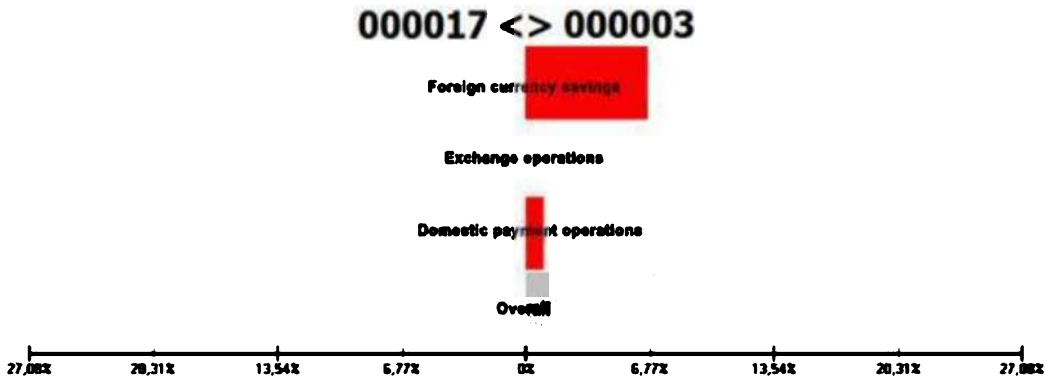

Figure 8: Sensitivity analysis - option Head-to-head for the city-branches: 000017 and 000003

In addition, the sensitivity analysis through the option of 2D is explained. In regards to the chosen criteria: foreign currency savings and exchange operation, the top city-branch is 000008 (Figure 9), and for its advantage over city-branch 00003 the contriubting criterion is exchange operations. City-branches 000003 and 000017 have the same priority in regards to the criterion of exchange operations, but when we take into consideration the criterion of foreign currency savings, then city-branch 000003 is in advantag

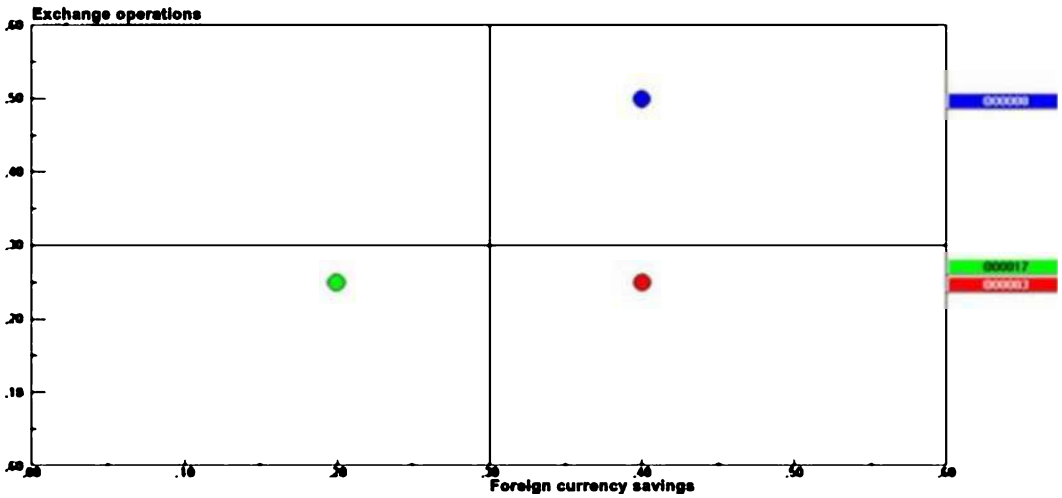

Figure 9: Sensitivity analysis - option 2D for the criteria: foreign currency savings and exchange operations for the first AHP model

For the purpose of analyzing whether the ranking of the three city-branches from Group A is stable, a sensitivity analysis is conducted, through the option of Dynamic, with the significance of each criteria separately increased by 5%. On the basis of the analyzed results it has been concluded that with the increase of the significance of the criteria by 5%, the ranking of the three city-branches from Group A is stable.

For the second AHP model, which ranks the city-branches that are part of Group B, the three top ranking city-branches for 2011 have been distinguished: 000006, 000035 and 000016. At the same time, the following three criteria have been chosen: denar savings, master cards and commission. For the third AHP model, which ranks the city-branches that belong to Group B, the three top ranked city-branches for 2011 have been chosen (000031, 000034 and 000018), while the criteria chosen are: denar savings, foreign currency savings and transaction accounts. In order to analyze whether the ranking of the three city-branches of Groups B and C is stable, a sensitivity analysis has been conducted, through the option of Dynamic, thus concluding that the ranking is stable.

8. CONCLUSION

The AHP can be applied for solving numerous MCDM problems (planning, optimizing, measuring performances, resource allocation, conflict solving, etc.). Through the conducted research presented in this paper, the following scientific contributions have been achieved: the AHP model for ranking the city-branches of a bank was developed and it was validated on the case of Komercijalna Banka AD Skopje. In our experience, the developed AHP model has strongly motivated all of the respondents (experts in banking) because their knowledge and preferences were incorporated in it. The developed AHP model with obtained weights of criteria can be used for prioritization of the city-branches of banks in general. The benefits of using this model are: the calculation of weights of criteria for ranking the city-branches can help bank managers to be more objective in the process of ranking; the ranking procedure is more transparent and simpler; better quality in decision-making at city-branches; improving the performance of city-branches that has a positive influence on the successful operating of the bank in which they belong to. In our further research we plan to develop generic AHP model for comparison of city-branches, as well as to use statistical methods for defining criteria. We will also try to develop the ANP (Analytic Network Process) model for ranking city-branches of the bank.

Abstract: *This paper presents opportunities of implementation of Canvas Business Model in e-business planning. Canvas has become an important tool for entrepreneurs nowadays. The advantages of this model are numerous. Therefore, the aim of the paper is to introduce the possibilities and benefits of using such model. Canvas Business Model can be used for new business ideas and for analysis of existing ones. There are several adaptations of this model, such as Lean Canvas. Lean Canvas is business model used for start-ups and mostly on-line business. The second part of this paper gives the examples and first steps for implementation of both models in electronic business start-up. Considering mentioned examples, this research can be used as a guide for future entrepreneurs in business model creation and the main objective reflects in ensuring that process of business development is concisely and clearly demonstrated including the crucial application steps. This model focuses on the key segments of a business. Moreover, it enables its users to define strengths and pain points and to understand them.*

Keywords*: canvas, business, model, lean, start-up, entrepreneurship*

1. INTRODUCTION

Business model presents conceptual tool containing a set of objects, concepts and their relationships with the objective to express the business logic of a specific business. (Pateli and Giaglis 2003). This concept was firstly introduced in 1957 in article written by Bellman. However, the academic research on this topic started in 1990s, and since then it intrigued numerous academics, scientists, businesspeople and entrepreneurs. It has become particularly popular in, what is known as, dotcom boom and it is thought that poor business models actually led to downfall of lot of e-business companies of that time. Globalization, uncertainty and ICT environment have contributed to the growing popularity of this concept, especially in the e-business industry.
Electronic business represents the conduction of business processes on the Internet. Business processes include buying and selling products, servicing customers, processing payments, collaborating with business partners, sharing information, running automated employee services, etc. (Radenković, Despotović-Zrakić, Bogdanović, Barać, Labus, 2015)

In e-business, information and communications technology is used to enhance business. It includes any process that a business organization conducts over a computer-mediated network. E-business can be described as transformation of organizational processes in order to deliver additional value through implementation of technologies and computing paradigm of trending economy (Lee, 2009).
Primary processes that are enhanced in e-business:

- Production processes, which include procurement, ordering and replenishment of stocks; processing of payments; electronic links with suppliers; and production control processes.
- Customer-focused processes, which include promotional and marketing efforts, selling over the Internet, processing of customers' purchase orders and payments, and customer support, among others; and
- Internal management processes, which include employee services, training, internal information-sharing, video-conferencing, and recruiting. Electronic applications enhance information flow between production and sales forces to improve sales force productivity. Workgroup communications and electronic publishing of internal business information are likewise made more efficient

The aim of this paper is to demonstrate how business model can be used in developing new business. In order to increase the understanding of this process and to provide steps and tools for its implementation, the service provider start-up will be used as an example..

Starting business on the internet is a good way to realize entrepreneurial idea, especially if it is cost consuming and requires significant investments. There are multiple ways to start business online, including selling products, creating an affiliate site that has a functional store, drop shipping for a merchant or starting an information publishing business (Chhabra, 2013). All of these methods have their own set of

advantages and disadvantages, which is the crucial reason to determine business goals before deciding on a model.

2. E-BUSINESS MODELS FOR START-UPS

The first step in e business development (regardless is it an e-business) is to create detailed business plan. One of the purposes of a clear business plan is to have all steps, ideas, hints and goals identified and transparent. In practice, for most business, plan should reflect focus strategy, resources and their responsibilities matrix, the financial projections of cash flows and necessary investments sales forecasts and marketing strategy. (Dollinger, 2003)
The plan helps the founders to distinguish meaningful pieces related to projected expense, sales, timing of payments. Its focus is definition of business purpose, how the goals are going to be achieved and why the founders are the right people for this business. Also, details regarding the financial resources necessary for progress and timeline of the growth phases that will lead to profitability are important step.
Bullet points that should be included and elaborated in every business plan are:

- Executive summary – it should reflect the key highlights of the plan
- Products and services - core of business purpose
- Management team - should include relevant team review that explain why management personnel are the right people for their jobs
- Market research and clear definition of target niche. Also, it is important to identify possible competition.
- Quality Strategy
- Milestones and Metrics – key metrics that will be used to track the growth and progress of business in question
- Financial Plan – the most critical component. It should include : Sales Forecast, Personnel Plan, Profit & Loss Statement, Cash Flow Statement and Balance Sheet
- Risk Management
- Continuity Plan

Simultaneously, it is necessary to define business model which must be implemented in process of business planning. The main difference between business plan and business model can be explained by following definition. The business model is the mechanism through which the company generates its profit while the business plan is a document presenting the company's strategy and expected financial performance for the years to come. The business model is the center of the business plan. (Neilson, Pasternack, 2005)
Model describes how the company is positioned within its industry's value chain, how it organizes its relations with its suppliers, clients, and partners and how it manages money flows in order to generate profits. On the contrary, he business plan translates this positioning in a series of strategic actions and quantifies their financial impact. Nowadays business models can be divided in “basic models” and “new models”. Basic models assume that companies compete either on price or non-price components. New business models are based on innovative organization forms and/or new products or services, mostly in electronic business area (Daidj, 2014).Academic research on business models has started in late 1990s, and since then numerous definitions emerged. One of the first was written by Timmers in 1998. Timmers defines a business model as a three part concept “(a)an architecture for the product, service and information flows, including a description of the various business actors and their roles; and (b) a description of the potential benefits for the various business actors; and (c) a description of the sources of revenues.”

Every company has a business model, whether that model is explicitly articulated or not (Chesbrough, 2006; Teece, 2010).

In 2005 Morris et al. proposed new definition which says that “A business model is a concise representation of how an interrelated set of decision variables in the areas of venture strategy, architecture, and economics are addressed to create sustainable competitive advantage in defined markets”. (Morris, Minet, Richardson, Allen, 2006)

Similarly, at the same year, Shafer at al presented his definition: “We define a business model as a representation of a firm’s underlying core logic and strategic choices for creating and capturing value within a value network.” (Shafer, Smith, Linder, 2005).

In recent years, George and Bock defined business model as the design of organizational structures to accomplish a commercial opportunity. They also mention three dimensions to the organizational structures: resource structure, transactive structure, and value structure (George, Bock, 2011).

The business model concept defines how a firm creates and captures value for its stakeholders (Amit and Zott, 2001).
Despite countless definitions, researchers have not yet come up with a general one. The reason can be found in diverse implementations of business model. Regarding e-business models, authors agree on key characteristics of model, but focus is different. Nowadays, most often used models are: Canvas and Lean Canvas.

2.1. Canvas business model

The Business Model Canvas is strategic management and entrepreneurial tool. (Osterwalder, Pignegur, 2010) It is well-known business model, used in order to highlight the key segments of a business. The model describes the most relevant parts of business plan and helps its users to focus on values for its enterprise. The purpose of Canvas is to point out how an organization creates, delivers, and captures value. (Osterwalder, Pignegur, 2010) It is widely used among entrepreneurs both for business plan creation and analysis. Canvas was created in 2008 by creator Alexander Osterwalder. and he created it in 2008 Since thean, a lot of numerous versions of Canvas Business Model emerged (Coes, 2014). Boris Shiskov compares Business Model Canvas to the Value Map in his book "Business Modeling and System Design ". He recognizes Canvas as one of the most established methods in industry for business design, innovation and creation. (Shiskov, 2014) Today's market is uncertain and driven by factors beyond one's control: demographic changes, recession, environmental issues, increasing global competition. These factors are beyond control of most companies, but they and their business models are affected by them. Therefore, companies cannot change the environment, but they can change the way they operate and the models they use. (Clark, Osterwalder, Pignegur, 2012)

Canvas Business model is a tool consisted of nine segments known as building blocks.
Nine main elements and also referred as key drivers of Business Model Canvas are:

- Customer Segments
- Value Propositions
- Channels
- Customer Relationships
- Revenue Streams
- Key Activities
- Key Resources
- Key Partnerships
- Cost Structure

These elements can be clustered in few groups: Value which includes value proposition, Relationships (including Channels, Customer Relationships, Key Partnerships and Customer Segments), activities (Key activities and key resources) and financial aspects (cost structure, revenue streams). Each segment needs to be filled in with answers to key questions. It is important to have in mind the main goal while filling the blocks. However, it is necessary to avoid any overlapping in defined questions and answers.

- Customer Segments (CS) - This building block defines the different groups of people or organizations a business plans to serve. A customer groups have to be carefully and precisely defined since there can be overlapping in some segments.

- Value Propositions (VP) - The Value Propositions summarizes all reasons and advantages of buying a product or using a service for specific consumer segment. The Value Propositions may be quantitative (example: lowest prices, speed of service) or qualitative (design, customer experience). This statement should point out why that one particular product or service will be the best choice in each aspect, what problem it solves and what is the value it delivers.

- Channels (CH) - This building block is used to show how a company communicates to its customers. Also in this part of a model it is important to explain how company plans to reach its consumers in order to deliver their Value Proposition. Channels are directed toward distribution, sales and communication activities.

- Customer Relationships (CR) - This block is used to describe what kind of relationships a business builds with key customers. This element includes personal interactions (such as one on one meeting), customized relations (mass customization), automated relationships (reviews, comments, and generic replies). This element influences the value propositions and thus overall customer experience.

- Revenue Streams (RS) - The revenue streams show how a company earns income and generates profit from its business. In this part it is described how each customer segment contributes to revenue and profit. Revenue streams can be classified and calculated differently. Usually there are two basic types: revenues from singular transactions and repeated transactions (monthly, yearly or other subscription). The focus in this building block is on calculation of customers' willingness to pay for a product/service.

- Key Resources (KR) - The most important assets which are crucial and irreplaceable for the business are key resources. Those resources can include intellectual resources, financial, physical or human resources. It is hard to define all key resources, but it is of utmost importance for business maintenance.

- Key Activities (KA) - Key activities represent the most important processes and activities the company has to undertake in order to make it business work. The important thing in this block is to list and define all the activities regarding other building blocks such as necessary operations to create Value Propositions, reach Customers, maintain Relationships, promote the product or service, upgrade values, reduces costs and earn revenues. and earn revenues.

- Key Partnerships (KP) - This block represents the stakeholders that make business model work. That is usually network, created among employees, business partners, suppliers, organizations, government and clients. Partnerships are essential in order to gain benefits and help build position on the market. Choosing the right partner can reduce the risks, expenses and it can enable acquisition of specific resources or activities which cannot be produced by the business itself.

- Cost structure (CS) - Cost structure describes all costs and expenses which occur in activities undertook in a specific business. Those costs can be created while creating value, maintaining partnership relations etc.

2.2. Lean Canvas business model

Lean Canvas is an adaptation of Business Model Canvas, but it is created primarily for new start-up business. It is often referred as a problem-solution oriented approach because of its structure and focus. The building blocks in this business model are somewhat different. The focus is on product and market.
This method is always associated with entrepreneurs and start-ups. The author of the book The Lean Start-up, says that The Lean Startup method teaches one how to start a start-up, how to drive it, when to turn, when to protect and how to grow a business with maximum acceleration (Ries, 2011). Moreover, it is often said that Lean Canvas is the model that helps identify risky parts of a business and find the right solutions in various learning cycles. (Croll and Yoskovitz, 2013) When using this tool, it is important to follow predefined order of actions. Some blocks have to be completed in pairs because they are correlated. It is important to use this model following predefined order of actions and to fill blocks in the bellow written order (Mohapatra, 2013).
Building blocks in Lean Canvas: Problem, Customer Segments, Unique Value Proposition, Solution, Channels, Cost Structure, Revenue Streams, Key Metrics and Unfair Advantage.
They can be divided in two groups, as mentioned: Product and Market. Some of the blocks are the same as in the Business Model Canvas. The different ones are: Problem, Solution, Key Metrics Unfair Advantage, and they will be further explained.

- Problem

In this block it is necessary to list few problems which can be related to the customer segments. Key question for this block is "What is one's problem and does it have a problem worth solving?" It is important to figure if the solution exists before investing time in defining it. The usual number of problems listed is three.

- Solution

Solution block needs to be fill in with solutions to the problems listed before. Each solution needs to address appropriate problem.

- Key Metrics

The key metrics in Lean Canvas model are the activities that move business forward.

- Unfair advantage

Unfair advantage represents something that cannot be copied or bought. This block is very often mixed with unique value proposition. The difference between these two blocks is who they address. The Unique Value Proposition applies to the consumers and unfair advantage to competitors.

3. EXAMPLES OF IMPLEMENTATION OF BUSINESS MODELS

3.1. Canvas in practice

The project "pickwith.us" represents software solution in hospitality services area. It is designed to make easier for users to discover and book place in every restaurant in Belgrade.
The main purpose of pickwith.us portal is to provide easier restaurants booking. It allows users to choose the appropriate restaurant based on desired parameters such as time, date, menu, location, price range etc. In order to book a table, it is required to create account with basic information. The process is simple and intuitive. Users of this portal can be divided in two groups: restaurant owners and guests. There are benefits for both user groups which will be described in Canvas business model.

Users of this portal are both owners of restaurants and guests. There are benefits for both user groups which will be described in Canvas business model.

Mission is to create universal environment which contains all information about restaurants in Belgrade and to attract both tourists and citizens.

Vision is to be the leader in providing new services on the market, in terms of integrated online booking in the multiple restaurants. Also, to fulfill customers' needs by providing accurate information, educative and interesting contents and to maintain strong relations with partners.

Table 1 : Canvas business model

- Customer Segments

In this project, there are few customer segments and each of them gains different benefits. We divided them in following groups: Belgrade citizens, Tourists, Companies and organizations and Restaurant owners

Belgrade citizens are primary segment because they are end users of the portal. It is important to engage them and to become a part of their routine. The benefits are reflected in: time saving, more information, wider choice.
Tourists are an important segment because they are willing to explore all options that a city offers. They rely on recommendations of other guests and they are looking for easiest way to be informed. Thus, benefits for them are: easier decision making, information, clear insight and cheaper and simpler booking process.
Companies and organizations represent corporate users which can use this service in order to find appropriate place for all kind of events they organize (including balance between restaurant capacity and their needs, menus and prices).
Restaurant owners are specific segment because they represent key for entering the market. They are main relation between end users and portal. Benefits for them are numerous: promotion, better organization, easier booking process, guests' database with useful information etc.

- Value Proposition

The value proposition relates to several benefits: fast, simple and user-friendly process of making reservations for portal users, reducing the time dedicated to processing booking requests for restaurants, reducing costs of marketing and promotion activities for restaurants owners, safe booking and availability of information (about time, free spots, menus, prices etc.)

- Channels

In this project, the main channel is portal. It is the key resource for establishing communication with users. Additionally, other web services such as engines, other websites, emails and social media are used. The phone and one on one meeting are part of communication channels, also. They are primary channel for reaching the restaurant owners.

- Customer Relationships

Pickwith.us portal is based on relationships built with customer segments. Relationships can be reflected in following: Reviews, Marketing, Personal relationships and Mass customization

Reviews are used to provide portal users with real-time and organic opinions. They can be useful for both parties: users can easily make decisions based on reviews, and restaurants can build reputation and improve their strategies.
From the "Pickwith.us" portal point of view, marketing is reflected in activities related to online publishing through Facebook and Google Adds. Google search engine and publishing on Display Network are part of portal strategy. Google search engine includes key words, such as: restaurants, Belgrade, lunch, reservation, contact etc. Moreover, the social networks will be used through Facebook page and moving forward end users of portal will spread a word about pickwith.us.
The partners rely on marketing using pickwith.us portal and its social network presence. The possibilities for promotion are numerous, from restaurant presentation on portal, published special offers and contents.
Mass customization refers to establishing strong relationship between users and restaurants through suggested choices based on customer preferences. Pickwith.us stores a database with information and historical data for every user and, by following their previous choices, gives proposals according to their style.
Also, restaurants can improve their rank on this website through personal relationships. They can point out themselves, increase their visibility and engagement through personalized offers and suggestions.

- Revenue streams

Revenues are expected from several sources. Primary source is paid promotion. Several packages are offered depending on chosen promotional activities such as: special offers, news, promotions on pickwith.us homepage, weekly newsletters, key updates, promotion on pickwith.us Facebook page.
The second source is a fixed monthly subscription made through portal.

- Key Resources

Key resources include project team, developers, portal, phone and mail. Project team is responsible for implementation of business plan, executing the idea, communication with stakeholders, monitoring revenue streams and costs, realization of promotion activities and overall daily duties. Developers

maintain portal and work on its improvements. They manage databases. Portal is the key resource because it is main role in project implementation. Phone and mail are main communication tools.

- Key Activities

Firstly, key activity is portal development and updates in line with trends. Secondly, negotiation with partners, the key activity necessary in order to create a database and content of the portal. Lastly, marketing activities followed by Improvement of service.

- Key Partnerships

In this project, three main partnership groups are: Restaurant owners, Companies and individuals

Restaurant owners through partnership with "Pickwith.us" portal increase number of their visitors, enhance online presence and with that, positively affect target audience awareness. Pickwith.us, as an intermediate between restaurants and guests, make the process of booking reservations simpler for both parties.
One of the groups are companies which tend to after a hard work of their employees provide them opportunity to socialize outside the workplace, with the aim of bringing together and spreading the team spirit within the team. Organization of team events, corporate parties, etc. can be reward and motivational tool for the employees, brings positive atmosphere and helps achieving company's goals.
Influential individuals can be key point for business growth. This group refers to public figures, people who can spread the information about new portal and indicate to its possibilities and positive effects. The aim is to attract influential individuals by presenting booking software solution and providing welcoming benefits which will have direct positive impact on promotion of the portal.

- Cost Structure

All cost items can be divided to fixed and variable ones, and they depend of numerous factors on a monthly basis. These are: Hosting and domain, Marketing, Administrative and Other expenses

Hosting and domain represent fixed cost item, which will be payed monthly. There are multiple providers with different packages. The provider should be chosen according to the best ratio of cost and benefits in terms of server space, bandwidth, price, number of subdomains, number of e-mail addresses. Goal is to define URL address, so that consolidated name with domain is easy to remember, but also interesting for users.
"Pickwith.us" project requires significant investments in marketing. Costs are variable and depend on a volume of advertisements, Google and Facebook adds, etc. Since viral marketing is an important part of marketing plan, part of the budget is dedicated to the promotion on the Facebook page.
Offline marketing costs include price of flyers that will be located in restaurants and labels on those objects.
Administrative costs are necessary for maintenance of daily operations and business activities. They are not directly nested in the production of services. These costs include staff salaries, rent, equipment costs, electricity and water bills, insurance, etc. Administrative costs are fixed and there is a limited scope in a ability to reduce them.
Other expenses refer to earmarked assets for unexpected costs which are likely to occur. Approximately, 8% of the planned expenditures will be intended for this cost item. The reasons that can initiate occurrence of unexpected costs are numerous, but they will be analyzed after every appearance, for future references and better planning process.

3.2. Lean Canvas in practice

Table 2 : Lean Canvas model

Problem	**Solution**	**What are your value propositions?**	**Unfair Advantage**	**Customer segments?**
Creating a network of restaurants that will be willing to pay for the service they used to get for free. Attract users and become part of their routine	Offering a free trial period for all partners in order to realize all the benefits. Creating digital marketing campaign targeting key audience.	Fast, simple and user-friendly process of making reservations Reducing the time dedicated to processing booking requests	Unique base of users and unique service on the market. Absence of a portal that provides the same set of services at once in Belgrade.	Citizens Tourists Organizations Companies and employees

The lack of a mobile version.	Including development of a mobile application in long term plan.		**Channels**	
	Key Metrics		Website Phone One on one meetings Mail	
	Number of sign-ups. Number of restaurants in the offer. Number of engagements on Facebook.			
Cost structure		**Revenue streams**		
Hosting and domain Marketing Administrative Other expenses		Income of paid post Fixed percentage per transaction Advertisements		

4. CONSLUSION

This paper presents guidelines for both future entrepreneurs who intend to start online business and those who want to improve their business. Highlighted is the fact that a business model is not just a document that helps obtaining investment, but it's truly a severe examination of whether modeled business idea is viable. Moreover, it can be used as a key tool for planning and control. Also, it is a sort of a guide for enterprise.

Defining all mentioned segments and analyzing each one of them individually and in correlation in the early stages of development of business can save great deal of time and costs later on. It can indicate the weaknesses of start-up idea and give a chance to correct those weaknesses before making any serious mistakes.

Starting a business involves taking responsibility for decision making, becoming increasingly self-reliant, pioneering, adventurous, daring, dynamic, progressive, proactive, opportunist, ambitious and holding values.

Canvas business model includes all steps required for implementation of business, leading from idea to realization and enabling to focus on key segments. Simultaneously, this model can be used for improvement of existing business. Lean Canvas, on the other hand helps users to focus on problems and product itself, and therefore understand the problem. In uncertain, risky and dynamic conditions, most start-ups forget to be analytical and thus fail to observe all potential risks. In example mentioned in this paper, it is shown how these models can be used to present the most important features of a business, thus, we can conclude that both Canvas business model and Lean Canvas can be of significant importance for enterprise. The main benefit of both of them is to have one single view on what a business model is. That way, misunderstandings among stakeholders and time-consuming discussions on the business model will be excluded.

The business model is crucial for any business since it represents the first tangible manifestation of the organizational phenomenon, because it obliges the potential entrepreneur to get moving.

MEASURING DEMAND FOR IT SKILLS ON THE SERBIAN JOB MARKET

Stefan Vujović*[1], Valentina Đorđević[1], Dušan Barać[1]
[1]Department for e-Business, Faculty of Organizational Sciences, University of Belgrade
*Corresponding author, e-mail: stefan@elab.rs

Abstract: *This paper describes how the demand for certain technical skills in Serbia can be measured. The primary goal of this paper is to investigate the current usage of programming languages and technologies in the Serbian industry and to show how the educational institutions can possibly benefit from monitoring the demand for specific skills. This paper will not answer which programming language is the best, but it could help people make strategic decisions such as choosing a programming language to learn or teach and even which programming language to choose in order to build a new and competitive software system.*

Keywords*: IT skills demand, IT job market, programming languages, technologies, platforms, Serbia*

1. INTRODUCTION

It is doubtless that we are witnessing dramatic changes in the field of Information Technology where certain skills become obsolete very fast. It happens very often that one technology that was considered the best solution for one problem in a very short time becomes replaced with other kind of technology.It has become hard to keep track of all the changes and the needs of the job market both for students and educators.

The information about programming language popularity, for example, is one Google search away but it is most often measured on a global level or in the US. However, the demand for technical skills needed in Serbia and in the US for example, are not identical. This is why we decided to monitor the demand on the Serbian market only.

There are various methods of measuring the popularity of programming languages proposed:

- counting the number of times the language name is mentioned in web searches, such as it is done by Google Trends. The main problem here is that the results may be corrupted because when typing Python, it could be an animal, or a programming language; Java could be an island of Indonesia and a programming language, etc.
- counting the number of job advertisements that mention the language, as it is applied in Indeed.com or TrendySkills.com web sites that are offering statistical data and quantitative representation about trends that job employers and employees seek in the IT industry.
- the number of books sold that teach or describe the language. A good example is Nielsen BookScan, which aggregates point-of-sale data from about 70% of US bookstores, including Amazon, Barnes & Noble, Borders, and many smaller chains and leading independent bookstores.
- estimate the number of existing lines of code written in certain language. Most often, it includes searching the web with the language name as a keyword, gathering code data and analyzing them. (Bieman & Murdock, 2001). The main problem could be underestimating languages not often found in public searches.
- counts of language references (i.e., to the name of the language) found using a web search engine. A good example of this practice is TIOBE.com, that is exploring trends based on the TIOBE index. The TIOBE Programming Community index is an indicator of the popularity of programming languages. The index is updated once a month. The calculation comes down to counting hits for the search query, and only certain search engines and programming languages qualify, by the beforehand defined criteria.
- counting the number of projects in certain programming language on platforms like GitHub (where the rank represents languages used in public and private repositories, excluding fork) and Stackoverflow (where developers often share where they work, what they build and who they are, and their data could be accessed and downloaded at any time).

- counting the number of postings in Usenet newsgroups about the language, since Usenet is a repository for messages posted from many users in different locations, similar to discussion forums.

Various sources are using different methods, and it would be a mistake if only one was declared the best. The most common approach is to combine more of them, depending on what we want to find out. If the question is which is the most popular programming language - combining web searches, lines of code, topics and book sales would be the best solution. Job advertisements are a good indicator of which language there is the greatest demand in the job market for. Job adverts and language references could be a good choice for determining which language has the biggest growth rate, etc.
Despite all that being said, it is not only the companies that are dictating trends, but the developers themselves as well. Attracting skilled developers can be difficult. So using programming languages that developers like and lots of developers know can be helpful for companies.

Taking the popularity of social networks into account, it would be a good practice to consider the data gathered from social network as well, and that certainly is the way the research would go in the future. It is a great challenge to combine more methods, it would require more time, the sources would be unstructured and more difficult to analyze, thus the results would be more accurate.

Based on the assumption that the primary interest of an educational institution is to prepare its students to properly meet the demand of the job market we decided to use the method of counting the number of job advertisements that mention specific technical skills. Since our department is focused on educating students in Serbia, our goal was to measure the demand for technical skills on the Serbian job market. Job adverts could be a useful indicator because they give us ad hoc results, representing the technical skills employers need.

We did not limit the research only to programming languages, because in many cases knowledge of a programming language is augmented by knowledge of specific technologies and platforms. This is why, when we say technical skills we mean: knowledge of programming languages (e.g. Java, Python, PHP), platforms (e.g. Android, iOS..), Quality Assurance, Linux administration and Game Development.

2. DATA SET

We started collecting data on December, 14th 2015. and we will continue to do so every day, because we believe the data will be even more useful as the dataset becomes larger. The data is gathered from a popular Serbian website called Startit where new job adverts are appearing every day.

The gathered data is separated to 13 columns. The date when the data was collected is inserted into the first column, other 12 columns are for the number of job adverts that mention the following IT skills respectively: Java, .Net, C, Android, iOS, Quality Assurance, Linux, JavaScript, Ruby, Game Development. We decided to track these particular skills because they are currently among the most demanded skills world wide. (indeed.com)

This is a data frame representation of the data collected on the first day:

date	java	.net	c	android	ios	qa	linux	js	php	python	ruby	game-dev
14/12/2015	79	39	6	33	27	20	12	67	57	17	10	11

Figure 1: Pandas DataFrame representation of the data

The process of data collection is automated with a python script which is hosted on an Amazon Elastic Compute Cloud (EC2) and is scheduled to run every day at 5:00 PM (CET). The script counts the number of job adverts with the following tags: java, .net, c, php, js/javascript, python, ruby, android, ios, game-dev, qa and linux.

3. DATA ANALYSIS

After plotting the data collected over the last 5 months we can see that the most job offers require knowledge of Java. JavaScript and PHP are not far behind, but it is also noticeable that these two programming languages have made significant growth in position openings in the last few months.

.Net, Android and iOS respectively are the three platforms wanted by the employers with iOS showing some decline in the past few weeks.

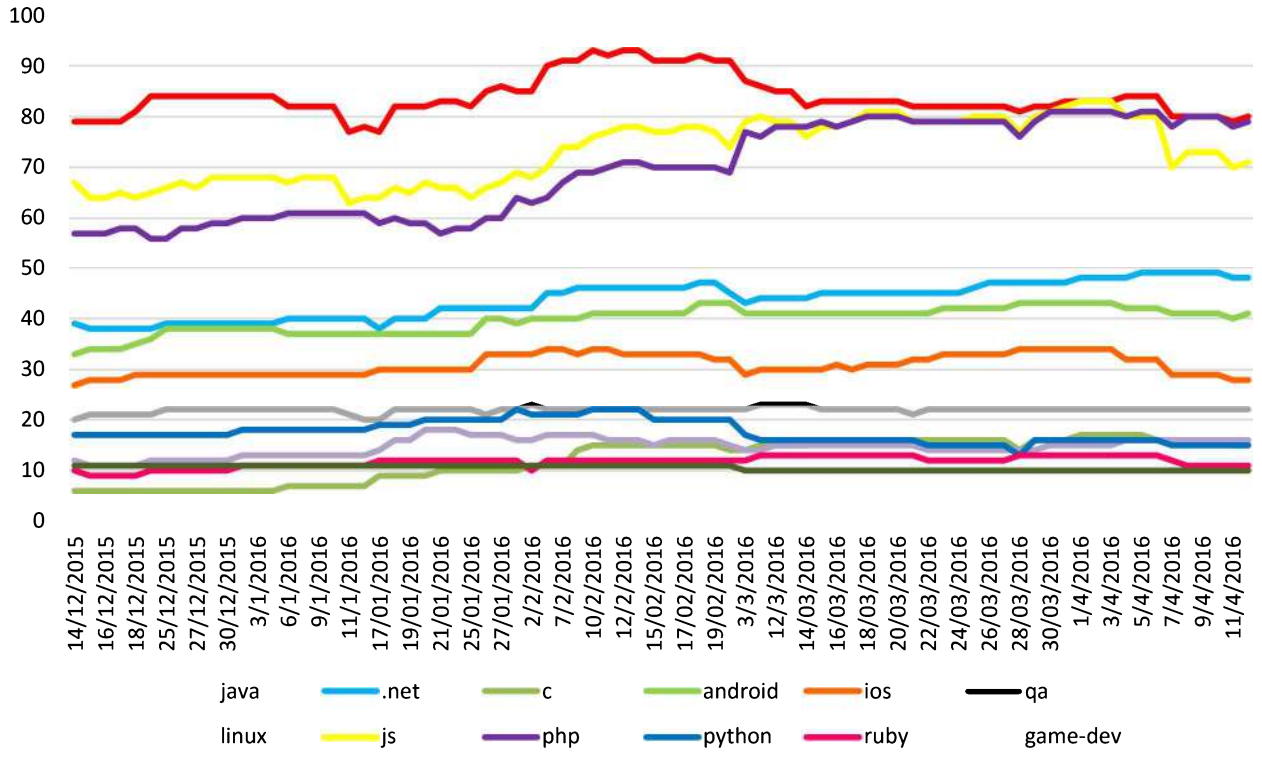

Figure 2: Demand for technical skills through time - Line Chart

When we look at the mean values (number of job posts recorded per day), adverts for Java developers achieved the highest number: 83,88 followed by JavaScript (73,17) and PHP (69.6), .Net (43.7), Android (39.76), iOS (30.97). Than, we have some lower averages, respectively QA - Quality Assurance (21.88), Python (17.56), Linux administration (14.70), C (12.27), Ruby (11.73), Game Development (10.56)

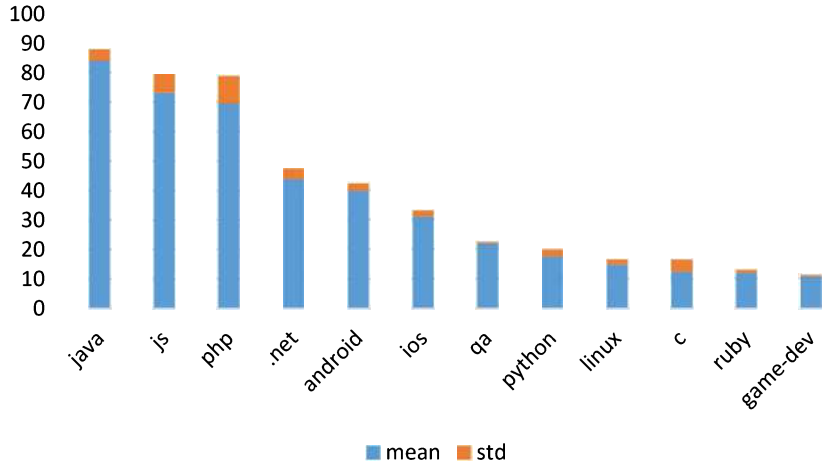

Figure 3: Mean and standard deviation for the number of job adverts for each skill

The largest standard deviation is recorded for PHP (9,32) and JavaScript (6,33) which makes sense because of a significant change in the number of job adverts. The lowest standard deviation was recorded for QA (0,55) which means the number of available jobs that require this skill is near to constant.

When we take a look at the minimal and maximal values we can see that the largest number of positions recorded on one particular date was again Java (93), followed by JavaScript (83), PHP (81), .Net (49), Android (43), iOS (34), QA (23), Python (22), Linux administration (18), C(17), Ruby (13), Game development (11).

The smallest number of available positions recorded was for C (6), Ruby(9), Game Development(10) Linux administration (11), Python (13), QA (20), iOS(27), Android(33), .Net(38), PHP(56), JavaScript(63), Java(77).

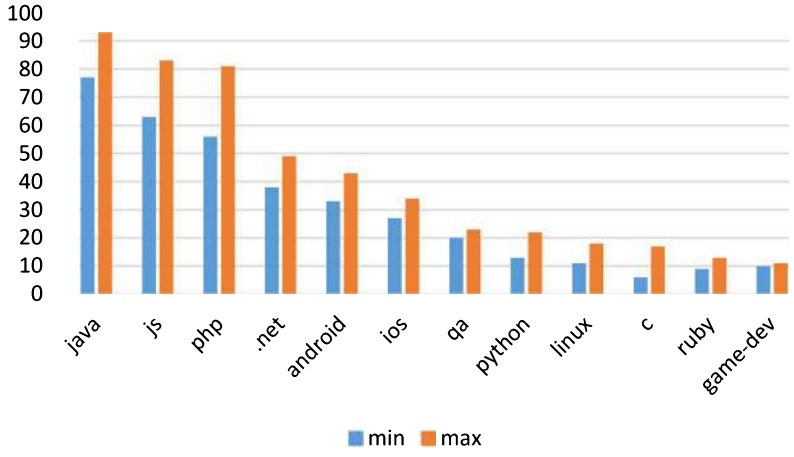

Figure 4: The minimum and maximum recorded value for each skill

On the next chart we visualised the interquartile range (IQR) values for each skill which represents the difference between the upper and the lower quartile. This value gives us the maximum difference between the middle 50% of the data, and in this case it could be interpreted as a metric that describes the amount of change in the number of job adverts that mention the particular skill. This indicates which skills should be monitored, because they have the potential to become more or less popular in the future. In our case, PHP (19), JavaScript (12), C (8,5), .Net (6,75), iOS (4) and Python (4) are the ones for which the demand could possibly grow in the close future. Java (3), Android (3), Linux (2.75), Ruby (2), Game Development(1), QA (0) are the ones with less variability in demand.

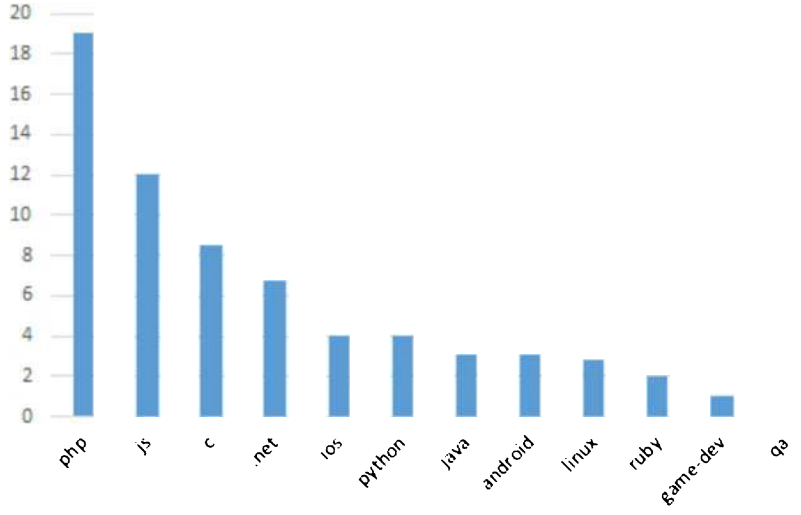

Figure 5: IQR for each of the skills

4. CONCLUSION

It should be noted that the gathered data may not be completely accurate due to the fact that our database was updated every day, but with the current number of job adverts for each skill. This means that if there are 80 jobs that mention Java one day, and 82 the day after, those numbers will be recorded. Therefore we are not aware what is the actual number of unique job adverts for each skill. This is important because of the website's policy which in some cases requires payment for adverts which has an impact on the time a certain advert is active on the page. Consequently, some adverts are counted for a longer period of time. However, the data we have can serve the purpose of measuring the demand for skills through time.

The first conclusion we made is that the job market demand for the majority of skills in question is growing or in worse case is constant. When it comes to particular skills, the most demanded skill for any position today is knowledge of Java, a general purpose programming language mostly used for development of desktop, mobile, web and other kinds of applications (Đurić et al., 2013) The skill for which the demand has made the most growth is PHP which is mostly used for web development (MacIntyre, 2010). A very close growth of demand was recorded for JavaScipt which has also been mostly used for client-side web development in the past, but has infiltrated the server side in the recent years, since the appearance of Node.js (Powers, 2015). All the skills in question can be separated into three groups: High demand, medium demand, low demand. Java, PHP and JavaScript fall into the high demand group., Android, .Net, iOS make the medium demand group and C, Quality Assurance, Python, Ruby, Linux and Game Development can be classified to the low demand group.

We think that from a perspective of Serbian educational institutions in this field at the university level Java, PHP and JavaScript should be a part of the compulsory curriculum. Android, .Net and iOS are worth considering if they are not already a part of the curriculum. But, for discovering the future potential of a skill it would probably be a good decision to compare the demand trends for jobs in Serbia with the demand trends in the US. From a perspective of someone who is willing to learn in order to get a job in the field, the easiest way to employment is to pick Java, PHP, JavaScript, but it could also be more financially awarding to choose a skill where there is a lower supply of workforce. From a perspective of someone making a decision which technologies are needed for the software system depending on the platforms (desktop, web, mobile..) Java and JavaScipt are probably the best option at this moment.

There are several things that we plan to improve in the future. First of all, the data collection process will be altered in order to track the demand changes more accurately by recording every unique job advert. Secondly, the data variety will be expanded in order to track the names of job positions, companies and cities that are mentioned in job posts in order to make even more detailed analysis and in order to grasp new conclusions. Thirdly, the data volume will be expanded, which means the number of technologies, programming languages and other skills will be taken into account because the idea of the system is to identify the appearance and growth of new and currently unknown skills. Additionally, as the dataset grows, we will be able to find out if the growth of demand for one skill impacts the decline of demand for other skills or not. We will also be able to understand which skills when they are combined are most needed by the employers in Serbia. And finally, the data will be collected from several different sources in order to find larger amounts of data and to draw less biased conclusions.

TRENDS SHAPING BUSINESS MODEL INNOVATION IN TELECOMMUNICATION COMPANIES

Nenad Orlić*[1], Vojkan Vasković[1]
[1] Faculty of organizational sciences, University of Belgrade
*Corresponding author, e-mail: orlic@madnet.rs

Abstract: *Business innovation is constant process for all companies but Telecommunication companies are facing ever bigger pressure to adapt to fast changing market conditions and improve performance and profitability. Changing user habits and increased regulation of telecommunication markets are putting pressure on companies to change their business practices and reinvent themselves not just to improve but to survive. This article gives an overview of current trends that fuel change in business models of telecommunication companies and analyses case for a freemium-like revenue models. It identifies key components of such a model and proposes changes to some standard practices and new sources for revenue.*

Keywords *, business model canvas, Telecommunication, Cloud computing, Internet of Things, freemium*

1. INTRODUCTION

Term 'Business model' is first mentioned in academic article by *Bellman and Clark (1957)* but it begins to be popular subject only at the end of 20th century. Since then, many authors offered their definitions of the term and tried to establish it's elements.

For the needs of this paper, we will accept definition of the term „business model" and it elements as defined by *Osterwalder, A., Pigneur, Y., & Tucci, C. L. (2005),* in their paper that is widely acknowledged. Their definition of the business model is: „A business model is a conceptual tool that contains a set of elements and their relationships and allows expressing the business logic of a specific firm. It is a description of the value a company offers to one or several segments of customers and of the architecture of the firm and its network of partners for creating, marketing, and delivering this value and relationship capital, to generate profitable and sustainable revenue streams." In the same paper they define nine building blocks of business model as its basic elements.

Table 1: Business model Building Block, *Osterwalder, A., Pigneur, Y., & Tucci, C. L. (2005)*

Pillar	**Business Model Building Block**	**Description**
Product	Value proposition	Gives an overall view of a company's bundle of products and services.
Customer Interface	Target customer	Describes the segments of customers a company wants to offer value to.
	Distribution channel	Describes the various means of the company to get in touch with its customers.
	Relationship	Explains the kind of links a company establishes between itself and its different customer segments.
Infrastructure management	Value configuration	Describes the arrangement of activities and resources.
	Core competency	Outlines the competencies necessary to execute the company's business model.
	Partner network	Portrays the network of cooperative agreements with other companies necessary to efficiently offer and commercialize value.
Financial Aspects	Cost structure	Sums up the monetary consequences of the means employed in the business model.
	Revenue model	Describes the way a company makes money through a variety of revenue flows.

Need for change of the way some companies operate their business may come from many places. Outside factors such as changes on the financial markets, technology advancement, user behavior and others are influencing decisions of management to adapt business models on whom their base their operations. Companies rarely change everything about how they operate – they mostly change elements of their business model to best accommodate their inner organization to new challenges on the market.

Telecommunication companies are subjected to many outside factors forcing them to change the way they do their business, mostly because of fast advancement of technology. That advancement has disruptive influence on the telecommunication market. In this paper we will try to identify trends that influence the change in business models of telecommunication companies, tie them to relevant element of business model and show how companies adapted.

2. TRENDS INFLUENCING CHANGES IN TELECOMMUNICATION COMPANIES

It is important to clearly distinguish business model from business process model. First can be viewed as firm's basic rules and guidelines on creating and commercializing value, while latter is the way business implements a certain process in its operations. Optimization of business process model bring efficiency to work process that is being reviewed. Changes in business model are done to expand overall capacity and competitiveness of the company.

In search for a key change in business model that could improve competitiveness of telecommunication companies in developed markets we identified trends that fuel change in segments of business models and then searched for relevant cases that show how companies adapt to new changes on the market.

Table 2: Business model elements and corresponding trends influencing them

Business model element	**Influenced by**
Value proposition	Integration of content offerings
Target customer	Internet-of-Things and increasing need for M2M communication
Distribution channel	Over-the-top content
Customer Relationships	Social networks
Core Competency	Outsourcing
Partner network	Changes in market regulation
Cost structure	Cloud computing
Revenue model	Success of freemium model in software market, especially apps for mobile devices

Integration of content offerings

"Content is King" is the *article Bill Gates wrote (1996).* In it, he claims: "Content is where I expect much of the real money will be made on the Internet, just as it was in broadcasting." This is now truer than ever. Lines between service provider, content provider and classic telecommunication provider are getting blurred with each of them expanding its offer with basic service bundled with different content, own or licensed.

In telecommunication world, customers were first offered 'single-play': separate voice, broadband or television service. 'Double-play' was introduced as integration of voice and broadband in a single package. 'Triple-play' included television as third component of the package and in the end 'quad-play' offer was created by including mobile service. In a world where 'Content is King', telecom operators needed to find a new value proposition for their customers who increasingly found this kind off offers to be inadequate

Apple, currently technology company with biggest valuation, is not just selling hardware it selling platform for content distribution. Their iTunes platform is key to their success. In year 2012, iTunes had 64% of paid music download share in USA according to Statista.com (2012).

Importance of integrated content offering is demonstrated by company Layer 3. They are trying to beat Comcast, largest USA cable company by offering content bundle from different content owners and at the same time integrating content from social networks in a seamless way for unique user experience. Although they are yet to produce visible result in terms of market share, key executives of this company are experienced old-cable-company managers that invested their time and money in something they think is a future of cable.

Internet-of-Things and increasing need for M2M communication

Internet-of-Things (IoT), a network of all sort of thing and appliances that are connected through standard internet infrastructure using standard communication protocols, is growing rapidly and will continue to grow in foreseeable future, as pointed out by *Mazhelis, Warma and others (2013).*

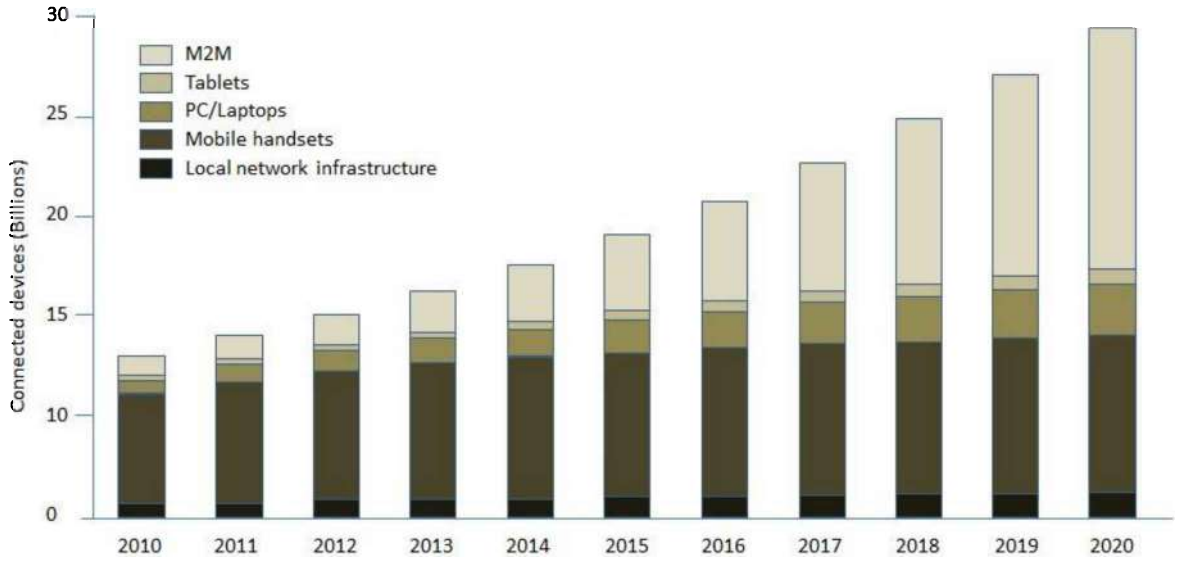

Figure 1: Forecast of growth of connected devices in IoT

It has become increasingly visible thanks to the rise of intelligent devices such as thermostats or refrigerators, smart fitness trackers, and the promise of autonomous vehicles. As Figure 1 shows, predicted growth in number of devices connected is set to grow to 30 billion by 2020, which is nearly three times the number of people on Earth. This growth opens up one complete new market segment for telecommunication companies. Their customers will need to find way to connect all these devices and that is huge opportunity that telecom operators do not want to miss. Telecom operators could exploit this opportunity by developing a flexible platform which will act as an enabler for IoT by providing a 'menu' of services to customers.

Other way to do so is expanding business by entering other sectors by merger or acquisition. The IDC report noted British telecommunication operator Vodafone's acquisition of Cobra Automotive Technologies in 2014 as an example. According to Vodaphone, the acquisition will help them become a global provider of connected car services for automotive and insurance customers. Another example is E2 Hungary, a joint venture utility company founded by MET Holding and Magyar Telekom, which started operating in January 2016. The merging of the two companies' client portfolios has already started with the transfer of Telekom's complete industrial utility business into the new company, which will also supply most of MET's current commercial clients. The 50-50 joint venture utility company will supply natural gas and electricity to more than 4,000 business customers in Hungary. Such a portfolio will put the new company among the most dominant players in the power and gas market. But most importantly it will give it an edge over competition in implementation of smart energy solutions based on IoT concept.

Over-the-top content

An over-the-top (OTT) application is any app or service that provides a product over the Internet and bypasses traditional distribution. Services that come over the top are most typically related to media and communication and are generally, if not always, lower in cost than the traditional method of delivery.

Over-the-top application can be anything that disrupts traditional billing models. Examples include Hulu or Netflix for video (replacing traditional cable TV provider) or Skype (replacing standard telecom operator providing long distance calls).

The creation of OTT applications has led to a wide-ranging conflict between companies that offer similar or overlapping services. The traditional telecom operators have had to anticipate challenges related to third-party firms that offer over-the-top applications. Well known example is conflict between Netflix and Comcast that resulted in Netflix paying Comcast for interconnection to its servers. In effect, OTT services created two-way distribution channel for both digital services providers and telecom operators. Digital service providers use networks of telecom operators as distribution channel for their services but at the same time telecom operators are expanding their digital services to new customers through networks of their competitors.

Social networks

Social networking sites such as Facebook and Twitter have become more than platforms for marketing and advertising. Increasingly, they are also valid and important channels through which customers, both old and new, solicit and receive customer service. According to Nielsen's 2012 Social Media Report, nearly half of U.S. consumers use social media to ask questions, report satisfaction, or to complain. Third of social networks users prefer to make contact over these media then over the phone.

Providing multi-channel support that includes social networks can present real challenges for B2B and B2C companies both large and small as well as opportunities to positively impact sales and customer loyalty. The reality is that customer service expectations are constantly rising and customers are expecting attention that spans from the showroom floor to the Facebook timeline. They require constant communication with companies and prompt answers to their questions. They want companies to be with them 24/7.

Burden put on companies is very high because not only they are required to answer to customer demands instantly through social networks they are required to do so mostly publicly and that demands different set of skills from people in support department then those required for customer support over the phone which was standard not so long ago. This is true for telecommunication companies as it is for any other.

To accommodate to this new demands, changes in internal organizational structure of companies is required. Adaptation of business model, in segment of customer relationship is necessary. Organizations tend to outsource online support, public relations and online marketing to companies that specialize in management of online presence on social network for other companies. As telecom operators provide 24/7 service for their customers, and social networks allow customers to be in constant contact with companies, integration of support, PR and marketing in-house may be necessary to meet this 24/7 level of support over social networks.

This problem is identified by Facebook and other and they are starting to implement AI (artificial intelligence) and bots (automated answering) to try at the same time to make it easier for companies to meet demands of customers and to help users get quality support as fast as they can. In April 2016, Facebook launched automated bot support and provided API for developers to build their own automated support service that will work with Facebook Messenger. At the same time, Microsoft is experimenting with its own AI based support. Xiaoice (Chinese word meaning “Little Ice”) is an advanced natural language chat-bot developed by Microsoft, for Chinese blogging service Weibo. Response of users is overwhelming with 850 thousand followers and average number of user interaction at 60 times a month.

Outsourcing

Outsourcing is allowing Telecommunication companies to focus on core competencies that are different from ones that we can find in more traditional business models, such as technological infrastructure or technological innovation. Outsourcing of services is nothing new and it has been used widely by telecommunication

companies. In a rapidly changing industry ecosystem, heavy investments in hard infrastructure can burden balance sheets and limit growth without outside funding. That is primary reason why we witness change in type of outsourcing where companies are outsourcing what is generally considered as basic core competency for telecom operator.

Leading example of this trend is Bharti AirTel Limited, telecom operator from India and their 'Total outsource' philosophy.

Bharti Airtel Limited is a global telecommunications company with operations in 20 countries across Asia and Africa. The company ranks amongst the top 4 mobile service providers globally in terms of subscribers with 307 million customers across its operations at the end of November 2014. Their core competency is not technology but branding and identifying customer pain points. Telecoms operators are classified as a high technology industry, but Bharti, on the other hand, has little expertise in technology. Their management team made a counterintuitive move: It outsourced network installation, maintenance, and service. Companies like Ericsson and Nokia Siemens Networks are operating core network, and IBM has built and managed its IT systems.

The vendors that were given task of network management are paid only for the capacity utilized by Bharti Airtel, not for the equipment. Bharti's innovative business model converted fixed costs in capital expenditure to a variable cost based on usage of capacity. Through this outsourcing arrangements, Bharti dramatically lowered its costs while ensuring high quality for customers, since vendors had world-class competencies in their domains. This allowed company to focus on marketing and customer acquisition which in turn allowed it to become one of dominant telecommunication operators in Asia.

'Total outsourcing' strategy is not without its downsides. In the last two years, Airtel did see its profit margin decline and decided to lower level of outsourcing and brought control over some of key functions in-house. Their tactics and unusual choice of core competencies allowed them to grow in unpreceded scale and adjustments made are more of evolution of their decade-long business model then deviation from it.

Changes in market regulation

There are many papers covering subject of market regulation influence on investment or service quality (see, for instance *Grajek & Röller, 2012 or Haucap & Klein, 2012*). Trend of increased market regulation for Telecommunication services continues in both USA and EU. New regulations were recently introduced on user privacy, data retention, net neutrality, open access, roaming tariffs. This regulation not only affect how telecommunication companies behave toward customers but also between each other thus directly influencing partnerships between them.

For example, net neutrality rules introduced with FCCs Open Internet order are directly limiting some existing and planned partnerships between companies providing broadband access and those providing digital services. Open Access Rules and Order, comes down to few Bright Line Rules:

- No Blocking: broadband providers may not block access to legal content, applications, services, or non-harmful devices.
- No Throttling: broadband providers may not impair or degrade lawful Internet traffic on the basis of content, applications, services, or non-harmful devices.
- No Paid Prioritization: broadband providers may not favor some lawful Internet traffic over other lawful traffic in exchange for consideration of any kind—in other words, no "fast lanes." This rule also bans ISPs from prioritizing content and services of their affiliates.

Those provisions, especially last one, clearly put some limit on how telecommunication companies in USA can arrange their partnerships with content providers.

In September 2013, the European Commission adopted a legislative package for a "Connected Continent: Building a Telecoms Single Market" with goal of equalizing market regulation in all EU states. In October 2015 the European Parliament's plenary voted in favor to end roaming charges by June 2017. From April 2016, operators are able to charge only a small additional amount to domestic prices up to €0.05 per minute of call made, €0.02 per SMS sent, and €0.05 per MB of data (excl. VAT). From June 2017 they will be forced to

charge same price for domestic and roaming traffic for voice, SMS and data. This regulation directly limits roaming agreements between telecom operators in EU and forces them to completely change this element of their business model and existing relationships with their roaming partners in EU.

General Data Protection Regulation passed in April by European Parliament introduces major reforms on current rules dating from 1995. It will come into force in April 2018 and will have wide reaching impact on how telecommunication companies and providers of digital services can use, handle and transfer user data. Since some telecom operators are trading with user data they will have to stop with that practice and that will have big effect on their relationships with companies from other sectors, especially marketing.

Cloud computing

Cloud computing, term that produced much hype over the last few years is now influencing cost structure of companies in some ways that were hard to predict. Now Cloud computing is now embraced in almost all branches of IT industry and beyond. *Mell and Grance (2011)* identified and classified several types of Cloud computing, but in most of its forms it may be looked upon as outsourcing and is mainly considered as such. There is new situation on the market where telecom operators are at the same time both providing cloud services to others and using other cloud services to provide some of it services to customers. Example for this are OTT IPTV cloud services that more and more operators are offering every day and at the same time more and more operators are providing their IPTV services to the customers based on Cloud platform hosted with the another operator.

There are several big players in the market that managed to provide service for even biggest and most demanding telecommunication companies. One such company is Amazon and its AWS service. Many digital service providers such as Netflix, Airbnb, Pinterest are using its services. Out of telecom companies that use AWS service, Comcast and NTT DOCOMO are probably the biggest.

Comcast is one of the largest providers of video, high-speed Internet, and voice services in USA. When demand for the company's new Xfinity X1 delivery platform exceeded the capacity of its on-premises data centers, they expanded capacity by using AWS. Comcast was able to quickly add capacity with Amazon VPC and Direct Connect, expanding their data centers to meet the scale of new demand.

NTT DOCOMO, Inc. is a leading mobile phone operator in Japan. When the popularity of its voice recognition service caused performance and capacity issues, the mobile operator decided to try AWS as a way to decrease strain on its network. Together with staff from Amazon, DOCOMO created a voice recognition architecture on AWS that helped the company scale for better performance during traffic spikes and accommodate its large and growing customer base.

Those examples show how implementing outsourced Cloud service can help telecommunication companies to quickly expand its capacity without big increase in capital expenditure to cover infrastructure cost.

But such approach has to measured. Those providing cloud services are doing it for profit and there is margin in their price. Companies need to plan volume growth of services they provide based on outsourced Cloud services because cost can increase nonlinearly compared to growth in service usage. Example for this can be found with Dropbox, one of largest provider of Cloud storage for users around the world, and one of most famous former Amazon customer. Dropbox had to move out of the AWS Cloud service to lower its operating costs. Process of moving such large amount of data from Amazon to its own data centers was not easy task. Transferring 500 million customers and 500 petabytes of data took almost three years.

All businesses need to take into account growth projections so in the end they do not lose to operating cost all the savings they managed to make on infrastructure investment. This new in-and-out Cloud strategy, if well managed, can significantly improve how fast and efficiently telecommunication companies can expand their offering to new and existing customers both in terms of new services but also in geographical coverage of their networks.

3. FREEMIUM-BASED REVENUE MODEL

As shown in previous chapter, telecommunication companies successfully adapted segments of their business model to changing market conditions and new trends. Revenue model segment of business model can be decisive factor in success of telecommunication company in competitive market. That is the reason why this subject is treated separately in this paper.

Success of freemium model that has proved itself in mobile apps (Liu, C. Z., Au, Y. A., & Choi, H. S. (2012)) and gaming industry is prompting other industries to experiment with similar models for their own services. Digital service providers such as Zynga (mobile games) and Spotify (music service) have built their entire businesses on the freemium business model. Spotify offers free music streaming to some 20 million customers with some 5 million customers opting to subscribe to Spotify's premium service.

Variations of this revenue model is present with telecommunication companies for quite some time. Operators are luring new customers with free trial offers to get them to sign-up for a service in the hope that customers will be satisfied with the service and decide to pay for it.

For years some telecom operators in USA are offering services in a form that is essentially based on freemium model. In 2013, T-Mobile offered buyers of select Windows 8 laptops free 4G broadband service for two years, but with limit of 200 MB traffic per month and with no strings attached. Once the free monthly data cap was met, trial users could subscribe to one of T-Mobile's premium subscription plans. Although average customer might use up the free monthly allowance of 200 MB in just a couple of hours, with this offer T-Mobile provided glimpse of its 4G service to new customers that otherwise would not event try it, let alone decide to pay for it.

Virgin mobile has experimented with freemium model for its mobile services for years. In 2008 it has introduced option for its prepaid customers in USA to add free minutes to their account when they look at the commercials and fill out surveys on their web portal. Recently, in September 2015, they introduced #Freemium package for users of Virgin mobile in Poland. Free option includes a packet of data of 300 MB, 30 minutes of calls for duration of 30 days, and without any obligation, without a contract. When customer spends this allotment, he can still use the services but according to the price list.

Using business model canvas, developed by *Alex Osterwilder in his publication Business Model Generation (2010)* we will try to present how Business model for telecommunication company with freemium-based revenue model looks like and how it compares with standard Business model for telecommunication company.

There are many examples of different freemium-like models in offerings of telecommunication companies but #Freemium offer by Virgin mobile is so far only true Freemium offer on the market. This may signal bigger change in revenue model of telecoms and soon we may see this model implemented for other services. If we assume that it can be implemented for other services Business model canvas in that case would look like one presented in Figure 2. We can see that revenue stream consists of two income sources: income from premium services and income from direct marketing. For some of services typically offered by telecom operators in triple-play bundle, new direct marketing channels should be developed to increase revenue from direct marketing especially for service like IPTV. Virgin mobile successfully implemented revenue stream from direct marketing for its mobile prepaid users but that model uses direct marketing channels not directly tied to the service itself, but one that uses traditional web-based approach, one that is detached from user's experience when using mobile phone. Therefore, there is room for improvement on that model that would allow direct marketing through basic voice service both mobile and fixed one.

As we can see in Figure 2, other segments of Business model canvas do not differ much from some standard telecommunication company business model. What is noticeable is that customer segments consist only of end-users because freemium-based model is not well suited for business users that require higher level of service that one that be provided in freemium based model.

What cannot be shown through business canvas is possible change in relationship with key partners. All relationships are there as they would be with any standard model for telecommunication company, but that partnership can be based on different principle. It is standard for telecommunication company to sign contracts for content rights or for upstream bandwidth based on fixed price per unit and for a certain volume. But with

freemium model, that partnership could be arranged in a such way to be completely or partially based on revenue-share model. That would add incentive for all companies that are vertically in provisioning of telecommunication services to support new direct marketing channels by including them in their offers to increase overall income.

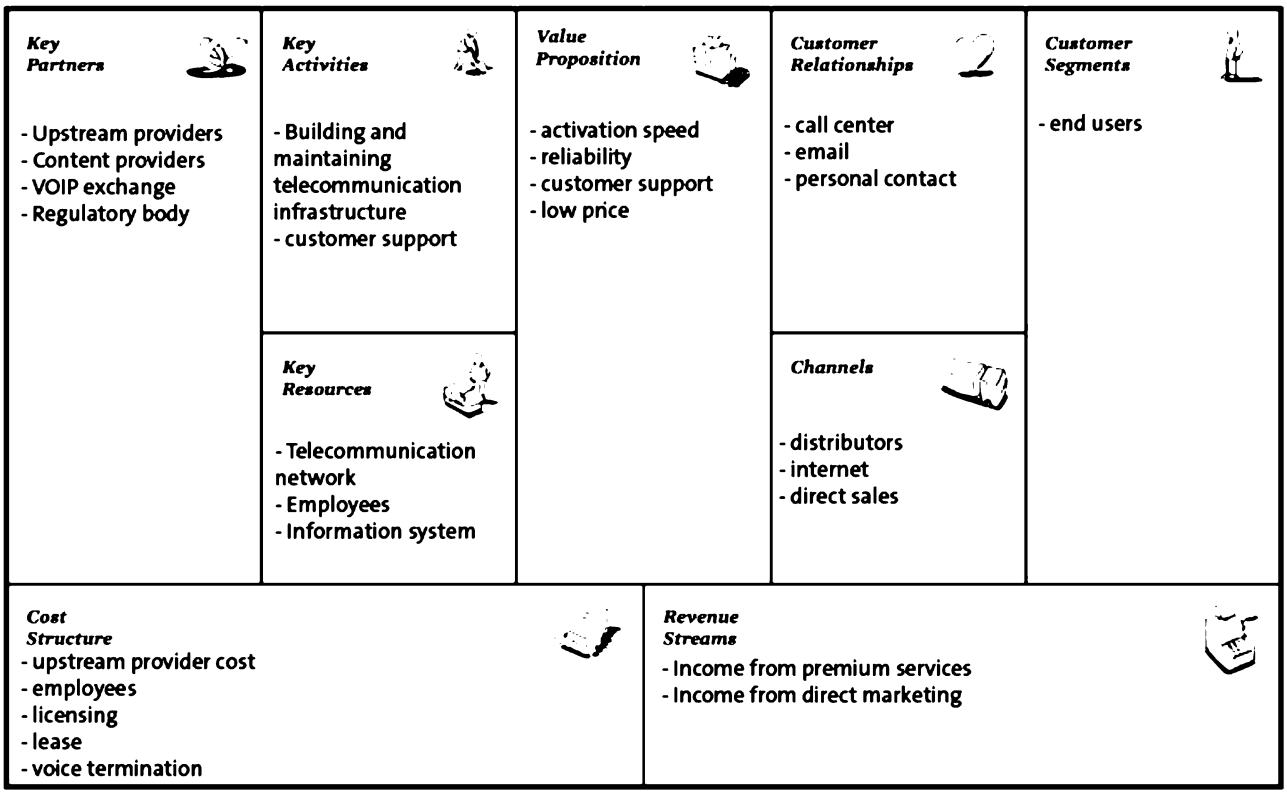

Figure 2: Business canvas model for telecommunication company with revenue model based on freemium-like approach

4. CONCLUSION

We have seen how business models of telecommunication companies are influenced on different levels by different trends. Companies constantly adapt to new surroundings and try to find optimal way to do business and meet customer demand. Every segment of business model is affected by different trends.

To increase competitiveness, telecommunication companies must adapt its revenue streams to include income based on freemium model. Change in other segments of business model is not necessary in that case, but it is recommended to improve its effectiveness. This model was already proven as feasible for mobile operators but there is no reason to think that it could not be implemented for other services offered by telecommunication companies, especially triple-play. Implementation of such a business model would allow companies to compete in saturated market with offer that is different and with very competitive price compared to standard offers.

Abstract: *Starting from the fact that the use of electronic content is an imperative of our age, and the general opinion that the application of modern information technology can establish a solution for a reliable and simple organization and systematization of documentation, the organization's success depends directly on the achieved level of information management. Bearing in mind that timely, accurate, verifiable, readily available and consistent data are the most important for business activities, the basic problem of the use of these data is not their existence, but the place and manner in which these data are stored and organized within distributed business units. Also, the introduction of information technologies in the conduct of business processes, user data is all over, but the question is the degree of their utilization. The subject of this paper is to improve the management of business processes using electronic content management. And goal of paper is to encourage the leaders of those organizations to think in the direction of improving business performance by investing in information technology.*

Keywords*: ICT, electronic content, content (document) management system, business process, business process management*

1. INTRODUCTION

One of the most important factors for successful business process management is the availability and way of information use. Information and knowledge are essential for successful management at all levels of business organization. And having knowledge means reduces the uncertainty in the activities of business organizations, reduces the cost of material resources and engagement of human resources. Also, in the process of implementation of business processes it is require to exchange some information between business units. Depending on the availability and timeliness, information can affect the acceleration or deceleration of activities realization.

Linking business units through information and communication technology enables access to relevant content in electronic form. Also, linking business units enables mutual coordination, integration, delivery, analysis and presentation of information. All of mentioned contributes that business organization makes decisions timely and quality.

There are no quality decisions without quality information. Information and communication technologies are very developed, so problem is not how to get information but problem is how to identify useful information.

The aim of this paper is to point out the problems in the implementation of business processes related to the use of business documents and information contained in. Also, this paper shows basis for the content management in business process management.

2. LITERATURE REVIEW

The necessity of improving performance and adapting to the modern trends of the digital world requires greater application of document management technology. According Adequate planning and setting requirements and conditions for the introduction of advanced information technologies can significantly contribute towards a more efficient implementation of business processes activities at all levels of business management (Goodwin, 2007).

Due to the development of information and communication technology business organizations need to adapt to the market, in order to be competitive and compatible with the continuous goal to became better and more efficiently (Craig, 2008). In whole market in the modern world of information and communication

technologies, information has a crucial role in their final outcomes. It's the same with business organizations where timely information are critical for business success.

Large business organizations require a good and reliable system for storing and organizing documents, and taking into consideration that business documentation is mainly produced in electronic form, managing with electronic documents by using modern information technologies represents a solution for reliable, quick and easy organization and systematization of data. Use of system for managing electronic documentation aims to solve the problem of managing with structural and non structural types of information, their archiving and re-use (Carmel, 2007). Furthermore, managing with electronic documentation contributes to a high degree of communication and interoperability between business organizations at both the regional and global level.

The success in the implementation of set tasks is in direct conjunction with the management of the information contained in the documentation. If the information is in the documents in paper form, and at the same time, the documents are not in one place but are dispersed over distributed units of business organization, processes and procedures in finding information take a long time, and therefore are too expensive. So, managing electronic documents by using modern technological solutions is the solution for reliable, quick and easy organization and systematization of business documents (EMC, 2012).

First of all, for the purpose of understanding the concept of document management, it is necessary to define the document as a basic entity concept and elements that define it. One of the generally accepted definitions of an electronic document is a form of information that is stored on the computer, but it can be treated as singular information within the database (Milenković, 2015). Unlike databases that are structured and have a precise form and content, the documents are carriers of unstructured data. They are intended for storage and transmission of information that have an arbitrary shape and content, as well as for the communication of organization with the environment.

From the viewpoint of business organizations, a document is a permanent record of a business event or a description of the state of the process at a given time. Examples of such documents are organizational rules and guidelines of the business organization itself, documents from the outer environment that affect business organization and influence its business processes and documents arising from the business processes, intended for business processes within the organization or entities from the external environment.

Electronic documents may contain additional information (Metadata) which is primarily intended for describing the document's contents and its characteristics (Milenković, 2015). The content of such metadata is arbitrary, depending on the needs of users and the complexity of business processes that are automated through information system, and often they have information about the author, creation date, and modification of documents, of customer and access time, actions that were undertaken on the document, and of business processes, which the document belongs to. Document management is actually an establishment of rules and procedures for handling documents in all phase of their life cycle: development, verification, approval, publishing, distribution, archiving and reuse. Well-defined and well-organized metadata have an incalculable importance for document management in each of the phase in its life cycle.

So, there are numerous problems in dealing with documents in business organizations. Documentation is created in electronic form, but is subsequently printed and exchanged in paper form manually, which considerably slows down the exchange of information contained in the documentation and increases costs. Flow of document procedure from making documents, signing, distribution and implementation of the same is fixed, and there is the possibility of losing them. This contributes to irrational spending of time and human resources in finding the necessary documents, aggravated execution of the tasks and inefficient decision-making in business (Power, 2009, Turban and Aronson, 2001). Finally, the procedure of document archiving and re-access to the same is difficult and requires time and human resources, and the control of access to documents, particularly of confidential documents, is outdated and inefficient.

3. RELATES BETWEEN BUSINESS PROCESS MANAGEMENT AND ELECTRONIC CONTENT MANAGEMENT

The development of information systems and information technology in general allows reducing the documentation generated in paper form, however, the automation of business processes must not ignore the huge amounts of documents from the past, which exists in paper form. It is necessary to digitize documentation in order to allow the existing business documents in paper form to be used in automated business processes. In this way, the future use of paper documents will be reduced to the minimum or will completely disappear (Milenković, 2014).

In organizations whose business functions are branched out and act on multiple distributed locations, effective monitoring and management processes, in accordance with business requirements and standards, is still one of the biggest organizational challenges. Management systems of (electronic) documentation (Electronic Document Management Systems – EDMS), represent the category of specialized information systems for managing documents and their metadata at all stages of their life cycle exclusively in an electronic environment. EDMS provide a systematic solution for entry, organization, management and storage facilities within the business environment. With their use, unstructured information contained in the documentation are managed according to predefined business rules and procedures. With adequate management of documents metadata through EDMS, it is possible to use the same information contained in the documents in a variety of business contexts, which is a common business necessity.

The following results are achieved by establishing the EDMS in a business organization (Milenković, 2015):

- more efficient realization of tasks and successful achieving of business objectives;
- interoperability in communications in the enterprise market is raised to a higher level;
- task planning and reporting on their implementation is better, more economical and more efficient;
- automation of document management of business and workflow shortens the time for their realization, and makes impact on effective business decisions;
- information contained in the documentation are available in almost real time;
- relevant documentation can be accessed from remote (distributed) location;
- increases the efficiency of human resources, reducing personnel costs;
- reduces the spending of time and material resources (space requirements for the archive, fax machines, paper, copiers, maintenance of office operations);
- achieves centralized automatic storage, and management of documents, and prevents the multiplication of documents;
- provides a high level of access control and security of electronic content;
- standardizes document formats; and
- rises the level of the culture of information management within the organization.

The realization of an EDMS in a business organization aims to modernize the business processes through the introduction of electronic office management. Simply put, the realization of an EDMS in a business organization aims to modernize the electronic commerce through the introduction of electronic office management. In the business to business (B2B) and government to government (G2G) e-business models that stands for the exchange of electronic documents between distributed business units with the primary objective to reduce the use of paper documents to a minimum. In the forms of business to customers (B2C), government to business (G2B) and government to customers (G2C) e-business models, the electronic office management stands for the exchange of electronic documents electronically with users outside the organizational structure of business organizations in order to achieve mutual interoperability, standardization of forms and the content of the documents, and the use of paper documents becomes minimized.

According Pelz-Sharpe (Pelz-Sharpe et al, 2010), Content Management Systems (CMS) are often used as a synonym for terms such as Electronic Document Management System (EDMS). In the context of this study, a content management system represents the most sophisticated element management processes electronic data essential to decision-making processes. CMS can be defined as a set of strategies, methods and techniques used for creating, storing, processing and distribution of electronic contents and documents that are part of the life cycle of organizational processes.

The results of the introduction of electronic content management system are to increase the availability and easier to control content, control access to information, more efficient implementation of business processes, saving material and human resources, reduce operating costs, and certainly support the decision.

Managing with the original copies of the documents is very important, but it is essential to ensure the security of electronic copies (backup /recovery system) and electronic archive of documents, including transaction log file. This document management functionality is extremely important in all forms of electronic business because documentation on activities implemented in business processes often must be available for dozens of years after their creation.

In accordance with their needs, every business organization should define the functional requirements that will be implemented within the electronic content (document) management system. There are other ways to define requirements for information system. In situations where the user does not have the necessary knowledge about the possibilities of information technology, the user engages associate to perform an analysis of the processes that should be automated.

In order to make any decision in relation to improving the content management use it is necessary to analyze the real situation of document management in the organization (Klein & Methlie, 2009). It means that it is required to analyze the types of documentation, or the content which the organization has within its business processes, and then estimate where and how this content is stored and whether and how are controlled.

4. USAGE ICT FOR THE CONTENT MANAGEMENT IN BUSINESS PROCESS MANAGEMENT

The main reason for the establishment of ICT is enabling storage and sharing of data contained in electronic form. Forming the virtual organizations that make asynchronous, distributed and collaborative work teams, which cooperate in the development of projects (collaboration), in different places (distribution) and at different times (asynchrony). As the Katuu points out (Katuu, 2013), ICT contributed to the work of many organizations become more efficient and more successful.

The introduction of ICT leads to changes in the processes of governance and decision-making. ICT enables managers to easily and efficiently perform their functions. Changes in management reduce costs horizontal communication, enabling teamwork and flexibility. Monitoring changes in the environment is critical, which means observing the real environment, competition and financial condition of which depend on business processes and technology trends (Klein & Methlie, 2009).

The importance of ICT for the business system is the common use of decision support software, unified information access, enabling electronic communication and data exchange, data management, increase productivity and reduce costs in business systems.

The development of ICT has enabled faster and better communication, improve business processes, secure storage of information, and easy search of information from any location in the world, 24 hours a day. Thanks to ICT, quality computer connectivity organizational units is achieved through the capacity, speed and efficiency of data collection, processing, transmission and data protection. Computer networking of organizational units contributes fallowing (Milenković, 2013):

- the use of common data and a unique understanding and knowledge of the real situation;
- increasing efficiency and cutting the time required for decision-making; and
- increasing the overall efficiency of the organization as a whole.

Some of the essential elements of ICT on which the realization of a CMS depends are (Cameron, 2011):

- storage (a repository) in which content is stored;
- use of electronic services which guarantees the authenticity of the content and authenticity of the authors of electronic files (documents) (such as electronic signature and time stamp); and
- hardware-telecommunication infrastructure that provides reliable and cost-effective use of all computer resources.

As the requirements for future EDMS are defined above, it is equally important to define the requirements for establishing an appropriate data warehouse that will serve as the repository of content and related data (metadata, data on realized transactions, users, on recorded events, and other data that are the result of the business process).

The repository of CMS is a central warehouse of electronic documents of a business organization and all part of the data that relate to documents and their management. Depending on the structure of businesses and the number and degree of distribution of its business units, the appropriate models of architecture of the repository of content are projected (Matthew, 2003). The designed architecture of the repository should be harmonized with the software solution for EDMS (Milenkovic, 2015).

The application of electronic signature opens up new electronic horizons for an even better and more reliable performance of business processes based on electronic documents (Milenkovic, 2015). Electronic signature is a technology whose application in the exchange of electronically signed documents allows inspection of the authenticity of the signer (authentication), protecting the integrity of the electronic message or document that has been signed (integrity), and non-repudiation of the electronic signature of the person who signed the document or message (non-repudiation). Authentication involves checking and confirming the identity of participants in the exchange of electronically signed documents. This element of protection prevents the possibility of impersonation by malicious users. The application of electronic signature to an electronic document does not provide secrecy (confidentiality) of its contents.

The system of electronic document management should be integrated with an electronic service for issuing and managing time stamps (time stamp authority). Time stamp authority is used to create legitimate

evidence that the business transactions are carried out at a certain time that the electronic document existed at that time and has not been edited at a later date. When using the services of the issuer of the time stamps, the prior establishment of trust with the issuer of digital certificates for electronic signature is necessary. Time stamp in combination with electronic signature and corresponding user applications represent a necessary and a sufficient condition to move from paper to electronic business in accordance with the applicable legal frameworks. The most important use of the time-stamping is in the field of archiving electronic documents, as it guarantees the authenticity of electronic documents regardless of the status of the digital certificate of the signer.

The concept of cloud computing is the business model and technology platform that was created as a result of the evolution and convergence of many seemingly independent computing trends that have been created over the last decade, including computing as a service (utility computing) services on demand (on-demand services), network computing (grid computing) and software as a service (Software-as-a-service) (Vujin, 2011). Cloud computing is an infrastructure that can provide great opportunities for the establishment and use of the system for managing electronic documents for the possible use of computing resources as a service. One of the most important features of cloud computing is scalability, and a key technology that enables that is virtualization.

5. CONCLUSION

Management staff has less and less time to makes decisions about the activities of their business processes, because it is burdened with a large amount of data that needs to be processed and distributed. Preference is given to the business organization that decisions about their activities made on basis of timely, reliable, accurate, verifiable, consistent and easily accessible data. The success of modern business organizations largely shapes the way the information are being used. Information is an important factor in business process management. In the realization of business processes, there is a need to share information among business units. It manifests itself as knowledge and the need for effective management at all business levels, which reduces uncertainty in the business activities; it allow to saves material resources and rational use of personnel capacity.

The establishment of two complex systems within a business organization: the management of business content (CMS) and business process management (BPM), effectively solve the problems in the performance of business procedures. As expected, the two systems must be correlated with one another and only the synergy of CMS and BPM can contribute to a successful business organization. In this way, the organization's business becomes more transparent and more efficient.

Supported by modern information technologies, content management is prerequisite for efficient management processes in business organization and contributes to the creation of competitive advantage and increase in profits.

STAKEHOLDER RELATIONSHIP MANAGEMENT IN E-BUSINESS OF LARGE ENTERPRISES

Suzana Milinović [1], Dragana Vasiljević[2], Marijana Despotović-Zrakić[2]*
[1]Falc East, Serbia
[2]Faculty of organizational sciences
*Corresponding author, e-mail: maja@elab.rs

Abstract: *The problem researched in this paper is stakeholder relationship management in e-business of large enterprises. The goal is to improve relations with stakeholders by means of modern e-business technologies. The research context is a footwear company whose supply chain is very complex. It needs to monitor the flow of materials from suppliers from different parts of the world, as well as the current production that takes place in multiple locations and countries. The company also coordinates the flow of finished products and organizes delivery for customers located throughout the world. Timely and accurate information and good collaboration among all stakeholders is essential to a successful supply chain. Large distributed companies need well-managed relationships with all stakeholders in order to establish long-term and effective competitiveness of the company's e-business.*

Keywords*: stakeholder relationship management, e-business, large enterprises, e-supply chain*

1. INTRODUCTION

Industrial production of footwear is permanently confronted with problems related to competition in the market. Market requires constant changes: footwear models need to be changed from season to season, new marketing activities need to be realized, and efficiency of the company has to be improved. Therefore typical sets of the goals need to be met:

- Reduce the time of delivery
- Improve the quality of footwear
- Reduce costs
- Accelerate and better direct the flow of movement of raw materials
- Increase the flexibility and time to meet the consumer
- Increase profits

In order for a company to achieve its strategic objectives, it is necessary to review and analyze different interests that stakeholders have, which includes:

- Identification of key internal and external stakeholders
- Analysis of the interests and expectations of the key stakeholders
- Creating management strategies with key stakeholders
- Identifying problems and solving them
- Feedback and control of problem solving.

All this is even more complex when it comes to large enterprises, whose business is spread worldwide. The goal of this paper is to analyze the problem of stakeholder relationship management in e-business of large companies. The specific goal is to present a model for the improvement of these relations which is based on the use of modern e-business technologies. The model is created on an example of a large distributed footwear company.

2. E-BUSINESS OF LARGE ENTERPRISES

Nowadays, it is unthinkable for large enterprises to operate without e-business. Thanks to e-business technologies it is possible to send large amounts of information in a very short period of time. Using different e-business services, large enterprises can significantly reduce costs, increase efficiency and competitiveness in the market, expand business opportunities, speed up work processes, enhance internal and external communication, etc.

Considering the complexity of supply chains of large enterprises, numerous stakeholders can be identified, and e-business technologies can offer tremendous help by providing fast communication and infrastructure

for quick problem solving (Schenkeln et al., 2015). Reduced creativity and reduced entrepreneurial ability frequently occur due to problems of mismanagement in large enterprises. However, it is of high importance to efficiently find creative solutions that can satisfy all the participants in the e-business processes. These solutions often involve compromise, and joint efforts to achieve the goal (Risso, 2010). The structure of relations among stakeholders is crucial to the success of large companies, and this means that each characteristic of a relation need to be considered, including (Bureau veritas, 2016), (Franzoni, 2005) (Il Manuale dello Stakeholder Engagement , 2005):

- Flexibility
- Information exchange
- Synchronization between partners
- Control of the activities
- Equal efforts to achieve the target
- Economic structure relationships.

The exchange of information is very important both within the company and with external partners in order to improve e-business processes and increase the profit of all participants. It is very important that the information is accurate and timely (Aydin et al. 2014).

Efficiency of e-business in the footwear industry improves the production process, technological processes, product development and introduction of new materials. Also, it improves hiring process, the opening of new production facilities and expanding business in general (Mazzola et al., 2015). When a manager uses the obtained information well, they can react promptly and create significant cost savings, and improve the business as a whole. Timely information can affect the sales, reduce marketing costs, influence retention and customer loyalty and attract new customers (Reijonen et al., 2015).

Falc company is a company in Italy engaged in the production of footwear. Falc exists for more than forty years, and each year it became more advanced and expanded. Today the company does all the work related to footwear, from design of footwear models, the development of new products, making knives, soles and insoles, sewing and assembly of finished product. Falc company operates in Ruma and Knjaževac in Serbia under the name Falc East, as well as in Italy and China, and has suppliers from Serbia, Italy, Romania and China. Distribution chain is spread across over fifty countries worldwide. So, it is very difficult to identify and coordinate all the stakeholders, examine their objectives, as they may be different and subject to different legal standards. In large companies it is difficult and complicated to coordinate the supply chain, but it is necessary to make the company perform well.

In Falc East, all business processes are conducted via the Internet. Two main software solutions are used. One is hosted in Italy and to the AS400, which is a complex solution that contains all orders for all manufacturing facilities; complete accounting of the headquarters in Italy, but it does not contain details of the production. The second software solution is adapted to the production and contains all the details of all wholesale customers, the production and materials (Milinovic et al., 2014). Wholesalers through authorized agents make an order, which is through the Internet forwarded to Planning department in Italy. All orders are fed into the AS400 database in Italy, which is then synchronized with the software of the local Serbian Planning department. Then, Purchase department orders the necessary materials from suppliers, it orders the knives, insoles and soles for the products. Then, Planning department creates a plan and program for production using data on expected arrivals of ordered goods. Commercial department provides information to customers on the date of delivery. Software in Serbia is adapted to the production process that takes place in Serbia and is used for data analysis, analysis of stocks, monitoring the production process and other local processes. Also this software can be accessed by management from Italy, so that the production process can be monitored. However, this causes a problem in communication between the various departments. The problem is that departments are not connected adequately, departments in Italy are not fully aware of local problems in Serbia, they are note familiar with timeline of work. For example, if a supplier has a problem with a type of ordered material, this information is not distributed through the supply chain. This could cause deadlocks in production of a certain model, causing delays in production of other models which could have been produced if the information about the first delay had been available on time. Therefore, communication through the chain needs to be enhanced, and adequate means for instant spread of important data need to be researched and implemented.

The analysis of the business process of Falc East helps in identifying the company's stakeholders:

- Suppliers
- Sales Agents
- Customers
- Association for Consumer Protection
- Municipal administration

- Workers
- Dealers in retail stores
- Human Resources Manager
- Technical Directors
- The directors of factories
- Heads of department
- Managing Director
- Technical feature for quality control
- Owners
- Top Management in Italy
- Banks
- Competition

3. MODEL OF STAKEHOLDER RELATIONSHIP MANAGEMENT IN E-BUSINESS OF A LARGE FOOTWEAR COMPANY

Figure 1 shows a model stake holder relationship management for company Falc East. The figure shows stakeholders, as well as services that the company Falc East can use to improve relationships with stakeholders. This model provides a number of e-business services and infrastructure that the company can use to enhance relationships, make successful future projects, improve collaboration and successfully implement strategic plans into action. It also presents services of the company Falc East such as production, marketing, service complaints, sales services and other services that promote, enhance and modernize operations of the company and its stakeholders.

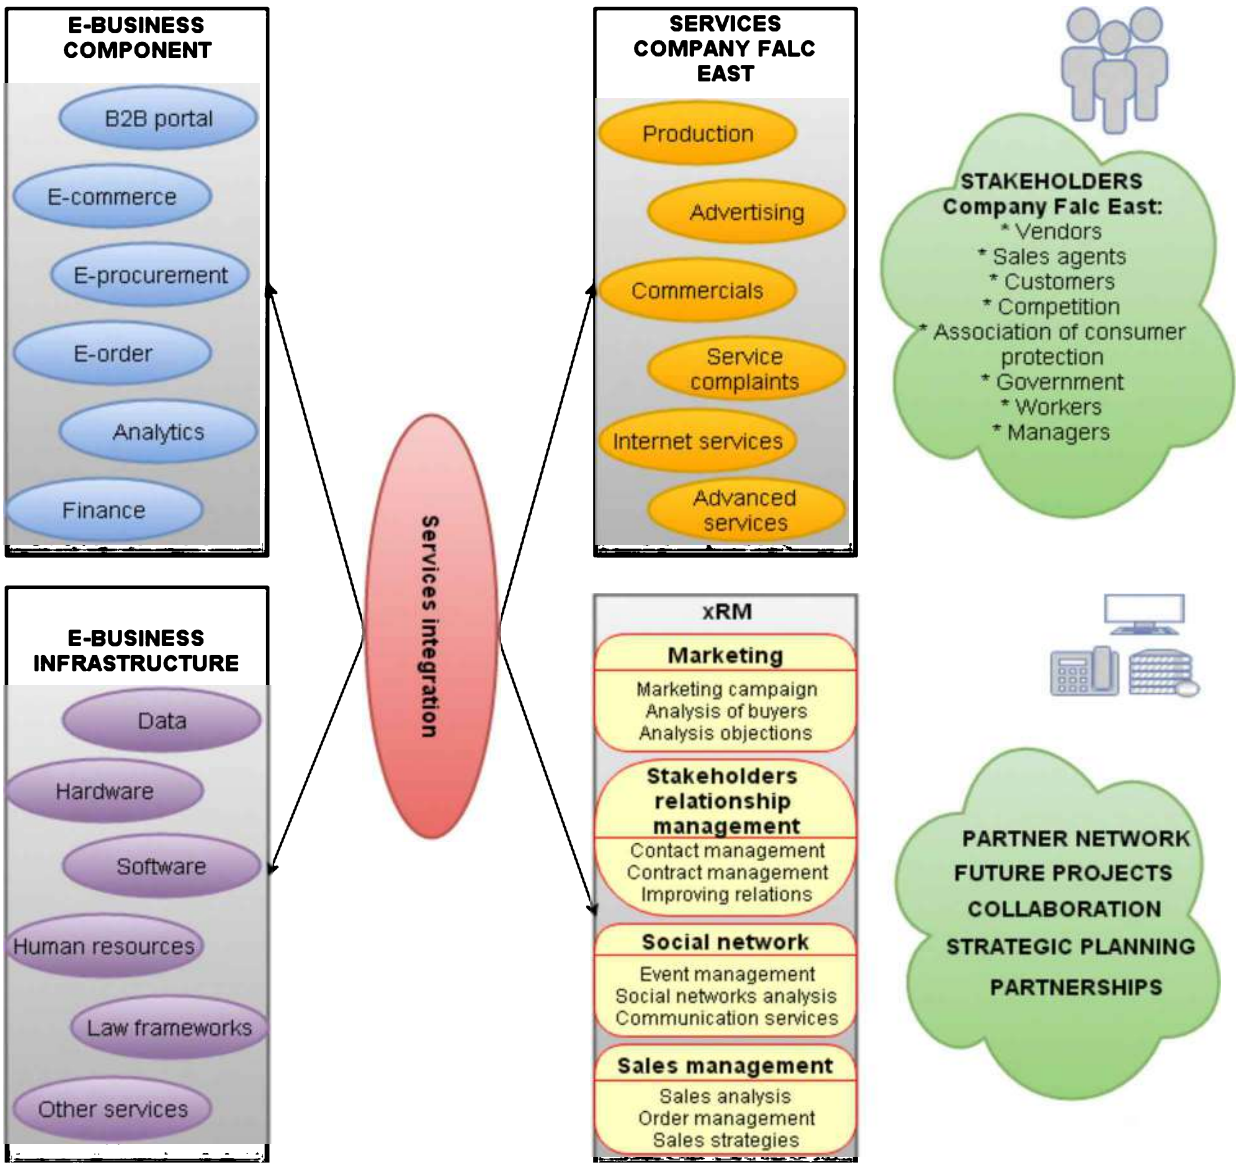

Figure 1. Relationships of Falc East with business partners

3.1 Relationship management with internal stakeholders

Internal stakeholders include management, workers and executives. Figure 2 shows the internal stakeholders in the company Falc East.

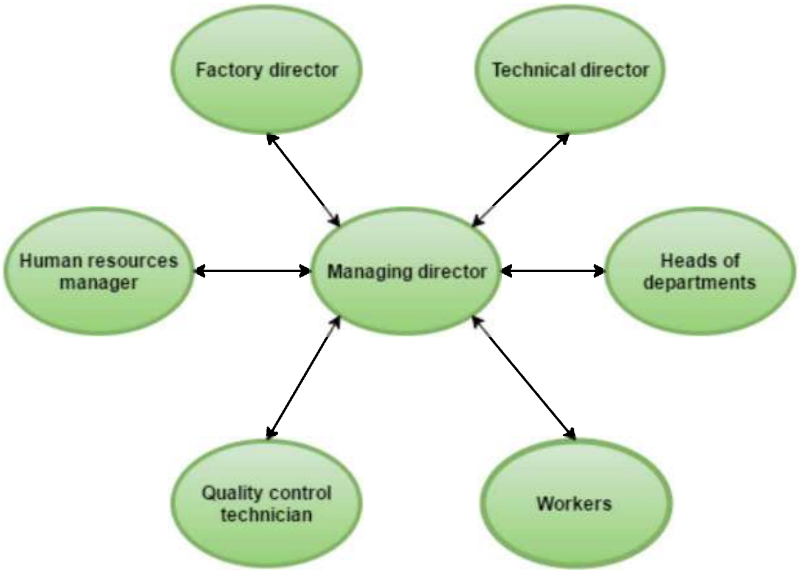

Figure 2. Internal stakeholders in the company Falc East

The analysis of the current situation in the company has showed that the one-way system of communication between the owner, management, managers and workers was used. Internal communication is completely neglected. It is essential that the management creates the environment where employees can express their views, concerns and ideas to improve the company's operations. Solving internal communication problems increases the efficiency of the company, and this is naturally reflected in the final products and therefore to the satisfaction of end users. The introduction of the internal social network would improve the communication between workers and management. It would also improve communication between management in Serbia and management in Italy. Workers would have an opportunity to report a problem or give an idea to make the job easier or more effective, while management would be able to answer and adopt every idea. Using the internet social network all interested parties can share news, comments, and problems and help the development of the company. It is also adequate tool for online team building, because it provides an environment for less formal communication, and therefore a sense of belonging to the company. It could also improve relationships between employees, develop team spirit, improve communication between employees, increase motivation, help in understanding the importance and the impact of each employee, and thus increase the efficiency and productivity.

Mobile services can also improve the internal communication. Company can accelerate the resolution of all small problems in the production, so it is now possible to send messages or images of problems in real time, and it is also possible to get a response. Since the modelers are based in Italy mobile services significantly accelerate troubleshooting in production and thus delays in the production can be avoided. Also, all employees now have constant access to web pages, internet social networks, and other intranet services.

3.2 Relationship management with external stakeholders

External stakeholders are:

- Suppliers
- Sales Agents
- Potential buyers
- Owners
- Top management
- Competition
- Association of Consumer Protection
- Banks
- Municipal administration

Figure 2 shows the external stakeholders in the company.

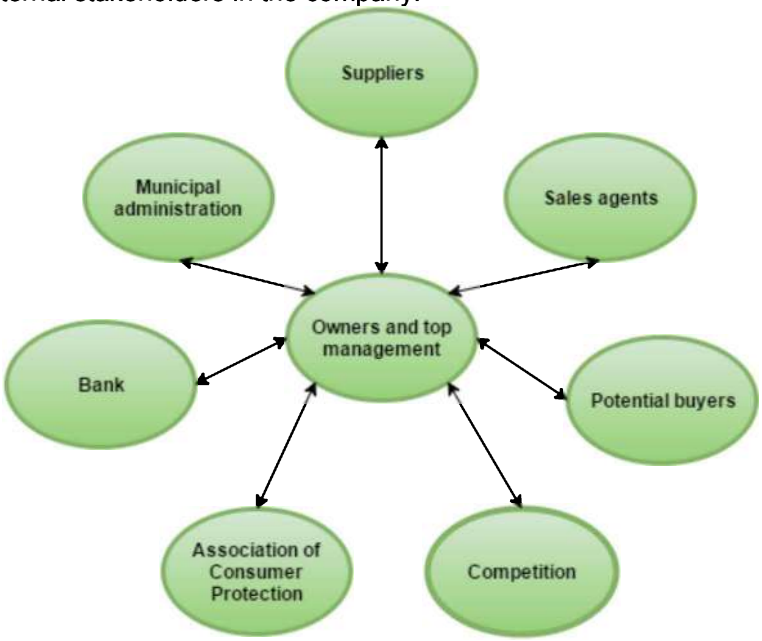

Figure 2. The external stakeholders in the company Falc East

Managing relationships with external stakeholders has multiple purposes, such as:

- The development of future projects such as the opening of new facilities or expansion of existing plant
- Planning to expand markets in Serbia or the opening of new sales outlets
- Strategic planning

Managing relationships with external stakeholders aims to:

- Improving relationships with stakeholders
- Making decisions based on the actual communication with stakeholders
- Prevention of possible future conflicts
- Better business results
- Easier implementation of plans
- Consumer satisfaction
- Reducing the risk
- Increasing Profits
- Increase of sales
- Increase product quality
- Improving the resolution of complaints.

In order to improve operations and reduce costs Falc East company introduced an online business at all levels of operations and with all associates. The first step is to adapt the software to the vendors, create possibilities of electronic invoicing instead of entering all data manually. The quantity of paper documentation should be reduced; the same format of documentation should be applied, leading to higher interoperability of business processes (Chituc et al. 2008). For this purpose ebXML can be used, as well as other specification. Also, higher usage of e-mail or IP telephony should reduce significantly the phone bills, since the orders are made in Serbia and the majority of suppliers are located in Italy and China. Instant messaging can be used for submitting and resolving complaints from suppliers, without misunderstandings and conflicts.

Sales agents should gain access to the central software themselves, so they can make orders remotely, canceled them online if necessary, which would reduce the costs and possibility of errors. Software should analyze all the data in real time, so all employees can update their information on time.

By creating a web site potential customers could buy products online at no additional costs. E-commerce is already a well known concept and Falc is not using the potentials of e-commerce at all. Online sales would improve the sales worldwide, but the distribution network should be carefully organized.

By connecting with consumers through social networks, Falc's management could respond and adopt suggestions and change something in business or in products. Crowdsourcing can be used for gathering design ideas, and online tools could be provided to users so that they could design their own personalized shoes.

Instead of the current flow of information that comes from various parts of the world to the headquarters in Italy, and from Italy to factories in Serbia and other countries, and then returns to Italy so it can be forwarded a particular country, a communication channel which would directly connect the participant in the supply chain should be provided. Direct communication through email, instant messaging and other tools would enable to immediately receive information and get a response. Through social media, management in Serbia would be able to see real time data on all the changes, guidelines for the development of models and the deficiencies that are found on models. Considering that it is necessary to do pre-production pilot test of each model, a pair is sent to Italy. Waiting for the answer takes too much time; this should be improved or changed, since this part of the work can be done very quickly. Pilot trials could be done in Serbia, with online participation of supervisors from Italy or other countries. Supervisor can immediately tell remarks, deficiencies can be corrected quickly and production of that model could start in short time. Also, in the case of certain problems in production of certain models, pictures or video of problems and solutions could be exchanged by e-mail, Viber, web portal or other online tool.

Mobile business can significantly improve operations of large companies. Numerous companies have already recognized the potentials of mobile business and adopted it fully. Falc has a lot to gain through the implementation of mobile technologies. All communication channels could be integrated and delivered via mobile devices, leading to increased efficiency, and increased profit of the company.

4. CONCLUSION

In order to operate successfully, a company needs to manage the relations with all the stakeholders. Understanding the organization, employees, the needs and expectations of all stakeholders, as well as successful and effective communication are essential for the company if it wants to achieve its objectives (Derrouiche et al. 2010). It is necessary to respond to the requirements and needs of the dynamic business environment as well as monitor and control the results of the stakeholder relationship management, to take appropriate actions, remove dissatisfaction and uncertainties. When a company succeeds to manage stakeholders effectively, and manages to develop good relations with all stakeholders, and thus acquires a good reputation, it will influence to creating a good attitude towards the company and greater support. This will further lead to an advantage over the competition. E-business technologies can significantly help in achieving this goal. They need to be implemented to greater extent, and Falc needs to recognize a need for this aspect of innovation if it wants to stay competitive in the future.

IMPLEMENTATION OF QUALIFIED ELECTRONIC SIGNATURE IN THE PROCESS OF CREATING TECHNICAL DOCUMENTATION

Miljana Novarlić*[1], Rastko Martać[1]
[1]Jaroslav Černi Institute for the Development of Water Resources
*Corresponding author, e-mail: miljananovarlic@gmail.com

Abstract: *Signing of technical documentation in paper with personal signature in ink and certifying with personal license seal has been changed and improved with digital signing of electronic document with qualified electronic signature. Purpose of the paper is to present the process of issuing qualified electronic certificate and illustrate a model for practical implementation of qualified electronic signature in the process of creating technical documentation within the process of application for electronic building permits.*

Keywords*: electronic signature, digital certificate, electronic document, electronic building permit, technical documentation*

1. INTRODUCTION

Digital world has influenced ordinary life of each and every individual as well as of legal entity. Internet revolution and new technologies has modified the way business processes are being conducted. Legal entities now have possibility to work on more efficient and transparent level. All those factors have provided a support to the government to determine internal communication as well as interaction with citizens and organizations on one new level. E-government is defined as providing public administration services to the citizens and organizations electronically (Radenković, Despotović-Zrakić, Bogdanović, Barać, & Labus, 2015). Strategy for Development of Information Society in Republic of Serbia until 2020 predicts that on or before 2020 all citizens will be able to electronically contact with government bodies, holders of public authority, courts and health protection system (Stategija razvoja informacionog društva u Republici Srbiji do 2020. godine, 2010).

As per the data published by Statistical Office of the Republic of Serbia for the year 2015 in the Republic of Serbia over 2,950,000 individuals use Internet every, or almost every day (Republički zavod za statistiku Srbije, 2015). When it comes to the electronic services of public authority (e-government) the research has shown that over 1,500,000 individuals and 94.5% of legal entities use aforementioned services.

From the 1st January 2016 one new service has been started – e Permits - Portal for electronic applications for construction permits. This portal, that is available within the Serbian Business Register Agency system (Agencija za privredne registre, 2016), has been developed within the process of implementation of the unified procedure. Unified procedure is a set of procedures and activities that are being executed by competent authority in relation with construction, upgrade or reconstruction of the object, i.e. execution off work (Zakon o planiranju i izgradnji, 2015). The aim of the procedure and implemented service is to establish the mechanism that provides functional allocation of duties within the administrative processes between citizens and government (Vasiljević & Čukić, 2016).

Precondition for using the above mentioned service is that user have issued, valid qualified electronic signature.

2. BASIC TERMS AND LEGAL BACKGROUND

The Law on Planning and Construction of Republic of Serbia defines that exchange of documents and submissions in unified procedure is conducted in electronic form and all related acts, including technical documentation is provided in the form of an electronic document in PDF format, signed with a qualified electronic signature (exceptionally, the technical documentation is provided also in dwg or dwf format, without the obligation of the digital signing) (Zakon o planiranju i izgradnji, 2015). In cases where the verification of the technical documentation or parts of the technical documentation is required by the project organization as well as by responsible and chief designer, with signature and seal of the project organization, or personal licenses seal, electronic document, in addition to being signed by a qualified electronic signature of the responsible person of project organization, or responsible or chief designer, contains digitized seal of design organization, i.e. personal licenses seal.

2.1. Qualified Electronic Signature

Electronic document, as per the Law on electronic document, has been defined as a set of data, consists of letters, numbers, symbols, graphical, audio or video records contained in application, written conclusion, document or any other act that is created by legal entity or individual or government authority in legal transaction or in administrative, judicial or other proceedings by the authorities, if made electronically, digitized, sent, received, stored or archived on electronic, magnetic, optical or other media (Zakon o elektronskom dokumentu, 2009).

The same Law (Zakon o elektronskom dokumentu, 2009) gives the meaning of the term digitalization - converting document from other forms into the digital form.

Electronic signature is a set of data in electronic form that are joined or logically connected with electronic document and that are used for signatory identification (Zakon o elektronskom potpisu, 2004).

The qualified electronic signature is an electronic signature that reliably guarantees the identity of the signatory, the integrity of electronic documents, and prevents subsequent denial of responsibility for their content. (Zakon o elektronskom potpisu, 2004). In order to be qualified, electronic signature must meet the following requirements:

- It is solely linked to the signatory
- Unequivocally identifying the signatory
- It is created using means that the signatory can independently manage and which are exclusively under the control of the signatory
- It is directly linked to the data to which it relates in a manner that unambiguously provides an insight into any changes of source data
- It is formed by the means for creating qualified electronic signatures
- It has been checked on the basis of qualified electronic certificate signer

Digital certificate is an electronic document which represents Identification Card in digital world i.e. Digital Identification Card (Digitalni sertifikati, 2016). The Government has regulated the issuing of qualified digital certificates through Certification Authorities (CA). Each qualified digital certificate contains user's and issuer's data, thus it is a document that confirms relation between data for verification of the digital signature and the identity of the signatory that has been published by CA.

Digitized seal is formed by transferring the stamp on paper into electronic form, or by scanning a paper on which is the stamp.

2.2. Technical documentation

Technical documentation is a set of projects that are developed in order to determine concept of object, elaboration of conditions, method of object construction and for the purpose of maintaining object (Zakon o planiranju i izgradnji, 2015).

There are several types of technical documentation (Vasiljević & Čukić, 2016):

- Main Design
- Preliminary Solution
- Preliminary Design
- Construction Permit Project
- Project for Executing Construction Works
- Built Design

Regardless the type of technical documentation, it includes:

- Main Notebook and
- Projects

Projects in addition may include elaborations and studies.

2.3. Legal framework in Europe with example of best practice

Digital signature technology is most often used in order to determine the document origin. In general, digital signature is a legal act that can confirm signatory identity and that the signatory has recognized the content of the file (Huang & Zhang, 2013). Most of the countries have defined standards and regulations within this area in order to assure authenticity, integrity and non-repudiation when said signatures are applied (Breier & Pomothy, 2015).

In 1999 European Union has passed Directive on electronic signatures (Directive 1999/93/EC, 1999), that represents legal base for implementation of electronic signatures for the member countries as well as for other countries that have adopted their legal framework in accordance with mentioned directive.

In 2014 European Parliament and Council have passed Directive (EU) No 910/2014 on electronic identification and trust services for electronic transactions for the inner market (eIDAS Directive) that repeals previously mentioned Directive 1999/93/EC and provides a comprehensive legal framework for electronic identification and authentication of services (Regulation (EU) No 910/2014 EC, 2014). Directive aim is to develop system of mutual recognition of national identification systems of member countries and to provide improvement of efficiency and trust within the European inner market for public and private cross-border electronic services and e-commerce.

eIDAS Directive provides mutual recognition of electronic trust services (electronic signature, electronic seal, time stamp, electronic registered delivery, website authentication) and electronic documents (Berdić, 2015).

eIDAS Implementation chronology is presented in table below.

Table 1: eIDAS implementation chronology (adopted from **(Berdić, 2015)**)

Date	eIDAS regulations
September 17, 2014	Directive has entered into force
September 18, 2015	Period of voluntary recognition of eIDAS regulation
July 1, 2016	Implementation of rules for trust services
July 1, 2017	Qualification authority shall submit a conformity assessment report to the supervisory body in order to stay as QA
September 18, 2018	Mandatory recognition of eIDAS

As per the data of Doing Business Report 2015 Republic of Macedonia is ranked on the first position in Europe and Central Asia for the system for issuing building permits (Doing Business, 2015). Application of electronic signatures in construction area has been started from 2013 and as per the statements of Chamber of certified architects and certified engineers of Republic of Macedonia, all active engineers in Republic of Macedonia have qualified electronic signature and for the period of two years it has been submitted 8.700 applications through the subject system.

3. ISSUING OF QUALIFIED ELECTRONIC SIGNATURE

Within the Register of certification authorities there are six Certification Authorities (CA) that are accredited for issuing digital certificates (Vulić & Prodanović, 2014):

- CA Post
- CA Ministry of Interior Affairs of Republic of Serbia (CA MUP RS)
- CA Ministry of Defense and Military of Republic of Serbia
- CA Chamber of Commerce of Serbia
- CA Halcom (HALCOM BG CA)
- CA E-Smart System (ESS CA)

Certification Authorities issue qualified electronic certificates to individuals and legal entities and for the needs of organization in which the certification authorities are formed. Except CA MUP RS, all certification authorities are commercial and issue resource certificates and certificates that are oriented on area of their business

Certification Authority of Ministry of Interior Affairs issues qualified digital certificates on ID card with chip, without any cost. Procedure of issuing qualified digital certificate is not significantly different among other certification authorities in terms of submission of request, selecting the media, expiration date of certificate and the amount of cost.

Implementation of qualified digital signature in the construction has been started from 2016, upon the entry on the force of the Law on planning and Construction of Republic of Serbia. Electronic unified procedure includes centralized information system (System for application of electronic submissions) with an aim to improve efficiency and transparency of the process of issuing electronic building permits. For the first three months of 2016 in Republic of Serbia have been issued 725 electronic building permits, as it was stated by the the-then Minister.

According to the Review of 10 most common mistakes of applicants of the requests in unified procedure that has been published on 19th April 2016 on the web site http://gradjevinskedozvole.rs/ on the first place is that submitted documents are not certified with qualified electronic signature. Second most common mistake is that technical documentation is not submitted in dwg or dwf format. Later on, the sixth ranked mistake is the absence of digitized seal of project organization, responsible and chief designer and the seal of the investor on the attachment of the decision of appointment chief designer. With rank eight is that attached digitally signed documents in PDF are missing personal signature in ink of responsible and chief designer.

Having in mind all above mentioned issues of implementation of qualified electronic signature within the process of creating the project and technical documentation, there is an obvious need for more detailed presentation and explanation of procedure of model for digital signing of technical documentation.

4. MODEL OF DIGITAL SIGNATURE APPEARANCE

Traditional model of signing the technical documentation was the process that have included several steps:
- Creating the technical documentation
- Printing the technical documentation
- Signing and applying the seal on multiple pages within the technical documentation by several persons
- Scanning the technical documentation
- Delivering technical documentation in person or sending the by mail/courier, or sending by electronic communication means

Now, with the possibility of implementation of the qualified electronic signature, the aforementioned process has been improved - shortened and accelerated, and include only three steps:
- Creating the technical documentation
- Applying the qualified electronic signature into the technical documentation
- Sending the technical documentation by electronic communication means

The following model provides to engineers who poses license that within presentation of data of qualified electronic signature integrate digitized personal license seal and signature.

Model of data presentation of qualified electronic signature assumes that following conditions are fulfilled:
- Signatory has valid qualified electronic certificate
- Signatory has at least one engineering license
- On the signatory's computer all necessary software and hardware for qualified electronic signing is installed and set up
- Technical documentation is prepared in PDF, i.e. PDF/A form.

Model has been developed in the last version of Adobe Reader DC software that can be downloaded for free from the official website. Adobe Reader DC allows digitally signing of PDF (PDF/A)

After the program installation it is necessary to set up few parameters within the program in order to certify PDF document with qualified electronic signature.

One of the steps referees to setting up the signatory appearance, which is the subject of the said model.

Model is based on the following steps:
- Scanning personal license seal and signature and saving in PDF form
- Within the setting up program parameters, selecting the item Edit, and in the dropdown menu selecting Preferences option.
- In the Preferences form, select category Signatures.
- Field Creation and Appearance provides setting up appearance of the data of qualified electronic signature
- Selecting the option Create New Appearance

Considering the possibility of creating several different appearances of data of digital signature, it is necessary to define unique name to the subject appearance, in order to provide easier access in the moment of signing.

Within the graphical configuration field, it is necessary to select the option Imported Graphic, and to upload previously created PDF which contains scanned personal signature in ink and personal license seal.

After this step, unchecking all offered attributes that refers to text configuration.

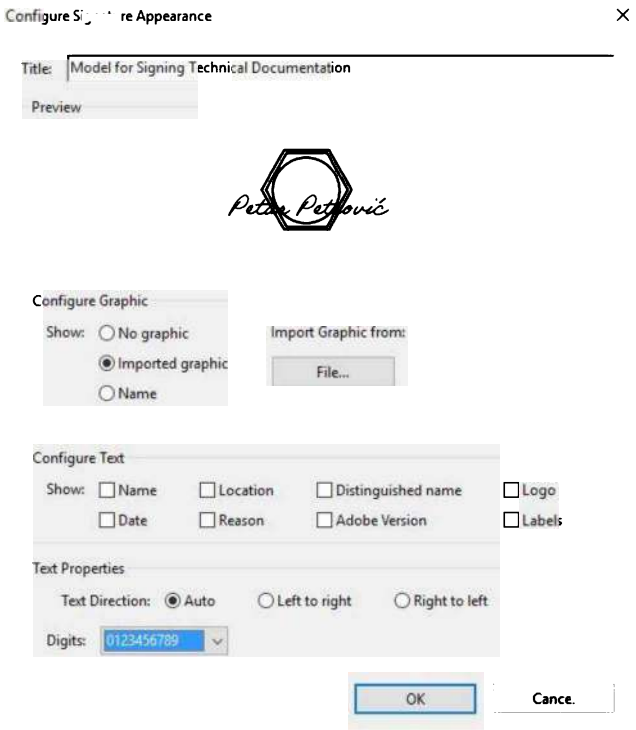

Figure 1: Creating Appearance for Digital Signature

The following paragraph briefly describes procedure that includes standard steps of the process of digitally signing of PDF documents with qualified electronic certificate, and it is also applicable to the technical documentation.

- Previously prepared technical documentation saves in PDF form
- Connect Smart Card Reader with PC and insert the smart card, i.e. connect USB token to PC
- In Adobe Raeder DC program, in the Tools section, select option Add Signature
- Select the area on the PDF where the signature data will appear
- Select previously described and defined appearance - Model for Signing Technical Documentation and confirm the selection
- Enter the Private Identification Number code (PIN code)
- Save digitally signed technical document.

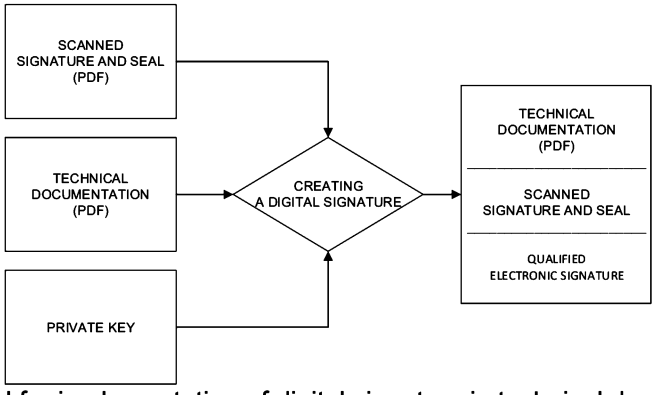

Figure 2: Model for implementation of digital signature in technical documentation

This kind of approach provides to the signatory to secure also the appearance of his personal data on the digitally signed document. PDF document, i.e. technical documentation, now contains all necessary elements as it is stipulated and regulated with respective Laws and Regulations. It is understood that the signatory has the unique access to his digital signature and personal license seal, and by integration of traditional and modern process of signing, the model acquires its practical implementation.

5. CONSLUSION

Advantages of the model are as follows:

- Model integrates traditional way of signing the technical documentation with a modernized way of electronic signing
- The model is flexible and adaptive to other systems
- The model is in accordance with the Laws
- The implementation of the model is simple
- Model offers the possibility of having an identical document in paper form and document in electronic form

From another point of view, the model has certain disadvantages:

- A qualified electronic signature increases the file size by 0.7 MB in average
- It is necessary to pre-define space for displaying data of qualified electronic signatures, in order to maintain the proportion of display stamp and handwritten signature

Having in mind the fact that the technical documentation consists of several parts and that every single part is being signed by several engineers, the question in the matter is the size of the final PDF document generated after adding all qualified electronic signatures.

From the one point of view, the Regulation stipulates that the technical documentation has to be signed and certified with personal signature in ink and sealed with personal license seal on all the places where predicts the Regulation, and the document also have to be digitally signed only once. This method means that the technical documentation should be previously prepared and printed, after which it is being signed with personal signature in ink and certified with seal for all involved engineers and responsible persons, then it is scanned, so finally, in the end it is being signed with qualified electronic signature.

From the other point of view, one of the objectives of the implementation e Permits service is the improvement of the efficiency of the process of issuing building permits and cost reduction.

The presented model has already, to some extent, found its practical application, which can be determined by examining the records of the Central Registry of the unified procedure.

In the future, it is expected the harmonization of the national Laws of Serbia with the European Directive in terms of digitalization of the seal and integration of the centralized information system for electronic building permits with the unique database of engineers.

MANAGEMENT INFORMATION SYSTEMS: E-LEARNING AT THE UNIVERSITY OF NOVI SAD

Ugljesa Marjanovic*[1], Nemanja Tasic[1], Bojan Lalic[1]
[1]University of Novi Sad, Faculty of Technical Sciences, Trg Dositeja Obradovica 6, Novi Sad, Serbia
*Corresponding author, e-mail: umarjano@uns.ac.rs

Abstract: *With the advances of information-communication technologies and its intensify usage, it is critical to assess and improve the efficiency and accuracy of management information systems. E-Learning platforms are utilized by many universities to improve information exchange, communication, student collaboration, as well as to better support learning management. Owing to limited IT budget and the need to justify the investment in e-learning platform, assessing the benefits of these is an important filed in research and practice. Accordingly, this study proposes an integrated model for evaluating the effectiveness of e-learning platform from a student point of view. This model is based on updated DeLone and McLean IS success theory. Structural Equation Modeling (SEM) methodology is applied on responses from students' who used Moodle e-learning platform at the University of Novi Sad, Serbia. System quality positively influence user satisfaction. Academic institutions can use the results of this research to assess the success of their e-learning platform implementations from their students' perspective.*

Keywords*: E-learning, IS success, DeLone and McLean, SEM, Moodle*

1. INTRODUCTION

With the advances of information-communication technologies and its intensify usage, it is critical for Universities to assess and improve the efficiency and accuracy of e-learning information systems. E-Learning platforms are utilized by many universities to improve information exchange, communication, student collaboration, as well as to better support learning management. Owing to limited IT budget and the need to justify the investment in e-learning platform, assessing the benefits of these is an important filed in research and practice.

The e-learning systems have received excessive attention in information systems (IS) literature and are mainly examined from the standpoint of effectiveness (successfulness) (Marjanovic, Delić, & Lalic, 2015). Since e-learning systems are type of Information System (IS) (Chen, 2012; Hassanzadeh, Kanaani, & Elahi, 2012) they can be assessed with the updated DeLone and McLean (D&M) IS success model. The model is applicable to the assessment of IS effectiveness in the Internet environment (DeLone & McLean, 2003).

This study presents an empirically validated model for measuring the success of an e-learning system at the University of Novi Sad by using the D&M IS success model. The focus is on testing a model to assess the success of e-learning systems by quality triad constructs and their impact on user satisfaction. The proposed instrument can be used to assess the success of university e-learning systems from the perspective of the students.

2. E-LEARNING EFFECTIVENESS

2.1. Applicability of the updated D&M model

The updated D&M (2003) IS success model consists of six interrelated and interdependent dimensions of IS success: system, information, service quality, system use, user satisfaction and net benefits (see Fig. 1). The revised D&M model is one of the most widely used models of information-systems success and has been used for various information systems: e-learning (Chen, 2012; Hassanzadeh et al., 2012; Marjanovic et al., 2015), mobile data services (Shin, Lee, & Lee, 2016), IS among SMEs (Ghobakhloo & Tang, 2015), electronic Portfolio (Balaban, Mu, & Divjak, 2013), e-government (Stefanovic, Marjanovic, Delić, Culibrk, & Lalic, 2016; Wang & Liao, 2008). The model is applicable to the assessment of information system's effectiveness in the World Wide Web environment.

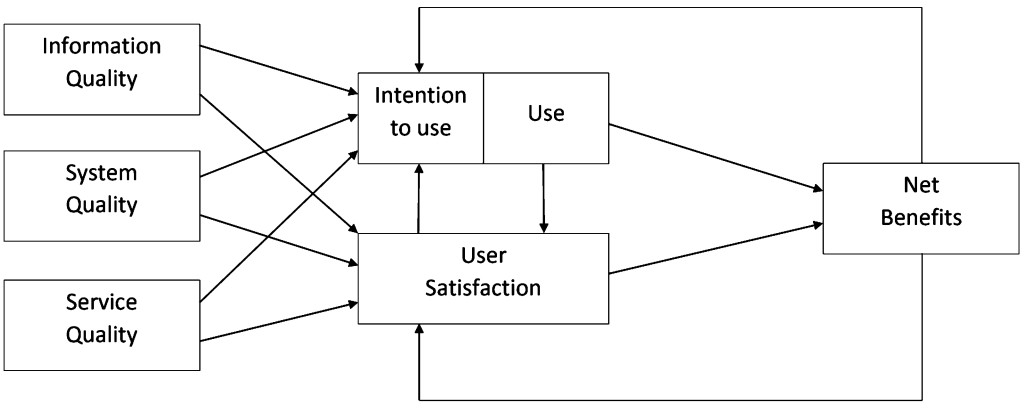

Figure 1: The updated DeLone and McLean IS success model (DeLone & McLean, 2003)

2.2. User Satisfaction

User satisfaction is one of the key components of success (Urbach, Smolnik, & Riempp, 2010) and can be defined in different ways. User satisfaction is the basic idea of the individual about the system (Wang, Wang, & Shee, 2007). Other authors define user satisfaction as a feeling of satisfaction or dissatisfaction arising from all the advantages that a user hopes to gain from interacting with the information system (Shin et al., 2016). User satisfaction represents feedback of a user after using the system, in other words, what an individual thinks and feels about the system (Marjanovic et al., 2015). Various instruments have been developed to measure user satisfaction and has not established a consensus, which would be the best instrument for measuring user satisfaction. The authors emphasize that the user satisfaction key dimension of success, but they are necessary and other dimensions to measure the success of information systems (DeLone & McLean, 2003).

2.3. Quality triad

As the e-learning platform becomes increasingly important in communication between the academic institutions and its students, it is essential for faculty personnel to provide quality services that minimize adoption barriers and maximize benefits. The D&M model suggests that the quality triad contains three elements that are important to the success of any information system: system, information and service. While this triad is composed of three elements, each can be considered individually to determine the strengths on which the academic institution capitalizes and shows where they need to make improvements.

System quality represents the technical quality of e-learning platform and measures technical success (DeLone & McLean, 2003). A higher system quality is expected to lead to higher user satisfaction, thus leading to positive impacts on individual productivity (Dong, Cheng, & Wu, 2014). For instance, if an e-learning webpage requires an extra click from the user, it might make a difference to, or have a lasting psychological impact on the user. Thus, the effect of system quality as a motivator in facilitating user satisfaction increase may be significant. System quality was measured in terms of ease of use, user friendliness and functionality (Dong et al., 2014; Marjanovic et al., 2015).

The content that an e-learning platform or information system has the more successful it will be due to more recurrent visits (Dong et al., 2014). Information quality, the quality of the information provided to the users by IS (Petter, DeLone, & McLean, 2013), is considered to be a key factor affecting IS success. Information is the reason most students use e-learning platform. In the e-learning platform context, information quality insinuates delivering up-to-date, useful and complete information (DeLone & McLean, 2003; Dong et al., 2014). It is proposed that the higher the quality of information, the more potential students would visit and browse e-learning platform.

Service quality refres to quality of service that users of an e-learning system receive from IT personnel (Petter et al., 2013). In addition to system and information quality, this construct measures the general quality of an e-learning system from the perspective of readiness of personnel to provide proper service, safety of transactions when using the e-learning system, availability of the system to users, individual attention of IS personnel and providing specific needs for users.

2.4. Conceptual model and hypothesis

In this paper, we tried to use the concepts and models mentioned in similar studies, taking into account the views of students, and provide a model for measuring the e-learning effectiveness, extending previous research. As e-learning system is considered to be an aspect of IS (Marjanovic et al., 2015), their success can be analyzed with the updated D&M IS success model. Based on a review of previous research results (Chen, 2012; Hassanzadeh et al., 2012; Marjanovic et al., 2015), we designed the initial conceptual model, presented in Fig. 2.

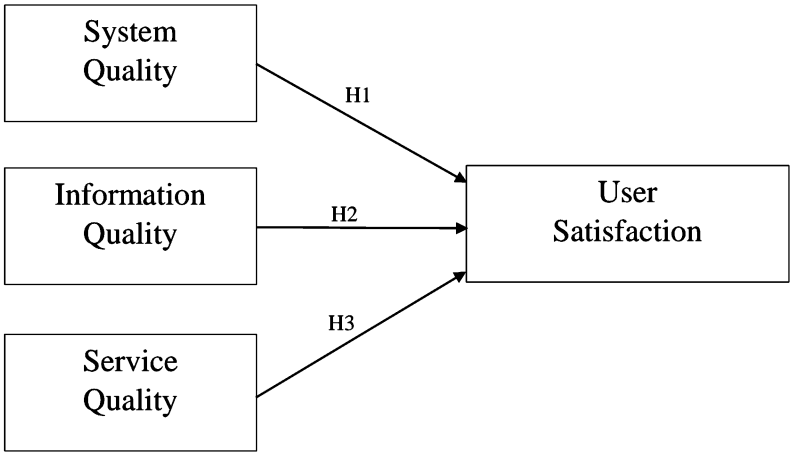

Figure 2: Conceptual Model

According to the Fig. 2, four dimensions from the updated D&M are used in this study: the quality triad elements and user satisfaction. Our hypotheses about the relationships in the model are presented below:

H1: System quality of e-learning system has a positive effect on user satisfaction of students

H2: Information quality of e-learning system has a positive effect on user satisfaction of students

H3: Service quality of e-learning system has a positive effect on user satisfaction of students

3. MATERIALS AND METHODS

The data used to test the conceptual model were obtained from a sample of senior students from the Faculty of Technical Sciences (FTS), University of Novi Sad, Serbia. The focus was on students that have used the faculty e-learning system Moodle. Following Dillman's et al. (2014) recommendations of applying the total design method of surveys, we emailed 500 students via the SurveyMonkey online survey tool. A total of 165 responses, that were using e-learning system Moodle during winter semester, were received over a period of ten weeks, representing a response rate of 33%. After conducting non-engaged bias analysis, 17 responses were deleted and the remaining 148 useful responses were available for data analysis, yielding a 29.6% usable response rate. Approximately, 68% of the respondents were female. Age distribution was as follows: under 23 (77.0%), between 24 and 28 (18.2%), between 29 and 33 (2.7%), and over 33 (2.0%). Detailed descriptive statistics relating to the demographic characteristics are shown in Table 1.

Table 1: Demographic details of the respondents (n = 148)

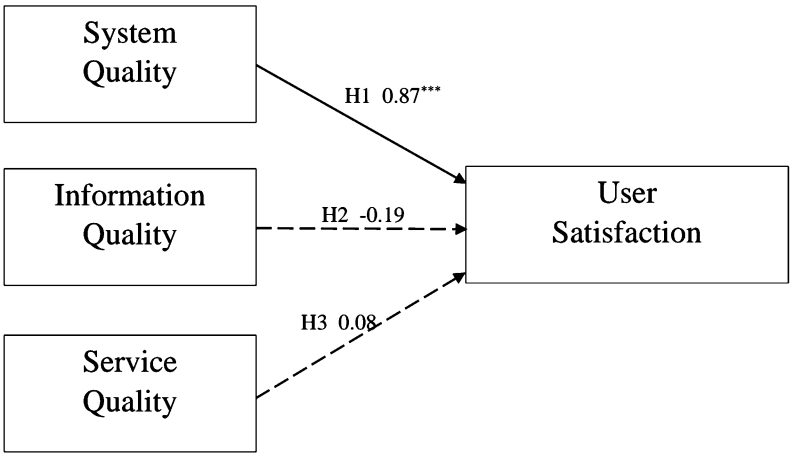
Measure	Items	Frequency	%
Gender	Male	48	32.4
	Female	100	67.6
Age	<23	114	77
	24-28	27	18.2
	29-33	4	2.7
	>33	3	2.0

4. RESULTS

In general, the Structural Equitation Modeling (SEM) technique was conducted in SPSS Amos to examine the model fit for each construct (to assess the measurement model) and to test the relationships among the constructs (to test the hypotheses in the structural model).

Reliability was evaluated by calculating Cronbach's alpha coefficients (Nunnally & Bernstein, 1994). The reliability of each factor collected by the survey instrument was as follows: system quality = 0.853; information quality = 0.843; service quality = 0.939; user satisfaction = 0.943. And the reliability of the whole instrument was 0.947. In addition, the reliability and convergent validity of the factors were estimated by the Composite Reliability (CR) and Average Variance Extracted (AVE). All the Cronbach's alpha coefficients and composite reliability values satisfied the minimum criterion value of 0.70 or greater, as suggested by Hair et al. (2009). The average variances extracted were all above the recommended 0.50 level (Hair et al., 2009), which meant that more than one half of the variances observed in the items were accounted for by their hypothesized factors. CR was greater than AVE for each factor. Thus, all the factors in the measurement model had adequate convergent validity. Discriminant validity can be evaluated by examining the Average Variance Extracted (AVE), Maximum Shared Variance (MSV), and Average Shared Variance (ASV). Following the Hair et al. (2009) recommendation, MSV not greater than AVE, ASV not greater than AVE, and Square root of AVE greater than inter-construct correlations will lead to discriminant validity. None of the factors had convergent validity concerns. In summary, the measurement model had adequate reliability, convergent validity, and discriminant validity.

The following set of fit indices was used to examine the structural model: ($\chi 2$=169.00 with df=84, AGFI=0.819, NFI=0.911, CFI=0.952, RMSEA=0.081). All fit indices values are in the acceptable range, indicating a good fit of the model. The standardized path coefficient, p-values, z-scores, and variance explained are shown in Figure 3.



Note. statistically significant ——; statistically non-significant -------; ***p < 0.001

Figure 3: Structural model

System quality is related to user satisfaction (β = 0.87, p < 0.001), providing support for hypotheses 1. Information quality and service quality are not related to user satisfaction (β = -0.19, p > 0.05; β = 0.08, p > 0.05), thus, hypothesis 2 and 3 are not supported.

Henseler et al. (2009) suggested using the coefficient of determination (R^2) of the endogenous latent variables as the essential criterion for structural model assessment. R^2 was 60% when the quality triad was used to predict the user satisfaction.

5. DISCUSSION

Based on our model and structural equations, it can be said that technical system quality is one component of measuring the success of an e-learning system in a university and, through a direct effect on user satisfaction, it can also affect the success of these systems. Hence, whenever the technical quality of an e-learning system is higher, user satisfaction of the e-learning system is higher. Instructors and system designers should make full use of user friendliness, ease of use, and functionality of the system to increase user satisfaction when it

comes to e-learning systems. This is in line with previous research that also found a positive influence of system quality on the user satisfaction (Hassanzadeh et al., 2012; Marjanovic et al., 2015).

This study presented an empirically validated model for measuring an e-learning system success. Our instrument can be utilized to assess the success of university e-learning systems from the student perspective. This evaluation will provide fast and prompt feedback to the university. IS managers that are handling e-learning processes within the university can use taxonomy that consists of system quality, information quality, service quality and user satisfaction, to improve their understanding of the level of e-learning success and take corrective actions for enhancement if necessary.
E-learning managers responsible for developing and implementing e-learning systems at the university can use the proposed model which consists of the system quality, information quality, service quality and user satisfaction, to improve their understanding of the success of these systems and, if necessary, successfully undertake corrective measures for improvement. Based on the relationships in the model, universities can assess to which dimensions they need to pay close attention to improve the success of the implementation and students' satisfaction from the e-learning system. For instance, if the instrument indicates satisfaction as a problematic dimension, the university can take advantage of that to improve the quality of the system in order to improve student satisfaction and make the e-learning system more effective.

The audit process and its application to the example of the e-learning system does not differ greatly from other IS in the organization. All IS within the organization should be fully integrated, that is routinized into the organizational processes, to produce the expected benefits (Armstrong & Sambamurthy, 1999). Bearing in mind that the audit process usually takes from 6 months to 1 year after initial implementation (Markus & Tanis, 2000), IS success assessment is twice recommended in the first year. Afterwards, if the results are satisfactory, the instrument could be administered on an annual basis, after each school year.

6. CONCLUSION

This research paper examined the IS success of a faculty e-learning system on the individual level of analysis from the students' perspective. A field survey was conducted at the Faculty of Technical Sciences, University of Novi Sad, Serbia to test the model. The empirical results verified the validity of the D&M success model in the context of e-learning in the transitional country such as Serbia. Our analysis showed that only one out of three quality dimensions (i.e., system quality) had a positive impact on user satisfaction.

Limitations to this study are in the areas of sampling. The sample was drawn from a highly homogenous group belonging to a single faculty, probably lacking the diversity that can be expected from a comparable sample chosen from different universities. Future studies should be conducted to evaluate the resulting models, using a sample from the entire Serbia.

IMPLEMENTATION OF THE CROWDFUNDING CONCEPT IN HIGHER EDUCATION

Nada Staletić, Petrović Vera
School of Electrical and Computer Engineering of Applied Studies,
e-mail: nada.staletic@viser.edu.rs

Abstract: *The subject matter of this study is the implementation of the crowdfunding concept in higher education. Part one of the study covers the basic characteristics of crowdsourcing and crowdfunding. Technologies necessary for the implementation of this concept have been discussed, as well as current business models and projects based on them. In part two, the possibilities for applying crowdfunding in higher education have been analyzed. The possibility of integrating the concept into formal educational flows has been analyzed in particular. Part three gives a proposal regarding the implementation of the crowdfunding concept in the School of Electrical and Computer Engineering of Applied Studies in Belgrade, on the Kickstarter platform. Paper offers a description of the most popular crowdfunding platforms to initiated project and crowdfunding project of schools and students in high education.*

Keywords: *crowdfunding, e-education, kickstarter, crowdsourcing, web 2.0*

1. INTRODUCTION

The advance of the Internet, as an information and communication technology, which is today present in all human professional and other activities, has entered a new phase at the beginning of the third millennium, known as: web 2.0. Unlike the early phase, when web contents were merely electronic catalogues intended for users, without a possibility of a more significant interaction with users, web 2.0 is based on an idea of a higher level of collaboration between users, who have the opportunity to post contents, shape the user interface and set in motion various global initiatives. Thanks to web 2.0 the Internet has become the most democratic media, because for launching an initiative into motion one needs a good idea, and the resources are often available free of charge (Jones, 2008).

Web 2.0 is the framework for the appearance of the crowdsourcing concept, which was designed several years ago and which has an increasing application in various fields of modern life. Crowdsourcing is a group of people who attempt to ensure the common good in the absence of a central body. In the case of crowdsourcing in e-education, this common good is in the form of video recordings, music or encyclopedic knowledge freely available to everyone. In the academic world, attention is the main currency within the online community, and status and acknowledgement have proven to be very important motivators for contributions.

In this study special significance is placed on crowdfunding as a model of crowdsourcing. Crowdfunding implies mass funding or raising funds from a large number of people via the Internet. Crowdfunding is a form of alternative funding, that originated outside the framework of traditional funding. In literature, crowdfunding is often referred to as funding of the 21st century.
In recent years the interest of users for crowdfunding has led to the implementation of this concept also in education. The launching of a crowdfunding project may greatly contribute to the advancement of education, especially in terms of education in underdeveloped countries.

A case study was presented in this paper which refers to the implementation of the crowdfunding concept in the School of Electrical and Computer Engineering of Applied Studies in Belgrade.

2. LITERATURE REVIEW

Crowdsourcing is an act undertaken by a company or institution in the form of an open call with the aim of transfering the function of employees and outsourcing to an undefined (and generally large) network of people, connected on the Internet (Howe, 2006).
Crowdsourcing is an online distributed problem solution and a model of business production (Brabham, 2008).

Crowdsourcing implies the existence of four main elements:
- A person, usually called the crowdsourcer, who designs, launches and manages the project (manager);
- A group of people, backers, who work on the project (crowdworkers);
- The market, usually called the crowdmarket, a place where managers and backers engaged in the project can meet,
- Sites (Internet platforms) used for implementing the process (crowdsites).

The issue of motivating the public, participants in the project, can be of crucial importance regarding the decision of an individual to participate in the project. The motivation can be personal satisfaction, review of acquired knowledge and skills, acknowledgements and awards in the form of appropriate certificates and public recognition or promotions on the Internet. Furthermore, monetary compensations can also be a motive for certain people, however, money awards for this work are usually small and depend on the complexity of the work and the amount of work put into the project.

Jeff Howe defined the taxonomy of crowdsourcing which enabled the defining of four main models (Howe, 2006):
- Collective intelligence or Crowd wisdom is one of the two most common models of crowdsourcing, where the „crowd" comes together and shares knowledge.
- Crowd creation work is an open call to the „crowd" to find new and useful solutions. It is applied when there is an insufficient number of experts in a certain field and when more different ideas are necessary.
- Crowd voting occurs when opinions on a certain topic are collected on the web, with the help of large groups of people.
- Crowdfunding is a special model of crowdsourcing. Unlike the aforesaid models, which imply that people contribute to a copyright through their work and services, crowdfunding refers exclusively to financial contributions.

Crowdfunding is an open call via the Internet for providing funds, either in the form of donations, or in exchange for some kind of award to support an initiative for special purposes (Belleflammea, Lambert & Schwienbacher, 2014). Crowdfunding refers to the attempts of entrepreneurs, individuals and groups from the field of culture, music, arts and non-profit organizations to fund their endeavors relying on relatively small contributions of a relatively large number of individuals who use the Internet, without standard financial intermediaries (Mollick, 2014).

One of the key principals of crowdfunding is the „rewarding" of donors, i.e. compensation for financial support which mainly implies that, upon the completion of the copyright project, the donors can download a film, album, video-spot or some other funded product (Bannerman, 2013). Crowdfunding is very common in the music, film and video-game industry, where individual projects probably couldn't even be carried out if their funding depended only on „corporate channels" (Poetz & Schreier, 2012).

2.1. Types of Crowdsourcing

The motivation of crowdworkers significantly contributes to the success of a crowdfunding project. It often depends on the applied type of crowdfunding. Hereinafter different crowdfunding types are presented in brief. There are four types of crowdfunding:
- Equity-based Crowdfunding – Enables the crowdworkers to fund a startup company and small enterprises in exchange for capital. Crowdworkers donate money for business operations and receive ownership of a small portion of that business.
- Reward-based Crowdfunding – Crowdworkers exchange donations for present or future products or services. Individuals or enterprises who launch a project can motivate crowdworkers by giving them various products, like tee-shirts, copies of products which are the result of a project, or even only by issuing them letters of recognition (Ahlers et al, 2015). Platforms for crowdfunding mainly differ according to whether they endorse the principle „all or nothing (AoN)" or the principle „Keep it All (KiA)". Some of them offer both solutions, and leave the choice to the crowdsourcer (the person who designs the project). In the first case, funds are withdrawn from the account of the donor only if the financial goal is achieved, and in the second case the author of the project is allocated a sum regardless of the attainment of the specified amount. Often the raised sum exceeds the initially defined goal. This type is one of the most popular and most common types of crowdfunding.
- Leading−based crowdfunding or Credit−based crowdfunding – Crowdworkers invest donations which are returned to them after a specific time period.
- Donation−based crowdfunding is a type of crowdfunding where crowdworkers as individuals donate money to charitable causes.

2.2. Platforms for initating crowdfunding

Crowdsourcing can be initiated from different Internet platforms: web sites; specialized web platforms; social networks; blogs; microblogs; and a significant role in the implementation of a project can be played by locations for multimedia sharing (YouTube; Flickr; Picasa; Pinterest). However, when it comes to crowdfunding as a model of crowdsourcing, platforms that are used for launching such projects are mainly specialized web platforms (crowdfunding platforms). The reason for this are the financial transactions carried out via such sites.

On crowdfunding platforms, the author posts their project, explains the financial goal, and then promotes the idea through video recordings or other multimedia modes, while the circle of potential donors is spread via social networks. Site visitors support the desired project by donations which they pay with credit cards for on-line purchases, and if the author managers to raise the planned amount, the crowdfunding platform takes app. 5 percent. There are several sites where individuals can safely invest money. The following sites can be regarded as such: Kickstarter, IndieGoGo, GoFindMe, RocketHub, iStockphoto, etc.

Kickstarter.com is one of the most popular crowdfunding platforms on the Internet. It has several million members who donate billions of dollars for funding creative ideas in the field of arts, music, film and video, games, design, technology etc. (Kuppuswamy & Bayus, 2015). Kickstarter is the leading crowdfunding platform in the USA where so far more than 2 billion dollars have been raised from more than 10 million crowdworkers and 100,000 creative projects have been launched (Figure 1) (Statistics on Kickstareter, 2016). Kickstarter operates on the principle of "AoN - All or Nothing", which means that the creator of the project needs to reach their financial goal before the expiration of the project.

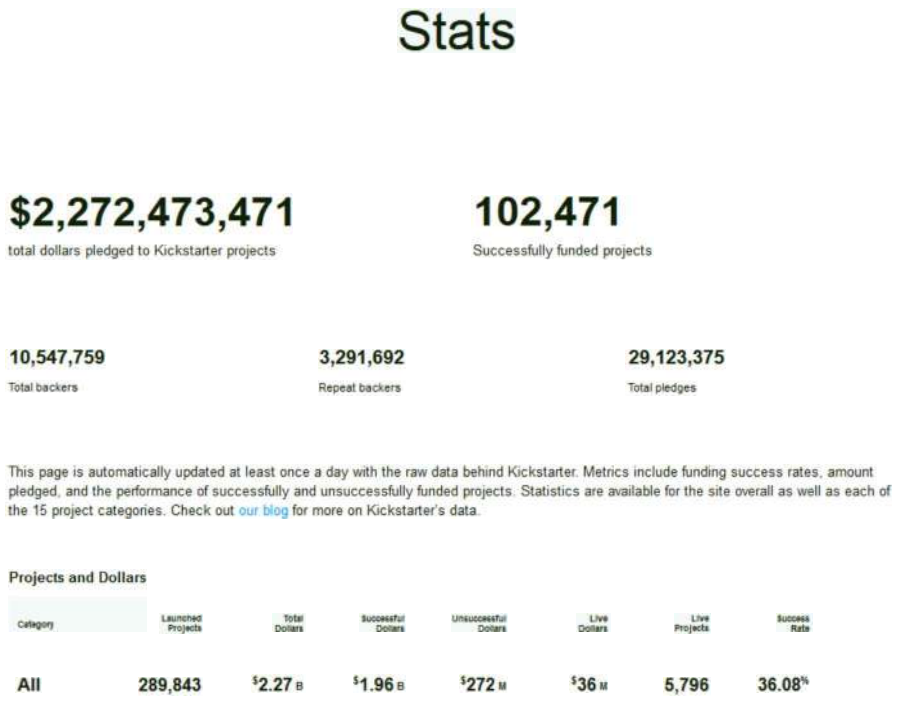

Figure 1: Review of the number of launched and the number of unsuccessful projects at Kickstarter (Statistics on Kickstareter, 2016)

On February 14, 2013, Kickstarter published an iOS application named Kickstarter for iPhone. This application is intended for users who create and donate projects. Thus, for the first time, Kickstarter acquired also a mobile version of the platform. At the end of January of this year, an application for Android OS was also created.

Kickstarter charges a commission fee of 5% of the total amount of raised funds. A payment processor calculates an additional tax of 3-5% on donations. Unlike many other forms for raising funds or investments, Kickstarter does not take ownership of projects. Web pages of projects launched on the site are permanently stored and are available on the Internet. When funding is completed, the projects cannot be altered or removed from the site.

iStockphoto.com is a web-based company which sells photographs, animations and video recordings. In order to become a photographer for iStockphoto, a user must fill out an online form, submit proof of their identity and submit three photos to be evaluated by the employees in iStockphoto. Photographers can post their photos on the site, which are stored in databases under key words (model: Crowd creation work). Visitors of the site browse through the stocks of photographs which they mostly intend to use on their web sites, brochures, business presentations etc. Those visitors of the site who are interested in purchasing, must firstly buy points (1 US$ per point) which they need to purchase photos they are interested in on the site (model: crowdfunding). The platform uses a business model of payment via credit cards (Visa, Master) and Pay Pal. Photographs of standard format and quality can be purchased for a price of one to five points, and high resolution photos, oversized photos and longer video recordings can cost up to 50 points.
Photographers receive 20% of the sale price every time one of their photos is downloaded from the web site. Some photographers, who become active members of the online community, are usually engaged for maintaining the databases, and can earn more by signing exclusive contracts with iStockphoto, where they receive 40% of the sales price for their photos. iStockphoto is a community composed of both amateurs and professionals who work in that field.

GoFundMe.com enables users to create their projects. During this process, members can explainthe goals of fundraising, can define the category, define the expected amount, can post photographs or video recordings etc. After the launching of a project on the GoFundMe platform users are given the opportunity to share their projects through integrated social networks (Facebook, Twitter etc.) or by e-mail. Also available is the GoFundMe mobile application for iOS and Android operating systems.
Millions of people have raised more than 2 billion dollars in the last 365 days.
Crowdworkers can donate money via the platform using debit or credit cards (but not PayPal, as on most other crowdfunding platforms). Those who donate can leave comments on the site as support for the project. GoFundMe generates income by automatic deduction of a 5% commission fee from every donation on the project. The compensation for processing donations is app. 3% per donation.

3. CROWDFUNDING IN E-EDUCATION

In institutions of higher education crowdsourcing is mainly used in logistics, and much less for studying and training purposes. However, use of crowdsourcing for studying and training can contribute to innovations in the teaching process and help develop learning and professional skills of students.

In terms of e-education, crowdsourcing can be defined as follows:
- A group of people (students, lecturers, administrators) who serve as a source of information, instead of depending on only one person as the authority.
- Team work focused on all members who contribute to the project by their knowledge.
- A tool used for managing ideas where ideas can come from any member of the „crowd“; everyone works together to solve a problem.

Some Universities have already launched crowdsourcing programs within their Faculties for various purposes. Information regarding subjects in all fields and disciplines are available on the Internet. According to the ComScore site, as average YouTube browser follows more than 180 online videos each month on topics like learning languages, programing and many others. Two years ago, YouTube launched YouTube EDU where many Faculties and Universities have their own channels. Visitors can find more than 125,000 videos with over 63,000 hours of recordings with different levels of academic material which can be accessed, commented and shared by students (Sclater, 2006).

When it comes to crowdfunding, as a model of crowdsourcing, in the field of education it is mainly used as a source for funding various projects, students' tuition fees, equipping of schools etc. Such crowdfunding projects can be launched on different crowdfunding platforms which offer funding in the field of education. Crowdfunding is a good way for students with good references and qualifications in underdeveloped countries to enlist in prestigious Universities, without tuition fees becoming a limiting factor (Abbey, 2013).

The first time crowdfunding appeared in university circles was in 2012, when a partnership was formed between the University of Utah and the RocketHub crowdfunding site. The first set of projects launched within the scope of this partnership raised a total of $ 32,000 and attracted more than 210 donors. The same year the University of Virginia initiated a crowdfunding platform. In addition to raising donations, they attempted to determine what motivates donors to invest in launched projects. Using crowdfunding the Universities were able even then to use their creativity and individuality, as well as the Internet, to recruit new

donors. It should be noted that the success of a crowdfunding campaign usually depends on the use of social media.

An example of using crowdfunding in education is the launching of a crowdfunding project, on the Kickstarter platform, for funding tuition fees for Emily-Rose Eastop, a master degree student at the Oxford University. The required amount defined in the project was £ 26,000, and after completion of the project the amount raised was £ 26,581. On the other hand, a master degree student, Nick Gaven, who also launched a project for funding his tuition fee on the GoFundMe platform, managed to raise only £ 700. This indicates that there are no guarantees when it comes to crowdfunding. A project should be concisely defined, the appropriate crowdfunding platform should be selected, a good promotion should be devised via social networks and other channels of Internet marketing, etc. (Llorente, Morant & Garrigos-Simon, 2015).

In recent years, budgets of higher education institutions have been reduced, thus schools have increasingly been turning to this method of fundraising. Many lecturers and students achieved success by creating crowdfunding projects on DonorsChoose.org, ClassVish and other similar crowdfunding platforms which are exclusively dedicated to funding in the field of education.

3.1. Examples of crowdfunding in e-education

Givology.org was founded in 2008 by a group of graduate students from the University of Pennsylvania. It is a crowdfunding platform where small donations are given (several dollars) as support for student projects and student scholarships in developing countries. It operates on the principle of "All or Nothing (AoN)". Givology connects donors on the Internet with non-governmental organizations and universities from all over the world, and also enables them to stay in contact through the platform blog. In addition, accounts are also created on social networks (Facebook, Twitter, LinkedIn) where there is wide interaction between students and donors.
Givology has raised over 300,000 dollars for support to more than 2,800 students in 26 countries. The goal of the site is to lower transaction fees to ensure that students receive the largest possible amount of donations. This means that a 100% of donated amounts goes to charity, while zero percent goes to covering expenses, i.e. site commission fees. Compared to other crowdfunding platforms which charge a commission fee of app. 5% of the total raised amount, this crowdfunding platform operates on a voluntary basis. Another interesting fact is that Givology has a separate fund for raising money which is used for covering banking transaction fees, which amount to 2-4% per transaction.
The Givology platform applies the Electronic Wallet principle, which simplifies the donating process. Google Wallet is used. The transfer of money into the e-Wallet is simple, and can be done in only one step. By depositing money into the e-Wallet, funds appear in the account of the donor who can then donate the funds to selected students and student projects. Donors who do not have time to search through the database of numerous students and projects, can use an option where the platform generically selects students who will receive the donation by using specific algorithms. Of course, the names of donors appear on donor lists for students and student projects. When students and projects are fully funded, Givology sends a check to a partner organization in charge of delivering funds to students or student project leaders. As intermediaries, these organizations regularly update information presented in the form of video recordings, photographs, correspondence with students etc. Givology staff then posts this information on line so that the donors can see their roles in the project, and by doing so the platform demonstrate that it promotes transparency of information.

DonorsChoose.org is a non-profit organization from the USA which enables individuals to directly donate to schools and school projects. At that time, DonorsChoose was among the first such crowdfunding platforms. Today, this site has over 2,000,000 crowdworkers, i.e. donors, and more than 690,000 funded projects involving app. 17,700,000 students.
DonorsChoose enables lecturers to post on the platform requests for necessary material and resources for their laboratories and projects, which are available to donors. Each project has a well-defined detailed description of the project, of the required budget and the necessary items for the implementation of the project. Donors can donate $ 1 or more to selected projects, which they can search by school name, lecturer's name, location, area and key words. DonorsChoose then transfers donations directly to schools where the projects were launched. This platform operates on the principle of "All or Nothing".
Of the total amount of raised funds for a specific project, the platform charges a 1,4% commission fee, while 4.4% of the total amount goes to cover transaction fees.
All donors receive photos of implemented school projects and a letter from the lecturers. Donors who donate $ 50 and more to a project receive a hand written letter of recognition from the students.

ClassVish.com is a non-profit and crowdfunding platform engaged in raising funds for equipping schools. Unlike the DonorsChoose crowdfunding platform which deals in funding higher education projects, ClassVish exclusively deals with financial aid to primary and secondary school education in the USA. On this crowdfunding platform lecturers and school principals can launch projects where they define a list of required resources for equipping their schools. Donors have the possibility to browse the site and find schools according to cities and states, according to school codes or names of lecturers who launched a project.
For covering transaction fees 2.9% and 30 cents are deducted from each donation. After the completion of the project, the ClassVish platform procures resources from the school requirement list by purchasing those resources at reduced prices from partners which have signed contracts with the platform. The difference between the reduced and regular prices is in fact the profit of the platform, i.e. the percentage its takes from every implemented project. The platform operates on the principle of " Keep it All (KiA)". When the defined time for funding a specific project elapses, the platform selects the resources which will be purchased based on the raised amount and the requirement list defined by lecturers or school principals. In case the platform is not able to purchase resources defined in the requirement list, the raised funds are paid directly to the school, reduced for 5% commission fee taken by the platform.

4. AN IMPLEMENTATION OF CROWDFUNDING IN HIGHER EDUCATION

Higher education is under the influence of constant changes. New technologies and innovations impact the concept of education forcing it to undergo constant transformations. The principle of obviousness in teaching, for the sake of a vivid understanding of the essence of the subject matter presented to students through teaching programs, has become multidimensional, with the dynamic development of digital multimedia and the possibility to virtualize and simulate a large variety of complex activities and processes, which are being studied in theoretical and applied studies of modern times. The School of Electrical and Computer Engineering of Applied Studies (VISER) in Belgrade has seven contemporary undergraduate study programs and six post-graduate study programs. It has twenty laboratories, eight of which are for general purposes, equipped with desktop computers using Windows 7, Windows 8 and Windows 8.1 operating systems, as well as 12 laboratories for special purposes, one of which is equipped with twenty Macintosh computers. Teaching activities within all study programs take place at the same location – the school building.

The School Board and the Governance Body of the School have decided to equip the ground floor auditorium, with 140 seats, and turn it into a general purpose smart classroom. Smart Classrooms represent synthesis of technology, user interface and traditional lecturing methods. New generations of Smart Classrooms are equipped with high technology and they become necessary for performing teaching processes at universities. Smart Classrooms have audio-visual equipment which enables transferring the knowledge by using a wide spectrum of different media (Gligoric, Uzelac, & Krco, 2012).
The amount of 12,000 dollars is provided by the School from its own resources. The amount of 8,000 dollars will be obtained through donations made by individuals and organizations who respond to a public call placed via crowdfunding. The project will be launched on the Kickstarter.com web crowdfunding platform. The project is launched for the purpose of fundraising in the form of donations for equipping a smart classroom. No limits are set in terms of donation amounts. The duration of fundraising through donations is limited to sixty days.
The defining of a project on the Kickstarter platform requires several steps. The first step is to define the field of the future project and its name. The name of the project is Equipping a smart classroom at VISER in Belgrade, in the field of Technology. In the next step it is necessary to input data relevant for creating an account on Kickstarter (name, e-mail address and password). There is also the possibility of logging in via a Facebook account.

As stated hereinbefore, Kickstarter is a crowdfunding platform operating on the principle of "All or Nothing (AoN)". If the project is successfully implemented, the Kickstarter platform charges a commission fee of 5% of the total amount of raised funds. There is also a 3-5% online transaction fee. More precisely, 3% + $ 0.20 per donation, except for donations under $ 10, which have a discount as micro-donations: 5% + $ 0.05 per donation.

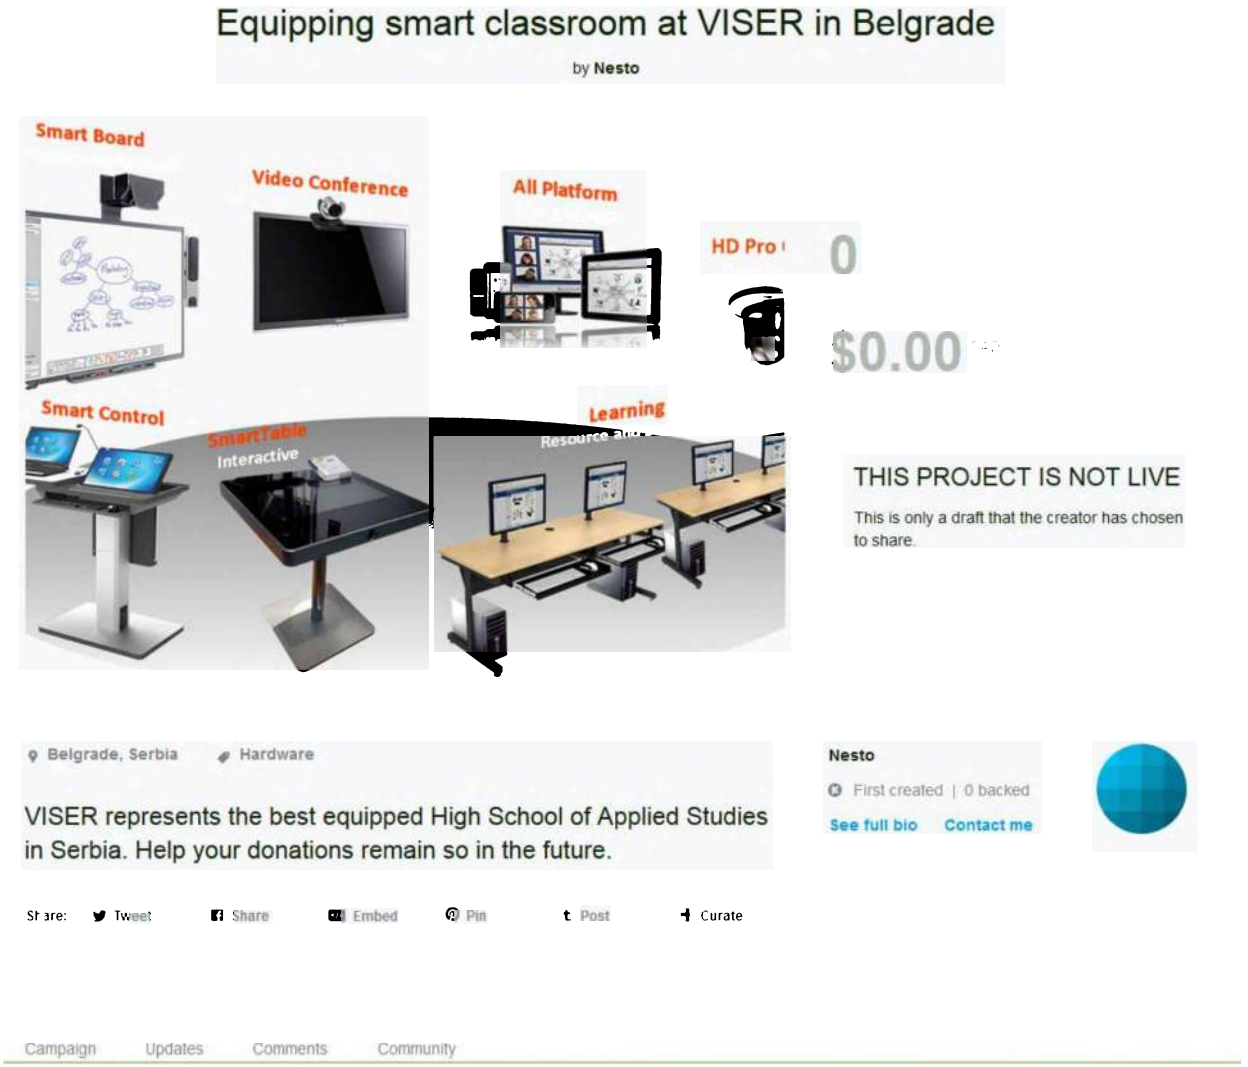

Figure 2: Launched crowdfunding project of VISER on the kickstarter.com site

Promotion via the Internet of the launched crowdfunding project on the Kickstarter platform is automatically posted and SEO optimized on the Facebook, Google+, Instagram, Twitter social networks, where the accounts were created by Kickstarter.

Once the project is created, Kickstarter informs about the rules of the platform which the crowdsourcer, i.e. the project manager must comply with. The rules are the following: the project that is being created must share something with others; the project must be reliable, clearly posted and presented; the project cannot raise funds for charitable purposes by proposing financial initiatives or presenting prohibited products/services.

Since the duration of the project is still in progress, the results will be published in one of the following research. After the implementation of smart classroom, participants in the crowdfunding project will be awarded letters of recognition for their donations and for participating in the project in a .pdf format which will be sent by e-mail. Participants in the project will also receive a cover letter containing the web address of the posted photo gallery from the opening of the smart classroom. On the School channel on the YouTube platform will be posted a short film with the mouth and the satisfaction of students, as well as the usefulness of smart classrooms.

5. CONCLUSION

Crowdfunding is a model of web 2.0, which, due to its usefulness and wide range of applications, has been undergoing intensive growth on a global level during the past few years.

Individual donations for launched crowdfunding projects influence the final financial value and outcome of the project. Each donor also contributes to the promoting of projects that their donates to and believes in. They will occasionally play the role of donors oriented towards supporting social projects and charity projects. In some cases, they will become shareholders and will contribute to the development and growth of a business. Motivation for user participation is a result of various sentiments, such as: to be at least partly responsible for the success of initiatives made by others (desire for sponsorship); to be part of a social initiative (desire for social participation); to request payment from financial contribution (desire to invest).

When it comes to the implementation of crowdfunding in education, compared to traditional forms of creating innovations or fundraising for a specific project in education, the following benefits can be pointed out:

- Easy access to flexible crowdworkers i.e. donors
- Funding of young and creative talents and support for educational institutions
- Greater efficiency (cost savings since there is no job creating; no salary payments and state contributions)
- Shorter time to enter the market and faster delivery of the project.

On a global level, today there are not many case studies regarding the application of the crowdfunding concept in the field of education. However, crowdfunding is a very flexible concept and its application in the field of education has good prospects. Education is a constantly evolving process, in accordance with curricular changes, changes in teaching methodology, new scientific disciplines and new courses.

In terms of online funding, crowdfunding is regarded as a premature conclusion. At a certain point in time, in a not so distant future, an increasing number of educational institutions, lecturers and students will launch crowdfunding projects on the Internet, which will be funded by people who they might never meet, and who will be credited for student scholarships or modernly equipped schools.

ILS LEARNING STYLE MODEL AND MULTIMEDIA E-LEARNING

Vitomir Radosavljević*[1], Danica Mamula Tartalja[1], Gordana Jelić[1]
[1]ICT College of Vocational Studies in Belgrade, Serbia
*Corresponding author, e-mail: vitomir.radosavljevic@ict.edu.rs

Abstract: *Contemporary trends in education are heading towards the learner-adapted education. Some research issues dealing with adaptive forms of education refer to the establishment of efficient adaptation criteria. This paper presents the results of the research aimed at identifying the correlation between the students'learning styles, based on Felder-Silverman ILS learning model, and multimedia e-learning styles. The research was carried out in October 2015, at the ICT College in a sample of 64 students. The results showed that currently no correlation can be identified between the learning style according to the ILS model and any of the four types of multimedia e-learning. Furthermore, the research pointed out the tendency of some students towards specific forms of multimedia e-learning. These conclusions can be used as the basis for the definition of criteria and the development of adaptive learning.*

Keywords*: learning styles, adaptive learning, multimedia e-learning, e-learning*

1. INTRODUCTION

The process of education and self-improvement is considered to be one of the basic elements in the society and represents the foundation of social prosperity and development. Consequently, the approaches which will ensure the efficient and effective educational process have been intensively developed. Contemporary trends in education are heading towards the learner-adapted education. The education process is adapted to meet the requirements and habits of a learner. It must be designed to best use the characteristics of a learner which are relevant for the learning process, to motivate the learner and to ensure the long-lasting retention of acquired knowledge.

Following the trends in education, the research was carried out at the ICT College in Belgrade, in October 2015, with the aim to consider the opportunity of introducing the adaptive forms of education into the teaching process. The ultimate objective of the research is the integration of multimedia e-learning styles into certain courses according to suitable adaptation criteria. This paper presents the results of the research aimed at identifying the correlation between the students' learning styles, based on Felder-Silverman ILS learning model and multimedia e-learning styles.

This paper is divided into several sections. After the Introduction, Section 2 presents the theoretical framework as the basis for the research. In Section 3, both the research and the research results are presented and analysed. The conclusions are given in the last section.

2. ADAPTIVE EDUCATION

Learning is a set of constructive processes which a person uses to activate himself, individually or in a society, and to elaborate, build and organize knowledge. On the basis of experiences and knowledge acquired through the learning process, a person's behaviour has undergone some permanent changes and thus his approaches towards situations are also changed. According to Vulfolk, Hujuz adn Volkap (2014) factors which affect the learning outcomes can be grouped into seven categories.

- Intellectual factors. The intelligence level is not universal for all segments of knowledge. This accounts for the fact some students acquire high grades in one field compared to lower success in acquisition of other fields of science.
- Learning factors. These factors are described through the correlation of knowledge and skills a learner acquires. Former bad knowledge in a specific field brings about the troubles in acquisition of new knowledge.
- Physical factors. Physical conditions such as disability and fatigue affect learning and acquisition.
- Mental factors. Mental fatigue and mental flaws also affect the learning efficiency.
- Emotional and social factors such as current mood, relationship with other participants in the classroom, motivation for learning, attitude towards the study topic, are only some manifestations of these factors.

- Teacher's personality and his/her approach towards a learner affect the attitude the individual has to the learning material, and the learning process. The teacher leads the learner through the studying process, and provides support, assistance and the feedback.
- Environment. Environment may be encouraging for the learner. Well-equipped environment in which a learner can without difficulties realize his objectives in the learning process has a positive influence on learning.

The way a person studies varies from person to person. Each individual has his/her own unique way of learning and uses different methods and techniques of gathering knowledge and processing the data he/she wants to learn. The way a learner studies describes his learning style. Learning style is commonly described as a learning strategy.

According to Felder and Silverman (1996) ILS (Index of Learning Style) model there are four dimensions, each containing two categories which define learning styles:
- information processing dimension with categories of active and reflective learners,
- information perception dimension with categories of sensing and intuitive learners,
- information repetition dimension with categories of visual and verbal learners,
- information understanding dimension with categories of global and sequential learners.

Information processing dimension includes two categories of learners. One category comprises learners who learn best through practical examples which apply the knowledge they must learn (Reflective learners). The other category includes Active learners who require an active participation in the learning process. Reflective learners gather and analyse knowledge before taking any actions. They are more prone to observe the work of other learners than to set themselves to some action.

Information perception dimension defines learners described as sensing and intuitive. Sensors are patient, good at memorizing facts and doing laboratory work. They like to solve problems by using pre-defined methods, they do not like complicated comparisons and unpredictable situations. Intuitive learners are better at accepting new concepts and more comfortable with abstractions. They like innovations and do not like contents and actions to be repeated. Sensors are more practical and more cautious than intuitive learners who are faster in work. The difference in approach to the lessons is reflected in additional materials which were "at hand" to sensors, while the intuitive learners' lesson contents were enriched with formulas and block diagrams.

The information reception dimension describes both visual and verbal learners. The former retains the subject matter through photographs, diagrams, maps and demonstrations that should be learned, while the latter memorizes through written text and verbal production.

Information understanding dimension describes sequential and global learners. Sequential learners follow the course section by section in linear way while global learners often skip parts of lessons and refer directly to the materials they find complex without too long pondering over simpler contents.

According to Hamada (2012) and Hwang (2014) learning style can be used as a criterion of learning process adaptation. Adaptive approach is realized through adjusting of particular elements of educational process to pre-defined criteria.The criteria that are set result from individual features of learners, level of motivation, learners' fatigue, features of working environment, instruction materials used in learning process. The most often used criteria in the research of adaptive educational environments are the level of learners' motivation, psychological personality traits, learners' interests, physical state of fatigue of students at a given moment, the style used by a student in the learning process. Adaptive environment for learning should be designed so as to recognize relevant information and to adapt, by using appropriate criteria, the learning process to learner's needs. The changes introduced by the system to adapt the learning process to a student can be of either statistical or dynamic type. Static changes are unchangeable over time and are defined at the beginning of educational process. The dynamic changes modify the educational process over time and constantly adapt it to a learner.

2.1. MULTIMEDIA E-LEARNING

Eysink et al. (2009.) describe multimedia e-learning as the type of learning that uses different sources of information of both visual and auditory type aimed at better understanding and easier retention of the contents to be acquired. Visual content represents video content, photographs, illustrations and graphs while auditory content includes sound recordings, printed or produced words. It is possible to observe 4 types of

multimedia e-learning: hypermedia e-learning, observational e-learning, self-explanation based e-learning, inquiry e-learning.

Hypermedia e-learning represents computer-based environment in which the multimedia contents such as pictures, animations and videos are kept in certain system nodes interconnected and accessed by hyperlinks. The multimedia components offer information through different text forms and photographs that are used to address other auditory and visual contents carrying information. Learners alone decide which information they wish to follow or ignore. The learning pace is individual and the sequence of pieces of information to be followed is determined by the learner. Hypermedia e-learning provides high level of interactivity between the students and the system and offers students high control of the e-learning process. As much as the e-learning process control is positive, it still has some negative aspects. The most important is that students alone should assess the relevance of information he/she gathers which in case of inexperience in the studied field can lead to flaws in learning.

In order to implement successfully this type of studying, a learner should recognize knowledge and skills he/she would like to acquire. A learner expects the outer support in this way of e-learning through leading in the selection of materials for studying and providing appropriate control of access to the contents depending on previous knowledge possessed by the learner.
The knowledge available to a student is represented in different forms. To enable an adequate approach to such information, the student is required to identify the missing knowledge. Information received from the e-learning system must be harmonized with the previous learner's knowledge and presented adequately so as to enable students to detect the missing knowledge. Only then, the learner can focus on obtaining of desired information, planning the search for them, reviewing on the available data in order to reach the desired information and finally to take actions to retrieve the desired data. The last step is verification of the conclusions.

Observational e-learning is a type of e-learning that occurs through observing of others while performing tasks or solving problems. The learner observes an expert, envisages and tries to adopt the applied process to perform a task. The observational e-learning implies also activities from the cognition domain. This type of e-learning implies engagement of an expert who explains process of reflection to a learner, which leads to drawing of certain conclusions, as well as a series of additional explanations including the reason why and when a certain strategy is to be applied. Through this type of e-learning students can practice tasks through mental reconstructions of previous problems and tasks. In computer environment the experts who present knowledge can be real life experts or animated personalities. The disadvantage of this type of e-learning is that learners are passive observers and do not participate actively in construction of mental models of knowledge they receive. Additionally, learners do not possess knowledge on the relevance of information in perceptually rich environment.Outer factors that can positively affect this type of e-learning refer to the increase of motivation with students.

In multimedia environment, most often used are animations or video material that describe which knowledge should be acquired. In case of problem solution the animation contains steps that lead to a solution. A student watches and follows the animation, verifies the steps of animations and listens or reads why a certain problem is solved in the presented way. Upon the completion of the animation, a student should analyse it and repeat an exercise in order to integrate the procedure and conclusions in the mental picture.

Self-explanation based e-learning relies on learning by example and self-explanation. By worked out examples a student is presented a problem that hides knowledge that a student should acquire. Through examples presented to a learner, a problem to be solved is formulated, principles for its solving are introduced together with the steps which lead to a solution and to a final problem solving. Teaching is not stopped on one sole example, but a student is introduced a series of worked out examples. It is thought that this learning approach is very effective because the learners can direct their cognitive potentials to problem understanding and not to searching for accurate solution. This way a learner is stimulated to explain to him/herself the process of reaching the solution and the solution itself. The learners who actively participate in the process of self-explanation based e-learning learn more than the students who do not take part in the process.

In multimedia environment, a learner reads, watches and filtrates information available to him and perceives the steps that lead to solution of the subject problem. In the course of work a learner is asked questions that explain how she/he perceives and understands the steps that are presented as solution. That way learners are stimulated to think about concepts and causal relations behind the procedure that is presented and that way he/she creates a mental picture and fills in his/her knowledge gaps.

Inquiry e-learning is defined as a learning process in which students state their own experiences with the respective subject. A student reveals concepts and features that refer to the subject matter of learning placing the subject in the experimental environment. Based on such data students draw conclusions. The process of learning consists of several phases: orienting, generating hypotheses, experimenting and drawing of conclusions. Due to insufficiently correct performance of an experiment, wrong conclusions can be drawn and incorrect hypotheses can be accepted.
In order to implement an appropriate experiment, a learner must rely to his/her previous knowledge related to the investigated subject matter. Based on previous knowledge, learners form hypotheses, as well as plans on how to examine and test such hypotheses. By comparing the results of different experiments a mental image of knowledge is generated which has to fit into previous knowledge. If it turns out that additional data are needed to complete the mental image, new experiments are to be implemented.

3. RESEARCH DESCRIPTION

The described theoretical concepts served as a basis for implementing the research aimed at examining whether learners who prefer particular learning style more often choose some of the four types of multimedia e-learning. The aim of the research was to establish connection of the learning style and selection of an appropriate type of multimedia e-learning.
The research was performed at the ICT College of Vocational Studies in Belgrade in October 2015. An overall of 66 second-year students participated in the study. They completed a 25-item questionnaire. The application used was Survey at the social network Facebook.

The questionnaire was organized in three parts. The first one included the questions regarding age and gender of the respondents as well as personal assessment of the computer literacy level. The second part encompassed the questions of the standardized Felder-Silverman LSQ. The standardized questionnaire according to the ILS model has 40 items. According to the research in 2007 the key questionnaire items were selected based on which it is possible to optimize the number of questionnaire items. So only 16 items were used to establish learning style according to the ILS model.The last part encompassed the questions in which the respondents could choose a type of multimedia e-learning according to the situation described in the question.

The answers obtained in the study were subject to statistical data processing and consequently the conclusions were drawn.

4. RESEARCH RESULTS

Based on the results obtained in the research it was not possible to establish correlation between the learning style according to the ILS model and forms of multimedia e-learning. This conclusion should be taken questioned to some extent. The sample of 66 respondents provided certain conclusions, but they could not be efficiently confirmed statistically. Due to specificity of the researched field and great number of categories that are statistically processed it is necessary to include larger sample in order to reliably accept or reject the initial assumptions of the research.

The software tool used for data processing was SPSS (Statistical Package for the Social Sciences). The descriptive statistics was used with cross-tabulation option of Chi-test. Based on the second part of the questionnaire, a profile of the learning style according to the ILS model was designed for each individual respondent. These answers were compared with the response to the questionnaire item “In your opinion, which is the most efficient way to understand and acquire certain knowledge?”.The four options of the answer to these questions were in correlation with the respective form of multimedia e-learning. These were the offered options:

- Reading of as many books and linked materials from the field to be learned (hypermedia e-learning)
- Observing experts using knowledge from the field to be dealt with and learned (e-learning by observation)
- Analysing as many examples as possible related to the subject matter (self-explanation based e-learning)
- Work with simulators and testing of simulation from the studied fields (inquiry e-learning).

The following results were obtained:

- Active learners mostly chose inquiry e-learning (13 respondents out of 24 active students opted for this type of e-learning)
- Learners equally described as active and reflective opted least for hypermedia e-learning (only 2 out of 24 students)

- Reflective learners almost equally chose all four forms of multimedia e-learning.
- Sensors chose to the greatest extent hypermedia e-learning (19 of the 42) while intuitive learners mostly chose self-explanation based e-learning (an overall of 7 out of 9 students).
- Visual learners mostly chose inquiry e-learning compared to other types of multimedia e-learning (17 out of 36 students). Learners who are both visual and verbal, as well as the dominantly verbal students equally chose all four forms of e-learning.
- The sequential learners mostly chose hypermedia e-learning (8 out of 22students) and inquiry e-learning (7 students out of 22). The learners who are equally sequential and global dominantly chose inquiry e-learning (13 out of 26) while global learners chose more inquiry e-learning (8 students out of 16).

The above results are presented in the table.

Table 1: Cross-tabulation for all domains of ILS learning according to the multimedia forms of e-learning

	Type of e-learning				
	hipermedia e-learning	observational e-learning	self-explanation based e-learning	inquiry e-learning	**Total**
Active	5	2	4	13	24
Active & Reflective	2	6	7	9	24
Reflective	5	2	3	6	16
Total	**12**	**10**	**14**	**28**	**64**
Sensing	7	9	7	19	42
Sensing & Intuitive	4	0	3	6	13
Intuitive	1	1	4	3	9
Total	**12**	**10**	**14**	**28**	**64**
Visual	8	3	4	7	22
Visual & Verbal	1	4	8	13	26
Verba	3	3	2	8	16
Total	**12**	**10**	**14**	**28**	**64**
Sequental	5	6	8	17	36
Sequental & Global	4	3	3	7	17
Global	3	1	3	4	11
Total	**12**	**10**	**14**	**28**	**64**

5. CONCLUSION

The implemented research provided important guidelines in the field of adaptive and multimedia e-learning. Although no statistically significant difference between the ILS model and multimedia forms of e-learning has been confirmed the authors' stance is that this attitude should be additionally researched. This type of research requires larger sample to obtain statistically significant conclusions. Nevertheless, the importance of this research is reflected in the results that indicate that there are grounds to support claims that certain dimensions pertaining to ILS model can be correlated with the choice of an appropriate form of multimedia e-learning. So, inquiry e-learning was mostly chosen by active, visual and global learners. Hypermedia e-learning was chosen by sensing and reflective learners, self-explanation based e-learning was chosen by the intuitive learners while observational e-learning was chosen by both visual and sensing learners. These stances should be additionally corroborated by the research that would take into account more respondents and consequently provide a statistical confirmation of the said assertions.

CRM MODEL IN E-BUSINESS FOR NON-COMMERCIAL ONLINE RADIO

Nenad Badovinac*[1], Katarina Đorđević[2]
[1]Azelija
[2]Faculty of organizational sciences
*Corresponding author, e-mail: nenad.badovinac@gmail.com

Abstract: *Non-commercial online radio stations require ICT support so they could promote themselves in today's turbulent times. The fact is that listeners don't have time to listen shows that do not belong to their interest group. This paper describes an idea that aims to raise the quality and increase the listening of non-commercial thematic online radio. For this purpose, we used the advantages of the concept of CRM and social media. From broadcasters of the online radio is expected to raise the level of professionalization of the narrator, and broadcast interesting and useful audio content. Worrying about the audience will be job of the CRM system, so that the management of the radio can be 100% focused on the quality of the audio broadcast. Interested listeners will show their satisfaction by giving the recommendations. Feedback on the overall activities of the listener will lead CRM system. CRM model described in this paper will be able to establish two-way communication with the audience: the audience will be divided into interest groups, and the show will be classified in a particular category. Example of CRM system for non-commercial online radio in this work is shown in the case of online radio Blagovesti.*

Key words: *CRM services, online radio, mobile applications, online surveys*

1. INTRODUCTION

In the Internet space is difficult to promote non-commercial online radio station. For the purposes of broadcasting, technology most commonly use one-way communication from the emitter to the listener. Electronic media are using modern ICT technologies that use two-way communication model where users can actively manage the content of program. This concept is more applicable for TV media then for the online radio. However, this concept is recommended for non-commercial online radio stations that do not have a budget for marketing. By using modern ICT technologies, it becomes easier to attract potential listeners and give them the opportunity to try the experience of two-way communication. The first step is to publish online surveys, which aims to get the contact information of potential listeners, who are interested in a particular topic. Contact information from the survey are going to be entered in a CRM system, and since then the CRM system takes care of them.

The paper has a detailed description of the CRM model that allows you to manage the relationship between broadcasters and potential listeners. Defined CRM radio model is for themed online radios that have, for example: scientific, historical, cultural, educational, medical or religious programming content. Since this is about non-profit radios, they are heavier visible to potential listeners. After registering and creating a personal profile on the online radio, the listener is identified as a member of the radio. The listener then has to install the mobile app on his smartphone and in that moment was started a two-way communication between broadcaster and listener. The CRM system takes care of the listener, sending him reminders on his mobile app with the time appointment of thematic programs. Listener can recommend online radio to his contacts. When the contact recommendations of satisfied listeners log on the system, CRM module will record and award recommendation.

2. REVIEW OF AVAILABLE SOLUTIONS ON THE WORLD MARKETPLACE

Customer Relationship Management (CRM) is each application or initiative designed to help the organization to interact with users, customers, suppliers or potential customers via one or more points of contact - such as call center, seller, distributor, branch, Web or email - with the intention of retaining or increasing the number of customers (TDWI 2000). CRM is based on the assumption that users are the core of business and the success of any company depends on the effective management relationships with them. Relationship exists if there is "a series of interactive episode between two or more parties over a period of time" (Buttle 2009). In case of our CRM model, whose use is on the online radio, it is clear that the interactions are very common. Using the information collected about users is aimed at increasing their loyalty and satisfaction, and the relationship gets better, longer-lasting and more profitable for companies. The important role of CRM in the

business of electronic media has been recognized in numerous studies. In the (Larose, 2004, 2010), the authors emphasize the importance of analyzing the specific characteristics of the audience, especially their habits. Also, the importance of determining the model of customer behavior in the digital environment is discussed (Webster, 2011). The authors discuss the structure and method of providing content to customers, but also they want to point out that the convergence of media and integration of the best solution.

On the world marketplace there are numerous solutions in our research field, and some of them are: WO Sales, Media, Radio workflow, InfluenceFM Radio Management Software, Salesforce, SalesTouch, Media Sales.

WO Media Sales. [1] This solution stands out as the main benefits:

- *The multi-layered architectures* - in terms of access and control of large organizations that operate on multiple markets with a large number of media.
- *Control of user accounts* - access to customer data, their habits, to create and monitor schedules and plans.
- *Create schedules and plans* - for each station and the market individually.
- *Research* - to easily create detailed reports based on the collected data.
- *Ranking data* - separation of data per significance.
- A clear order of work process: knowledge of listeners, campaign creation, contracting marketing, acceptance of bids, monitoring performance, the acceptance of the final results.

Radio workflow[2].

This CRM system is intended primarily for radio stations. Contributes to reduce costs, increase productivity and income, to implement quality processes, contributes to better communication. In the support of this CRM system is going great number of world famous stations that use it: Virgin Radio, Shore 104.3 FM Classic Rock 101, Zinc 96.1, Hot 91.1 FM.

InfluenceFM[3].

The CRM solution is for radio stations. Some of the functions that allows tracking user activity, obtain notification depending on client activity (cancellation, customer dissatisfaction, etc.), planning the interactive calendar, the integration of Gmail and Outlook calendars, tracking all levels of the sales process, the automatic creation of reports, work on a large number of devices (Windows, iOS, Android).

Media Sales[4].

Comprehensively CRM solution has the following functionality:

- Monitoring of the company, contacts and products
- Work with user accounts
- Create messages and e-mails
- Work with your calendar, plan

Supplied solutions have proven to be very effective in communicating with a large number of users, so it's our conclusion that we should follow the world trends and offered solutions, but also to harmonize the product for our customers and their needs in order to increase the listening of the radio and the listeners happiness.

3. CRM MODEL FOR ONLINE RADIO STATIONS

Announcing the campaign on social nets it is possible to reach the potential listeners, which are interested for thematic online radio stations. By forming the central web portal for presenting non-commercial thematic radio stations, potential listeners will have a chance to choose the thematic radio station depending on their interests, for example: Radio for fishermen, Radio for gourmands, Radio about history or religion.

[1] http://www.wideorbit.com/wideorbit-products/wo-media-sales/
[2] https://www.radioworkflow.com/
[3] https://influence.fm/
[4] http://www.wedelsoft.com/en/mediasales-software/crm-for-media-companies/

When the potential listener has decided for specific thematic online radio, he receives the link for downloading mobile application which he has to install on his cell phone. Mobile application will offer survey questions and corresponding answers will determine the specific group of listeners. CRM system is grouping listeners' profiles in specific groups staggered depending on the level of interest for the specific theme. For example, for a listener who started the online radio for gourmands, there are these specific groups: Mediterranean dishes, Seafood, Mexican specialties, etc. When the specific group of listeners is determined, then the CRM model for announcing listeners' profiles by using pop-up messages on a mobile phone is activated. Messages are related to timetable of categorized programs dedicated to specific internal groups. Every single day, within CRM module, will be created the list of programs for the next day, which will contain a scheme for broadcasting. Like for example:

The list of programs divided in specific groups for the „Radio for gourmands", for the next day will be:

Group MD – Mediterranean dishes: 02h, 05h, 15h
Group SF – Seafood: 18h, 19h
Group MS – Mexican specialties: 20h, 22h

When the mobile application gets this list from the CRM module, it will inform the listener with reminder, half an hour before the program starts.

CRM module subjects are:

- Online radio administrator
- Narrator
- A potential listener
- Listeners

An administrator – of non-commercial online radio organizes professional narrators for the specific subject of that online radio. It confirms and agrees that a specific audio program can be placed on the online radio server by a narrator. The administrator creates 24h program scheme. PHP scripts will do the technical job, put the 24h program on the shout cast server. The administrator follows BI statistics.

Narrators – will produce mp3 files and categorize them in specific categories. Narrators will put the specific prefix in the mp3 file's name by which they will categorize the program, for example: Program about preparing seafood will have the prefix „SF", program about Mediterranean kitchen will have prefix „MK", and etc.

A potential listener – potential listeners are contacted through social media. They have a choice of one of offered non-commercial thematic online radio stations. After registration, they are downloading smartphone application and are becoming active listeners, members of online radio. They are becoming the part of CRM system.

Listeners – are registered radio members which have a possibility to listen to the radio program, but also to be informed on time about interesting programs next day. They also have a possibility to recommend non-commercial online radio to their contacts and use the possibility to take a part in a radio program as loyalty members.

CRM system guides the listeners' profiles (groups with different interests) and audio program (categories). It will create relationships between the program and a listener. The information about the belonging of a listener to a specific group will allow the CRM system to inform a listener at the time (30 mins before the program starts) by the pop-up message on his mobile that the program from his group of interest will start soon. Statistics will be notifying the number of listeners and will be informing him about eventual need for a group change.

3.1. Architecture of a proposed paper

Potential listeners, and listeners

- Fill in the survey when choosing the thematic radio
- Decide which specific non-commercial thematic online radio want to listen
- Register for that radio
- Download smartphone mobile application
- Choose the area of interest – belonging to a specific group of interest

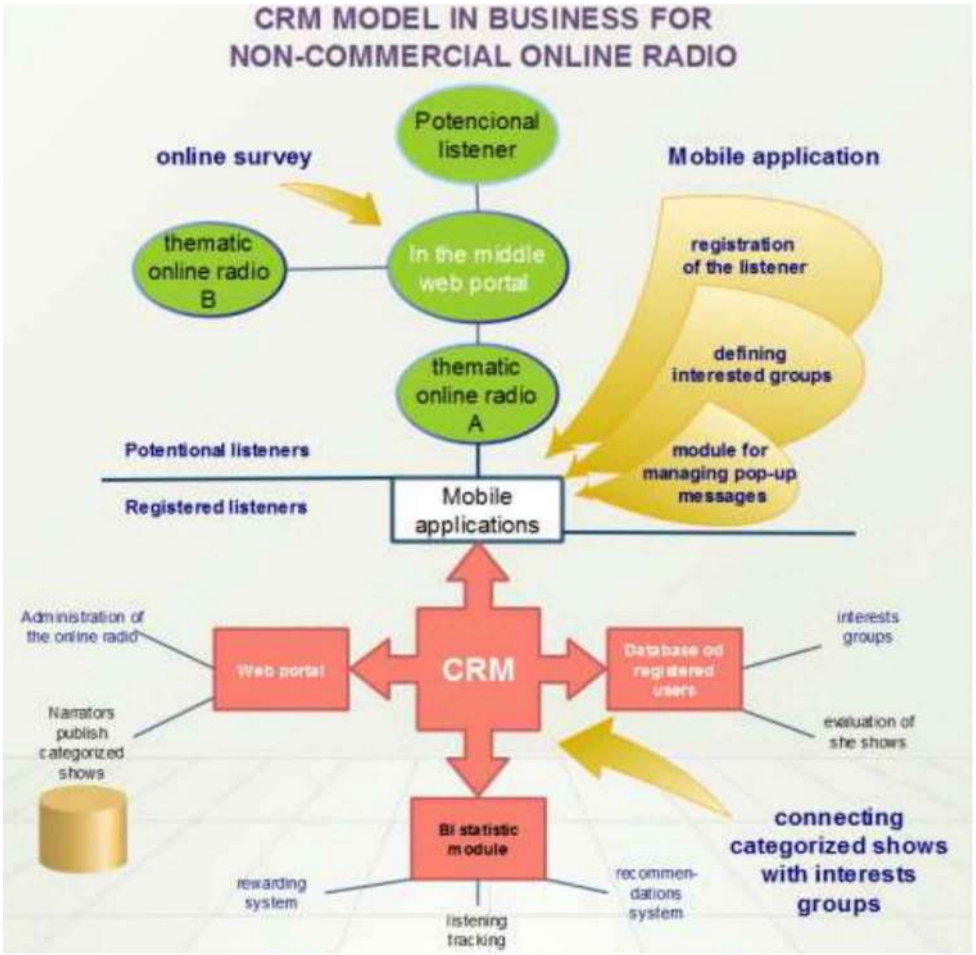

Figure 1. Model of CRM online radio

Mobile application

- Online radio player
- Overview of a program scheme for the current day
- Module for management with a reminder for thematic programs interesting for a listener
- Statistical module measures the listening time and accepts listeners' marks
- Implemented module for managing with recommendations

CRM system

Application layer

- Administrative panel for managing the program scheme
- Narrators categorize a program and using WordPress put them on a Web panel
- CRM module links the programs categorized by narrators with the correct groups of interest
- CRM module informs a mobile application with a registered user's profile with a list of programs that needs a reminder sent to listener and inform him about interesting programs

Data layer

- Database of registered listeners classified in specific groups of interest
- Database of categorized mp3 audio programs

Statistical layer

- Statistical data of the number of listeners
- Statistics recommend an eventual change of a group of interest
- Evidence of recommendations of a registered listeners

4. THE EXAMPLE OF THE IMPLEMENTED CRM ONLINE RADIO

The project of online radio Blagovesti uses advantages of the ICT technology stated in this paper. It is related to a religious theme. Potential listeners have been contacted through social nets, and they have left their profile data by filling in online surveys. CRM has divided them into groups of interest. The radio administrator sends some thematic texts to narrators. They read them, categorize them into specific categories and put them on the web portal made in WordPress.

During the next day, narrators are putting audio programs on the web page. At the end of the day the radio administrator puts the program scheme for the next day. PHP script that implements the program for the next day is automatically activated at midnight.

When the PHP script is done, CRM system has the access to the data with the list of categories of programs which will be downloaded by mobile applications. For example, categories: programs with spiritual messages will be broadcasted at 01h, 03h, 07h, 09h, category Reportage will be broadcasted at 02h, 15h, 18h, category Program about the history of the Church at 17h, 19h, category Programs about health at 22h, 23h. Regarding statistical data, the average number of listeners (IP addresses) connected to the online radio Blagovesti is approximately 40, i.e. 80 listeners constantly. They usually spend approximately 180mins on the radio what implies that approximately 800 listeners access the online radio.

Figure 2. Web site

On the web portal of the radio Blagovesti, there is a program scheme for the next day on the right-hand side, and in the middle, broadcasts are placed by narrators. Programs are available for off-line listening, which means that all of them can be listened by choosing the web page or by downloading it in the mp3 format. Reproduction of the program starts automatically by accessing the web page. A player as a WordPress plug-in is incorporated in the web page.

Mobile application: A dedicated Mobile application "Radio Blagovesti 2.0" has been created and it serves as a player for online radio Blagovesti, but also for the two-way communication between CRM system and a listener. By using a mobile application, a listener is defining his interests, and the CRM system contacts the application about the lists of the programs dedicated to a group of interest to which a user's profile of a mobile application belongs.

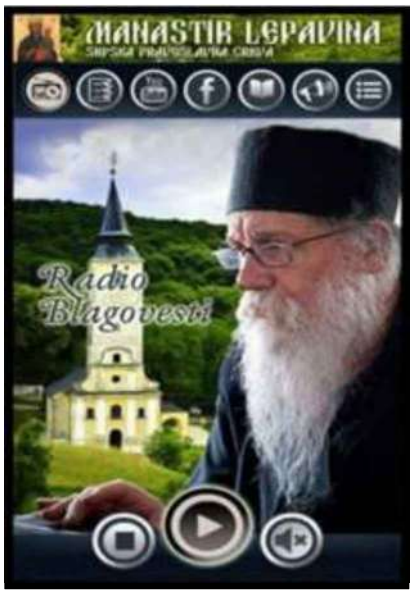

Figure 3. Mobile application
"Radio Blagovesti 2.0"

Mobile application has several functions:

- Audio player
- An overview of the radio broadcasting scheme
- Access to the administrative Facebook page
- Access to the YouTube canal
- Archiving of the web links of audio programs which belong to the listeners' group of interest
- CRM functionality: incorporated reminder system
- CRM functionality: accesses users' profile data
- CRM functionality: defines and changes listeners' groups of interest
- CRM functionality: manages recommendations

5. CONCLUSION AND DISCUSSIONS

By using CRM functionalities thematic non-commercial online radio stations could easily reach their listeners and make a two-way communication with them, which is important nowadays when a listener wants a better quality service. Listeners do not have time to listen non-commercial radio program the whole day, and it is needed to be in touch with a listener and inform him about the programs which he specified in the survey as interesting. A mobile application will archive web links of those programs which are of exceptional importance for a listener's group of interest. This way we respect our listeners' time and take care of them.

WEB SITE INTEGRATION INTO ORGANAIZATIONAL STRUCTURE OF THE LOCAL TOURIST COMMUNITY

Jelena Vasković[*1] Miloš Bačević[1]
[1]Belgrade University, Faculty of Organizational Science

Abstract: *In the operations of the local tourist community, Web site represents a central place where visitors can be informed. Based on the impressions they have gained there, their decision whether to visit the destination or not will be made. Since site is significant for business, two elements should be defined: site integration into the organizational structure of the local tourist community and methodology for evaluating the quality of the site, as well as its success in the business environment. The paper proposes a model of Web site integration and defines the methodology for its quality evaluation. Evaluation of the site has always been problematic because there is a large number of subjective factors that affect its quality. In this paper, Elements of Quality of Service (QoS) are separated from Quality of Experience (QoE) in addition to the analysis of other criteria. Thus separated Methodolog of evaluation, provides the opportunity to mesure quality of website more precisely.*

Keywords*: site integration model, site evaluation, local tourist community*

1. INTRODUCTION

In modern environment, the existence of local tourist community without a well-conceived Web site is almost impossible. First of all, it is necessary to present, in one place, local tourist community, as well as to display all options for informing visitors. Marketing and promotion of local tourist community is business which has to be organized with an aim of presenting the offer in the best way. Also, it is a place where local service providers (hotels, motels, apartments, caterers and others) should set their links, so visitors can find all relevant information in one place. Individual facilities generally have modest Web sites without additional options such as payment services or loyalty schemes and it is in their best interest to connect with the environment, so they can use those additional features. Local tourist community website should be a portal, where all local service providers can connect and get advanced features and services. They can achieve this by placing their link on the site of the local tourism community. By using a website, local tourist community acts as a single unit with unified offer of all services relevant for visitors with a main goal to promote all its associated members engaged in providing tourist services and place them in an equal position.

2. LOCAL TOURIST COMMUNITY WEB SITE

Website of the local tourist community is a part of system and its task is to integrate several elements of the tourist offer, as well as to deliver information to the customers-tourists and to be one of the focal points of their connection with the environment. In order for the Website to function, it must be intensively supported by the local administration, which means that part of the services must be involved in the development, implementation and maintenance. Base initiative must be generated at the local level, and someone has to fund the initial development of the website, define the basic concept requirements and do the initial version of the site. It is possible to assign the site development to local experts employed in the local administration, but in most cases, to outsource these jobs.

In order for Website to function, it is necessary to form the background department whose task is to prepare materials that will be shown on the Website. This is a serious and thorough work which has to be constantly harmonized with the management of the local tourist community. It implies that rules for the preparation and approval of the materials that will be shown on the site must be agreed between the background departments and local tourist community. Control over this process should not be given to employees in background department, because materials prepared in such a way may conflict with the decisions and policies of the local tourist community and because it is not advisable to deny previously published information. Site is a public way to communicate, so any published information has to be confirmed as valid and has to be in accordance with the interests of the entire community. This means that all materials prepared by background department have to be present to relevant persons in local tourist community, and only after obtaining their consent, be published on the Website.

In order for a Website to function in unity with the environment, it is necessary to connect it with environment so that booking system, payment system and loyalty scheme could be involved in the business. This connection is established through a background department (back server), because the part of the local

booking systems that apply only to the local community can be serviced locally, but if you need to include payment systems or loyalty schemes, then there must be a connection with these systems. (Daglas, P (2015)).

The second set of information that should be collected and refer to local tourist community are information collected from sensor networks. Placement, collection and distribution of information such as air and water temperature, humidity, pollen, parking places in the city, etc. is usually made within the information systems of the local tourist community (Smart city), but their processing and distribution is made through the website. This further means that collected information should be analyzed and prepared for posting on a website. These data can be made available through other channels too, but it is required that they be placed in order to have all information in one place.

Data collected in this way can be used to prepare the proposals for tourists and suggest them what to do on particular day. Based on the weather forecast (sunny, cold, windy) it is possible to suggest visiting places of interest, or to offer to organize entertainment events. Website or background department that receives and distributes information, should be a central place for organizing offers for events to be held at particular destination. Relevant information may also contain suggestions on to what to do in certain cases (where to go if it is raining).

The third set of the information are articles, pictures and multimedia materials that should be available on the site. This is something that is dealt by journalists, photographers and staff responsible for multimedia presentations. This kind of work should be delegated to marketing and branding sector of local tourist community. It implies linking all facilities that have their own separate sites and integrating them vertically into existing infrastructure.

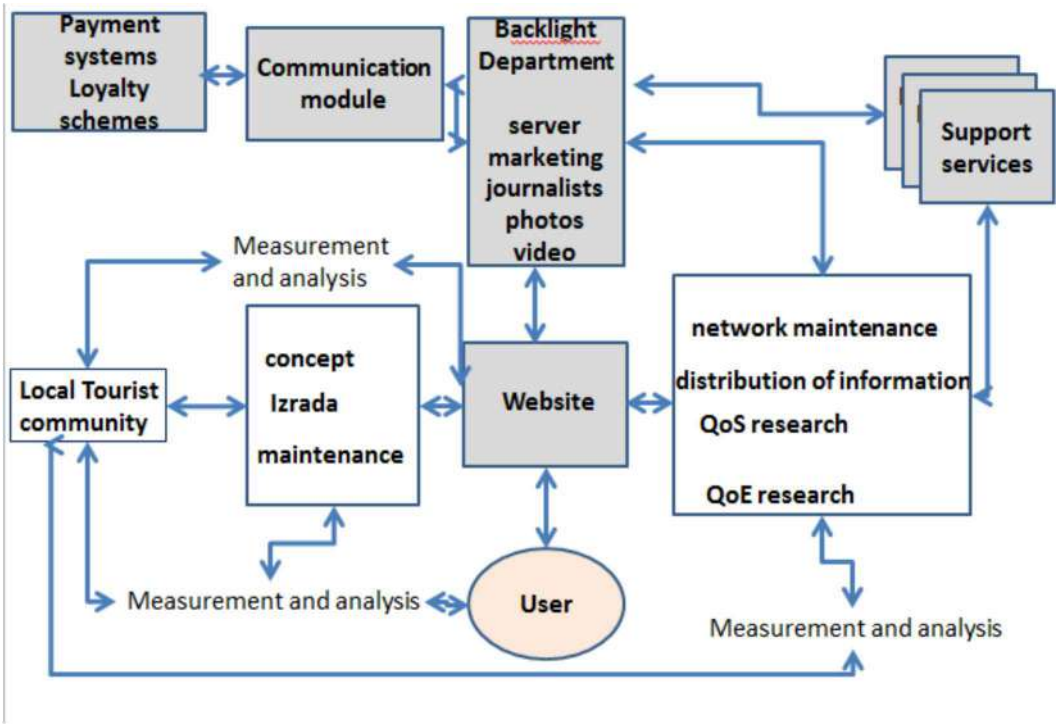

Figure 1: Model integration site into the structure of the local tourist community

In order for site to successfully perform its function, it has to be well organized so that information can be easily found. This especially applies to accommodation at the relevant destination, and offered entertainment events, which should all be supported with pictures. Pictures should be large and well-chosen in order to have an emotional impact on visitors. Pictures can say a lot more than the text so they should be chosen with special care, because their main goal is to awaken the desire to visit the destination. Besides pictures, video materials are something that can significantly complement the emotional involvement of users, particularly if they are accompanied by appropriate music and well prepared text (spoken and written). It is important to display guests at particular destinations in pictures and video materials, because it increases the emotional experience and potential tourists desire to visit the destination. Special attention should be paid to the segment of population that the site is intended for. Before the preparation of the material, detailed analyses should be made of visitors' habits, preferences and experiences. This further implies that there

should be a specialized sector within the local tourist community conducting research work on who the visitors are. Significant part of these information can be collected using social networks, based on the information which users themselves place. By following this information and by direct contact, users can be motivated to share their positive experience with local tourist community which, at the same time would gain insight into what should be done in order to improve the offer. Simple and elegant design of the site which includes maps, hints and tips on what to do and how to spend the time at chosen destination, significantly enhances operations of the local tourist community. (Buhalis, D., & Lawb, R. (2008)).

On the other hand, a large number of questions and requests ca be expected from the users. This means that some of the answers can be found in the "frequently asked questions" part of the site, but they should also have at their disposal "Call Center", phone or agency for any additional questions or problems solving.

Site means continuous work and in order for it to function in accordance with the business environment, it is necessary to have a methodology to evaluate its effectiveness and quality.

3. WEB SITE QUALITY EVALUATION OF THE LOCAL TOURIST COMMUNITY

Since the appearance of Internet, there is a constant need to evaluate sites and to measure their quality. Problems that occur in these estimates are primarily in the complexity of the criteria and the specifics of the web sites impact in different business environments. This further means that sites in certain industries can be quite satisfactory and same concept in others does not give good results. Web site is a place of communication with users. In order to allow evaluation of their quality, different methodologies have been used. (Malak, G., Bader, L (2004)).

In order to enable a comprehensive evaluation of the sites quality it is necessary to separate two different views in the methodology, QoS (Quality of Service), which include technical elements of the site quality and the quality of user experience QoE (Quality of Experience).

Quality of Service (QoS-Quality of Service) depends primarily on the technical capabilities of the network through which users have access. In addition to these limiting parameters, the service quality is also affected by the size of graphics, video materials and all the multimedia elements that require a large amount of transmitted information. Multimedia materials, that are needed on the site significantly increases load of the communication channels, so they are expected to have a large bandwidth, sufficient bit rate where there will not appear delay or packet loss when it comes to the live broadcast. Special category that should be mentioned here is the ability to access the site using different devices. Increased presence of mobile devices and access to Internet services through these devices requires the site to be adjusted in such a way that will ensure its display on these devices. This emphasizes the need to take into consideration communication channels when evaluating the quality of the site. Set of parameters for QoS includes additional services such as social networks, connection with the environment and e-marketing.

On site e-marketing represents an additional load because this includes demanding multimedia presentations, video and audio materials of high quality graphics which significantly loads communication channels.

Since QoS does not consider the quality of network performance from the standpoint of customer perception, QoE (Quality of Experience) concept has been introduced to improve the quality of the customer experience. QoE in this case should serve as a metric to qualify quality of service and network administration from the perspective of customer perception but also to analyze other criteria that make users satisfied. In this case QoE presents a measurement of the quality of the customer's perception. In this way acceptance of the placed materials and services can be identified. Thus, the fundamental difference between the concepts of QoS and QoE is their network relationship so it can be said that the QoE is user-oriented, and QoS network-oriented concept. Of course, these two concepts cannot be seen isolated one from another. (G Sarada P., V. Pallap 2015)

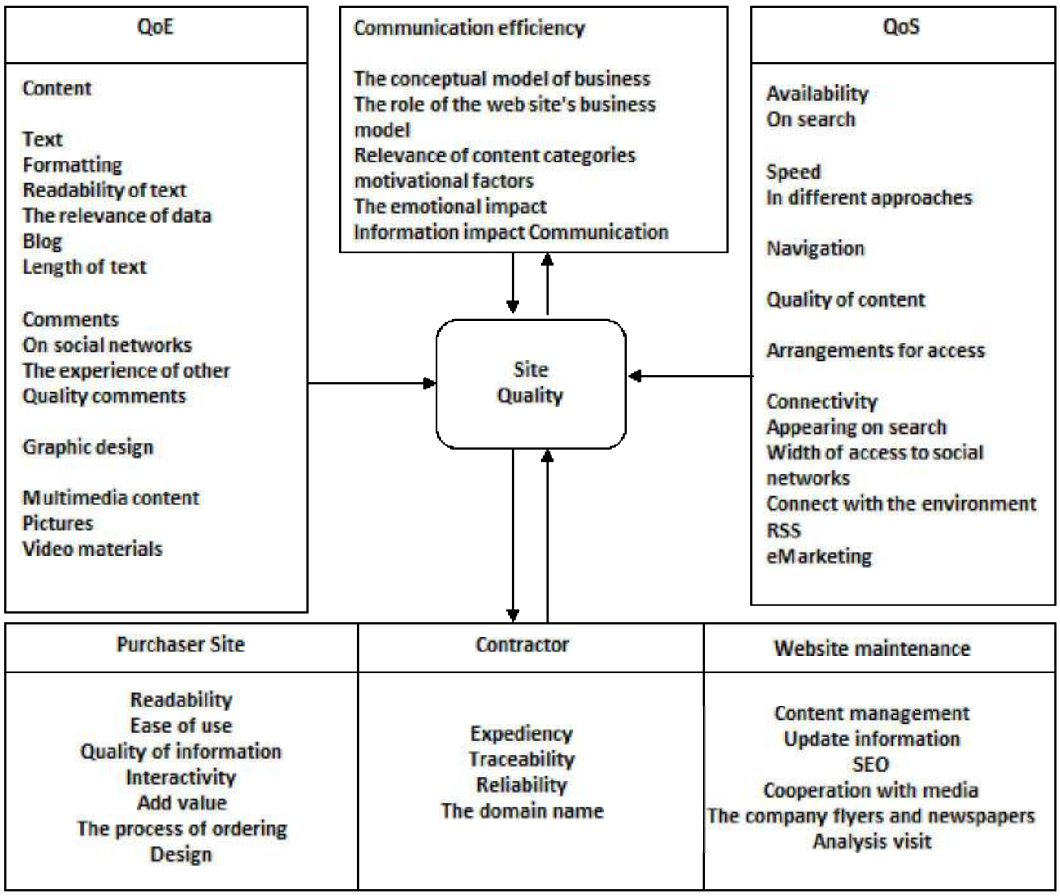

Figure 2: Categories for assessing the quality of the Website

QoE (Quality of Experience) includes a whole range of criteria that significantly affect customer satisfaction. The most important is quality level of graphical design that affects QoE. Well blended color, legible text and appealing design are the basis for high-quality design. Multimedia is almost obligatory part of the site, and it is directly related to QoS. Position of the pictures and all the other visual elements of the site must be easily recognizable and user friendly. All that is shown on the website should focus user on the main goal of website and its offer.

Compatibility is meant to be fully achieved. This means that site is available for different browsers and can work on different operating systems.

The next category which is important for evaluation of the site is communication efficiency. The conceptual model of the company should be primarily analyzed in order to comprehend the role of the Web site in its business model. Business model can include a larger number of categories, for each of them capacity allocation is needed to avoid overlaps. On the other hand, depending on the business model in certain industries (tourism, for example), sites emotional impression on the visitor has a dominant influence. Multimedia content has the special role in this case. The combination of emotion and information creates prerequisites for successful business connections.

Last but also very important category is associated with the development and maintenance of the site. When planning creation of the site, it is necessary to define a set of criteria that the site should achieve. Program requirements should be defined in advance so they can be aligned with main purpose of site and services planned to be implemented. This criteria can be applied only with monitoring of website in long period of time and knowing the organizational structures of development of site. Out of categories available on the site, legibility (the ratio of background colors and letters), the quality of information, additional features and design can be evaluated.

Evaluation of team, that was tasked to create a site, also belongs to this category. Reliability of the site and its stability can be estimated within a long period of observation. The domain name is also very important but even today it is quite difficult to find a suitable free domain.

The specific element of this group is maintenance. This segment can be very well monitored and evaluated since the changes on the site can be easily tracked.

It is significant to note that there are several limitations that such evaluation makes questionable. First of all, all data collected for the evaluation are based on a limited number of access to each site at a particular time, beside the fact that the Web is a highly dynamic and changeable medium. Similar studies in different periods of time can show different results. Evaluation like this will also shed some light on whether there is a divergence or convergence of Web activity over time. If only technical parameters can be evaluated, QoS would be the only parameter that can be measured. Analysis of "log files" is also reliable data and detailed research and comparison can be performed based on this data.

Another problem is the subjective evaluation of the factors and assigning weight coefficients, which introduces subjectivity in this analysis. Interviewing employees can improve the allocation of weight coefficients, because only they know how much individual categories are relevant to their business. Once assigned weight coefficients can be later modified in order to obtain objective research.

4. CONCLUSION

The tourist industry depends on the quality of communication with their visitors. Website, as a central place where visitors can be informed, thus it must meet all their requirements, provides information and also initiate emotions. Website integration into business environment presupposes that the organization has prepared itself. First of all the scheme of preparing material that will be on the site, procedures for compliance and approval of materials that will be posted, must be defined. The website is a public service and for all that is placed on it someone has to be responsible. Technical personnel that maintains website cannot be held responsible, but the responsibility is on the competent management of the local tourist community. There must be a mechanism for coordination and methodology of harmonization in order to avoid conflict. These sites are typically advertising destination or local tourist community and if there is a favoring of certain market participants, conflict of interests must be taken into consideration. The rules must be set, before the commencement of work. Periodic control of quality implies that there is a methodology for evaluation on the ground of which periodic control is made.

Abstract: *This paper presents integration of crowdsourcing and microlearning in higher education. The goal of this paper is to develop a model of collaborative microlearning based on crowdsourcing. The suggested integrated model can be applied in smart learning environments. The implemented crowdsourcing microlearning project is student-centered and it provides students with opportunity to be both knowledge creators and knowledge users at the same time. The evaluation of results was based on the data collected from survey. The students showed remarkable readiness and interest for participation in collaborative and crowdsourcing projects. Furthermore, it was found that students with higher tendency to participate in crowdsourcing by participating in more crowdsourcing projects have increased intensity of satisfaction and intrinsic motivation. It also influences their perception of the usefulness of crowdsourcing on the dimensions of learning and acquiring skills. On the other hand, the higher tendency for participation in crowdsourcing projects reduces the intensity of perception of reward as extrinsic motivator.*

Keywords*: crowdsourcing, collaborative microlearning, microcourses, creation, attendance, smart learning environment*

1. INTRODUCTION

Development of information and communication technology resulted in different changes in education. It is obvious that the number of classical “face-to-face” lectures was being reduced at universities. At the same time, the level of individual students’ learning is increasing. This type of students’ learning is usually conducted through the use of Internet and must be stimulated with different resources like video materials, individual activities for learning with self-evaluation, etc. (Coccoli, Guercio, Maresca & Staganelli, 2014). The present need to reduce time for learning resulted with development of microlearning and microcourses, and it leads us toward the “micro-era” (Wei, Yang, Zeng & Yu, 2015). There had been changes in the learning styles of students as a result of interactive world around us as well as the increasing popularity of social media which stimulates students to share knowledge in the form of social and collaborative learning (Coccoli et al., 2014). The growing gap between technology and students' motivation for learning (Heusler & Span, 2014) resulted in the necessity for the creation of student-centered educational environment. Smart educational environment accompanied with physical environment enables creation of situations and events necessary for stimulation of individuals to study and find solutions for different problems, to socialize within the group, to exercise and think (Koper, 2014).

As a collaborative model for knowledge creation, crowdsourcing has been used for creating and broadening of knowledge. The examples of using crowdsourcing in the process of education can be found in collaborative projects, supplemental instructions, open educational recourses, public content, peer assessment, problem-based learning and serious games (Anderson, 2011). Development of crowdsourcing has been facilitated by the use of web technologies which help individuals to solve individual, organizational and social problems. Crowdsourcing is characterized by dynamically formed group of people who respond to call from crowdsourcer (Pedersen et al.2013). Further characteristics of crowdsourcing include openness towards the group, participation of a large number of individuals and the use of different platforms (Hosseini et al., 2014). In the process of e-learning, the term crowd is used for describing students. On the other hand, in certain crowdsourcing projects the term can also be used for teachers, alumni, associates, etc. The aim of crowdsourcing is to take an advantage of collaborative work, joint goals and collaboration of students. In higher education, four key models of crowdsourcing can be distinguished: crowdteaching, crowdlearning, crowdfunding and crowdtuition (Llorente & Morant, 2015).

As a new form of education, microlearning can be implemented as a crowdsourcing project in two phases: phase of creation and phase of attendance. Development of online crowdsourcing community fosters collaborative learning. Furthermore, students are in interaction among themselves and with the crowdsourcer. They can create content, share ideas, knowledge and skills, virtual and physical resources, evaluate certain activities and content, vote, etc. Microcourses or microlessons are the forms of online web

video courses which are developed around key points of knowledge (Wei, Yang, Zeng & Yu, 2015). Microlearning shows positive effects on acquiring targeted knowledge and it is adjusted to human attention span (Sun et al., 2015). For that reason, duration of microcourses is usually between 5 and 8 minutes (Wei et al., 2015). Microcourses can be used for online, blended, and face-to-face learning (Hou, Gou & Gao, 2016). Microcourses are primarily based on video materials and they can be formed around the points that can represent problems and difficulties for students at that course (Shen & Shen, 2015). Additionally, microcourses provide students with the opportunity to study anytime and anywhere they want and to adjust learning according to their time (Hou, Gou & Gao, 2016). Social media and specialized platforms can be used to support microlearning. These platforms enable creating, publishing and attending microcourses, among which Coursmos, Daily Bits Of and Grovo are important examples.

Crowdsourcing and microlearning conceptually offer different possibilities and approaches to teaching and learning, but their integration offers the improvement of individual students' work and learning. In this paper we developed a model of crowdsourcing creating and attending microcourses in smart learning environment. In such environment, students are knowledge creators and knowledge users at the same time. The aim is to integrate crowdsourcing into overall process of microlearning. Implementation and evaluation of this project has been conducted at Laboratory for E-business at Faculty of organizational sciences in Belgrade. Evaluation of results indicates significant influence of crowdsourcing mechanisms for creating and attending microcourses on students' satisfaction, perception of acquiring skills, studying and acceptance of the used technology.

2. MODEL OF CROWDSOURCING MICROLEARNING

Integration of crowdsourcing and microlearning in educational process implies design of integral model that will respect performance of existing physical environment, adaptive crowdsourcing mechanisms and readiness for implementation of crowdsourcing collaborative network as a way of upgrading existing e-education.

Microlearning through microcourses can have two dimensions: collaborative learning through creation of microcourses and individual learning through microcourses attendance. Identified crowdsourcing mechanisms in creation of microcourses are: group work, identifying hierarchical/demographic group work, interaction in the group, rewards and relation to crowdsourcer. Within the microcourses attendance the following crowdsourcing mechanisms are significant: comments about content, evaluation, recommendation for others, sharing microcourses on social media, giving recommendations for related microcourses, brainstorming for new topics, rewarding and relation to crowdsourcer.

Adaptive crowdsourcing mechanisms of microlearning have a potential to strengthen participative role of students so that educational environment gains new dimensions and functionalities. Smart learning environment is defined as physical environment enriched with digital, context aware devices in order to advance the process of learning. Such environment has got an educational goal to create productive, smart and responsible members of society (Spector, 2014). In reference to smart environment it can be said that such system should be designed to focus on human and to use all available technologies for sustainability, reliability, mobility and flexibility. Smart solutions should be personalized, adaptive and interactive, and available at any moment, from any place and from any device (Coccoli et al., 2014). In his work, Spector (2014) suggests theoretical framework for conceptualized smart learning environment. It is mostly realized through Internet and Things (IoT) which connects things and devices from real world to the things from virtual world.

Integrated platform for microcourses in smart learning environment should integrate services and applications of crowdsourcing platform, mobile applications, social media and IoT platform (Figure 1). Integrated system should have the following characteristics: availability, adaptability, interoperability, reliability, and possibility of reuse.

The users of integrated platform for microcourses in smart learning environment are students, professors and crowdsourcer. The users can access the platform from different devices like smartphones, tablets, laptops and applications for such devices. The two main ways to access the platform is through web and mobile application. The users can access directly to integrated platform for microlearning or through certain parts of the system (e.g. social media or IoT platform).

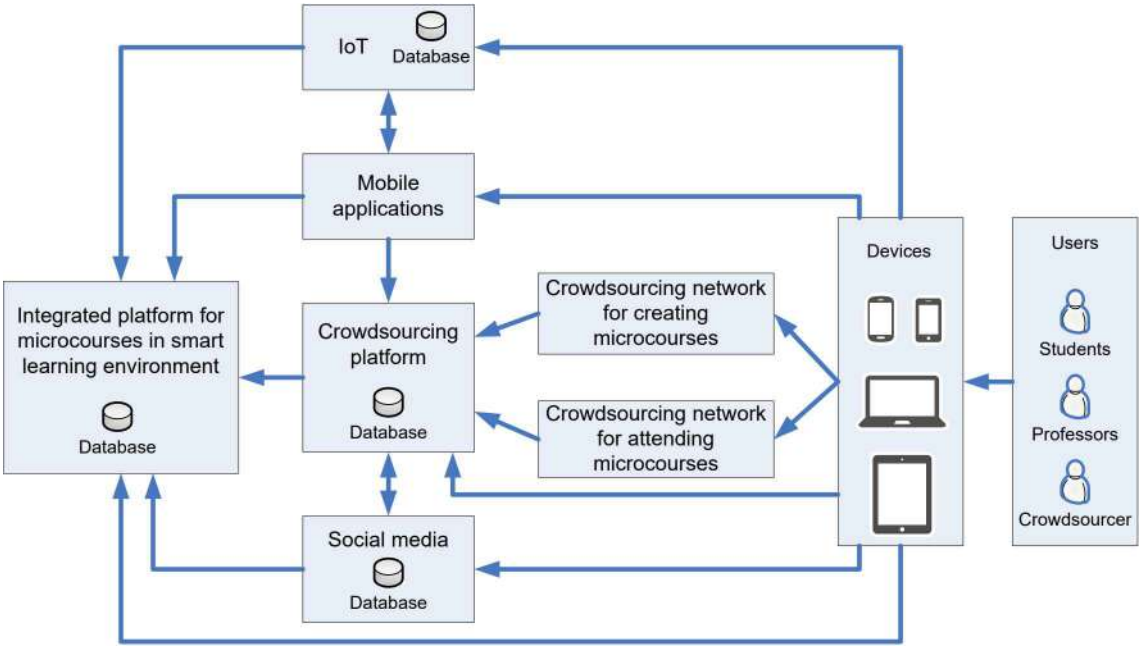

Figure 1: Model of crowdsourcing microlearning in smart learning environments

Crowdsourcing platform, which represents a part of integrated platform, gives an opportunity to the users to become a part of crowdsourcing network for attending or creating microcourses, and to participate in other crowdsourcing activities. The role of social media within the model refers to the possibility to engage networked group of people or to share final results of crowdsourcing activities (e.g. microcourse). Integrated crowdsourcing platform should have an option for personalized tracking of students' activities in real time of the crowdsourcing process. IoT platform can enrich integrated platform with different sensor data in reference to educational environment, localization of students' activities, etc.

3. MATERIALS AND METHODS

The project of crowdsourcing microlearning and evaluation of crowdsourcing mechanisms for e-learning through microcourses has been conducted as part of the study course E-business at Faculty of organizational sciences, University of Belgrade, year 2015/16. Crowdsourcing task referred to creation and attendance of microcourses. The procedure of crowdsourcing microlearning implementation is represented at Figure 2.

The project has been planned, implemented and evaluated under supervision of E-business department professors. The professors had formed a team of five members to represent crowdsourcer. The crowdsourcer had the tasks to: identify and publish potential topics, organize students' applications, form groups together with students, help students, examine the final microcourses, choose a platform for microcourses and to publish good quality microcourses. The project team chose the open platform for microcourses – Coursmos. This platform offers possibility to create free and paid microcourses, and it also provides online certificates for students, testing of students, etc. (Coursmos, n.d.).

The students were invited to participate voluntarily in creating and/or attending microcourses. Both activities were rewarded with bonus points for the final exam.

The task was to create a video microcourse lasting 5 to 7 minutes. The microcourses were created by using software for screen recoding. The period for creating microcourses was two weeks. Totally 123 students participated and 46 microcourses have been created among which 44 had been published on Coursmos platform. The professors evaluated published microcourses according to two criteria: educational and technical quality.

Totally 127 students attended microcourses. Their task was to attend minimum two microcourses, to comment and evaluate microcourses.

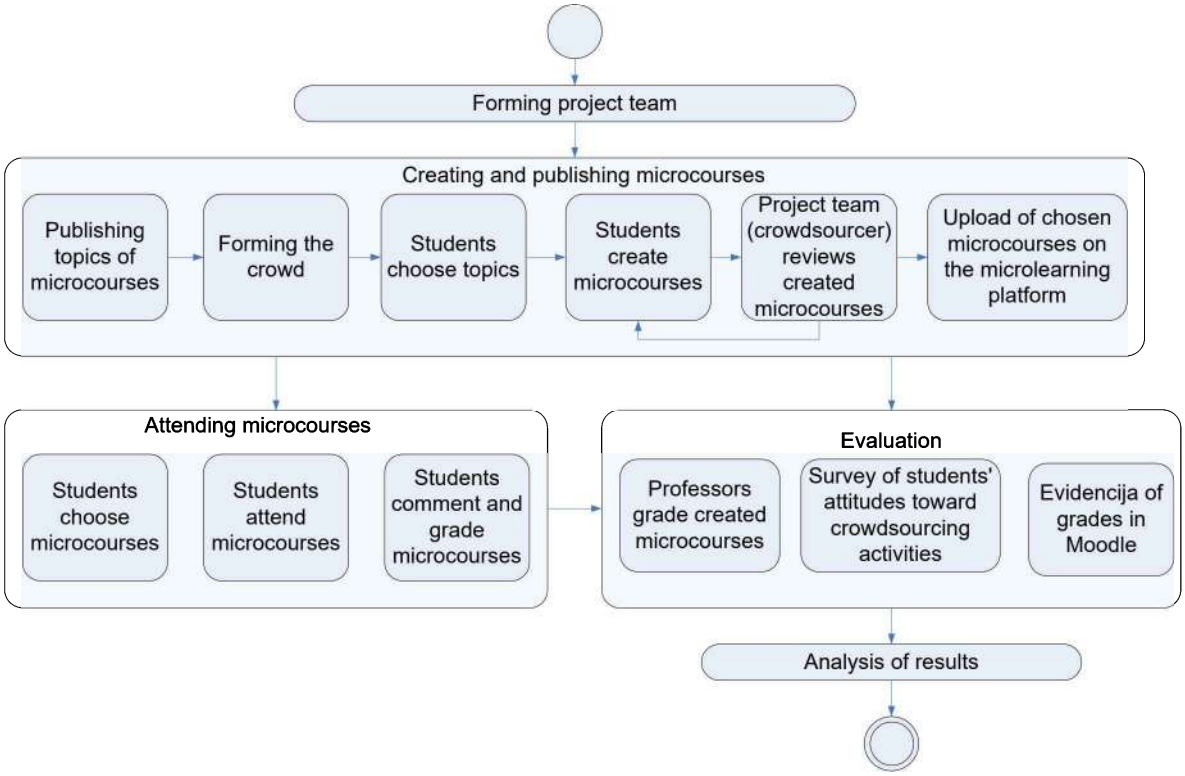

Figure 2: Procedure for implementation of crowdsourcing microlearning

Experiment was conducted as a part of broader experiment in which all students had been included in real conditions. Data were collected through the survey which was given to students at the final exam. The students who attended microcourses were identified through data collected from Coursmos platform. Moodle provided data concerning marks and structure of points at the subject.

The survey was filled out by 271 students, among which 71 created microcourses (sample "created"), and 74 attended microcourses (sample "attended"). Since 39 students created and attended microcourses (stratum "created and attended"), two more strata have been identified: "only created" and "only attended".

The sample "created" included 57.7% of population, and the sample "attended" included 58.3% of population. Characteristics of the samples and strata are given in Table 1. There are missing data on the average grade of students.

Table 1: Characteristics of the sample

		Sample			**Stratum**		
		Whole sample	**„Created"**	**„Attended"**	**„Only created"**	**„Only attended"**	**„Created and attended"**
Number		271	71	74	32	35	39
Gender	**M**	95 (35.1%)	28 (39.4%)	24 (32.4%)	14 (43.8%)	10 (28.6%)	14 (35.9%)
	F	176 (64.9%)	43 (60.6%)	50 (67.6%)	18 (56.3%)	25 (71.4%)	25 (64.1%)
Study programme	**ISIT**	173 (63.8%)	65 (91.5%)	56 (75.7%)	28 (87.5%)	19 (54.3%)	37 (94.9%)
	ME	98 (36.2%)	6 (8.5%)	18 (24.3%)	4 (12.5%)	16 (45.7%)	2 (5.1%)
Average grade	**6-6.99**	4 (1.5%)	0	0	0	0	0
	7-7.99	96 (35.8%)	19 (27.9%)	23 (31.5%)	5 (16.7%)	9 (25.7%)	14 (36.8%)
	8-8.99	126 (47%)	28 (41.2%)	34 (46.6%)	13 (43.3%)	19 (54.3%)	15 (39.5%)
	9-10	42 (15.7%)	21 (30.9%)	16 (21.9%)	12 (40%)	7 (20%)	9 (23.7%)

The survey had 3 parts. The first part was filled out by all students, the second part was for students who created microcourses and the third part was for the students who attended microcourses. The central part of all 3 parts of the survey included measuring students' attitudes on a five-point Likert scale.

The first part of the survey measured the students' attitudes (initial perception) about the relation of collaborative learning and dimensions of e-education, such as: the influence of collaborative projects on e-learning, results of individual/collaborative learning, acquisition of skills and usefulness of accepted technology. Each dimension contained multiple items. This part of the survey also included questions like gender, study programme (ISIT – Information systems and technologies and ME – Management), learning orientation, usage of social media and ranking of motivation factors in collaborative work.

The second part of the survey measured attitudes of students who created microcourses about the influence of collaborative creation of microcourses on the following dimensions of e-learning: satisfaction, learning, skills and incentives. It also measured the characteristics of crowdsourcing activities of individuals and groups.

The final part of the survey involved the group of students who attended microcourses and it consisted of three sets of items. The first set of items measured the influence of attending microcourses on the following e-learning dimensions: satisfaction, learning and usefulness of accepted technology. The second set of items contained students' evaluation of attended microcourses, while the third set of items was used to measure the platform functionalities. Moreover, the following data were also collected: number of attended microcourses, the average time needed to complete microcourse, characteristics of microcourses and activities on the platform.

Cronbach's Alpha was used to investigate internal consistency of the survey for measuring attitudes of students who created and attended microcourses. Cronbach's Alpha values for samples „created" and „attended", as well as for all strata are in interval from 0.832 to 0.922. Furthermore, each question in Cronbach's Alpha if Item Deleted is in the range 0.799 to 0.926. All these coefficients indicate an acceptable level of internal consistency of the used measuring instruments (higher than 0.7).

4. ANALYSIS OF RESULTS

4.1. Analysis of influence of creating microcourses on e-learning

Descriptive statistics was used to analyze the influence of creating microcourses on different attributes and dimensions of e-learning for the whole sample (C), strata "created and attended" (CA) and "only created" (OC) (Table 2). The identified attributes are divided into four dimensions: satisfaction, learning, skills and incentives.

Mean values of eleven attributes are higher for stratum "created and attended" when compared to stratum "only created" and the whole sample. Only the mean value of attribute "bonus points" is higher for stratum "only created". It is obvious that students who participated in the entire project have greater intensity of attitudes regarding influence of creating microcourses on different dimensions of e-learning: satisfaction, learning and skills, as well as on the attribute "recognition of colleagues".

Of all the attributes, "satisfaction related to participation" has the highest mean value for the sample as a whole, as well as for strata "created and attended" and "only created" and it represents the most important attribute. On the other hand, attributes from „incentives dimension" have the lowest mean values for the whole sample and the both strata. Reward in the form of bonus points has the lowest mean value for the whole sample and stratum „created and attended". Attribute „recognition of colleagues" is the least important attribute of creating microcourses for stratum „only created".

„Administrative support of crowdsourcer" is second rated attribute for the whole sample and stratum „only created", and it is the third rated attribute for stratum "created and attended". High average grades of this attribute show high level of understandability of the project for both strata.

Regarding the influence of creating microcourses on "learning dimension", the most important attribute for both strata is "stimulation of creativity". The biggest difference between the strata in this dimension refers to the attribute "stimulation for making an effort for the subject".

There are relatively big differences in mean values for attributes in "skills dimension" between two strata. For stratum "created and attended" the most important attribute is "preferring collaborative skills", while for the whole sample and stratum "only created" it is "advancing teamwork skills". The least important attribute in this dimension for both strata is "advancing scientific-research skills".

Table 2: Influence of participation in microcourses creation on different dimensions of e-learning

Attribute	Mean		
	C	CA	OC
Satisfaction dimension			
Satisfaction related to participation	4.31	4.38	4.22
Administrative support of crowdsourcer	4.06	4.15	3.94
Learning dimension			
Adjustment to learning orientation	3.92	4.03	3.78
Stimulation of creativity	4.00	4.08	3.91
Stimulation for making an effort for the subject	3.73	3.97	3.44
Skills dimension			
Advancing social and communication skills	3.82	4.03	3.56
Preferring collaborative skills	3.97	4.23	3.66
Advancing analytical skills	3.76	4.05	3.41
Advancing teamwork skills	4.03	4.15	3.88
Advancing scientific-research skills	3.54	3.82	3.19
Incentives dimension			
Bonus points	3.17	3.15	3.19
Recognition of colleagues	3.30	3.54	3.00

T-Test was used to determine whether there are significant differences between the two strata regarding influence of creating microcourses on various attributes of e-learning. It was found there are significant differences between these strata ($p < 0.05$) in terms of:

- stimulation for making an effort for the subject($p=0.02$, eta=0.07, effect size=medium to large);
- advancing analytical skills($p=0.02$, eta=0.07, effect size=medium to large);
- advancing scientific-research skills ($p=0.03$, eta=0.07, effect size=medium to large).

4.2. Analysis of influence of attending microcourses on e-learning

Descriptive statistics of influence of attending microcourses on e-learning was used for the whole sample (A), strata “created and attended” (CA) and “only attended” (OA). The three dimensions of influence of microcourses on e-learning were identified: satisfaction, learning and usefulness of accepted technology. The mean values of these dimensions are given in Table 3.

Mean values of all attributes regarding influence of attending microcourses on e-learning for stratum „created and attended“ are higher compared to stratum „only attended“ and sample as a whole. „Acquiring new knowledge“ is the most important attribute for both strata and for the whole sample. The least important attribute for the sample as a whole and the two strata is "adjustment to learning styles“.

Table 3: Mean values of attributes of attending microcourses

Attribute	Mean		
	A	CA	OA
Satisfaction dimension			
Satisfaction related to participation	4.19	4.26	4.11
Learning dimension			
Acquiring new knowledge	4.46	4.51	4.40
Adjustment to learning orientation	3.95	3.97	3.91
Adjustment to learning styles	3.91	3.92	3.89
Stimulation for making an effort for the subject	4.09	4.15	4.03
Usefulness of accepted technology			
Improvement of educational environment	4.28	4.31	4.26
Sharing on social media	4.11	4.28	3.91
Using mobile applications	4.12	4.28	3.94

Regarding attributes in the „learning dimension“ there are no important differences between mean values for the two strata, as well as for the whole sample.

The most important attribute in dimension “usefulness of accepted technology” for the whole sample and the two strata is “improvement of educational environment”. The stratum “created and attended” has the same average grade for attributes “sharing on social media” and “using mobile applications”. Sample as a whole and stratum “only attended” consider “using mobile applications” on platform is somewhat more important when compared to “sharing on social media”.

T-Test results showed that examined population of students who attended microcourses is homogenous in terms of all attributes, so there are no significant differences in attitudes between stratum “created and attended” and “only attended”.

4.3. Comparative analysis of the influence of creating and attending microcourses on e-learning

There are three common attributes identified for samples “created” and “attended”: satisfaction related to participation, learning orientation and stimulation for making an effort for the subject (Tables 1 and 2). By comparing mean values of students’ answers it is found that creating microcourses has higher level of satisfaction and a greater perception of compliance with orientation towards learning than attending microcourses. However, attending microcourses encourages students more to make an effort for the subject than creating microcourses.

Correlation analysis using Pearson coefficient demonstrated the following:

- between all considered attributes for creating and attending microcourses there is statistically significant positive correlation for samples „created“ and „attended“, and for stratum „created and attended“;
- for sample “created” there is moderate to high positive correlation (0.5-0.75) between all included attributes;
- for sample “attended” there is a strong positive correlation (r>0.75) between attributes „adjustment to learning orientation“ and „stimulation for making an effort for the subject“, and moderate to high correlation between attributes „satisfaction related to participation“ on one hand and attributes „adjustment to learning orientation“ and „stimulation for making an effort for the subject” on the other hand;
- for stratum “created and attended”:
    - low to moderate correlation (0.25-0.5) between attributes „satisfaction related to participation“ and „stimulation for making an effort for the subject”, and moderate to high correlation between attributes „adjustment to learning orientation“ on one hand and „satisfaction related to participation“ and „stimulation for making an effort for the subject“ on the other hand;
    - satisfaction in creating microcourses is not associated with satisfaction in attending microcourses;
    - correlation between attributes „adjustment to learning orientation“ in creating and attending microcourses is moderate to high;
    - correlation between attributes „stimulation for making an effort for the subject“ in creating and attending microcourses is low to moderate.

5. DISCUSSION

Implementation of the microlearning project in academic environment confirms that student collaborative projects and crowdsourcing represent important fields of e-education which are oriented towards development of students' participative mechanisms and improvement of educational processes. The identified crowdsourcing mechanisms of microlearning represent adequate framework for using students’ collective intelligence in creating and broadening of knowledge. Students showed readiness and interest for participation in collaborative and crowdsourcing projects (Kapp, 2009).

During the experiment, the group of students who participated in both crowdsourcing projects (creating and attending microcourses) clearly stood out. It was found that students with higher tendency to participate in crowdsourcing by participating in more crowdsourcing projects have increased intensity of satisfaction and intrinsic motivation. It also influences their perception of the usefulness of crowdsourcing on the dimensions of learning and acquiring skills. On the other hand, the higher tendency for participation in crowdsourcing projects reduces the intensity of perception of reward as extrinsic motivator (Hosseini et al., 2014). These findings confirm the mean values of all attributes in identified dimensions of e-learning in both projects.

A particularly important attribute in creating and attending microcourses for all students is "Satisfaction related to participation". This confirms that students accept this way of learning and participating. On the

other hand, the motivation mechanisms through bonus points and recognition by other students proved to be the lowest graded attributes of microlearning.

Acquiring new knowledge is one of the most important functions of microlearning. Students' orientation towards learning is in compliance with activities of creating and attending microcourses. However, creating microcourses encourages students to a lesser extend to make an effort for the subject compared to attending microcourses.

In terms of students' attitudes toward acquiring skills in project of creating and attending microcourses, it is confirmed that the mean values of all attributes of the group that created and attended microcourses are higher than in the group that only created microcourses.

There is a significant difference between strata "created and attended" and "only created" regarding attitudes toward influence of creating microcourses on the following e-learning attributes: stimulation for making an effort for the subject, advancing analytical and scientific-research skills.

Limitations of the research include identification and selection of dimensions and attributes of crowdsourcing creating and attending microcourses, which are mostly based on our own observations of students' behavior and our own model, and to a lesser extent on results of other researches. Indicators of influence of crowdsourcing microlearning on e-learning attributes are based on survey of students' attitudes which limits the interpretation of results. The other limitation of the research results arises from the fact that the experimental population consisted of students who volunteered to participate in this project. While the survey included most of the students who created and/or attended microcourses, we used a convenience sampling, which is a limitation of the research results. Also, implementation of the crowdsourcing project and research was conducted in one higher education institution, so the conclusions can't be fully accepted as generalized, but rather as indicative.

6. CONCLUSION

Integration of collaborative learning and students' collective intelligence through implementation of microlearning project and evaluation of crowdsourcing mechanisms in creating and attending microcourses represents a new approach to e-learning in higher education. An integral model of crowdsourcing microlearning in smart learning environment is developed. Implemented student-centered crowdsourcing model provides an opportunity for students to be both creators and users of knowledge. Crowdsourcing approach to microlearning confirmed interest and willingness of students to collaborate and produce good quality content. It also confirmed high level of self-organization among students. Students who tend to participate in more crowdsourcing projects gave higher grades to influence of microcourses on different attributes and dimensions of e-learning. Identification of students based on these attributes could be predictor variables for their involvement in other crowdsourcing projects.

*Corresponding author, e-mail: slavica.strbac@ict.edu.rs

Abstract: The concept of mobile learning has been gaining popularity in new lecture planning methods owing to the advancement and the increased use of new devices and technologies, such as smart and tablet devices. Augmented reality (AR) nowadays represents one of the possible applications of smart mobile devices. New technologies should not serve only as a tool for learning, but as a means to provide students with easier access to information, to increase the level of active learning, to improve cooperation, enable interaction and increase motivation in students. The AR technology offers a new experience when accessing the exiting data which, in itself, represents an additional motivational factor. This paper consists of potential uses for AR technology integrated into smart mobile devices, for the purposes of education, with emphasis on mobile learning.

Keywords*: augmented reality, mobile learning, smart devices*

1. INTRODUCTION

Increasing usage of mobile devices can be promptly directed to an entirely new direction, the direction of education, consequently, implementing education into a new way of life and consciousness of young generations. On the other hand, the users of wireless mobile devices, in accordance with their growing requests regarding everyday choice of services, will inevitably insist on the possibility of education in this way. Current development of technology is on the level which can respond to such requests (Štrbac, Grgurović, Jelić, 2010).

The increase in numbers of smart mobile devices, as well as applications for these devices, open a new dimension of everyday use, from reading different materials, to observing, to taking in some of the materials. Most educational applications are developed so that they respond to the interests of school children, but students should not be left out either, as well as adults, in the program of lifelong learning.

M-learning is a contemporary form of education and training using mobile devices. The concept of m-learning has become popular in lecture planning because of the advancement and increased use of new devices as technologies such as tablet and smart devices (Alioon, Delialioglu, 2015). With the development of smart devices, the number of educational mobile applications has increased as well. Generations of school children are growing up with mobile devices, using them for communicating, connecting, sharing data, gathering information, education.

Augmented reality, on the other hand, enables the superposition of objects in real time, which makes it possible to add digital information to physical objects. Contemporary smart devices, owing to their performance specifications, enable AR displaying, which opens the possibilities of using AR for educational purposes, via numerous real-time actions, such as:

- Displaying materials in real time,
- Geo-locating users,
- Using stored data in a device,
- Recording real objects,
- Combining the aforementioned actions.

It should also be emphasized that AR technology-supported mobile devices enable using only one (mobile) device, instead of using numerous peripheral devices designed for AR. Mobile devices also represent an ergonomic improvement in mobile device applications for learning, as they include sensors for displaying AR (GPS, inertia sensors, accelerometers, compass, Wi-Fi).

Designing and implementing new approaches to learning require careful surveillance from both perspectives, technical and pedagogical. The pedagogical aspect can be assessed through the following six elements: integration of ubiquitous technology into the system, theoretical basis, research on programming and

coordination, teacher accessibility, adjustment of activities to the configuration and characteristics of a device, and evaluation (Jairak, Praneetpolgrang, Mekhabunchakij, 2009).

The technical aspect includes mobility, immediacy, individuality, connection,and accessibility as main characteristics of mobile devices around which mobile learning revolves (Korucu, Alkan, 2011).

Many authors have researched different aspects of mobile devices. This includes, above all, their role and use, as well as their efficiency in educational domains. Aside from these roles, the readiness of students to accept the device use also stands out (Ally, 2009), (Kennedy, Judd, Churchward, Gray, Lee- Krause, 2008), (Abas, Peng, Mansor, 2009).

The idea behind m-learning as a way of improving the traditional way of learning by use of AR technology has been gaining more significance, most of all because of the fact that it offers a unique visual and interactive experience.

2. M-LEARNING – THE BASIS FOR AUGMENTED REALITY

The main advantage of m-learning is the possibility of continual access to educational materials through a mobile device at any given time from any location. For the last few years, mobile applications have been improving by means of integrating new possibilities, service operators have been competing in application offers, all with the goal to create a new experience for users. Higher education has been keeping up with the trend of increase use of mobile devices through situational learning.

The current concept of higher education has the potential to utilize the space out of the classroom by improving e-learning and m-learning. M-learning has a potential advantage over e-learning (figure 1) (Pachler, Bachmair, Cook, 2009) keeping in mind that, aside from the main advantage of mobility, the following three m-learning characteristics also exist:

- The use of mobile devices by students who are applying and using specific tools adjusted to mobile technologies;
- Out-of-classroom learning, while providing the students with the support in different learning situations;
- The students' need for mobility, which provides the students with the ability to learn any time (Zapata-Ros, 2012).

With the increasing use of smart devices, the demand for AR applications has also been on the rise. Contemporary smart devices combine fast processors with graphics hardware, gradually larger touch-sensitive screens, sensors (camera, GPS, compass, accelerator), which makes them ideal for AR experience in and outside of the classroom. Researchers and commercial programmers have the opportunity to use these platforms for developing educational programs and enabling new learning experiences.

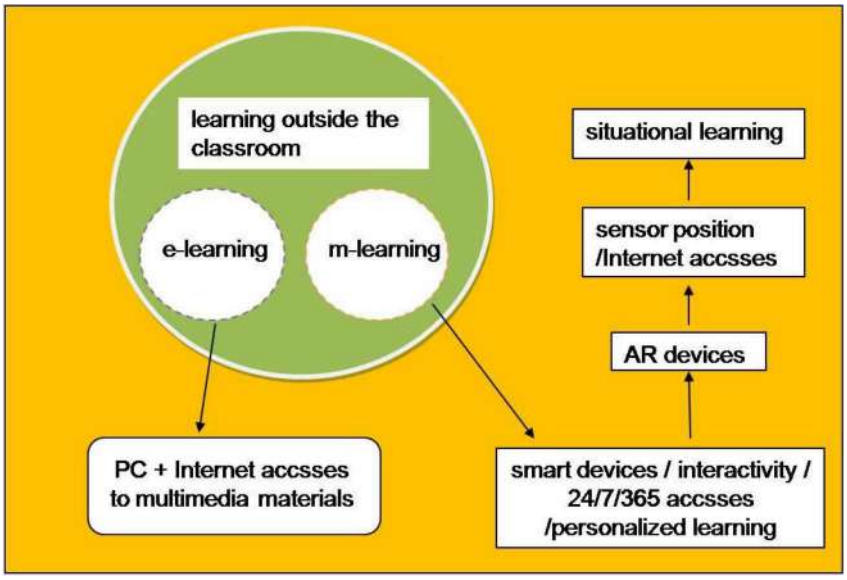

Figure 1: E-learning and m-learning in educational surroundings

The research on this topic has shown that offering AR experiences through mobile devices can have a unique advantage over materials which do not offer this experience.

3. AUGMENTED REALITY AND EDUCATIONAL MATERIALS

Augmented reality can be viewed as an extension of reality. It ensures displaying surroundings-related virtual information, while also enabling the digital information differs depending on the device on which it is viewed. If we view the human body as an interface which experiences its surroundings through visual, auditory, somatosensory, olfactory, and gustatory senses, augmented reality is a form of extension which amplifies the perception of an outer interface.

Using AR technology on mobile devices in adaptive surroundings puts the emphasis on the level of personalization. A student advances independently, by his or her own pace, according to his or her own interests and capacities. The advancement in learning is presented to students through interactivity with their own surroundings, which enables them to move on to new materials and new tasks. Technology provides access to resources which improve learning by means of a more efficient, better reality. The main idea is to use additional educational information to make an impact on the perspective, understanding and meaning of decision-making in reality.

3.1. AR System Functioning

AR system components can be put into three categories: displaying, following, and interacting.

The displaying components enable users to display an optical or video version of materials, depending on whether they are trying to view individual images or video recordings. The device construction plays a crucial role in determining where the display will be placed relative to the user (on their heads, in their hands, or spatial).

The following components serve to integrate virtual information (text, images, 3D) into real surroundings. These components depend on the viewer's position and the device position. The accuracy of orientation does not only depend on the device position, but on the rotation, direction of moving, and slope as well. The following component is defined by six points (coordinates X, Y, and Z, rotation, slope, and yaw). Overall, the following components can be put into three groups: sensory, visual, and hybrid.

Interaction is a category which requires the most attention, since it is necessary to establish a connection between the user and the virtual materials. The basis of interaction are activities such as: managing, copying, commenting, erasing virtual objects and materials, or information. The access interface, during the interaction between the user and the AR materials, depends on the GUI version, and the keyboard, mouse or screen are most commonly touch-sensitive. Interaction styles can be divided into: direct management, menu selection, entry form, programming and natural language (Gesa, 2012). It is also essential to follow the so-called eight golden rules when designing the interface: consistency, including shortcuts for experienced users, feedback option, specially designed problem-solving dialogue, simple handling in case of errors, simple undo option, user support control, and the release of short-term memory.

3.2. Possibilities in AR application in education

Using AR application, the existing educational materials are enriched with virtual materials, which remain invisible to others. In this way, students are offered a new layer of knowledge, new level of information, or a visual guide through the materials and tasks.

When it comes to the materials which can be offered through AR technology in educational purposes, the methodology of clearly forming such materials does not yet exist (Mesarošova, Ferrer Hernandez, Mesaroš, 2014).

Expanding educational space to mobile devices can increase students' attention. In order to make students feel a part of the technological space and participate in activities, it is necessary to design the surroundings. The surroundings created with mobile devices increases the communication span in everyday life, and could thus be used to increase students' attention in classroom and when learning (Pachler, Bachmair, Cook, 2009).

Some studies have researched the implementation of AR technology into education. One of these studies, a study from the University of Nottingham, which researched the expansion of viewers experience in Lake District, where geography students can access additional information about their surroundings through a helmet-like display (Shneiderman, 1997). Another study from the same university was done with history students, who gained access to additional information on places of historical events through smart phones,

based on their GPS positions (Priestnall, Brown, Sharples, Polmear, 2010). AR can also be used as a supplement to traditionally written books, as a way of teaching storytelling skills, or to satisfy the desire to read the (non-)obligatory bibliography (FitzGerald, 2012).

3.3. Challenges in AR application in education

As any new technology which is widely applied, AR technology faces challenges in its implementation into education. Some of those challenges are:

- Overcoming innovation factors, since every innovation must show improvement compared to the existing sustainable teaching methods;
- Problems with the use of equipment in real-life situations, such as display size, device behavior in outdoor conditions (display reflection, etc.);
- Stepping out of informal into the formal education by introducing innovations into official lecture plans, which requires accreditation;
- Changing the existing practices;
- The question of appropriateness of the media to reality (the notion of misappropriation).

In order to overcome some of the aforementioned challenges, a short study was conducted at the ICT College of Vocational Studies involving first-year students, researching their will and opportunity to use smart mobile devices for learning.

Out of 53 respondents, 96 per cent of them already own a smart mobile device (image 2), but only 58 per cent use it for purposes of learning (figure 2). It is obvious that there is a potential for the use of smart mobile devices for purposes of m-learning.

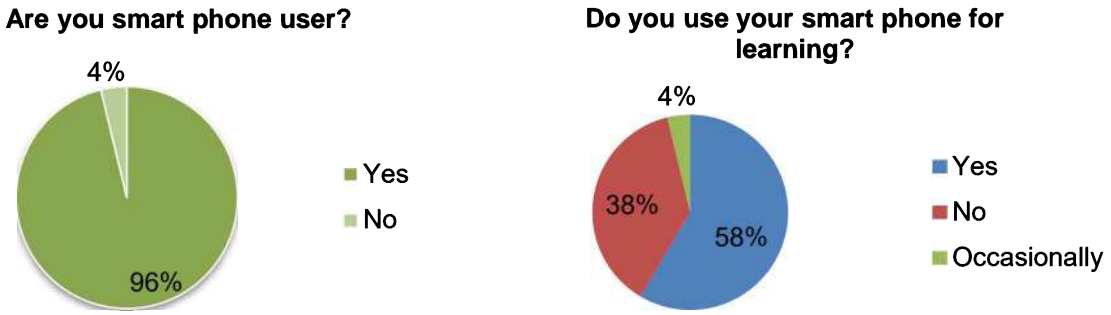

Figure 2: The number of smart phone users and the number of those who use smart phones for learning

This is also supported by the fact that a large number of participants (79 per cent) would install additional m-learning applications (figure 3), as well as the fact that 69 per cent of the students prefer lectures which involve combined multimedia (text, pictures, video material) (figure 4).

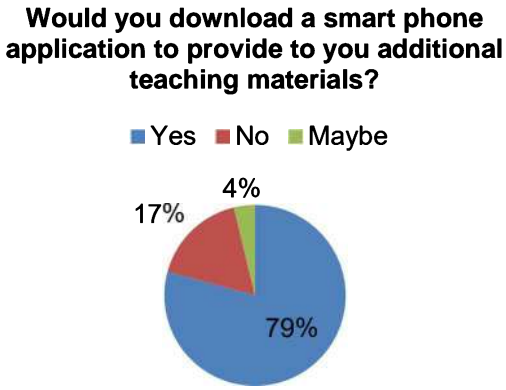

Figure 3: Number of students who would download an additional application for m-learning

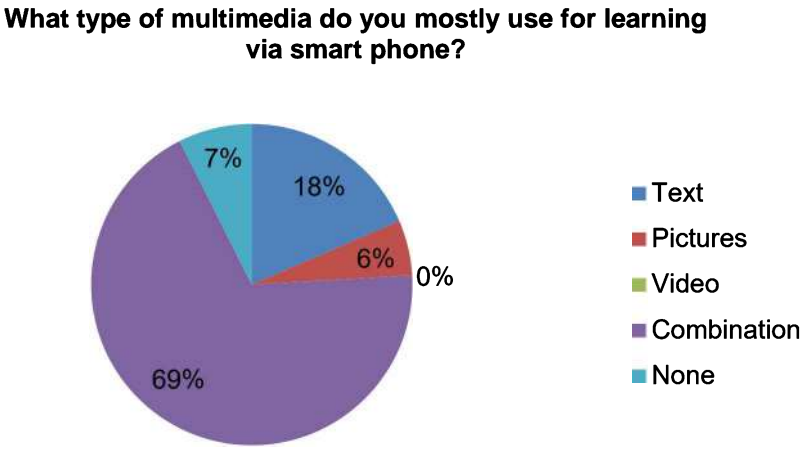

Figure 4: Multimedia materials used on smart mobile devices

Since this group of students largely prefers the Android platform – about 90 per cent of them (image 5), the potential m-learning application should be made for this platform.

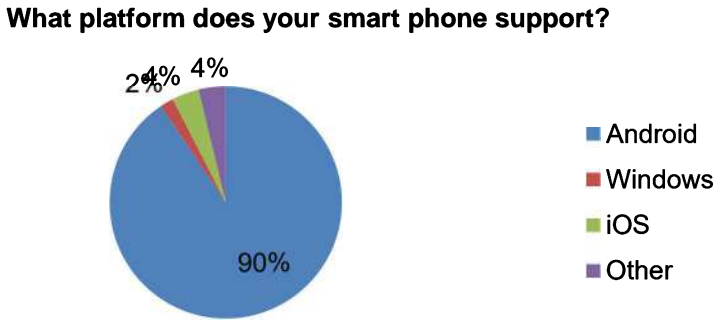

Figure 5: Frequency of mobile OS

4. CREATING AUGMENTED REALITY FOR EDUCATIONAL PURPOSES

Over previous years, m-learning has mostly been analyzed in elementary and high-school contexts, and thus the future of m-learning lies in higher education and education of adults (Alioon, Delialioglu, 2015).

Providing AR experience does not necessarily result in more effective learning. As with any technology, the most important lessons to be learned are those concerning the optimal use of AR in educational contexts. Whether or not the effectiveness will be greater if the traditional teaching materials are only enhanced with AR experiences, or with completely new materials with integrated AR elements, remains to be seen.

Creating teaching materials enriched with AR elements is becoming increasingly simpler. Namely, there is a large number of tools which do not require programming knowledge for creating such materials (buildar, artofillusion, wikitude, yalp, etc.). This offers students not only the possibility to observe the prepared materials, but to actively take part in creating them. The process of creating AR scenes carries in itself certain educational value, since students have to think of ways to use technology in order to introduce complex concepts. In addition to this, working on producing and using materials includes processing and solving problems using team work. This combination could affect motivation, involvement and commitment of students. When they create materials using AR creating tools, students create their own AR experiences and ensure further learning.

Support with displaying educational materials through multimedia, digital materials, such as 2D and 3D images, sounds, and video materials, enables students to notice, memorize, and understand information better. This implies especially to students who have difficulties understanding the traditionally written materials (McKenzie, Darnell, 2004). According to a study where participants read books with and without AR elements, the group which used AR elements noticed things better and reproduced information more

effectively later (Billinghurst, Duenser, 2012). It is interesting that application of AR in education gives the best results in high-school education (Moreno, Mayer, 2005).

The interactive element which AR brings is the key element to success. Namely, when using interactive materials, students see learning as a game, which can prove to be very important when creating materials and overcoming the usual learning limitations.

4.1. The potential benefits of the application of AR in education

Most AR systems are created as a prototype for a certain project or purpose, and it is difficult to compare any results gained that way.

In general, books with AR elements have the potential for high-quality and very employable educational material, in laboratory conditions, as well as in traditional classrooms. In addition to this, intuitive interactions and spatial 3D material visualizations can increase the value of educational materials. Another important value of AR is the possibility to gain skills and experiences which students should overcome with real jobs, which they will get after graduation, as their goals.

A special value of AR is related to the aforementioned interactivity dimension. Some researches claim that interactivity can result in learning and activating certain cognitive processes (Dünser, 2008). A high level of interactivity enables better learning, especially in students who learn through kinetic, visual, and other methods which are not based on a text. In this way, the learned materials are stored as long-term memory. Students who interact with materials can remember more than students who passively receive data. Aside from that, they are better at applying what they have learned.

5. CONCLUSION

Using AR in classroom is still a relatively new notion, but the impact of new technologies has been on the rise ever since AR system platforms became widely accessible. At the moment, experiences are directed only towards the visual expansion of the real world, but several key ideas have been established when it comes to using AR in class:

- AR technology is strong enough to support experiences, especially in the form of extended books and mobile AR learning applications;
- AR experiences should be used as a complement, and not as a substitution to traditional teaching materials;
- AR offers real benefits when reading, through understanding spatial data, especially for students who have difficulties with understanding traditional learning materials.

As the use of AR technology is expanding, the educational model is most likely to be completely different for students who have mobile devices with AR applications.

Based on the insight into the way and frequency of use of smart mobile devices in college students, it can be concluded that there is a great potential for using mobile devices for m-learning purposes. Future m-learning applications, especially when it comes to AR, should be designed for operating systems most frequently used.

Future educational AR experiences will be offered through video channels supplemented with audio and kinetic channels, with a wide variety of interactions. For example, while walking around and using a mobile AR application, a student should be able to hear audio data related to a certain place, as well as see visual signs. This multimodality can be a part of materials which enrich learning experiences and transfer ideas in different forms. These materials can be delivered to students with different preferences when it comes to learning and different learning styles, through active involvement in new, individual ways of learning.

Introducing hardware devices of new capacities, flexible and collapsible displays, 3D cameras, pico projectors, etc. will bring new ways for displaying and interacting with AR materials.

Future AR technology will enable a wider spectrum of educational experiences. Research in new areas open up possibilities for applying abstract concepts to practical lectures. The technology itself enables creation of materials, so that a way is made for students to create materials themselves, who, in this way, experience real-life situations which they can encounter in real-life surroundings.

Abstract: *This paper describes a model for creating semantic elements* for *the current learning management systems (LMS). Propsed model is based on ontology and semantic web technologies. The goal of this paper is to enable dynamic mechanisms for real time mapping, semantic annotation, learning resources enrichment, student profile creation and personalization according to the adaptation criteria. Selected criteria for adaptative systems is the Felder-Silverman learning style model (FSLSM). Also, this work describes real time monitoring of students activities on Facebook social network and learning resources enrichment from external academic open repositories by tags and criteria of adaptation. Several modules (plug-ins) have been implemented.*

Keywords*: semantic web, ontologies, learning objects, adaptive learning, personalization, learning styles.*

1. INTRODUCTION

The main characteristic of e-learning systems is their ability to recognize students needs, their educational behavior and also, their capabilities. In an educational environment, learners with diverse learning capacities and background information require different learning paths (Brusilovsky, 2012). Each student has his own characteristics (profile, learning style, prior background and learning objectives). These individual attributes are very useful to provide each student the most adequate learning path to accomplish his learning outcomes.

LMSs (Learning Management Systems) are platforms for administrating, documenting and delivering e-learning content. They offer the enrolled students a vast number of courses with highly customizable capabilities. A way to automatically plan student-oriented learning content in Moodle was built in (Caputi & Garrido, 2015). For personalized e-learning, several different strategies and characteristics can be used and considered by teachers and course authors/designers (Dorça, Lima, Fernandes, & Lopes, 2013).

Adaptation is a key element in web based learning systems. Most of the existing learning management systems focus on adaptivity in general, whereas others focus more specifically on adaptivity based on learning style (Popescu, 2009). There are many different learning style models that adaptive e-learning systems are generally based on. An automatic, dynamic and probabilistic approach for modeling students learning styles based on reinforcement learning was presented in (Dorça et al., 2013). Another method based on adaptive content presentation, communication methods, and organization of online activities to students' learning styles and preferences was described in (Despotović-Zrakić, Marković, Bogdanović, Barać, & Krčo, 2012). Trends and approaches within this area are covered in (Somyürek, 2015).

Learning styles can be defined as strategies, or regular learning manners usually applied by an individual, which are built on student's fundamental potentials (Kurilovas, Kubilinskiene, & Dagiene, 2014). Learning styles are one of the criteria that adaptation of online courses can be made. In this paper, Felder-Silverman model (FSLSM) is selected because there are the questionnaire and the comprehensive guide on how to use it provided (Felder & Silverman, 1988). In addition, this model has been turned out to be powerful in numerous adaptive learning systems and it has often been used in technology-enhanced learning in order to deliver personalised content adapted to student's learning styles.

Learning objects (LO) have become a fundamental element to develop educational content for e-learning environments. In the modern educational systems number and complexity of learning objects is large. Therefore, there is a problem in the creation, maintenance and retrieval of semantic academic libraries and repositories. Also, many of them are not open. Thus, there is a limited number of semantic repositories or many of them which in different ways describe the same concept. These problems can be solved by developing a personalized, dynamic, semantically-oriented model for annotation and enrichment of learning object. This mechanism involves mapping procedures, adaptations and visualization of certain educational resources in accordance with the rules defined in ontologies. One possible solution for adaptation is an

approach for recommending personalization strategies based on the learning objects included in the course presented in (Essalmi, Ayed, Jemni, & Graf, 2015). In this work it was also evaluated how well these strategies support particular combinations of learner's characteristics.

Semantic web, ontologies and rule-based reasoning play a major part in the development of knowledge and personalized student's profile (Nafea, Maglaras, Siewe, Smith, & Janicke, 2016). Semantic web technologies can be applyed for e-learning systems (Begam & Ganapathy, 2013; Qwaider, 2012; Sheeba, Begum, & Bernard, 2012) and can be used for intelligent discovery of learning objects (Hsu, 2012). They significantly affects the annotation of learning objects, their transformation and semantic enrichment. The advantage of using an ontology is made possible by overcoming interoperability problems between different e-learning systems, as well as the re-use of knowledge in the field to which it relates. Of particular importance to the subject of this paper is to describe the ontologies and rule-base reasoning field of adaptive and personalized e-learning.

Ontologies are open vocabularies, models that describe the world common types, attributes, and relations. Any form of relationship between two concepts can be expressed using strongly typed relations. A short, concise definition of ontologies states that they are a "formal, explicit specification of a shared conceptualization" (Gruber, 1993). Ontologies are powerful and extendable and can be used to personalized knowledge search and recommendation (Chen, Chu, Chen, & Chao, 2013) and extending moodle functionalities (Rezgui, Mhiri, & Ghédira, 2014; Yunianta, Yusof, Jayadianti, Othman, & Suhaimi, 2014). In our study we used Protégé for ontology development because it is the most popular and widely used ontology and knowledge based editor. Also, it has flexible knowledge model and extensible plug-in architecture (Malviya, Mishra, & Sahu, 2011).

There is an increasing demand for sharing learning resources between existing learning systems to support reusability, exchangeability, and adaptability. One approach reccomends a domain-independent, automatic and unsupervised method to detect relevant features from heterogeneous textual resources, associating them to concepts modelled in a background ontology (Vicient, Sánchez, & Moreno, 2013). Generally, the learning resources need to be annotated with ontologies into learning objects that use different metadata standards. These ontologies have introduced the problems of semantic and structural heterogeneity. There are many ways to overcome these problems and one of them is a semantic ontology mapping for interoperability of learning resource systems presented in (Arch-Int & Arch-Int, 2013).

2. LITERATURE REVIEW

Adaptivity in e-learning can be based on the learning flow, where learning and sequence of activities dynamically adapt to each student, or can be based on content, where educational resources and activities available to students dynamically change. In both cases, it is necessary to introduce educational activities and used them as learning objects. Quality of personalized e-learning systems depends on appropriately selected learning objects, their relationships and criteria of adaptation.

In the case of e-learning, learning materials and sources are primarily digital in nature. This allows them to be easily modified in order to adapt to users' needs and learning context. Student-created and professionally-created learning materials can be found on the internet in various formats. The amount and diversity of available resources are becoming an issue for both the learners and the information systems that facilitate learning. Using a descriptive and a standardized set of attributes (metadata), the aforementioned problems can be solved. IEEE Learning Object Metadata (IEEE Learning Technology Standards Committee, 2002) is a prominent metamodel for description of learning objects. Another popular set of standards, based on the IEEE LOM, is Sharable Content Object Reference Model (SCORM). SCORM learning objects are packed into content packages of specific structure, and are based around the use of web-centric technologies, HTML pages and interactivity with the system. Many resources like research papers, student-created materials, links to web pages, etc. do not naturally fit into this concept. In order to facilitate easier and automated searching and indexing of diverse learning resources, a simplier, implementation-agnostic set of metadata is likely a better match.

The evolution of learning processes is almost always linked to social changes and/or technological changes. One of those processes is e-learning, which is involved in the changes brought by web 2.0 trends. This new tendencies consider the user, socialization and collaboration as the main important elements and this must be considered also in e-Learning contexts. Web Services can be applied to define open learning environments (Conde, García, Casany, & Alier, 2010). Social networks, for example Facebook, can be used as e-learning tool for higher education institutes (Ainin, Naqshbandi, Moghavvemi, & Jaafar, 2015; Manasijević, Živković, Arsić, & Milošević, 2016; Qureshi, Raza, & Whitty, 2014).

The transition from the traditional web to Semantic web (relational databases (RDB) to semantic graphs) requires new structuring of data. In this context, we propose D2RQ server which allows automatic extraction of data from RDB and their restructuring in the form of RDF graphs using the Jena API to make them available for the Semantic Web (Bakkas & Bahaj, 2013; Bäumer, Gim, Jeong, Geierhos, & Jung, 2014). On D2RQ server it is possible to execute SPARQL queries over semantic base and also get a semantic data (Calvanese, Cogrel, Komla-ebri, Kontchakov, & Lanti, 2015). These data are later transformed into the semantic subset - OWL model. The goal of our stady is to create an ontology model, and to enrich it with the components of the RDB schema using different classes provided by the Jena API. Jena Semantic Framework also enables implementation of the semantic web recommendations (Carroll et al., 2004).

Pellet is the first sound and complete OWL-DL reasoner with extensive support for reasoning with individuals, user-defined datatypes, and debugging support for ontologies (Sirin, Parsia, Grau, Kalyanpur, & Katz, 2007). The OWL API (Application Programming Interface) represents Java API for OWL ontologies. The OWL API supports parsing and rendering of the syntaxes defined in the W3C specification, manipulation of ontological structures, and the use of reasoning engines. The reference implementation of the OWL API, written in Java, includes validators for the various OWL 2 profiles. The OWL API has widespread usage in a variety of tools and applications (Horridge & Bechhofer, 2011).

Rule sets in SWRL (Semantic Web Rule Language) have the fundamental role of being the inference engine to create new knowledge inside the Semantic Web. SWRL allows the combination of rules and ontology terms defined using the Web Ontology Language (OWL), increasing the expressiveness of both of them (Hassanpour, O'Connor, & Das, 2010).

3. SEMANTIC MODEL FOR ADAPTIVE E-LEARNING SYSTEMS

Our research differs from previous works in relation to several aspects. We provided personalized student profile based on the learner's behavior pattern using FSLSM model. Educational resources from external academic semantic repositories were enriched using the mechanisms of visualization. Also, adaptive learning was supported using different types of techniques such as ontologies and inference rules. The proposed model is not only intended to ensure the learner's ability to learn, but it is also expected to be useful in providing a learning path and guidance based on individual differences (learning style). Personalized guidance is achieved by collecting a student's initial capability and preferences and by using semantic rules and rule-based reasoning in order to detect learner behavioral changes.

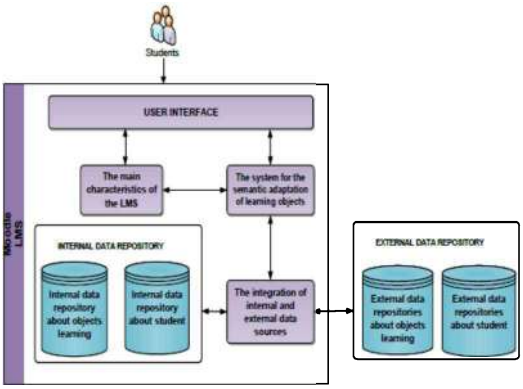

Figure 1: The model architecture

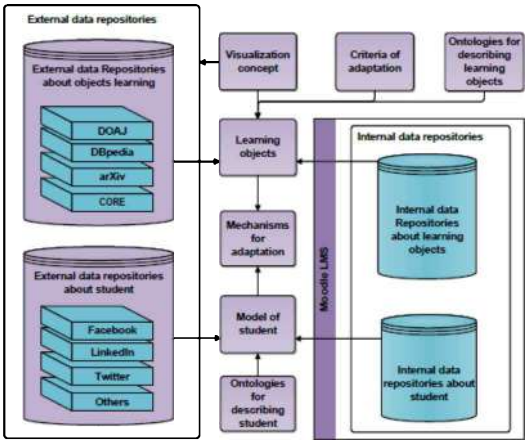

Figure 2: The main model elements

The architecture of the proposed model is shown in Fig. 1. It includes the following components: learning objects (metadata, annotation and semantic content enrichment), the student's model (static and dynamic data on the student), ontology (ontology for describing learning objects and ontologies to describe students) and criteria of adaptation (Felder – Silverman learning styles model). The figure 2. shows the main model elements.

The proposed model is based on the next procedure: The initial step in the procedure is student Interface. It is the communication component that controls the interaction between the student and the system. It deals with the user account data (such as registration and login). After this step, student will answer learning style questionnaire related to FSLSM model. If student logs into the Moodle for the first time, he will need to fill Felder Silverman Questonary, if not, his learning style will be already available in the system. Real time monitoring of the activities of students in the system and the use of learning objects will be executed by Moodle, and forwarded to Jena. D2RQ server is responsible for transforming Moodle MySQL relational database into a semantic database that is organized in tables. The next stage is creating ontology in Protégé 5.0.0.beta version. In this stage, the system compares the outcomes from questionnaire to these from the reference ontology using inference rules (association rules). Subsequently, it starts to recommend adaptive content based on the personalization. The result is transfered to Jena Semantic Framework. Jena enables implementation of the semantic web recommendations (Carroll et al., 2004). Dynamically reasoning over the semantic data is done by Pellet. Base SWRL rules defined in the ontology and rules defined in the Pellet receive the recommendations in which way learning objects should be personalized. Through this, aaccording to student's learning style, appropriate contet will be displayed to him. The inference engine is the crucial component for constructing adaptive learning. It includes comparing recommendation agent and updating agent that provide personalized student profile dynamically. Whenever new information is available, it will be sent to the inference engine, which functionality is based on rule-based reasoning. Jena returns results of the semantic reasoning to Moodle by connecting with OWL and PHP API. This procedure requires several web services for implementation.

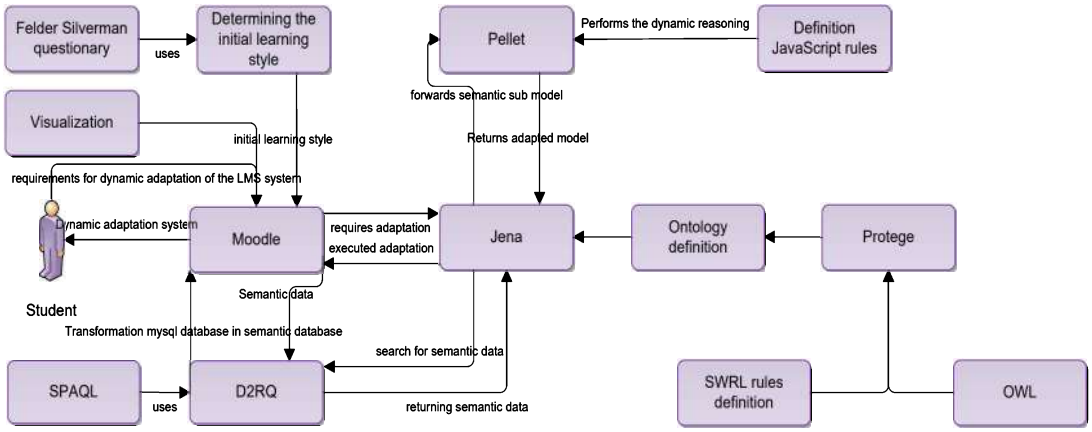

Figure 3: The proposed procedure for adaptive e-learning systems

.

3.1. Creating semantic elements in moodle

Three plug-in blocks and two web services were implemented in the Moodle platform for the purpose of this research (figure 4):

- MAU (Moodle Adaptive Learning) block where for each student initial learning style according to the Felder Silverman questionnaire is defined. During the time, the student's learning style can be changed.
- MAU resource block for resource classification based on learning style.
- MAU visualization block (Recommended resources button available for each week) for visual representation of semantic enriched resources. It contains an internal educational resource from Moodle and resources are recommended to students according to their learning style from three semantic academic repositories: DBPedia, Directory of open access Journal (DOAJ), arXiv I COnnecting REpositories (CORE).
- Web service that monitors the behavior of students in Moodle in real time. The task of this web service is to monitor how much and how often student performs some actions and activities with educational resources.
  - Web service FB app that monitors the students' activities on Facebook. The reason for this is to follow with greater precision if he belongs to a particular learning style. This web service is done by connecting Facebook and Moodle API. Jena combines all of the API calls.

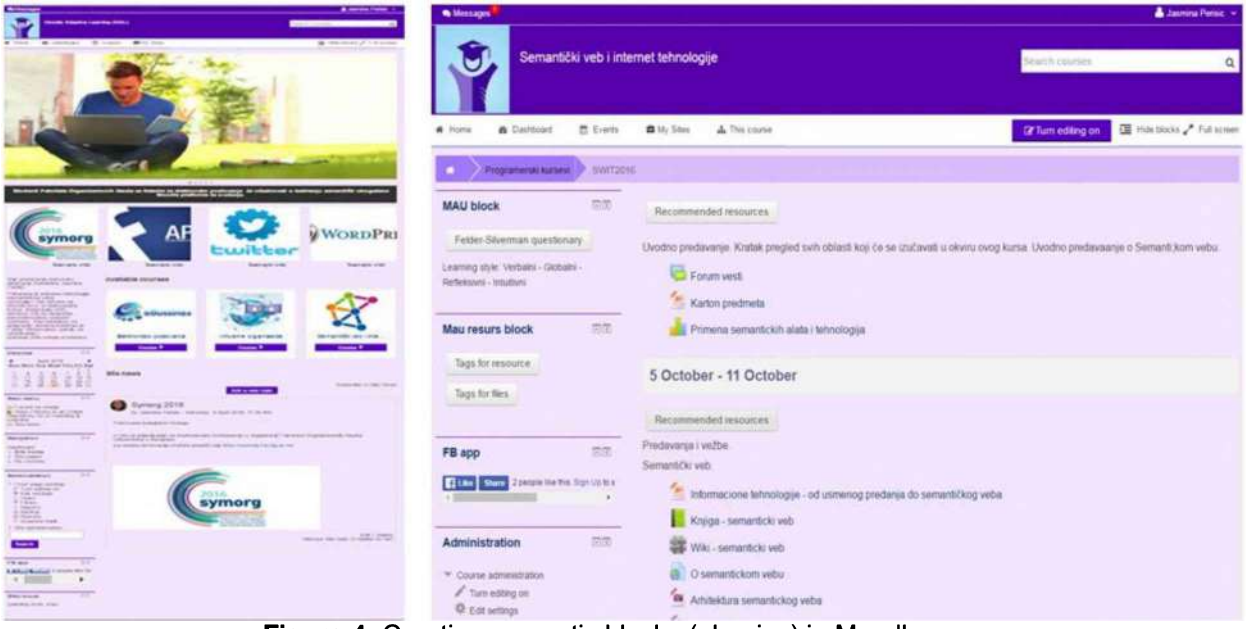

Figure 4: Creating semantic blocks (plug-ins) in Moodle

3.2. Moodle data semantic mapping

The process of translating relational database into semantic can be made using D2RQ platform (figure 5). The D2RQ Platform consists of:

- The D2RQ Mapping Language - a declarative mapping language for describing the relation between an ontology and a relational data model. Mapping of one table from Moodle represents one class in D2RQ Mapping Language.
- The D2RQ Engine - a plug-in for the Jena Semantic Web toolkit that uses the mappings to rewrite Jena API calls to SQL queries over the database and passes query results up to the higher layers of the frameworks.
- D2R Server - an HTTP server that provides a Linked Data view, an HTML view for debugging and a SPARQL Protocol endpoint over the database.

Figure 5: Moodle mapping classes (dataset)

The figure 6. shows D2RQ Engine Moodle classes. Actually, it represents a SPARQL endpoint for our Moodle dataset mapping. So, we can execute some SPARQL queries for mapping classes and properties. The result of the SPARQL queries can be used by Jena in JSON or XML syntax.

Figure 6: D2RQ Engine Moodle classes

The figure 7. shows the source code from Moodle relational database server D2RQ that is mapped using the semantic database with the default prefix *vocab* replaced with the prefix of our ontology *mau*. The D2RQ generic code has Tirttle syntax.

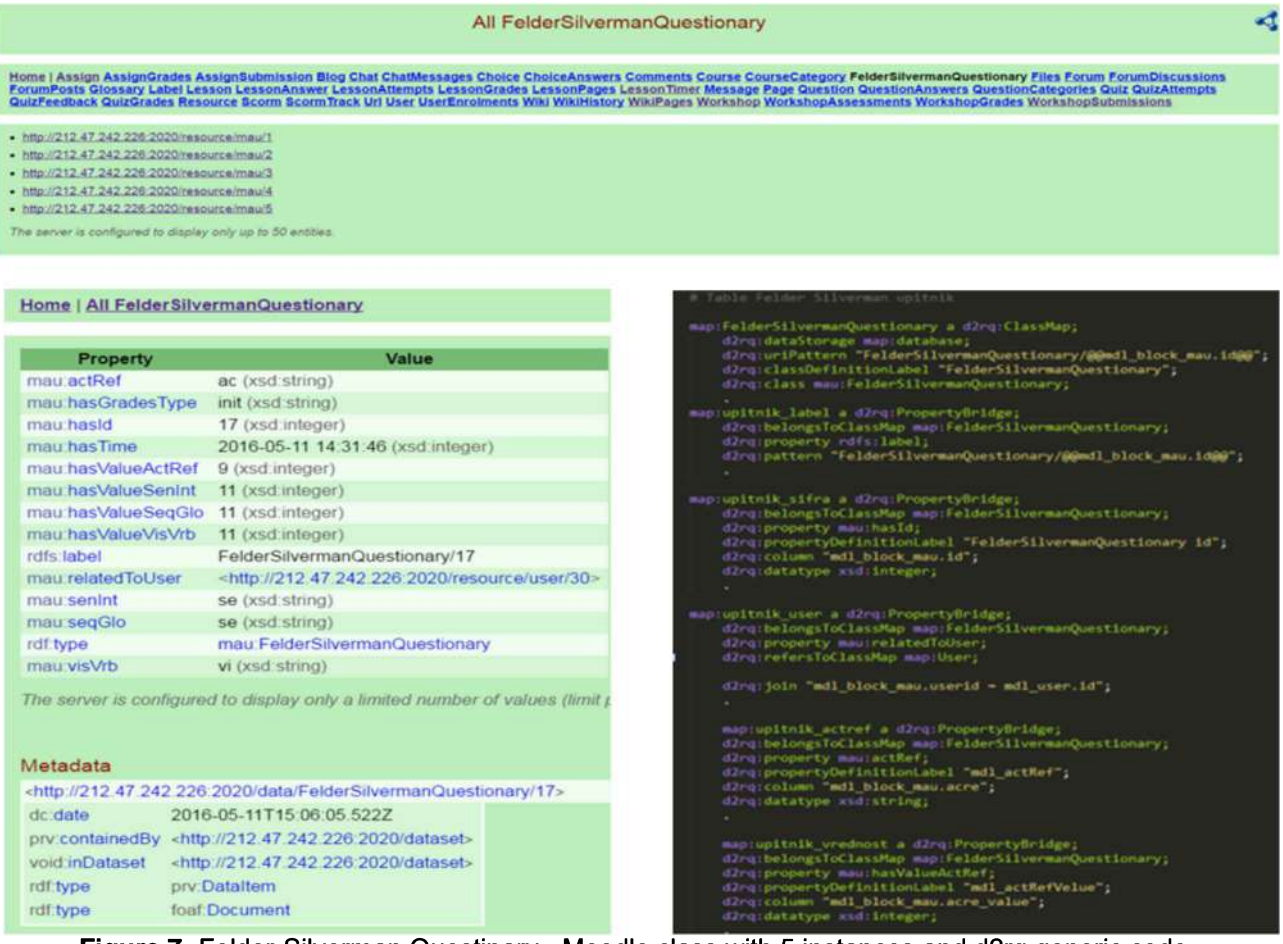

Figure 7: Felder-Silverman Questinary - Moodle class with 5 instances and d2rq generic code

3.3. Creating a domain ontology in Protégé and SWRL rules

Properly designed ontologies can accurately describe any domain, but caution needs to be exercised with balancing their expressiveness and complexity. For the purposes of this paper, it was necessary to partially take advantage of existing standards (vocabularies, ontologies) and use their classes and properties in the D2RQ mapping file (Fig. 8). For creating a student model, we used the basic FOAF ontology. For the modeling of learning objects, we used the basic Dublin Core and IEEE LOM ontologies. Those mapped Moodle data represent a good base for enriching of domain ontology and making more precise rules for personalized dynamic adaptive e-learning systems.

Figure 8: Using existing ontologies for creating the domain ontology

Ontology and learning bases can be adjusted intuitively inside Protégé, being accessed with a graphical client interface and Java API. Protégé can be extended using pluggable components to include new functionalities and administration (Calvanese et al., 2015; Lohmann, Negru, Haag, & Ertl, 2014). We used this editor for ontology development because it enables the construction of domain ontologies and customized data entry forms. In addition, it allows the definition of classes, class hierarchies, variables, variable-value restrictions, and the relationships between classes as well as the properties of these relationships. The figure 9. shows list of clasees, data, object properties and instances in the created ontology.

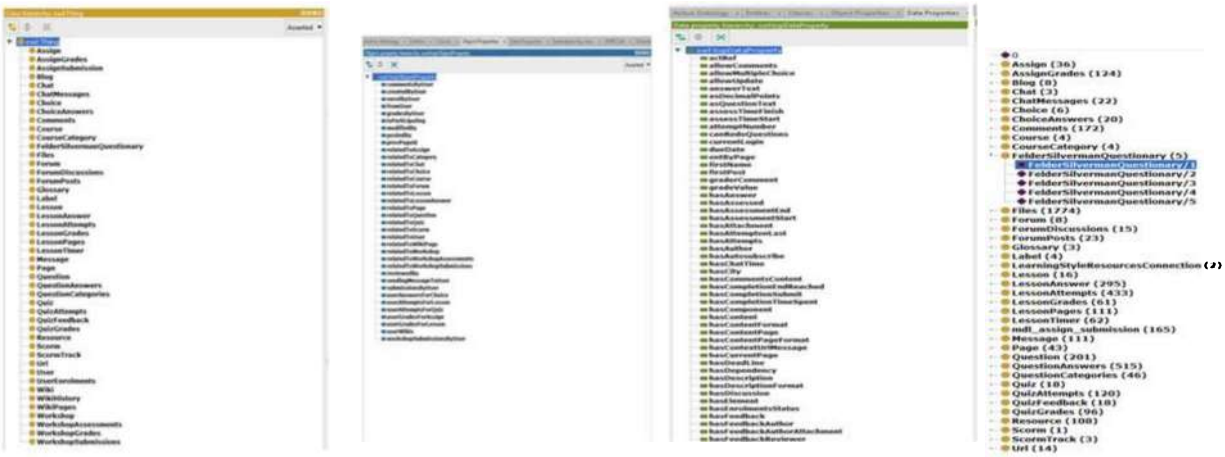

Figure 9: List of Classess, Object Properties, Data Properties and instances in MAU ontology

The first phase of the ontology building process is to identify the ontology, goal and scope, in order to specify the domain ontology and required resources. Figure 10. shows creation of simple adaptation rules which are defined with SWRL syntax. For instance, the Felder Silverman questionnaire class has an initial value of 0. Then we define SWRL rules for student's learning style classification after the questionnaire is completed. The student must belong to one learning style in one dimension. If the learning style changes over time, the student can move only his counterparts within the same dimension.

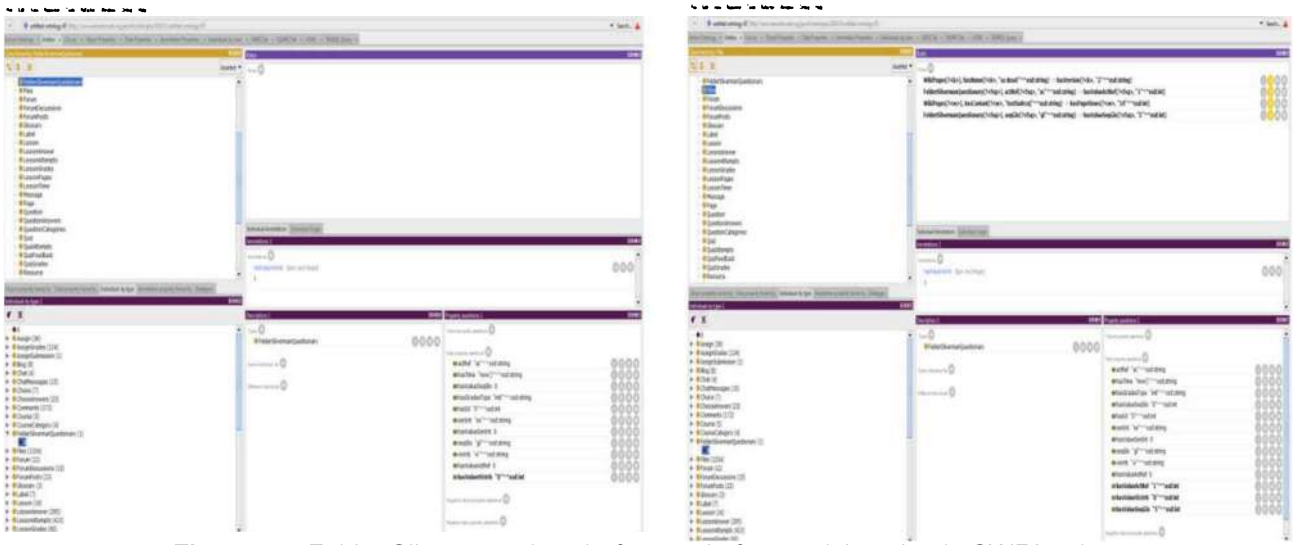

Figure 10: Felder Silverman class before and after applying simple SWRL rules

Rule 1: FelderSilvermanQuestionary (?fsq) ^ seqGlo(?fsq, "gl"^^xsd:string) → hasValueSeqGlo(?fsq, 5)
Rule 2: FelderSilvermanQuestionary (?fsq) ^ actRef(?fsq, "ac"^^xsd:string) → hasValueActRef(?fsq, 1)
Rule 3: WikiPages(?k) ^ hasName(?k, "sa deset") → hasVersion(?k, "2"^^xsd:string)
Rule 4: WikiPages(?w) ^ hasContent(?w, "testSadrzaj"^^xsd:string) → hasPageViews(?w, 10)

The first two rules are related to the Felder-Silverman questionnaire and the other two to WikiPages. Rules execute sequentially. Values that belong to the class of individuals and values returned to the set of SWRL rules are shown in the Individual Description and Individual Property fields. Creation and execution of SWRL rules are executed in Protege SWRL Tab.

4. CONCLUSION

Learning Management Systems have demonstrated to be a useful tool in learning processes, especially for online students, and they are implemented in most universities worldwide. In this paper, we propose a new semantic model for creating dataset and ontology model for adaptation in e-learning systems. It is based on real behavior patterns of students during interaction with the Moodle LMS and social networks. Those patterns involve the use of ontologies, semantic technologies and adaptation rules according to the personalization with a FSLSM model in real time. An advantage of this proposed model is that if the metadata model changes in the dataset and ontology, then, all semantic plug-ins in LMS that use this ontology as a reference model will change their behavior without changing its code.Future work will focus on extending our ontology to other metadata standards and external vocabularies. Also, in the future we will try to extend the criteria of adaptation to some other student preferences.

ACKNOWLEDGEMENT

The authors are thankful to the Ministry of Education and Science for financial support grant number 174031.

SUCCESS FACTORS FOR LUXURY BRANDS IN E-BUSINESS: BURBERRY CASE STUDY

Tijana Radisavljevic*[1], Aleksandar Markovic[1]
[1]Faculty of organizational sciences, University of Belgrade
*Corresponding author, e-mail: tijanafon.radisavljevic@yahoo.com

***Abstract**: The most of brands in luxury fashion industry are resistant to adopting e-business due to certain characteristics of Internet that are threatening to diminish luxury brand exclusivity. However, many researches showed that e-commerce could bring new opportunities of increasing markets for luxury goods. Thus, the question is no longer whether luxury brands should go online, but what is the best strategy to do it. Hence, the aim of this paper is to identify best practices and define conceptual model that provide guidance to the companies entering digital world. Based on analysis of Burberry's digital strategy, as the company with the highest digital IG, recognized, this study presents some of critical success factors on luxury fashion e-business.*

***Keywords:** e-commerce, digitalisation, luxury, brands, burberry, online, strategy*

1. INTRODUCTION

E-commerce is an inevitable trend as consumers purchase more products and services through online channels (Kotler & Keller, 2009). Chaffey (2015) reports that more than 40% of the World population is using the Internet and Forte (2014) predicts that online market will reach $ 1.4 billion, which is 14% more than in 2012. Yet, there are still companies, mainly from luxury fashion industry, that are wittingly avoiding the implementation of e-business into their strategy. The underlying reason for it is belief that Internet characteristics will diminish exclusivity and value of the luxury brand. However, statistical data and other researches showed that Internet has major influence on luxury shoppers as well that carefully designed e-strategy can help luxury companies to benefit from online presence and involvement (Mau, 2015). Moreover, Bain & Company (2014, p.17) said in their report that online luxury market multiplied 12 times in the past 11 years composing now 5% of total sales.

Concepts of luxury and Internet, at first site, are carrying opposite ideas. While luxury is related to the ideas of originality, creativity, precision, focus on details, emotions, exclusivity, prestige, high prices, high quality and very narrow target group, Internet is related to mass accessibility and availability as well as low price (Okonkwo, 2010). There is 35% of luxury brands, among which are Chanel, Dior, Celine, Hermes, that used these contrasts as the excuse for not integrating the online business into their strategy (Bain & Company, 2014, p.17; Mau, 2015). Even though this excuse may seem reasonable, statistical reports and other researches showed digital technology is part of everyday life of luxury consumers, as well that there are many examples of the luxury fashion companies (such as Burberry, Gucci or Ralph Lauren) that successfully implemented online strategy and benefited from it (Choi et al., 2014; Galloway, 2013).

Digital technology is important when it comes to two-way communication between company and customers. Companies are using digital technology to interact with their customers in order to gain insightful feedback, while customers are using it to create communities and share experiences (Euromonitor, 2013). Moreover, McKinsey&Company (2015) reports that three out of four luxury shopping are influenced by online experience, even though they are done offline. Moreover, digital interaction between consumers and luxury brands is directly increasing the offline sale for 13% and overall sale for 20% (McKinsey&Company, 2013). Not only online experience influences the offline shopping but demand for online luxury products is on constant growth (Okonkwo, 2010). Furthermore, unlike the offline sale growing only 7% a year, online sale grows 27% a year. Despite the fact that Internet cannot offer the prestigious locations, atmosphere, smell and touch that luxury products put forward, Okonkwo (2010) states that modern technology has made it possible to develop, adapt and apply e-business strategies that will enable luxury to thrive on the Internet without compromising its innate qualities and unique philosophy. Burberry was named the company with the highest digital IQ when it comes to Luxury Industry (Galloway, 2013), hence this paper aims to determine patterns and define common conceptual benchmark model that could help other luxury brands to implement their e-strategy.

Companies in luxury fashion industry are lagged behind adopting e-commerce due to some difficulties of maintaining brand image while being present online. However, e-commerce could bring new opportunities of increasing the size of luxury goods market. Thus, the issue of 'why' luxury should be online is no longer relevant but the current challenge is 'how' luxury should position itself online, particularly as consumers take charge of their online experiences. Based on in-depth analysis of Burberry, recognized as a digital innovation leader in luxury industry, this study presents some of critical success factors on luxury fashion e-commerce.

2. ELECTRONIC BUSINESS

Electronic business (e-business) is often thought to refer to buying and selling using the Internet, however, it involves much more than online financial transactions between two parties. Adoption of e-business is driven by benefits it brings to various parts of the organization, depending on the orientation of e-business (Chaffey, 2009; Okonkwo, 2010).

E-business represents "all electronically mediated information exchanges, both within an organization and with external stakeholders supporting the range of business processes" (Chaffey, 2009, p.13). Thus, e-business includes "online communications, client relationship management, consumer monitoring, Internet marketing, experiential marketing, branding, retail, logistics and their connected dimensions like merchandizing and after-sales support" (Okonkwo, 2010, p.20).

When evaluating the strategic impact of e-business on an organization, it is useful to identify the orientation of e-commerce, whether it is sell-side or buy-side, as well as the benefits in terms of increased revenue and/or reduced costs (Chaffey, 2009). Electronic commerce, defined as "all electronically mediated information exchanges between an organization and its external stakeholders", on one hand has its buy-side whereby transactions are done between a purchasing organization and its suppliers and on the other, sell-side where transactions occur between a supplier organization and its customers (Chaffey, 2009, p.10). The focus of this study is the sell-side e-commerce, which has for a purpose to sell the products and/or services, provide necessary information, stimulate the purchase, and to build stronger brand image. Benefits arising out of these activities are reflected in decreased costs and/or increased revenues. While potential revenue growth is a result of larger customer base and encouraged loyalty, cost reduction is achieved by delivering services electronically whereby staff costs, transport costs, costs of materials and others are cut (Chaffey, 2009).

Electronic Business should be understood as an integrated approach to every aspect of online business with a purpose to continuously optimise a company's value proposition through adopting digital technology and the Internet as channels of multiple business activities.

2.1. Online Value Proposition Model

Online value proposition of a specific brand refers to the set of dimensions, which provide benefits for the customers and distinguish it from its competitors (Kotler and Armstrong, 2006; Sheth, Newman and Gross, 1991; Schultz and Zelezny, 1999). In order to conceptualise this topic, some scholars were focused on defining frameworks with key dimensions that would determine essential attributes for their business value proposition (Chaffey, 2009; Rayport and Jaworski, 2001; Rayport and Jaworski, 2003).

Schultz and Zelezny (1999) define values as beliefs that lead and evaluate the choices, outcomes and desirable behaviours. Considering the consumption when it comes to purchase, different types of values are what is directly driving customer choices (Sheth, Newman, and Gross, 1991). Accordingly, a value proposition was defined as "the set of benefits or values it promises to deliver to consumers to satisfy their needs" (Kotler and Armstrong, 2006, p. 9). It implies to customers how it will satisfy their needs better or differently from competitors ((Tsun-Yin) Tung, (Catherine) Jai and Davis Burns, 2014).

In order to provide a clear understanding of benefits for the customers, some academics proposed application of online value proposition models as a part of online strategy. Chaffey (2009, p.37) introduced the "6 Cs" model that consists of six different elements: content, customization, community, convenience, choice and cost reduction. Similarly, Rayport and Jaworski (2001, p.116) proposed "7 Cs" model that includes slightly different dimensions: context, content, customisation, community, communication, connection and commerce. Given the fact that this paper is focused on luxury industry where high prices of the products/services are one of the main characteristics, Chaffey's model of "6 Cs" is found to be less suitable for the specific scope of this study, thus the focus will be on "7 Cs" model:

- *Context* captures the aesthetic nature and functionality of the site, which have significant impact on consumer perception (Tsun-Yin) Tung, (Catherine) Jai and Davis Burns, 2014). Rayport and Jaworski (2001) defined Context as "the look-and-feel of a screen-to-face customer interface" (p. 11). In order to create a positive experience and influence on the customer, it is important to have highly organised linking structure between pages and important information easily visible (Chaffey, 2009; Lee and Benbasat, 2003).
- *Content* should be focused on what site delivers, comprising the mix of product and service (Lee and Benbasat, 2003). Rayport and Jaworski (2001) defined it as "all digital subject matter on the site" (p. 115). Content could be presented through combination of product and service information, interaction with the customers and multimedia support (Tsun-Yin) Tung, (Catherine) Jai and Davis Burns, 2014).
- *Community* deals with the interaction between the users including a sense of involvement and membership through which they share their opinions and experiences (Chaffey, 2009; Lee and Benbasat, 2003).
- *Customisation* refers to the site's ability to offer customised content and personalised interface based on the customer preferences (Chaffey, 2009; Lee and Benbasat, 2003). Rayport and Jaworski (2001) defined it as "the site's ability to tailor itself or to be tailored by each user" (p. 115). Customisation has two main concepts depending which side is the initiator of the customisation- tailoring is initiated by the firm and personalisation by the user. This feature is important part of online value proposition model as it is able to encourage consumer's shopping activities (Tsun-Yin) Tung, (Catherine) Jai and Davis Burns, 2014).
- *Communication* concerns "the dialogue that unfolds between the site and its user" (Rayport and Jaworski, 2001, p. 116), which can be both one-way information exchange, or interactive whereby communication flow would be two-sided (Lee and Benbasat, 2003; (Tsun-Yin) Tung, (Catherine) Jai and Davis Burns, 2014).

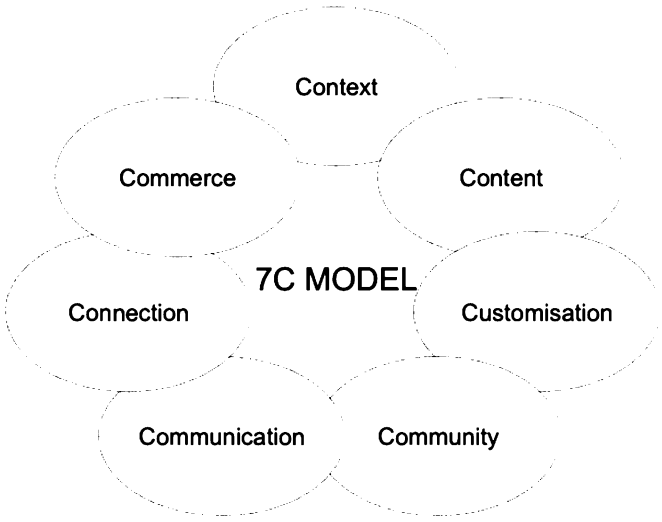

Figure 1: Seven Cs Model (Rayport i Jaworski, 2003)

- *Connection* is defined as "the extent of the formal linkages between the site and other sites" (Rayport and Jaworski, 2001, p. 116), which can create additional value for the customers (Lee and Benbasat, 2003; (Tsun-Yin) Tung, (Catherine) Jai and Davis Burns, 2014).
- *Commerce* involves various aspects of business transactions ssuch as "the sale of goods, products, or service on the site" (Rayport and Jaworski, 2001, p. 116), pre-sale and after-sale support, security, order tracking, delivery options, etc. (Lee and Benbasat, 2003; (Tsun-Yin) Tung, (Catherine) Jai and Davis Burns, 2014).

The purpose of the 7Cs framework is to show the importance of the seven dimensions when it comes to influencing consumer perception, creating value for them and meeting their needs in order to grow the business.

3. LUXURY INDUSTRY

Among the businesses currently present in the market, luxury business is, by far, one with most complexity and wide-range (Hoffmann and Coste-Manière, 2011). Fast- moving environment is bringing new challenges but as well opportunities for the companies.

Most people are able to recognise luxury products but cannot define the characteristics that contribute to the concept of luxury. Some define luxury by price, others by a list of attributes, and some by exclusivity of distribution (Hoffmann and Coste-Manière, 2013). Karoline Huber, cited in Boyden (n.d., p.8), explains, "Luxury is based on an emotion and it is people who create emotional differences. Competing on product provides less advantage – but using people as a competitive differentiator creates the emotional benefits that drive loyalty, protect brand value and build brand equity". What justifies the premium pricing of luxury goods is the value of a brand in the consumer minds. Brand value is created through stories, traditions, innovation, scarcity, differentiation and exclusivity (Dubois, Czellar and Laurent, 2005). Luxury goods are not used for their intrinsic value but for their symbolic value that for each individual can be different. Hence, it can be said that luxury product has two facets, tangible and intangible. Tangible aspect involves at first place product quality that is assured on all stages of supply chain. Furthermore, visible aspects include exceptional and scarce materials (components), expertise in manufacturing, craftsmanship heritage, original design and outstanding performance (Brun and Castelli, 2013). According to Herzberg's Motivation Theory (1959) tangible characteristic of luxury product would be dissatisfier, meaning that luxury consumers will naturally expect excellence in the product performance and quality. Luxury product must satisfy three criteria: it must have a strong artistic element, it must be the result of craftsmanship and it must have a global brand reputation (Hoffmann and Coste-Manière, 2011). Yet, what motivate the consumers to opt for luxury product are intangible facets of it, which include emotional appeal of specific luxury brand. Emotional appeal is driven by many intangible factors, such as global reputation of the brand, innovation, shopping experience, a lifestyle brand is proposing, exclusivity of product achieved by marketing approaches and premium prices (Brun and Castelli, 2013; de Azevedo Rosa, 2012).

The global luxury market is composed of nine different, yet complementary, segments presented in the Figure 2, whereby the focus of this study is Personal luxury goods. In 2014 the global luxury market

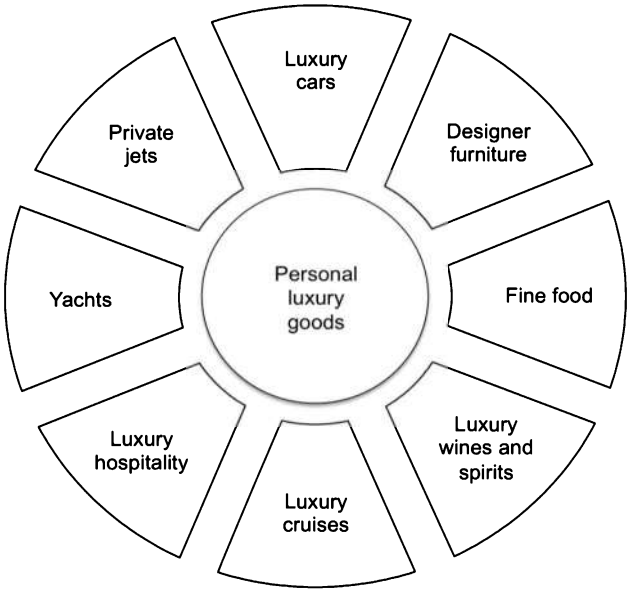

Figure 2: The nine segments of global luxury market (Adapted from: Bain & Company, 2014, p. 8)

exceeded €850 billion from which the personal luxury goods market generated more than €223 billion, which is for 3% higher than in the previous year (Bain & Company, 2014, p.8). Moreover, Bain & Company (2014, p.7) stated that the market of personal luxury goods tripled over the past 20 years and represents the "core of the core" of luxury.

All definitions and associations of luxury contain concepts of power, distinction, excellence, beauty, sophistication, superiority, class, privilege, rarity and exclusivity (de Azevedo Rosa, 2012). Luxury brand industry comprises exclusive group of brands across different product segments, whereby luxury brands differ from non-luxury brands according to functional and symbolic dimensions of the product as well as consumer perceptions of luxuriousness (Seo and Buchanan-Oliver, 2015).

3.1. Luxury Value Proposition Model (Offline)

Following the comprehensive understanding of all factors that build a luxury brand, Wiedmann, Hennigs and Siebels (2009, p.4) proposed a single model that includes "all relevant present and potential value sources of

the consumer's luxury perception". Drawing on existing luxury research theory, Wiedmann, Hennigs and Siebels (2009) defined the model with the four different dimensions and its variables (Figure 3) through which customers perceive the value of luxury product and/or service.

Financial Value represents the necessary element when it comes to luxury goods and it refers to the monetary aspects of the product or service in terms of price, discount, investment, etc. However, it is important to emphasise that in case of luxury goods qualitative characteristic are more important than quantitative. Accompanying the Financial Value, Price Value is positively correlated with high quality suggesting the sense of prestige and social status, which makes a product more desirable (Hennigs, Wiedmann and Klarmann, 2012; Wiedmann, Hennigs and Siebels, 2009).

Functional Value refers the essence of the luxury good, its purpose and core benefit. This dimension refers to the visible elements of a luxury good such as rare resources and materials, tradition, unique craftsmanship, original design and excellence in performance. Functional value is driven by usability, quality and uniqueness. Usability Value refers to both the product functionality and customer needs that will be satisfied with the product functionality. Thus, customers expect the item they purchase to perform and look as expected. Quality Value is related to the superior quality as the reason why customers opt for luxury

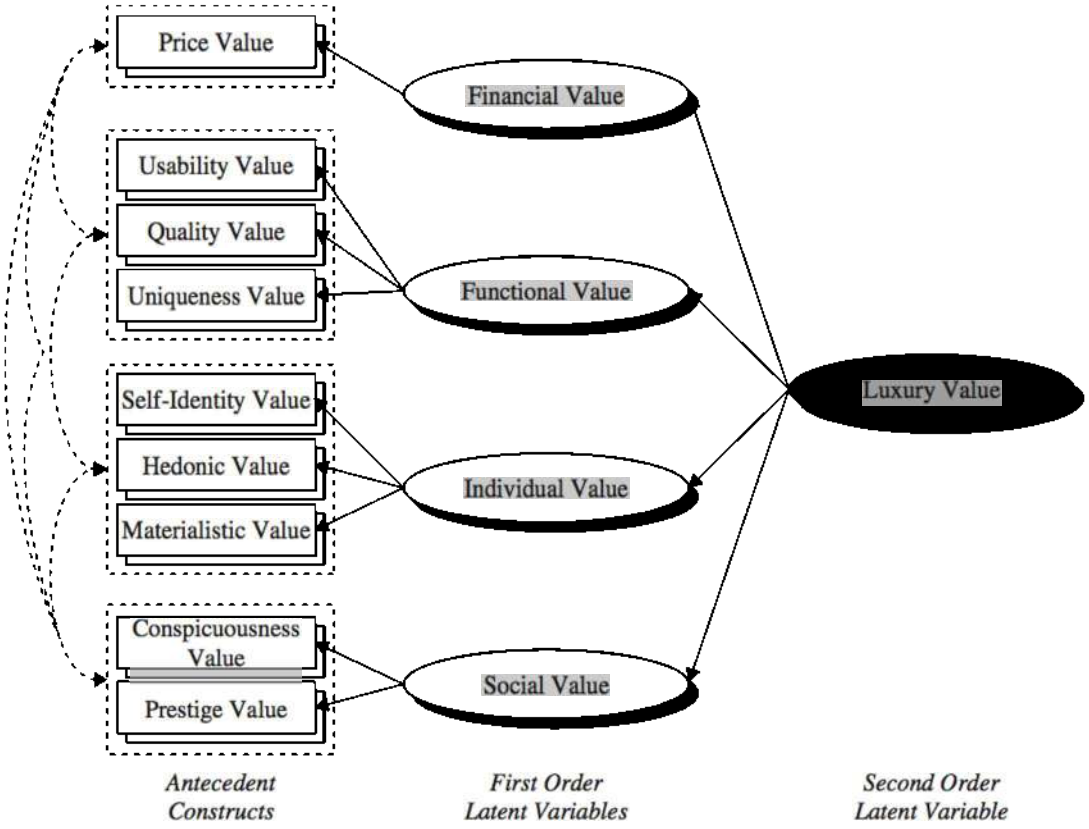

Figure 3: Conceptual Model: Determinants of Consumers' Luxury Value Perceptions (Adapted from: Wiedmann, Hennigs and Siebels, 2009, p.629, fig. 1)

goods as well to the assumption that luxury brand offers "greater product quality and performance than non-luxury brands" (Wiedmann, Hennigs and Siebels, 2009, p.630).

Individual Value of Luxury Value Perception has to do with consumer's personal preferences when it comes to luxury consumption. It addresses personal matters such as Self-Identity Value, Hedonic Value and Materialistic Value. Self-Identity Value is related to the research that showed some people opt for luxury brands in order to identify themselves with the symbols of luxury, such as exclusivity, authenticity, high quality, uniqueness, etc. Hedonic Value explains the intangible benefits of luxury goods that are creating emotional value, pleasure and excitement for the consumers. Materialistic Value represents the consumers' need to posses and acquire luxury goods in order to impress the social environment and position themselves highly in the society (Hennigs, Wiedmann and Klarmann, 2012; Wiedmann, Hennigs and Siebels, 2009).

Social Value is refers to the strong social function the consumption of luxury goods has for individuals. It represents the perceived utility in terms of conspicuousness and prestige value that luxury goods

consumption brings to the individuals within the their social groups. Conspicuousness Value is important to individuals who seek the social status and representation. Bearden and Etzel, cited in Wiedmann, Hennigs and Siebels (2009, p.632) concluded that "luxury goods consumed in public were more likely to be conspicuous goods than privately consumed luxury goods and that conspicuous consumption still plays a significant part in shaping preferences for many products that are purchased or consumed in public contexts". Prestige Value serves as the symbolic sign of elite group affiliation that will distinguish them from the no affluent lifestyles (Hennigs, Wiedmann and Klarmann, 2012; Wiedmann, Hennigs and Siebels, 2009). The key to creating successful strategy, including taking up online space, understands all relevant facts of consumer perception of luxury. The four proposed values and their antecedent constructs encompass consumer values that justify luxury purchase and represent prerequisite for successfully deployed online strategy.

3.2. Online Luxury Value Proposition Model

The Internet has played important role in the global market by enabling consumers not only to have an insight in the latest trends worldwide but also to shop worldwide (Deloitte, 2014a). Due to current trends in the market, the four-dimension model of luxury value proposition is extended through additional components related to e-business (Hennings, Wiedmann and Klarmann, 2012).

The latest trends like the market globalisation, digital technology, the Internet, democratisation of luxury and an increase in number of wealthy individuals are requiring from companies not only to adjust their strategies to the newest trends but also to change their perception of luxury as phenomenon (Radisavljević, n.d., p.10). Globalisation, as very popular trend lately, represents the integration of global market through social, economical, cultural, technological exchanges. Additionally, the Internet enabled a comprehensive availability, which led to assimilation of luxury preferences regardless cultural differences. One more consequence of these trends is the "democratisation of luxury" which refers to the fact that exclusivity got replaced by mass accessibility (Deloitte, 2014a, p.10). Furthermore, Okonkwo (2010) stated that online demand for luxury goods is on constant increase and influencing the growth of offline sales for 13% (McKinsey&Company, 2013, p.1). In addition, Bain & Company (2014, p.17) reported that in the last 11 years online luxury market multiplied 12 times and now accounts for 5% of total sales.

The refusal to accept the Internet as a complement to offline retailing and the inability to innovate is one of the biggest threats for luxury brands today. Luxury brands are finding justification in the adversarial relationship between the luxury and the Internet. While luxury nourishes tradition and exclusivity, Internet is quite an opposite. Even though many luxury brands are still hesitating to going online, this paper examines the power of the Internet as an instrument to reach a global audience while still maintaining a sense of exclusivity and sensory experience (Hennings, Wiedmann and Klarmann, 2012; Okonkwo, 2010).

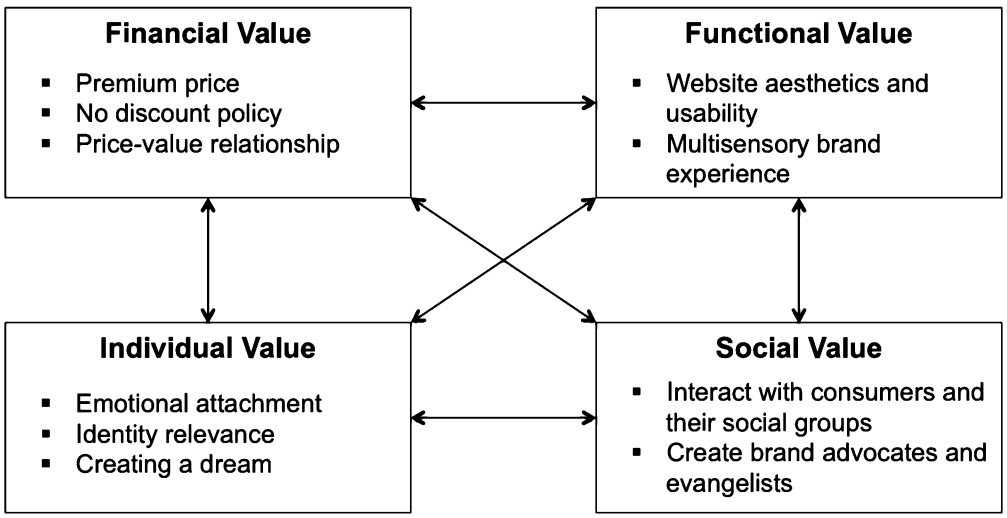

Figure 4: Online Luxury Value Proposition Model (Adapted from: Hennings, Wiedmann and Klarmann, 2012, p.34, fig.2)

With reference to the above-mentioned value dimensions, leaders in online luxury also incorporate the aspects that have to be addressed in luxury online business as illustrated in the Figure 4 and described in the following paragraphs.

Financial value. Despite the fact that a high price is widely accepted as a key component of luxury goods, it is important to point out that nature of luxury is qualitative and not quantitative. Hence, the price–value relationship is crucial, especially because the consumption of luxury products should provide social and psychological enhancements (Okonkwo 2010). In order to prevent potential diminishment of luxury goods in the virtual environment, the price premium associated with uniqueness, exclusivity, superb quality, hand-made craftsmanship, and impeccable service needs to be ensured in the virtual environment via limited distribution (Hennings, Wiedmann and Klarmann, 2012).

Functional value. Besides product-related characteristics that create value for luxury customers, the functional value of luxury in the virtual environment refers to the usability, quality and uniqueness of the online appearance when using the website and other applications. Even though the senses of touch and smell are missing, the digital technologies can leverage movement, music, texture, space and community to successfully regenerate a brand‘s philosophy online. Luxury brand managers should go beyond aesthetics and create marketing products that add value for the customer in terms of entertainment, education and engagement with the brand (Hennings, Wiedmann and Klarmann, 2012).

Individual value. Individuals use the luxury goods to support their identity projects and satisfy emotional needs, which represents the key elements in defining the concept of luxury. Customers experience luxuries as symbolic resources to transfer the brand's social symbolism, such as exclusivity, authenticity, quality, uniqueness and culture, into their own aspired identities. Therefore, with regard to the individual value of luxury, luxury brands should transfer the offline image into the online appearance and involve customers with the brand at a deeper level using the opportunity to gain feedback and make adjustments accordingly (Hennings, Wiedmann and Klarmann, 2012).

Social value. The social dimension of luxury addresses the social groups and focuses on online social networks. A lot of wealthy Internet users are regularly using social media becoming potential brand advocates. Customers broadcast their association with luxury brands within their social circles in order to relate brand's characteristics with their individual profiles, whereby they simultaneously promote the brand. Thus, by using the appropriate strategy, brands can become a part of the customer's online identity and vice versa.

The luxury companies can apply these four value dimensions with differing priorities, depending on their strategy for communicating their luxury message online. Researches have shown the opposite of what majority of luxury brands have thought (Hennigs, Wiedmann and Klarmann, 2012; Okonkwo, 2010; Radisavljevic, n.d.). The well-defined online strategy is crucial for luxury brands as it is not weakening, but strengthening the brand. The digital environment offers the opportunity to reach billions of people internationally, thus brands have to integrate their philosophy into online world in order to stay relevant and desirable for current and future customers (Hennings, Wiedmann and Klarmann, 2012).

Best practices give evidence that the key value dimensions of a luxury brand's offline strategy are a useful basis for the development of complementary online strategy that can create a true luxury experience. Further, this paper will examine the Burberry's best practice.

4. FINDINGS- A HOLISTIC LUXURY VALUE PROPOSITION MODEL

Given the above mentioned it could be concluded that in luxury industry online values cannot be created without the successful offline strategy. Likewise, researches showed that due to latest trends, it is not enough for luxury brands to propose only offline values but they need to adopt online strategy and reach their target group in virtual environment (Okonkwo, 2010). Thus, this study is proposing a holistic approach to creating a value for luxury customers.

The model presented in the Figure 5 integrates the both online and offline Luxury Value Proposition models with the 7Cs model. The integration of these three models is reflected in the correlation and overlapping between 7Cs' element Commerce with Financial Value, elements Communication, Content, Context with Functional Value, element Customisation with Individual value and elements Connection and Community with Social Value.

This model and the relationship of its elements can be explained the best through Herzberg's motivation theory (Herzberg, 1959). In order to succeed in digital environment, firstly it is necessary to have the values successfully implemented so that luxury brand will have well-established philosophy, story and tradition. If these elements are not well designed, they will diminish the luxuriousness of the goods. However, they are not enough to succeed digitally. In order for customer to buy a luxury product online the next step will be

implementation of online luxury values that are aligned with 7Cs model as presented in the Figure 5. Similarly, Abrams Research (n.d., p.6) are suggesting the five steps for business digitalisation: translate unique brand elements to social platforms, adapt business practices to the online business model, identify and expand audiences, empower customers and manage customer relations. Challenges that arise here are

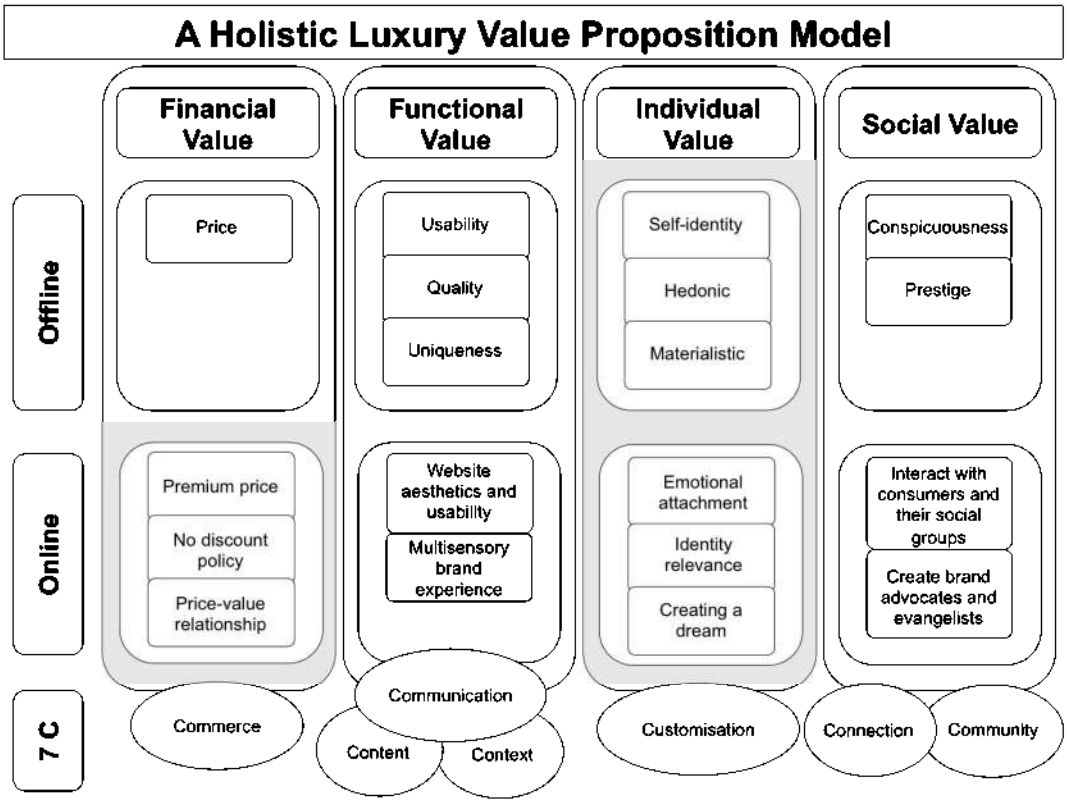

Figure 5: A Holistic Luxury Value Proposition Model (Source: The Authors)

to meet or exceed customer's expectations, to assure sophisticated social media presence and to participate in two-way communication on social media (Abrams Research, n.d.).
The e-business brought many challenges and opportunities for growth in luxury industry. Luxury brands should translate their brand message in the digital environment taking care not to diminish existing values and brand philosophy. However, in order to translate those opportunities into growth and success it is necessary to apply strategic and organised approach to online business in terms of holistic approach presented in the figure above.

4.1. Burberry Case Study

Burberry, the main representative of British fashion scene, was founded almost two centuries ago, in 1856 (Burberry, 2014). Burberry's strategy proved to be successful over the decades as Burberry always finds its place in the top of the lists of the world's best brands (Deloitte, 2014a). Moreover, according to Galloway (2013, p.5) Burberry is the most successful luxury brand when it comes to e-business. It started implementing its online strategy as of 2011 (Choi et al., 2014; Galloway, 2013). Moreover, when it comes to financial performance it is one of the most profitable luxury companies in European market (Choi et al., 2014; Deloitte, 2014). Given the fact that Burberry proved its quality and strong brand image over the years, its offline strategy will not be considered in this study. The focus of this study is to examine Burberry's online strategy and tactics in the light of the holistic concept presented in the Figure 5.

Burberry's vision to become the first company to be fully digitalised is supported by £30million investment that aims to connect Burberry with its customers, employees, partners and suppliers (Burberry, 2014; Choi et al., 2014). This investment also supports the value creation for new market through digital innovation, mainly through implementation of e-commerce. The value created in this way is supposed to provide the exactly same Burberry experience regardless of where, when and how customers are accessing the brand. Using this strategy, Burberry is not only targeting existing customers but also young people, potential customers,

who do not have money yet to invest in Burberry goods, however emotional connection that is built later can turn them into real consumers of Burberry luxury goods (Choi et al., 2014).
With the reference of Figure 5 presented in the previous section, tactics that Burberry applied in order to use opportunities of digital environment and consequently increase profits and strengthen the brand identity are presented in the Figure 6 below, in the "Online" section.

When it comes to Financial Value, Burberry keeps the same prices in online and offline stores, offering online discount only when in offline stores as well. Moreover, Burberry gives the benefit of international return policy whereby customers can return goods they are not satisfied with (Burberry, 2014; Choi et al., 2014; Rayport and Jaworski, 2001).

Functional Value in Burberry case offers profuse and high quality contents and benefits. Not only are Burberry goods presented in high-quality photos on their online platform but also in 360° view, which facilitates the experience of "see and feel" (Choi et al., 2014, p.6). Likewise, besides the real-time streaming of Burberry fashion shows (Runway to Reality), its customers can order looks straight from the catwalk as of 2012. Moreover, Burberry's customer support centre is available 24/7 in 14 different languages (Burberry,

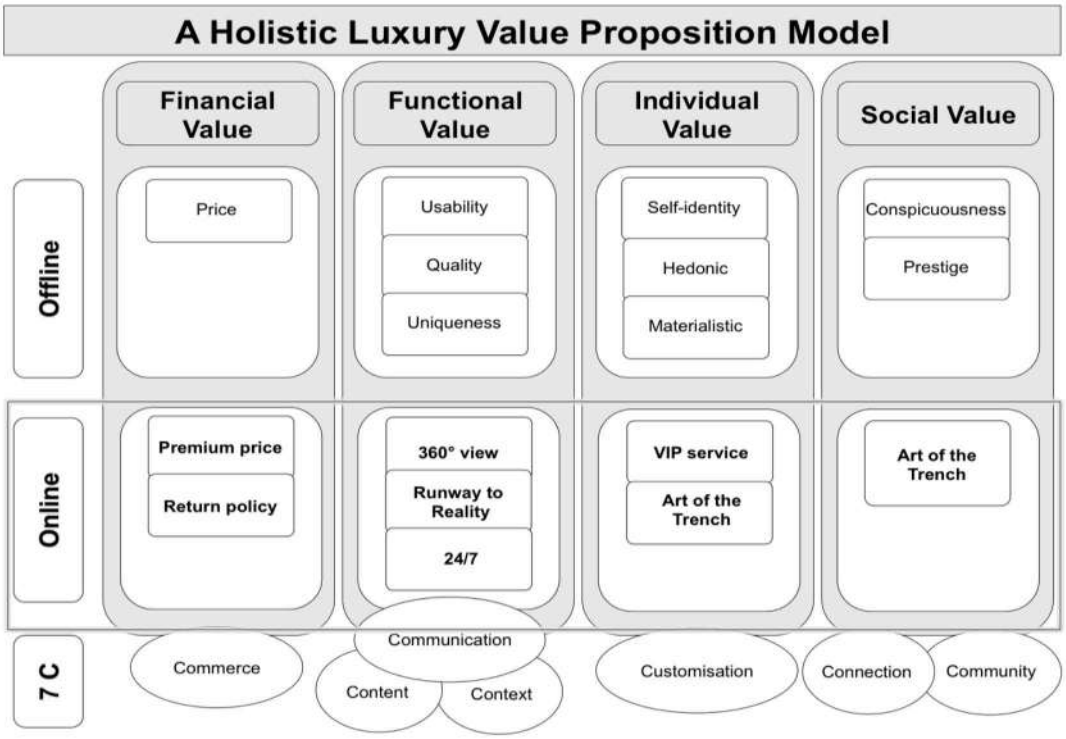

Figure 6: A Holistic Luxury Value Proposition Model- Burberry case (Source: The Authors)

2014; Choi et al., 2014, p.7; Rayport and Jaworski, 2001).

Burberry's strategy in case of Individual Value is to provide support to very important customers (VIP) in order to preserve exclusive treatment that customers expect and also their loyalty. Besides that, both Individual and Social Value are supported with the feature "Art of Trench". This feature is actually Burberry's very own social network designed to allow customers to upload a photo of themselves in the famous and iconic Burberry's trench coat. In this way, customers of luxury goods can satisfy their need of conspicuousness. During the first year of launching, the Art of Trench network reached more than 11 million views (Choi et al., 2014). Moreover, this project created the community of its customers promoting Burberry's brand in the same time (Burberry, 2014; Choi et al., 2014, p.7; Rayport and Jaworski, 2001).

Burberry is the luxury brand with the highest digital IQ. The benefits of being involved in digital environment, even for luxury brands, are reflected in Burberry's financial performance. In 2012, Burberry had both revenue and operating profit growth of 24%. In addition, it increased brand awareness among young population (Choi et al., 2014). It can be concluded that all tactics Burberry uses to provide financial, functional, individual and social values for its customers not only remained faithful to original brand philosophy and tradition but also improved Burberry's business as a whole.

5. CONCLUSION

This paper examined how luxury brands could benefit by digitalising their business. Luxury brands perceive the Internet as a threat to attenuate the brand value. However, we argue that the question is no more whether luxury brands should adopt online business but how they should do it. Thus, the challenge is to deliver the unique experiences for their luxury products to their customers as they do in offline store.

The luxury customers worldwide have accepted the internet as a resource, communication vehicle and e-commerce platform. As the customers continue to spend more time online, a strategic approach to e-business will prove critical. Luxury brands would be negligent not to do the same. Although the primary purpose of luxury businesses has not changed, the most effective and efficient ways for reaching it have. According to the latest studies, luxury brands should invest in their online presence and translate their original philosophy into digital environment that should be understood as the extension of the existing business and not a new concept. Consequently, the progress of a luxury brand's digital presence translates to measurable gains in terms of financial performance and the number of people who interact with that brand.

This research used the case of the British luxury brand, Burberry, to show how this company adopted e-commerce and which tactics it used in the light of a holistic value proposition model developed in this study. As a result of all efforts when it comes to digitalisation, Burberry has become the most successful brand among the luxury fashion companies. As this paper argued, Burberry suitably translated and adapted its offline values, exclusivity and philosophy into online platform, which resulted in financial growth and brand awareness increment.

To succeed online, luxury brands must convey their quintessence to the digital environment and leverage the unique capabilities of the digital space to reach customers in modern and stirring way. Customers will only identify with a luxury brand that ads value to their own personality. Luxury brands that have adopted this are experiencing benefits across the various aspects from customer communities, to the raise of brand ambassadors, to enlarged brand awareness, to online sales growth and to increased market share.

DIGITAL MARKETING AND SOCIAL MEDIA IN HIGHER EDUCATION

Jovana Vujin
Faculty of Organizational Sciences, Belgrade
e-mail: vujinj1991@gmail.com

Abstract: *This paper presents opportunities of implementation digital marketing and social media marketing in higher education. The world of digital media is changing and progressing, and the way people are using technologies is constantly evolving. The goal of this paper is to analyze the potential of implementation digital marketing in higher education in Serbia. The paper shows that technical habits of students in Serbia are eligible for implementation of digital marketing and higher education synergy. Also, the paper presents the global digital marketing trends in higher education. The second part of the paper gives an example and first steps for implementation of this synergy. The institutions of higher education in Serbia have chance to use digital marketing and social media and introduce higher education into next technical level.*

Keywords*: Digital Marketing, Social Media Marketing, Social Networks, Higher Education, Search Engine Marketing (SEM), Search Engine Optimization (SEO)*

1. INTRODUCTION

The digital media world is changing constantly. Beside the technology progress, the way of using internet is evolving and changing. These changes are transforming not just how people access to information, but how they communicate and interact. Also, the way people choose and buy products and services is changing. Ryan and Jones point out that "People are embracing digital technology to communicate in ways that would have been inconceivable just a few short years ago. Digital technologies are no longer the preserve of tech-savvy early adopters, and today ordinary people are integrating them seamlessly into their everyday lives" (p.8). According to Parker “The explosion of new digital technologies and practices is also revolutionizing teaching and learning and there is probably no academic discipline more affected by the emergence of Internet technology than the field of marketing” (p.173). Today’s students often referred to as the “digital generation,” use an impressive assortment of technological tools in a wide variety of ways.

In 2011, Constantinides and Zinck noted that “the importance of the internet as commercial platform is by now universally recognized and increasingly businesses adopt online marketing channels at the cost of traditional ones. The social media, being second generation (Web 2.0) internet applications, allow interaction, one-to-one communication, customer engagement, and user generated content” (p.1).

All of this made a space for digital marketing and social media in education. This is primarily an opportunity for institutions of higher education in Serbia.

This paper presents the preconditions, the advantages and disadvantages for implementation digital marketing in higher education in Serbia and why is it so important for higher level educational system to implement digital trends.

2. DIGITAL MARKETING IN HIGHER EDUCATION

Integration of technology into the marketing classroom is not a new phenomenon. Nuldén noted that by the late 1990s, technology had become a routine component of the classroom pedagogy and of education in general (p.363). However, the technology and its integration in the marketing classroom have changer past ten years. According to Grewal and Levy “The changes and advances in social, mobile, and online technologies have created a perfect storm, forcing firms to change how they communicate with their customers” (p.84).

Hensen, Shneiderman and Smith pointed that digital and social media have changed the nature of interactions between customers and companies, engendering radically new ways of interacting and, essentially, revolutionizing marketing. As such, an integration of digital and social media into business marketing strategies is necessary to promote increased engagement and interaction (Coulter & Roggeveen,

2012). Engagement is the name of the game in marketing practice (Rohm & Weiss, 2014), and the marketing professoriate needs to be ahead of this technological storm instead of behind it (Crittenden, V. & Crittenden, W., 2015).

2.2. Digital marketing trends in higher education

Continuous monitoring of trends is necessary in every activity, including education. When big universities started using Social Media in education, most students immediately accepted the idea and actively involved, which shows that this channel of communication is close and familiar to them. Based on this, the conclusion is that this synergy can only bring positive results.

According to Hanover Research institutions of higher education are focusing on branding and marketing far more than previous years. Many have hired marketing professionals from the corporate world and invested significant time and money to create strong institutional brands (p.5).

Based on digital marketing trends defined by Hanover Research, the aditional trends that higher education institutions must follow if they want to implement digital marketing, are:

- Responsive website design: Institutions are placing more emphasis on responsive web design to create intuitive and easy to navigate websites that can be viewed on multiple devices and platforms.
- Search Engine Optimization and Search Engine Marketing (SEO and SEM) - the importance of this trend is reflected in the fact that educational institutions rank first places in search engines (Google). Also, Google Search Engine is constantly changing, so that more and more top results are paid ads. This makes institutions of higher education to invest resources in SEM.
- Uses of web analytics – Institutions of higher education are relying on data-driven analytics to determine who, how, and where they are reaching their audiences. The use of analytics software is increasing as the higher education web ecosystem is becoming increasingly complex, and the amount of online material institutions is expanding (domains, sub domains, etc.). Better analysis of this data is a new area of concentration for institutions of higher education.
- Strategic Social Media Management – like in many business areas, Social Media Management have a major impact on education. Most institutions of higher education in Serbia have accounts on at least one Social Network.
- Mobile development - Because of the rise of mobile technology and connected devices, colleges and universities are making greater investments in having a mobile presence. This includes not only mobile versions of websites and other content, but also making of mobile applications and BYOD (Bring Your Own Device) access to mobile devices.
- Content Management System and Customer Relationship Management (CMS and CRM) – Alongside the use of web analytics and other methods of harnessing “big data” in higher education, institutions of higher education are relying more heavily on content management and customer relations systems. CRM systems are especially important tools for admissions professionals engaged in outreach to prospective students, and also to make communication better and more efficient.
- Blogging and vlogging - Institutions of higher education should have a blog and a vlog. This will help students to solve everyday problems and answer to their most frequent questions.
-

2.3. Technology preconditions for the implementation of digital marketing in higher education

For making use of digital marketing in higher education successful, it is necessary to examine if our target group (students, 17-28) have daily access to the Internet. According to data from website Consumer Barometer with Google, on the chart Figure 1, we can see that the number of people who have access to the Internet from year to year is constantly growing, so in 2015, 97% of respondents said that they have access to the Internet. Also, the number of people who access the Internet every day is increasing, so we can say that these two categories are going to equalize, with the prediction that in a few years all people who will have access to the Internet, access the Internet every day.

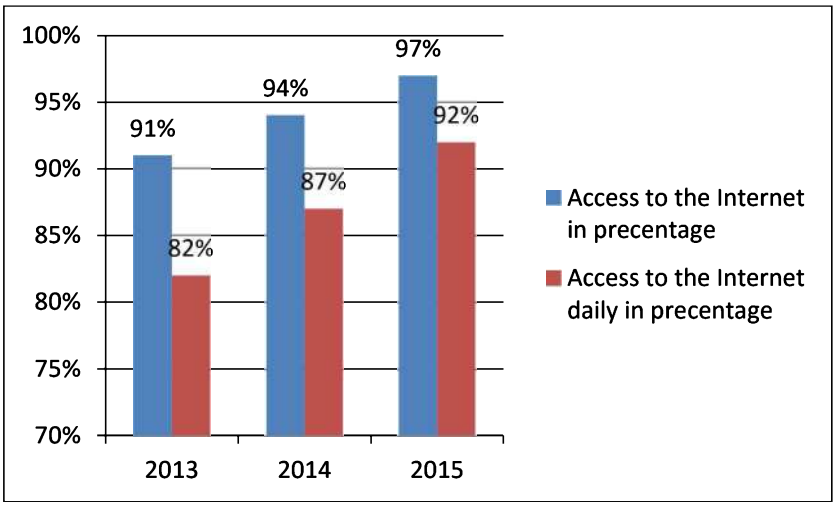

Figure 1: The ratio of people who have access to the Internet (%) and people who access the Internet daily
www.consumerbarometer.com

For implementation of digital marketing in higher education it is important that students can get information anywhere, anytime, and that the only requirement is the Internet access. This is enabled by the portable devices such as mobile phones and tablets. Of course, the use of computers is irreplaceable when we talk about writing papers, access online exams etc. On the chart, Figure 2 we can see the percentage of people (under 25) who use smartphones, computers and/or tablets. We can notice that the number of people who use computers since 2013. is in stagnation, while usage of smartphones recorded rapid growth.

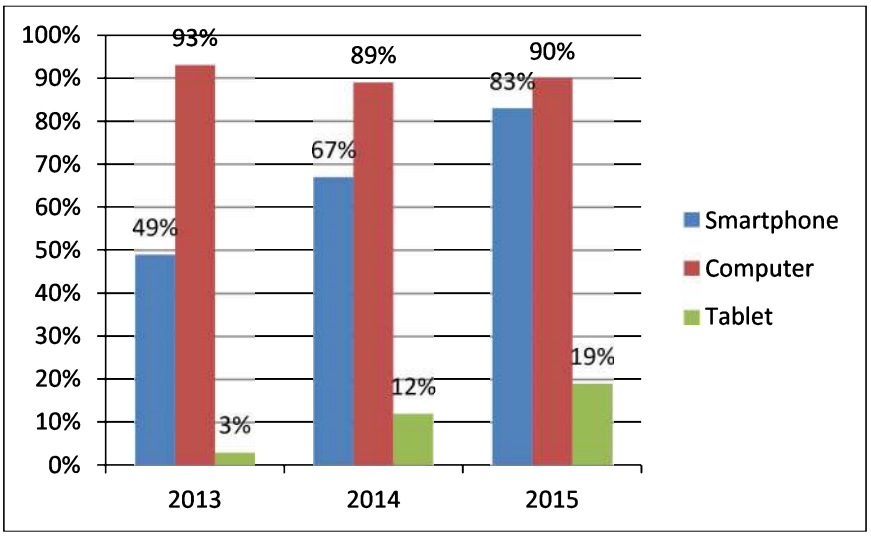

Figure 2: Percentage of people who use a smart phones, computers and tablets
www.consumerbarometer.com

Based on previous facts, we can conclude that Serbia fulfilled basic technology preconditions for the development of the synergy of digital marketing and higher education.

3. SOCIAL MEDIA IN HIGHER EDUCATION

The social media is a relatively new but fast-growing category of online interactive applications. These applications are based on user-generated content rather than supplier-generated allowing peer-to-peer communication and user-participation (Nambisan & Nambisan, 2008; Shankar & Malthouse, 2009).

Internet technology development in last years enabled that users can use Social Networks daily, in any place and at any time. Social Networks development caused that organizations and companies started to use them on the way that places them as an important part of marketing concept. That made some space for using Social Networks in educational purposes, which can be good chance for institutions of higher education.

Also, digital marketing and social network development changed the way that organizations/companies/institutions interact with users. With social networks, interaction became more simple and efficient.

One of the advantages of using social networks in higher education is that universities now can share different content, from sharing content directly from official website, to sharing various information which can be interesting for students, but can't be found on website. This is how institutions of higher education can come closer to their existing and potential students, because they show themselves as an institution which takes care of their students.

When we talk about students (existing and potential) as a target group (17-28 y/o), almost everybody from that target group owns smart phone or some other portable device. Social networks became important thing in student's life. They are something like personal information card, where you can find many details about user's life, from statuses where they write about their daily routine, photos and videos, to their relationship status and their likes. Social networks users are used to get important information in real time from those communication channels. The main indicator of good online interaction between institution of higher education and students are Facebook groups where information about exams, results of exams, important dates and other experiences are exchanged. Based on this indicator, we can conclude that there is definitely a place on social networks which is reserved for institutions of higher education.

The most used social networks in Serbia are Facebook (3,2 million users), Twitter (350.000 users), Instagram (360.000 users), LinkedIn, Google+ (as special groups which are created and used for special purposes) and YouTube (reach 47%, with TA music) (McCann Ericson, Wave5, 2010).

Based on this indicators, we can conclude that population in Serbia is following global social network trends.

According to research by website Top Universities from 2014. year, the most students are using social network Facebook, but also, other social networks should not be ignored,

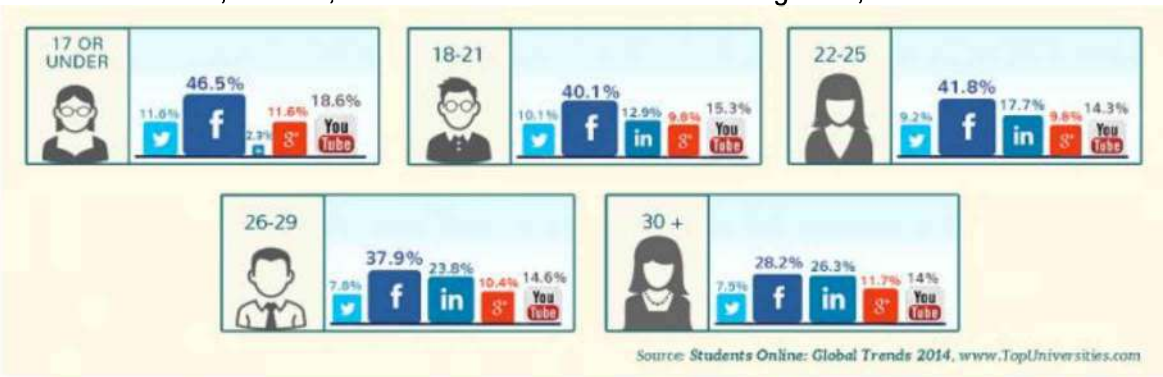

Figure 3: Students Online, Global Trends 2014
www.TopUniversities.com

As students mature, they are changing the way of using social networks. By the time, students are starting to use LinkedIn, because of their need for employment is increasing. (Tucker, L., 2014).

According to researches about the presence of the institutions of higher education on social networks, we can notice that the full potential is not used, and that there is a lot space for advance in presentation, engagement and interaction on social networks.

From the research conducted by the website emarketer.com from May 2015., (Table 1), we can see that the students (17-25 y/o) spend much of their free time online.

Table 1: Daily Time Spent on Social Networks (eMarketer, 2015)

Social Networks	Google+	LinkedIn	Twitter	Instagram	Facebook
0-1 hours	92.6%	89.5%	73.4%	57.6%	39.3%
2-3 hours	4.9%	7.8%	18.1%	24.1%	34.1%
4-5 hours	1.4%	0.6%	5.3%	10.3%	15.6%
6-7 hours	0.4%	1.2%	2.0%	3.9%	5.8%
8-9 hours	0.4%	0.6%	0.4%	2.5%	2.7%
10+ hours	0.4%	0.4%	1.0%	1.6%	2.5%

As we can see from the Table 1, the most respondents spend 0-1 hours daily on social networks, but also the number of people who are spending 2-5 hours is not low. Of course, there are extreme groups who spend online 6+ hours and if we consider only Facebook than this percentage is not negligible.

Because of the student's behavior the potential of the active presence of institutions of higher education on social networks is huge and definitely should be used. Institution of higher education should take advantage of social networks to encourage students by offering useful information.

3.1. Advantages and disadvantages of using social networks in education

As an educational tool, social media enriches the learning experience by allowing students and teachers to connect and interact in new, exciting ways (Lederer, K., 2012). There is an ongoing debate regarding the integration of social media in education. Guy point out "Advocates of social media usage point to the benefits of using social media for academic practice while critics are calling for regulations and/or the removal of such online technologies in the classroom. Finding middle ground has become a challenge" (p.12).

Advantages:

- Better open access to education
- Better integration and communication with students
- Better integration with students from distant locations
- Better integration between students and professors
- Real-time efficient and fast communication
- Enabling and presentation tools that help students in solving problems
- There are no age limits for the level of difficulty, students can learn at their own pace
- Reducing the cost of travel for students (in combination with an LMS system)
- Presentation of institution of higher education in the best possible way
- Presentation of study programs to high target group from any location
- Increase student motivation
- The participation of the masses. Scientific material may be accessible to the general mass
- A combination of formal and informal learning
- Availability on portable devices (smart phones, tablets)

Disadvantages:

- Social networks can disrupt student in learnigng.
- Cyberbulling - Open side of comunication have that disadvantage, i.e. proffesor can be disturbed by the students, or students can be disturbed beetwen themselves.
- Face-To-Face communication absence - We are still living in time in which is FTF comunication considered as the most relevant and efficient. This can be changed by the change of generations.
- Students maybe still don't get the seriousness of this way of learning, because they are still thinking of social networks as a way of fun

4. AN EXAMPLE OF IMPLEMENTATION OF DIGITAL MARKETING AND SOCIAL NETWORKS IN HIGHER EDUCATION

The Institution of Higher Education in Serbia wants to implement digital marketing and social media marketing in the education system. It is necessary to have a website with generated content which will be the final destination of using any digital marketing tools.

Website of The Institution of Higher Education can provide a basis for an engaging user environment (Weiss, 2008) and the social media is an ideal extension for the relational marketing activities due to their collaborative and interactive nature (Zinck Stagno, M., 2011). Website must follow the technology trends, be innovative and to give students all needed information. Having a mobile-responsive website is also important with the growth of smart phone and tablet use, particularly amongst young adults which are our target group.

Looking at the experiences from the business practices (Constantinides, 2010), one could argue that such strategies can provide higher university institutions with new communication possibilities allowing direct engagement with potential students. Such engagement can involve interaction with institutions of higher education recruiters or interactions with other students during the process of searching for a suitable study

and university. Engaging potential students in the social media domain is in principle an inexpensive way for universities to attract and persuade potential students. Social networks or online communities created by schools as part of their online presence can bring together potential student with students who already enrolled, or with peers looking for similar information and help (Zinck Stagno, M., 2011).

First, The Institution of Higher Education must work on SEO optimization and invest in SEM campaigns. Students are using search engines as their first source of information for higher education institutions and 9 of 10 are not knowing which institutions of higher education they wish to attend during initial research stages,. It's more important than ever to make sure that the website of The Institution of Higher Education looks and operates to a high standard to show up within the top search results. Unlike other industries, users who are looking for higher education information don't just stop at the homepage, but navigate through sites to find admission and course information, student associations and even details on what student life is like on faculty. This is why an SEO optimization is very important and could bring only benefits to the institution of higher education. Also, when potential student Google institution of higher education, on Google Search will first appear paid results. Because of that, The Institution of Higher Education has to invest resources for SEM campaign.

With the right strategy, Social Media can make studying more collaborative and efficient, and bring benefits to the both side, The Institution of Higher Education and students. The Institution of Higher Education should open accounts on the most popular Social Networks in Serbia, and those are Facebook, Twitter, YouTube, LinkedIn, Instagram and Google+ (just for special needs). Social Media Networks are an ideal way for institution of higher education in Serbia to engage with students. Social Media enables talking with students in real time, answering their questions and directing them to the website. This will not only increase the traffic to the website, but it will also enhance the user experience, allowing students to view institution of higher education as helpful and student-focused. Social Media also gives the opportunity to connect with other educational associations. Also, The institution of higher education can share important and interesting information, student's life quotes, courses, exam results, etc. This all will help students, but it also can help The institution of higher education in future development and growth.

Those are the first steps for implementation of digital marketing, and when this sets properly, next steps are following and implementation of digital marketing global trends.

5. CONCLUSION

There are many advantages that can bring synergy of digital marketing and higher education, like better open access to education, more efficient and real-time communication and interaction, making students more satisfied, branding and attracting new students, etc. The institutions of higher education in Serbia have fulfilled basic technology preconditions for the development of the implementation of digital marketing and higher education. Also, because of student's behavior the potential of the active presence of institutions of higher education on social networks and implementation of digital marketing is huge and definitely should be used.

ANALYSIS AND VALIDATION OF SUCCESS FACTORS OF MOBILE APPLICATIONS AS E-MARKETING TACTIC

Natasa Đurđević
Faculty of Organizational Sciences
e-mail: ndjurdjevic@coca-cola.com

Abstract: *With fast penetration and adoption of smart phones, mobile marketing and mobile applications as one of the possible mobile marketing tactics are increasingly gaining relevance. Previous theory and research dealing with mobile applications and mobile marketing typically covered one (or few) aspects: technology, process or user experience, defining success factors and good practices. Using the example of Tastly application in Serbia, this paper attempts to integrate all of the mentioned aspects and validate success factors. Main theoretical guidelines have been validated with additional useful implications for marketing practitioners.*

Keywords*: mobile marketing, mobile application, native type, agile methodology, user experience*

1. INTRODUCTION

Mobile communications accelerate with fast adoption of smart phones and that also drives significant growth of mobile applications market. Mobile phone's ubiquitous nature and the fact that the user almost never separates from it make this device an attractive channel for direct, two-way, real time communication with the consumer. Most of the scientific papers so far covered one (or few) functionality and success aspects and factors of mobile apps. Using the example of Tastly application in Serbia this paper analyses complete approach for development, launch and maintenance of a mobile app as a marketing communication tactic, covering the aspects of process, technology and content. The objective is to validate theoretical assumptions of successful use of mobile application as a tool for consumer communication.

2. SMART PHONE AND MOBILE APPLICATIONS RELATED TRENDS AND IMPLEMENTATION IN MARKETING

Fast adoption of smart phones drives dramatic growth of mobile applications market. This segment is one of the fastest growing industries (Datta, Kajanan, 2014). IDC forecasted 182.7 billion mobile apps downloads in 2015 (Păvăloaia, 2013). With more than 2.6 billion smart phone users in the world, mobile communications industry alone contributed to 4.2% GDP growth globally last year, with mobile apps and services segment ranking second in size (GSMA, 2016). Internet via mobile phone accounts for 25% of total internet traffic in 2014 (Yan et al., 2014). Forrester forecasted that 42% of world population would own a smart phone in 2015 (Forrester, 2014), while GSMA recorded 60% smart phone penetration in Europe (GSMA, 2016).

With no physical location limitations, mobile technologies allow advertisers and retailers to contact their consumers always and everywhere (Fong et al., 2015). Possibility of contact anytime and anywhere are significant advantages of mobile devices (Persaud, 2012). Even though 90% of purchases are still made in brick-and-mortar stores, 70% of consumers use a mobile phone prior to purchase, more than 50% of purchase decisions are influenced by mobile phone and this technology increases conversion by about 40% (RetailmenotInc, 2015). Smart devices allow marketers to develop a wider range of pull-based services and employ a larger set of marketing techniques (Persaud, 2012). In 2015 in USA more than half of total digital communications investments have been allocated to mobile devices (eMarketer, 2015).

Association for Mobile Marketing defines it as set of practices that enable organizations to communicate and engage with their target audience in an interactive and relevant manner and with any mobile device or network (MMA; Ström et al., 2013). Mobility can be related to mobile medium, device, channel or technology (Shankar et al., 2010). Some of mobile marketing tactics are SMS, MMS, mobile banner, QR codes, mobile applications, mobile web design (Hadadi and Almsafir, 2014) etc. Presence of various sensors and services within a smart phone enable geo-targeting, motion triggers, beacon activations and so on.

3. SUCCESS FACTORS OF USING MOBILE DEVICES AND APPLICATIONS IN MARKETING

Mobile phone is almost always on its user which allows for communication everywhere and always and implementation in marketing (Persaud, 2012; Bauer et al., 2005; Banerjee and Yancey, 2010). One of important questions covered in numerous scientific papers was the question of utility and value. Perceived utility impacts acceptance and use of mobile technology and acceptance of marketing services (Ström et al., 2013). Bauer (Bauer et al., 2005) finds that entertainment and information value are most important factors of perceived utility. Value or benefits can be defined as utilitarian, emotional, social and monetary (Ström et al., 2013). Issues in mobile marketing are the result of variety of platforms, data security and privacy, obtaining permission for communication, ease of navigation, user experience, battery power, processing and memory power of the device etc. (Hadadi and Almsafir, 2014; Watson et al., 2013; Mahmud et al., 2014; Rupnik, 2009).

3.1. Mobile applications for smart phones

Mobile applications on smart phones are a specific tool for target group communication and activation. Mobile application is a software that operates on mobile devices using the operating system of the device (iOS, Android…) (Datta, Kajanan, 2014), i.e. it is a program that runs on mobile devices and presenting value to the mobile user (Rupnik, 2009).

"Mobile first" approach in today's practice (TCCC, 2015) helps avoid poor user experience resulting from browsing web pages which are not tailored for mobile devices (Guirguis, Hassan, 2010). Older web applications face challenges from variety of browsers and their compatibility, screen size and resolution, security, operating systems, touch-screen interface, usage of camera, location service, screen rotation and other device features.

3.2. Technology aspects of mobile applications

Mobile application development is a set of processes of writing software for small and wireless computing devices (Mahmud et al., 2014). Technical aspects include application type, operating system, web service and architecture.

There are three types of applications: web, hybrid and native. Figure 1 provides comparison of different application types (Mahmud et al., 2014):

Criteria	Type of mobile application		
	Web	Hybrid	Native
Development cost	Reasonable	Reasonable	High
Speed	Fast	Native speed	Very fast
Device access	Partial	Full	Full
Approval process	None	Low overhead	Mandatory
Application store	Not available	Available	Available
Multi cross platform support	Full support	Full support	Limited support
Native look and feel	Limited support	Some support	Full support
Access to peripheral SDK	Limited support	Some support	Full support

Figure 1: Differences between web, hybrid and native applications

Hybrid type is recommended to optimize budget, development and maintenance of application, while native application offers best user experience and fully leverages device features and possibilities.

Application architecture defines user-server architecture and usually has multi-layered structure: user, presentation, services, cloud service, data (Păvăloaia, 2013; TCCC, 2015). This defines, for example, how application can operate without server connection, storing data on local database until server connection is restored and data transferred (Mahmud et al., 2014).

3.3. Mobile application development process

General software development cycle assumes four phases: analysis, design, implementation and testing (Rahimian and Ramsin, 2008) and this can also be applied for mobile applications development. Somewhat

detailed process according to (Maharmeh and Unhelkar, 2009) includes: project initiation, project plan, analysis, design, coding, testing, deployment, post implementation (closure).

There are many process types that can be applied for applications development (Waterfall, iterative, V model, spiral, prototype model, agile) (Păvăloaia, 2013; Maharmeh and Unhelkar, 2009), and each has certain advantages regarding level of detail in planning, risk reduction or user collaboration during development.

Agile methodology has been accepted as the best practice for mobile applications development – design and implementation are key activities of development process (Păvăloaia, 2013; Mahmud et al., 2014; Rahimian and Ramsin, 2008). This process is incremental, cooperative, simple and adaptable (Abrahamsson, 2002).

3.4. Mobile application content and user experience

Marketers see mobile marketing as a vehicle for direct, personalized contact with consumers without temporal or spatial barriers, while perceived utility and relevance are among most important factors of mobile applications acceptance and usage by the end user (Watson et al., 2013). Assuming basic requirements of data security and privacy are fulfilled, users are ready to exchange their personal data for useful services (Persaud, 2012; Ström et al., 2013). According to Xu (Xu et al. 2014) convenience and simplicity are main reasons for using mobile services. Personal data can be obtained actively (provided by user) or passively (generated by technology) (Pousttchi and Hufenbach, 2013; Xu et al. 2014), and they are the basis for building and applying CRM (Hadadi and Almsafir, 2014; Xu et al. 2014).

Smart phones and tablets are mainly used for social networking, content sharing and personal productivity (Bancora et al., 2015). Therefore, integrating applications with device functionalities (camera, geo-positioning, calendar, planner…) helps fulfil these needs (Hadadi and Almsafir, 2014).

Keeping same approach in digital communication development for web and mobile phones is inefficient and provides poor experience for the user (Guirguis, Hassan, 2010). “Mobile first” approach becomes a standard that marketers are adopting more and more, but certain potential problems still remain: different screen sizes, content optimization to screen, ease of navigation, connection quality, battery life, memory capacity, processor speed, security (eMarketer, 2015; Rupnik, 2009).

Users recognize added value for tailored content, adapted to context, individual preferences, location, time, activity and interactivity (Fong et al., 2015; Persaud, 2012; Ström et al., 2013; Unhelkar and Murugesan, 2010).

4. TASTLY MOBILE APPLICATION EXAMPLE

As part of the small baskets project, The Coca-Cola Company identified the opportunity to use mobile devices for customer communication during pre-shop phase.

Based on extensive shopper behaviour research (Company’s standard global methodology) in a few markets of Central and South Europe (CSE), one of key behavioural models of shoppers when on small basket missions is the “mental shopping list” (shopper knows what is needed to be purchased on this routine shopping mission, but does not have that list written down) – preparing for this shopping trip the shopper (in this case a mum) thinks about what to prepare for the main meal of the day, which food items she may still have at home, where would be most convenient to do the shopping, how much money she has available… In addition to checking household stocks, internet becomes important source of information and inspiration when preparing for the shopping trip i.e. preparing the main family meal.

One of key marketing activation platforms for brand Coca-Cola is “Coke & Meals”. Main activation tactics until 2015 were focused on traditional media and retail outlets, with limited use of digital media and social networks. Data from different markets indicated that a lot of mums (main target group for this platform) currently and increasingly more use internet and especially mobile phone during shopping preparation – searching for information, recipes for inspiration, recommendations, checking prices and looking for offers. Central shopper marketing team for Coca-Cola in CSE identified the opportunity to implement mobile marketing as tactic that could respond to shoppers’ needs.

4.1. Application development process validation

Application development process will be validated according to Maharmeh (Maharmeh and Unhelkar, 2009): project initiation, plan, analysis, design, coding, testing, deployment and post implementation.

Based on insights from above mentioned shopper studies, shopper team briefed the agency to propose relevant solutions for defined target group activation objectives. Agency proposal included development of a mobile application which would contain following features: recipes for inspiration, shopping list creation, current promotions and leaflets across retailers, retail outlets maps and various entertainment content (music, fashion).

Idea was interesting and decision to initiate the project was made. Key objective of this phase was success and sustainability assessment of such an initiative. With people, financial and technical resources limitations, project team was tasked to develop a sustainable plan.

First step was the extensive analysis of existing market offering. Application development is not the core competency of The Coca-Cola Company – challenge was to develop something new that would be differentiated and useful to users. Reviewing more than 30000 existing application related to cooking and shopping, following key functionalities were identified: step-by-step recipes, useful tips, local cuisine relevance, shopping list creation, sharing. None of the existing apps provided all of them.

Next stage was defining way of working – internal vs external development and maintenance team, inclusion into existing Company IT systems or using market available IT solutions, development model options, possibility to maintain and keep relevance across all CSE markets and beyond (globally), reviewing locally relevant resources needed to maintain local app version, ways of sourcing content for the app (relevance and reliability or sources, legal requirements and limitations, intellectual property solutions, sufficient content quantity) and estimation of financial resources needed for launch, expansion and maintenance.

Satisfactory solutions from the analysis stage were given the approval for project launch, i.e. approval of the plan with all technical, organizational, financial and timing details. Serbian market was selected as pilot market for this project.

Application design was initiated – architecture, graphic design, coding. Beta versions were tested on limited number of users, mainly Coca-Cola system and partner agencies employees. Beta testing took five months, until final version was ready for full launch.

Prior to launch, success criteria were defined – those would be used to validate the pilot and decide on expansion in Serbia and other countries. Main KBIs were: 25% user base of target group of mums smartphone users (69000) within 4 months, daily users (5000), application rating (>4).

In September 2015 Tastly application became available on Google Play and App Store for Android and iOS smart phones. The app is free for the user, in accordance with validated practice of launching apps free of charge as an effective way to build awareness, affinity, creating usage habits and word of mouth expansion (Datta, Kajanan, 2014; Liu et al., 2012; Kim and Morris, 2007). Distribution and discovery are very important phases of the process, as per internal Company process – in addition to app stores availability, launch media plan for advertising in digital media was put together, containing banners with link to app store as well as PR texts on target audience and topic relevant sites and pages (recipes, cooking, family, shopping etc.). Results have shown significantly higher efficiency of PR texts (Figure 2 and Figure 3).

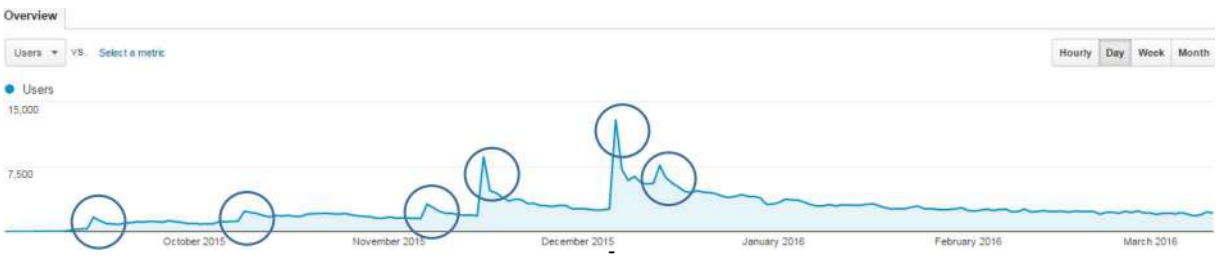

Figure 2: Daily overview of new users for Android version of Tastly app for Sep 2015 – Mar 2016

Figure 3: Daily overview of new users for iOS version of Tastly app for Sep 2015 – Mar 2016

Number of users surpassed the set target (reaching more than 85000), as well as the application rating (4.6), while daily users were below set target (reached 2500) (Figure 4 and Figure 5). Since the number of regular users is extremely high (89% for Android and 81% for iOS version), as well as the number on weekly users, pilot was evaluated as positive.

Figure 4: Activity overview for Android version of Tastly app Sep 2015 – Mar 2016

Figure 5: Activity overview for iOS version of Tastly app Sep 2015 – Mar 2016

Tastly app will continue to be used as a marketing tactic in Serbian market and will be further developed and it will be launched in other markets of CSE. Based on experience in Serbia, team has defined precise process with mandatory steps and guidelines for other markets how to proceed in preparation, launch and activation. In line with brand objectives and consumer behaviour and needs analytics new functionalities will be added, and that is another factor of success for an application according to Datta (Datta, Kajanan, 2014).

Whole process can be illustrated as in Figure 6, showing which functions were involved, in which way, at each of the project phases. For clarification, following is the meaning of abbreviations: CIC – Consumer Interaction Centre (locally responsible person for consumer interaction in digital media), CCH – Coca-Cola Hellenic, local bottler.

Function / Project phase	Shopper Marketing	CIC	IT	Digital	Marketing	CCH	Developer	Media Agency
Project initiation	R/A	C		C	C			
Plan	R/A	R/A	C	C	C	I	C	
Analysis	R	A		C	I		A	C
Design	R	A	C	C	A	C	A	
Coding	R	C	C	C			A	
Testing	R	A	C	I	A	I	A	I
Deployment	C	R	C	I	A	C	A	A
Post implementation	R/A	A	C	I	A	C	C	I

RACI: Responsible, Accountable, Consulted, Informed

Figure 6: Internal process of Tastly application development

To conclude, more detailed process as per (Datta, Kajanan, 2014) in this case was more useful than the simpler general version as per (Rahimian and Ramsin, 2008) for the following reasons: it allows for more detailed steps during preparation and planning, it provides for steps after testing and deployment and it assumes testing prior to deployment which prevents launch of suboptimal application version.

4.2. Application development model validation

As mentioned in 3.3 agile application development methodology has been accepted as best practice (Păvăloaia, 2013; Mahmud et al., 2014; Rahimian and Ramsin, 2008). The process is incremental, cooperative, simple and adaptable (Datta, Kajanan, 2014; Abrahamsson et al., 2002), which was relevant in case of Tastly.

Team that worked on application preparation and launch was small and flexible, with following members: central shopper team, local digital team (Company and agency), central IT team, developers, local marketing team, local bottler representative, local media agency. Communication between team members was frequent and direct, on needs be basis, not only as per protocol. Each team members used his own network of friends to include users to test the app and collect feedback to improve functionalities.

Architecture is multi-layered, as per best practice defined by (Păvăloaia, 2013; TCCC, 2015). It is cloud hosted, which helps overcome device limitations of processing power and memory capacity, and it allows for contextual user engagement and geo-targeting (Gupta and Agarwal, 2015). User data are also stored in cloud, currently using external analytics and CRM services, while user engagement tactics are being evaluated and tested for scalability.

This approach enabled entire development and beta testing to be completed within 8 months and pilot validated within a year since project initiation, keeping costs at acceptable level.

4.3. Application content validation

Tastly has been developed as native application for Android and iOS because quality user experience and connection with device functionalities have been defined as main objectives (Mahmud et al., 2014; TCCC, 2015).

Based on available consumer insights, application functionalities fit users' needs when preparing for shopping, meal planning, managing household budget, and simplifying shopping. Tastly has following features: recipes search and browsing, shopping list creation, current retailer leaflets and promotions review, store location relative to user's location, possibility to share comments, ask questions, share content, connecting with social networks profiles.

Knowing that privacy and data protection is very important to users (Jiang et al., 2015; Hadadi and Almsafir, 2014; Pousttchi and Hufenbach, 2013; Persaud 2012; Bauer et al., 2005), Tastly does not require identification or registration, but allows for optional link to Facebook and Google+ account. Passive data resulting from using the application enable anonymous application analytics (Xu et al., 2014): recipes search and browsing, shopping list content and geolocation will be used to develop algorithms for user engagement in the coming months, in collaboration with retailers (via notifications and beacons in stores).

This application is also an example of content creation solution, which is becoming frequent practice by advertisers (Jutkowitz, 2014). Tastly is an integral part of total marketing plan for "Coke & Meals" platform – source of recipes are mum food bloggers, it features current retail promotions, retail outlets are mapped and described, it links with social networks and relevant media.

There are multiple indications that right solutions regarding content have been implemented: high application rating, high percent of regular users, positive comments about the app and within the app, interactivity between users and their recommendations. It has all been based on understanding consumers' needs and creating solutions to their needs, coupled with visual graphic design and technical solutions. According to Datta (Datta, Kajanan, 2014), regular application updates and development of new features and content drive success, which would be validated in the coming months when new features will be added to Tastly.

Analysing in-app behaviour flow (Figure 7) indicates opportunity to improve visits and usage of shopping list. This feature is important to the Company for the purpose of measuring efficiency (during pilot period, presence of Coca-Cola brand in the shopping list (as the best approximation of purchase) has been three times higher than incidence in purchases measured by household panel).

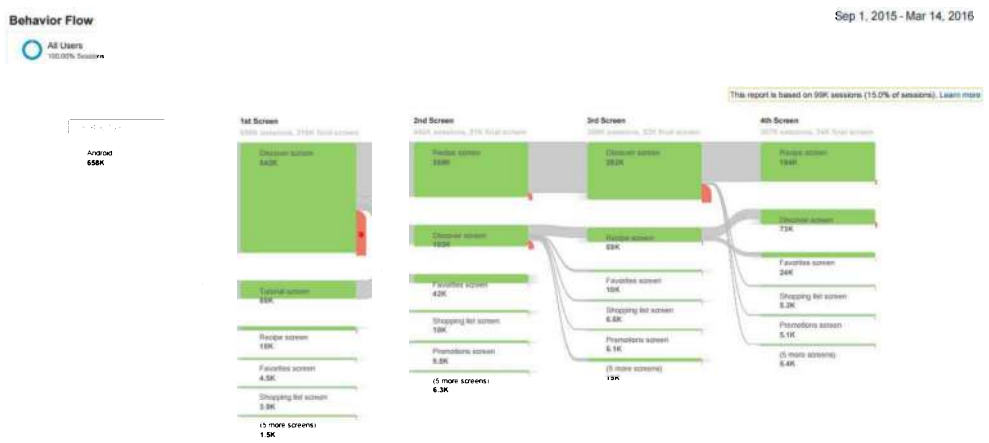

Figure 7: Overview of behavior flow for Android version of Tastly application for Sep 2015 – Mar 2016

Statistics show that it is very hard to succeed in mobile applications market: out of more than a million available apps, average user actively uses about 24 apps per month, spending more than 80% of time on only 5 (Forrester, 2014). During pilot, Tastly was among top five downloaded apps in Serbia, with excellent statistics on regular users.

For The Coca-Cola Company important utility test for Tastly will be when personalized communication and offers will be activated, as well as geo-targeting and beacons activation within retail outlets. All of these are validated success factors for mobile applications and mobile marketing in general (Fong et al., 2015; Gupta and Agarwal, 2015; RetailmenotInc., 2015; Xu et al., 2014; Banerjee and Yancey, 2010; Rupnik, 2009; Bauer et al., 2005), providing platform for collaboration with retailers and direct tracking of efficacy via sales results.

5. CONCLUSION

With fast penetration of smart mobile phones, use of mobile devices for consumer communication becomes increasingly important. Theory on processes and methodologies about mobile applications development is abundant, with established recommended best practices. There are also many academic papers that analyze success factors of mobile marketing and mobile applications. This paper attempts to validate good practices and success factors using the example of Tastly mobile application, developed by The Coca-Cola Company.

Selected exampled demonstrates high level of success a mobile application as a mobile marketing tactic can reach by respecting and deploying efficient processes, technologies and management. In this case, agile methodology and extensive process were significant for success – from clear objectives, flexible, small and dedicated team with frequent interactions, thorough testing, results tracking and tactics adjustment during implementation, to clear directions for future application evolution and management.

Regarding content, most critical for success was understanding potential users' needs and creating the application as response to those needs. Regular updates and information accuracy help maintain user satisfaction. Also, timely reactions to users' comments and questions, as well a regular tracking and analytics are important to succeed and require dedicated human resources.

Possible future research in terms of further understanding success factors can be in domain of dynamics and scope of improvements in new application releases and what is the most efficient way to inform existing and potential users about those changes, as they could be important to attract new users and drive frequency with existing occasional users. In addition, possibilities for partnering with retailers (and other partners) in real or digital world and measuring direct impact on brand perception, attributes and sales would be relevant to marketers to define the role and investment level into such tool as part of broader marketing plan.

E-SERVICES IN THE REGULATION OF MEDICINES AND MEDICAL DEVICES

Tatjana Stojadinovic*[1], Igor Vanevski[1], Ljiljana Radovanovic[1]
[1]Medicines and Medical Devices Agency of Serbia
* Corresponding author, e-mail: tatjana.stojadinovic@alims.gov.rs

Abstract: *This paper presents the development of e-services and e-submission request of clients in the pharmaceutical industry as a subsystem of e-government of the Republic of Serbia. The main goal of this paper is to introduces the relationship of e-business in the regulation of medicines with other segments of e-government, e-health and e-pharmacy. The methodology for the development of e-services, methods for modeling and analysis of business processes, the reference model of e-business in the regulation of medicines are the main scientific contributions of this work. E-services development in the regulation of medicines, as one subsystem of the e-government implemented in Medicines and Medical Devices of Agency of Serbia, is a major professional contribution of this work.*

Keywords*: internet, e-government, medicines, e-services, e-submission*

1. INTRODUCTION

Electronic business (E-business) is the exchange of standardized electronic messages between natural and legal persons in negotiating, contracting, purchasing, sales, payments, communication with the administration and the courts, and in all other business transactions for which the law allowed its application (Ivkovic, Radenkovic, 1998).
E-business can be defined as "buying and selling of information, products and services through computer networks and support for any type of business transactions via the digital infrastructure." On the other hand, e-business can be seen as a process of conversion of digital inputs and outputs through a set of intermediaries. E-business is based on more modern work organization adapted to the use of ICT, internet usage in the performance of most business transactions, organization and implementation of information systems (IS), implementation of electronic signature and using cryptographic protection mechanisms. In the context of business operations relationships are established between companies and enterprises, enterprises and customers, buyers and customers and the rest, so that we can distinguish between the following business models: B2B (Business to Bussiness), B2C (Business to Customer), C2C (Customer to Customer)…
E-Government uses the application of information technology to improve: efficiency, productivity, transparency and accountability of the Government in dealing with: citizens, businesses and institutions, other government units and private officials. E-government can be seen from the "online access to services" to "tools for the construction and reconstruction of democracy"(Pedro, Gonnet, 2001). The objectives of e-government are: providing better services to citizens and businesses, clearer rules and procedures and less opportunity for corruption, and better control of costs and claims. In recent years, e-business and e-government there has been progress thanks to, on one hand, technological advances in the field of hardware, and on the other hand, the emergence of new methodologies in e-business and e-government. E-government is a Web-based technology that uses the local government as a communication channel, which is offered to visitors, citizens, business partners, other local governments and employees. Business models, which are used in the development of e-government are G2C (Government to Customer), G2B (Government to Business), G2G (Government to Government)...

2. E-BUSINESS IN THE REGULATION OF MEDICINES AND MEDICAL DEVICES

E-business has changed the traditional way of doing business. For regulation of medicines and medical devices, e-business is used for collecting, recording, storing and securing data, and information about medicines is a source of necessary information for the daily work of doctors, pharmacists and other health workers. The development of e-business in regulation of medicines, as one segment of e-government of Serbia provides interactive e-services tailored to the needs of citizens, public authorities, regulatory and educational institutions and industry (producers, representations, importers, representations of medicines and medical devices, health care and pharmaceutical institutions). The goal of this approach is the integration of e-government and the segment relating to the regulation of medicines, ensuring the efficiency of how the process of modeling and model implementation, which should result in models that must be

explicit, understandable, modular and can be effectively amended and supplemented, distrubuted and placed on a variety of computing platforms and operating systems in e-government.
E-business in regulation of medicines is one of the segments of the development of e-government in Serbia. Without e-business in regulation of medicines it is unthinkable to develop e-health and e-pharmacy. Providing information on medicines is one of the e-services in the regulation of medicines. Information about medicines is coming from routine sources, specific non-routine, library sources and research sources. Information on medicines, which must be precise and authoritative data are necessary for the daily work of doctors, pharmacists and other health workers in general and special branches of medicine, pharmacists in the production, medicines and pharmacies, as well as other professionals involved in health care, regulatory bodies. At this level, the information collected is detailed, often imprecise and poorly structured, while face to face contact provides sufficient information for the collection and processing. This information is then filtered, grouped and standardized. In a further move of information, less detailed information is required , but the number of people is getting bigger. Because of this, there is a need for standardization of terms and reports of how data can be easily grouped, analyzed and compared, and with a limit on the collection and analysis of just what is really needed.
Integration of eBusiness in the regulation of medicines and medical devices, eGovernment, eHealth and ePharmacy in Serbia (Figure 1) uses e-business models to better communication, better management of documents and records in public administration, the pharmaceutical industry and the health system, as well as the achievement of measures directly connected to savings in dealing with several aspects (time - efficiency, money - economy). Networking of institutions in the field of information on medicines and medical devices affects how efficiently the business of the Medicine and Medical Device Agency of Serbia (ALIMS) and health institutions, patients or the pharmaceutical industry is, which leads to a significant reduction in total costs and time saving. ALIMS was ready from the start to participate in the initiative to open data and thus enable that information on medicines and medical devices, and integration with other data, to get more value and become useful to other state bodies and institutions.

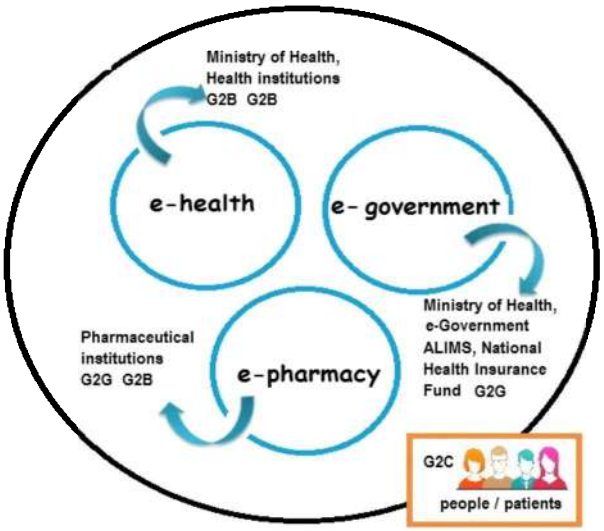

Figure 1: Models of e-business between eHealth, eGovernment and ePharmacy

3. METHODS OF DEVELOPING SOFTWARE IN E-GOVERNMENT

Methods of software design are specific strategies that propose and provide a set of notations which are used with the method (as a description of the process that should be used when monitoring methods , and a set of guidelines for the use of the method) (Budgen, 2004).
Some of the methods of design software are: object- oriented design, functionally - oriented design , design - oriented data structures and design based on components. This section will describe the methods, methodologies and software development models, which are used in e-government. Particular attention will be devoted to the life cycle of software and business intelligence, and SOA (Service Oriented Architecture) and BPM (Business Process Modeling). The methods of the life cycle of the attention will be devoted to a single method of software development process. The integrated framework, which will be displayed and used in this paper is based on the use of RUP methodology and agile methodologies, business intelligence with the principles of data mining and data warehousing, BMPL (Business Process Modeling Language) and UML (Unified Modeling Language) - notation and reengineering business processes. The main principles are incremental and iterative development, active participation of users, based on the development of models, testing and cooperation. The paper consolidated methods, techniques, standards and process models in the field of e-business and access to quality analysis, modeling and design of the portal system of the Serbian authorities. The life cycle of software can be considered through its processes, ie. activities that make this

process as well as through its models, methods and strategies. Software Life Cycle Processes are defined by a number of reasons, including increasing product quality, facilitating human understanding and communication, support process improvement, and support management processes. It also enables the automatic routing process and provide support for automatic execution. Various elements of the process can be defined by means of activities, products and resources. Software process is a set of activities, methods, practices, and transformations that are used to develop and maintain software and related products.Methods for software life cycle can be said to describe the process of software development through its individual operations or processes. Model describes the software life cycle phases that occur during software development. Software development process includes 5 stages: requirements specification, analysis, design, implementation and testing. Different methods of software life cycle models use different software life cycle.
The purpose of Business Intelligence (BI) is not just a collection, but also processing, analysis, visualization and use of information for business purposes, mainly in order to support business decisions. By definition, the term BI combines methodologies, technologies and platforms for data warehousing, OLAP (Online Analytical Processing) and data mining allow companies to create useful management information from the data on the operations, which are at different transactional systems and come from a variety of internal and external sources. BI is a set of tools and applications that enable the creation of a system for the collection, analysis and dissemination of business information, with the aim of making better business decisions (Kevin, 2007).

3.1. SOA and BPM

This subchapter focuses on SOA, where programming is based on the process approach and represents a higher step in the development of software engineering. Process oriented programming does not need to replace, but to complement existing approaches to programming, such as structural, component and object-oriented programming. SOA describes the concepts, architecture and procedural framework to ensure cost effective development, integration and maintenance of IS, through the reduction of complexity and stimulation of their integration and re-use. SOA does not represent a radically new architecture, but rather the evolution of the well-known distributed architecture and integration methods. SOA improves and expands the flexibility of previous integration methods and distributed architecture and focuses on the re-use of existing applications and systems, effective interoperability and integration of applications, as well as the composition of business processes through service secured applications. An important feature of SOA is the ability to implement the changes that will occur in the future, in a relatively simple and easy way. SOA is more than a set of technologies. It is not directly related to any technology, although they are often implemented using Web Services (WS). WS are the most appropriate technology for the realization of SOA. The most important concepts of SOA are (Emig, Weisser, Abeck, 2006):

- Services that provide business functionality and business value, that hide implementation details and are autonomous.
- Interfaces, through which users access the service. The interface defines a set of public service operation signatures and represents a contract between service providers and service users. The interface is separated from its implementation, the self-descriptive, and independent of the platform.
- Messages that specify the data to be exchanged, describe them in a manner independent of platform and language use patterns.
- Synchronous and asynchronous communication to call the service operations.
- Poor connectivity includes services that only show the necessary dependencies and reduce all kinds of artificial dependencies.
- Registers, where service providers publish services, while service users search registers to find the needed service.
- Quality of service marks attributes such as - security, reliable messaging, transactions, correlation, addressing.
- Composition of services into a business process (the most important SOA concept), providing support for business processes in a flexible and relatively easy way, as well as rapid changes of business processes with less effort.

BPM refers to the design, management and execution of the business process, and its strength lies in the unification and expansion of existing process oriented techniques and technologies. For business analysts, BPM means the perception of the organization as a set of processes that can be defined, which can be controlled, and which can be optimized. Instead of the traditional orientation, according to which parts of the operations of organizational units, BPM is oriented towards business, regardless of the organizational unit that are executed. For technical staff, BPM technology represents a group focused on defining, executing and monitoring process logic. Regardless of the different perspectives of both groups, and business analysts and technical staff, aim to improve business processes. BPM should be used only for applications that are process-oriented, respectively, which are: long-term, state kept in databases, most of the time waiting for the action to start the next activity and processes which are responsible for the management and coordination of

communication between different role of systems and people. Process applications need to meet at least part of the above characteristics. The reasons for the use of BPM are: formalization of existing processes, better understanding and incorporation of improvements in the business processes, more efficient execution of business processes from the use of BPM software, increasing productivity and reducing people's participation in the execution process, enabling people to solve.

4. DEVELOPMENT OF E-SERVICES AND E-SUBMISSION IN ALIMS

ALIMS is a public agency of the Republic of Serbia, whose work provides the services of issuance, renewal and amendment of licenses for medicines for human and veterinary medicine, as well as the registration of marketing authorizations for medical devices, quality control of medicines and medical devices that meet the requirements for efficiency, quality and safety. The vision of being a modern, efficient and socially responsible institution is conducted everyday by a teamwork of employees, which is based on four basic principles: social responsibility, leadership, trust and quality. Transparency of the work is reflected through the portal of ALIMS where they meet all the criteria of functionality, defining the guidelines for making Web presentations of the state administration.

ALIMS participates in the development of eGovernment portal RS. The functional area of e-services is enabled on the primary web page of the ALIMS site and contains a list of all names of e-services published on the portal of e-government.

The latest e-services "Downloading registry of medicines and medical devices" is set in 2015. State agencies and legal entities can retrieve the registry of medicines for use in human and veterinary medicine, as well as a registry of registered medical devices for which the ALIMS issued a marketing authorization, and the registration of medical devices in the Register of medical devices, with the use of a qualified digital certificate. The aim of this service is to download data on medicines and medical devices in digital, machine-readable formats that can be used for further work and use in other state bodies and legal entities, especially in the context of the development of the e-Health of the Republic of Serbia. Register of medicines and medical devices in the form of e-Service enable downloading of the codebook data on medicines and medical devices from the ALIMS database that are updated on a daily basis. E-service "Downloading registry of medicines and medical devices" enables downloading on a daily basis from the updated medicines register for use in human and veterinary medicine and medical devices registered in the register of MS, in digital, machine-readable, and open formats: .csv and .xls. Data on medicines and medical devices that ALIMS handed over to the state institution and legal entities on the eGovernment portal, are available for those with qualified electronic certificate, which allows authentication in order to ensure data protection using existing protection mechanisms. This way of downloading data is also conducting and updating records on persons who retrieve data, as well as the institutions that are interested in this information. The download process data is very simple. E-Government portal, onced logged in on by using a digital certificate, displays information about the owner of the digital certificate who has to state a reason for downloading data. This way ALIMS achieves more benefits for almost all sectors of society: new business and economic opportunities - turning data into economic systems at all levels and new innovative solutions - combining data from multiple sources, which then creates new values.

At the end of last year ALIMS has started a new project that will enable the integration of ALIMS and pharmaceutical industry, and includes e-submission request of clients in the pharmaceutical industry on the easiest way by selecting the appropriate eServices and completing the application form, which was given the opportunity to submit the attached documentation in electronic form with certain requirements. The basic idea of this project is to enable clients wishing to apply electronically. The vision of the project is to develop application forms for eGovernment portal where customers will be able to electronically fill patterns ie. customer requirements and deliver them electronically with all the accompanying documentation. The project titled "eSubmission" began in the middle of last year, with the plan to be completed by the end of August 2016. The project includes the development of 60 eServices ALIMS and allows the pharmaceutical industry to operate without physical arrival at the location ALIMS by applying for the appropriate electronic service ALIMS. This is reached by using a digital certificate, which provides training and leads to the pharmaceutical industry when it comes to the development and application of informational technologies and provides additional support for the development of the same in the Republic of Serbia. For the future of e-government and e-business in regulation of medicines in Serbia it is important to use the experience of other countries, with consideration of their successes and failures, as well as adapting this knowledge characteristics of socio-economic environment in Serbia. Equally important is the cooperation with the Ministry of Health and the Government of Serbia, because in this way there is a solution that information subsystem of e-business in regulation of medicines integrates into the overall IS of e-government of Serbia leading into single architecture, which can be reached by working together and forming an agreement of all stakeholders, starting from the government, through the non-governmental sector, academic institutions, to the citizens themselves.

This chapter shows model and life cycle of the process (Figure 2).

SOA is implemented using WS as follows:
- WS that enables the transfer of all customer requirements with the appropriate electronic services from eGovernment portal to the internal ALIMS network (external eGovernment portal to DMZ at ALIMS),
- WS that enables the transmission of the same client requests and integration with electronic document management system of ALIMS (DMZ at ALIMS to internal, production EDMS at ALIMS).

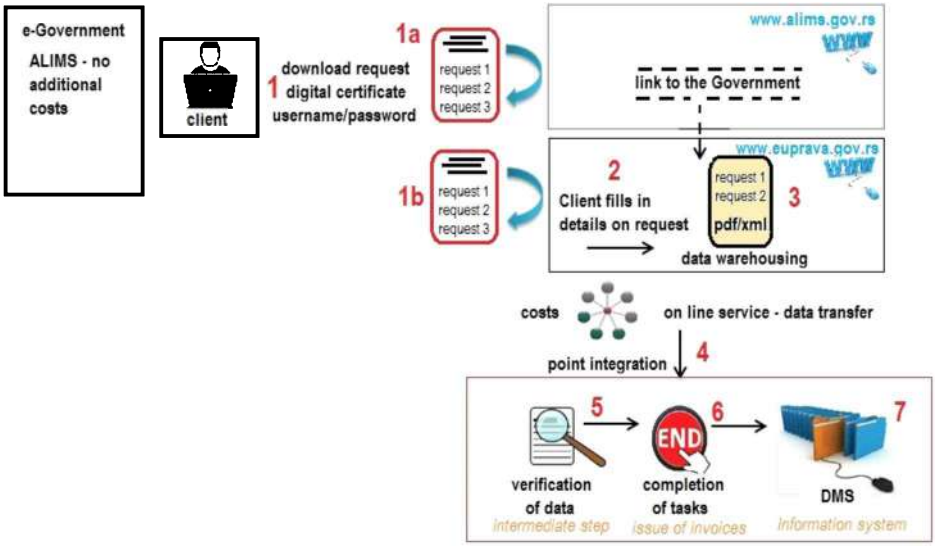

Figure 2: Model and life cycle process

The life cycle process is:
1. Requests for clients are located on the ALIMS site linked with the eGovernment portal. Link on each request is transferred to the appropriate eGovernment services portal (1a) .The client only with a valid digital certificate has the ability to fill the requests (on the eGovernment portal).
2. Client selects appropriate eService and fills request directly using the application, which is located on the eGovernment portal.
3. Data is stored with the request in the database on the eGovernment portal, which can be accessed by the authorized person. The document, which is formed as a client request must contain the e-signature, and is in pdf and xml format.
4. Online WS on the eGovernment portal then transfers the request to the defined system integration point, which is server located in the DMZ at AliMS. Server in the DMZ at AliMS automaticly passes the requests to the internal EDMS (Electronic Document Management System).
5. In the system EDMS data verification is done by the colleagues that work on Acceptance of client requests.
6. After verification, acceptance and ending task, there shall be issued a pro-forma invoice to the client and confirmation of receipt, which are sent by e-mail or otherwise electronically or physically considering the fact that the client has to come and bring the documentation also.
7.Flow in the process takes place in the information system of the ALIMS-EDMS
List of e-services is divided into three segments: human medicines, veterinary medicines and medical devices,in the following way with total of 62 forms used:
• Human Medicines (23 Forms): Application for marketing authorization (6), Application for the import of unregistered medicines (2), Application for the approval of clinical trials (4), Application for the SPC, PIL and Labeling (3), Application for approval of promotional materials for the medicines or medical devices (1), Application for issuing the technical opinion (1), Application for the issue of categorization of medicines (1), Application for reporting doubts about the quality of the medicine (1), Application for the quality control (1), Application for supplementary documentation (1), Application for the suspension of request (1) and Application For partial suspension of the request or changes the marketing authorization grouped variation request (1).
• Veterinary medication (25 Forms): Application for marketing authorization (6), Application for the import of unregistered medicines (4), Application for the approval of clinical trials (4), Application for veterinary SPC, PIL and Labeling (3), Application for approval of promotional materials for the veterinary medicines and medical devices (1), Application for issuing the technical opinion (1), Application for the issue of categorization of veterinary medicines (1), Application for reporting doubts about the quality (1), Application for quality control (1), Application For supplementary documentation (1), Application For the suspension of request (1) and Application For partial suspension of the request or changes the marketing authorization grouped variation request (1).

• Medical devices (14 Forms): Application for for registering the medical device in the Register of medical devices (1), Application for import of unregistered medical devices that are not registered in the Register of medical devices (2), Application for authorization or notification of clinical testing of medical devices (1), Application for promotional material for medical devices (1), Application for issuing an expert opinion (1), Application for the categorization of medical devices (1), Application for reporting adverse reactions to a medical device usage (5), Application for reporting doubts about the quality or deviations from the standard quality of the medical devices (1) and Application for quality control (1).

5. ANALYSIS

The survey relating to the testing of e-readiness of the pharmaceutical industry for the project of e-submission was implemented in August 2015. The questionnaire was sent to all pharmaceutical institutions with a term of one month for an answer. Of the total number of participants, the survey was completed by 32% of participants. Most of the participants are familiar with the concept of electronic storage of data / documents and with the guidelines on the subject of filing documents. The Agency's intention to move to an electronic system of communication was supported the most. The proposal to organize workshops and conferences on this subject in order to inform and educate the clients on time, in order to better and more successful transition to the new system of application was also well supported. Figure 3. shows some of the results of that survey.

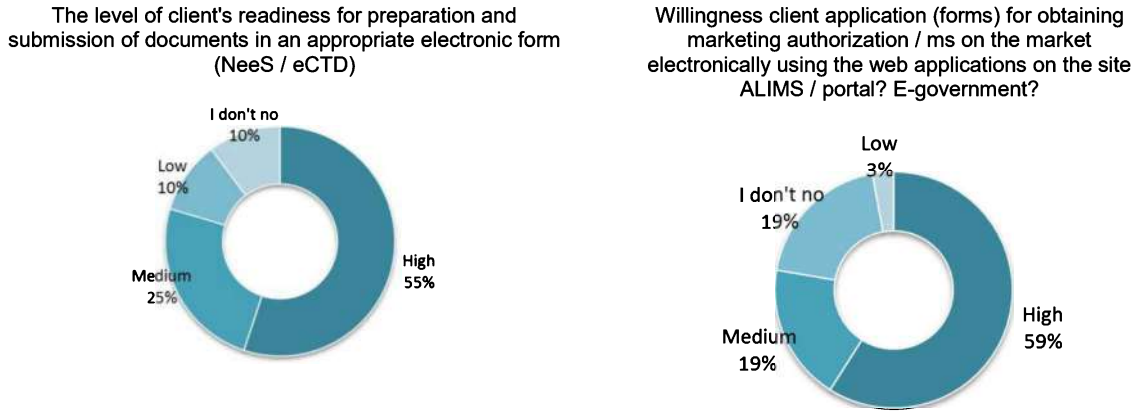

Figure 3: The testing of e-readiness of the pharmaceutical industry in Republic of Serbia

6. CONCLUSION

The methodology for the development of e-services, methods for modeling and analysis of business processes and reference model of e-business in regulation of medicines as one of the subsystems of e-government process metamodel in the context of e-government, life cycle business system design on the e-government network web portal and e-business in regulation of medicines, are the main scientific contributions of this work. Developing web software for e-business development in regulation of medicines, as one subsystem of the e-government implemented in Serbian Agency are the main professional contributions to this work. Improving e-business in regulation of medicines, as a subsystem of e-government would have to aim: the development of interfaces and support for model specification systems through interaction with citizens, the economy, healthcare, pharmaceuticals and other public authorities, support the adopted modeling standards, integration of e-business in regulation of medicines, the e-government, e-health and e-pharmacy in Republic of Serbia, application of methods and techniques of life cycle business model which are presented in the thesis, agile methods and application of SOA, BI, and BMP. The "e-filling clients' requests ALIMS" will enable the integration of ALIMS with pharmaceutical industry and provide electronic submission of customer requirements, thus achieving significant savings for ALIMS as for the pharmaceutical industry in the RS. In this way ALIMS fulfills its mission - to promote and improve the health of people and animals, as well as to contribute to the realization of the fundamental human right to access to quality, safe and effective medicines and medical devices. The development of e-business in regulation of medicines, as a subsystem of e-government of the Republic of Serbia, provides a unique environment for communication, better information about medicines, education via Internet for health workers, as well as the more efficient operations in the healthcare and pharmaceutical industries and the realization of the concept of e-government in segment which regulates medicines and medical devices areas.

INTERNET OF THINGS IN E-HEALTH: APPLICATION OF WEARABLES FOR STRESS MANAGEMENT

Branka Rodic Trmcic *[1], Aleksandra Labus[2], Bozidar Radenkovic[2]
[1] Medical College of Applied Studies in Belgrade
[2]Faculty of Organizational Sciences
*Corresponding author, e-mail: branka@elab.rs

Abstract: *In this paper, we investigate the potential of the Internet of Things in health and well-being. One of the most popular component of well-being is stress management and many research attentions have been focused on relationship that exists between stress and different contexts. In this paper, the model of mobile health for well-being based on wearable computing has been introduced. It allows monitoring of vital parameters and environment parameters that are of importance for the identification of stress or its predictors. As a support to the wearable system, a mobile health application for well-being was developed, featuring relaxation content. Mobile health application for well-being with relaxation content should minimize the excitement and impact on reducing stress. The main goal of research in this paper was measurement of vital parameters during students' term papers defense. Results shows differences between measured vital parameters through wearable system before and during students' defense of term papers.*

Keywords*: e-health, mobile health, Internet of Things, wearable computing, mobile technologies, well-being, stress management*

1. INTRODUCTION

The use of Internet of Things in health in different contexts is not a novelty, and the idea of constant monitoring of well-being is becaming more and more popular. Wearable sensors in health care allow continuous monitoring of relevant vital parameters during every day human activities.
Collected data can be distributed to health gateways or remote systems where they can be processed and analyzed based on algorithms or expert knowledge. Such expertise may indicate the occurrence or symptoms of certain illnesses or stress.

Many life situations can lead to stress-induced excitement today. Heart starts beating fast, face changes and sweating starts. Most obvious example are public speeches (Kusserow, Amft, & Tröster, 2013). Student who defending term paper, taking exam orally or defending thesis also has public onset.
Stress that occurs on those occasions can significantly reduce the quality of speech and increase the possibility of making mistakes. If repeated several times over a longer period can affect the changes in student's behavior or his attitude towards learning and future career (Sohail, 2013).

By measuring certain vital parameters in students, such as heart rate, skin conductivity etc. one can observe their variations in different contexts (waiting for the exam, while defense term paper, taking exams, etc.).
The source of stress for students can be reached through cross-referencing, comparison and analysis of measured data over a longer period.
Testing the influence of mobile health application for well-being in the reduction of stress can serve to build model-pattern of behaviour that can be used to predict the same or similar reactions of the same population in the future (Dragon, et al., 2008), (Shen, Wang, & Shen, 2009).

The research aims of this paper are the concepts of the Internet of Things in the area of electronic health, wearable computing in different areas of well-being, as well as technical and technological setups necessary for the realization of Internet of Things solutions.
Mobile health system based on wearable computing for stress management has been developed. System will measure presence of stress in students during defense of term papers. Mobile application for well-being with relaxation content should increase stress in students.

2. INTERNET OF THINGS IN E-HEALTH

With the expansion of the Internet and the introduction of modern ICTs, a modernization of almost all aspects of business in society took place. Electronic health or e-health originated as the crossroads between health

informatics, public health, and processes related to providing healthcare and to the information generated and transferred through the Internet and related technologies (Eysenbach, 2001).
According to the definition of the World Health Organization, electronic health (eHealth) denotes the use of information and communication technology in healthcare (World Health Organization, 2015).
According to the definition of the European Commission (European Commission, 2015), electronic health is defined as the application of information and communication technologies for fulfilling the needs of citizens, patients, healthcare professionals, healthcare providers and health policy creators.

The term mobile health (mHealth or m-health) is an area of eHealth. Mobile health is a term that is used in providing health and medical care as well as in public health, with the support of mobile devices (World Health Organization, 2011). This term also covers healthy lifestyle applications that, in a direct or indirect way, improve the health and quality of life of individuals. Such applications are often connected to medical devices or sensors (watches, bracelets, jewellery, etc.).

Market and performance of mobile phones has seen such advances that tens of millions of people who previously had no access to a phone or a computer, use cell phones nowadays, which provide them communication and data transfer.
Smartphones allows smooth transfer of data such as multimedia content, high-resolution images, voice, etc.
In Serbia 91.4% of population, own mobile phone and more than 60% Internet connection (Statistical Office of the Republic of Serbia, 2016).
Mobile devices have a wireless Internet connection that allows them to connect anywhere and continuous access to data. Today's smartphones have a number of sensors such as gyroscope, accelerometer, GPS that measures specific user activities. In addition, they are unavoidable in the development and deployment of mobile applications for well-being.
The Internet of Things represents a network of physical objects connected using wireless or wired Internet networks, which contain built-in sensor technology, allowing for interaction with the interior state of the smart device itself or with the external environment. Devices collect and exchange information directly between themselves, with other devices or through a cloud, where it is possible to collect, store and analyse data (Chouffani, 2015).

Wearables are one of the Internet of Things technologies. Wearables are small electronic devices, which are often composed of one or more sensors and have computing capabilities (Salah, MacIntosh, & Rajakulendran, 2014). Wearables are objects which are worn on the body, e.g. on the head, foot, hands, wrists or waist, they can be built into clothes, or they can also be clothes themselves (Mann, 2014). They can take the shape of watches, sunglasses, clothes, contact lenses or even a very modern jewellery. Wearable devices are portable, which allows for the comfort and mobility of those wearing them.
Measurement of vital parameters are possible during users' normal daily activities, regardless the location of the user, and the data can be transferred to a remote server, health gateway or mobile device, where its further analysis and distribution will be performed.

2.1. Wearable computing in eHealth

The promotion of healthy lifestyles and well-being, and their impact on health, has encouraged people to take part in managing their health.
This led to the fact that in recent years, there is increased interest in wearable medical devices, in research area, as well as in health activities (fitness, wellness, equipment for people with disabilities, dermatology, etc.) (Ranck, 2012).
As many technologies are available nowadays (micro technologies, telecommunications, energy efficient devices that consume minimal amounts of energy, new fabrics and flexible sensors), it is possible to design new and modern devices. That devices are usually very comfortable, modern and safety for users and users easily accept them and wear them in different occasions.

Stress is main and leading challenge in modern society. Stress activates the sympathetic nervous system, and its activation causes different reactions in the human body as:

- Heart rate increased. Heart rate is the number of heartbeats per unit of time, usually measured at the wrist. Heart rate shows the health condition of a person and can give early indication of heart diseases.
- Sweeting. When a person is under tension or influenced of certain emotions, sweat glands become more active and secrete more fluid through skin.
- Muscle tension. Muscle tension, facial expressions and eye blink rate increase while person is under tension or influenced of certain emotions.

Long-term repetitions of such manifestations in any population are a frequent predictor of other health conditions and disorders, and even of mental illnesses.
Among students, there is a frequent onset of stress whose sources lie in a separation from home, change in habits, short deadlines, social environment, long waiting in lines etc., all of which can significantly contribute to a reduction in academic performance (Sohail, 2013).
The presence of stress can be identified by measuring various vital parameters of the user, as well as measuring the parameters of the environment that may have an impact on the change in the values of the vital parameters.
Many studies are dealing with stress identification with different type of sensors or their combination.

Galvanic skin response (GSR), also known as electrodermal response (EDR), psychogalvanic reflex (PGR), or skin conductance response (SCR), is a method of measuring the resistance of the skin.
Skin conductivity is one of the signal often used in lie detectors.
Fear, anger, startle response, orienting response and sexual feelings are all among the emotions that may produce similar GSR responses (Mohankumar, 2010).
When person is in its calm state, skin has high resistance and low conductivity. If the blood flow to the skin, when stress is present, blood vessels becomes leaky and water leaks out to form the sweat. This mechanism is important because it cools the body skin through the evaporation of sweat. When this happens, the resistance of the skin decreases to be capable to remove water from itself. At the same time, as the skin's resistance and conductivity are directly proportional, the moist skin increases electrical conductivity.

The sensor for conductivity is involved in many studies that deal with the identification of stress. In the study (Picard & Scheirer, 2001), a skin conductivity sensor was applied as a wearable device for the identification of a person's excitement while listening the seminar speakers. LED light simulated a change in values of GSR.
Following study (Zubair, Yoon, Kim, Kim, & Kim, 2015) also performed detection of mental stress during everyday activities with wearable sensor for GSR. In a case of changed values user, get alert through mobile phone in order to manage the stressful situation.
In study (Sano & Picard, 2013) a skin conductivity sensor and existing mobile phone features (calls, SMS, location services) were used for stress detection. The results were compared with traditional research techniques for stress detection.

Heart rate is one of more certain indicators of the presence of a change in mood or stress, and it is useful to monitor it in actions of health prevention.
A heart rate measurement system is often implemented in devices related to sports (Suunto, 2015), fitness (BASIS Science, 2015), and in stress management (Millings, et al., 2015).

Heart rate sensor is one of the most common sensor in stress management. In (Kusserow, Amft, & Tröster, 2013) a heart rate sensor was implemented together with a skin conductivity sensor, accelerometer and temperature sensor in a familiar natural context – public appearance of PhD students in front of an audience, where significant variations in the values of measured vital parameters were observed.

SpO2 stands for peripheral capillary oxygen saturation. Pulse oximetry is a method used to measure the concentration of oxygen in the blood. SpO2 can be measured by pulse oximetry by emitting and then absorbing a light wave passing through blood vessels (or capillaries) in the fingertip. Normal SpO2 values vary between 95 and 100% (Withings, 2015).

Certain parameters of the environment can affect the individual feels like or a change in his behaviour. Therefore, it is important to monitor them in certain contexts with appropriate sensors. Some of the parameters that may have an impact on well-being during exams or defences of term paper or thesis are noise levels, room temperature, air humidity, the amount of oxygen and others.

2.2. Model of mobile health for well-being based on wearable computing

Model of mobile health for well-being based on wearable computing consist of wearable system for monitoring of vital parameters, system for environment parameters measurement and Android application for well-being with relaxing content, and services for connecting components, hosts and users.

Implemented wearable system and system for measurement of environment parameters consists of heart rate sensor and pulse oximetry (Pulse Oximeter Contec CMS 50D+), GSR sensor (Grove - Galvanic Skin Response – GSR), noise level sensor, CO and temperature sensor.

The system was implemented using the Arduino microprocessor and the Raspberry Pi microcomputer. The implementation on these devices was carried out using the *Python* programming language and the *php* script language.
The Android well-being application was created in the Android Studio 1.2.1 programming environment, using the Java programming language. Contents that students-assistants found to be relaxing were implemented in the app: funny sport scenes, beautiful nature photos, relax music (SPA, relax music, Zen, Chill out etc.). The content was taken from YouTube channel.

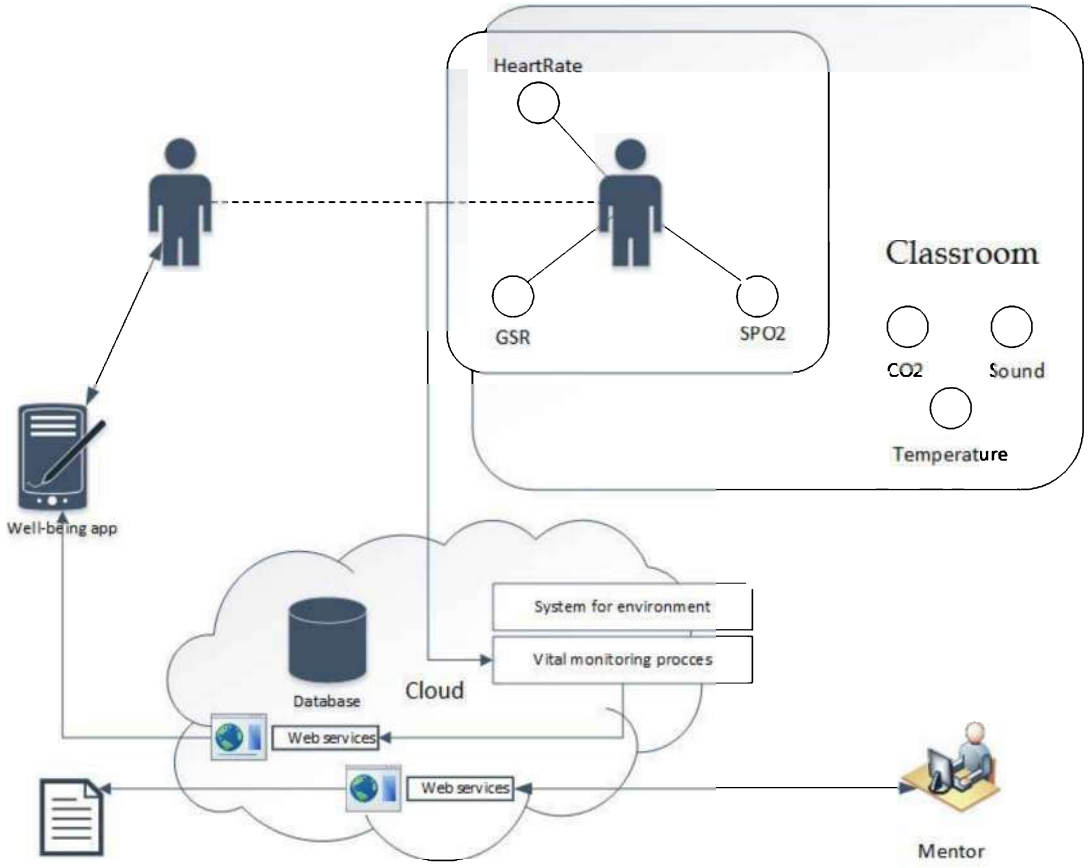

Figure 1: Model of mobile health for well-being based on wearable computing

Since a high level of noise or temperature can cause concentration issues, the values are measured using a noise and temperature sensor and the obtained information is analyzed.

3. METHODOLOGY

The aim of research is measurement of vital parameters during students' defense of term papers, as well as determining the differences between measured GSR values, oxygen saturation and heart rate through implemented wearable system before and during defense of term papers.

The students were supposed to defend term papers in e-business, i.e. Internet of Things in e-health, and they were familiar with the concept of the wearable computing. Research took place in April 2016 at the E-business Laboratory of the Faculty of Organizational Sciences, University of Belgrade. The measurements were conducted over one day.

3.1. Experimental protocol

After arrival, respondent was situated in a pleasant room, connected to sensors (heart rate, SPO2 and GSR). Heart rate sensor was attached on forefinger, GSR sensor on middle and ring finger on the palm side of the left hand. After that, the respondent was given a general questionnaire.
After completing the tests, respondent was given a tablet with a pre-installed Android application for well-being with relaxation content and short instructions on how to use it. The respondent had 15 minutes to relax and use the application content. During the use of the mobile application, the duration of the use of the application and the content browsed by the user were tracked. The obtained values of vital parameters for the respondent were recorded.

The test began after the 15-minute of relaxation. Three examiners entered the room. The test consisted in three parts: first part – preparatory notes, second part – presentation and third part – questions and math.
The test began when one of the examiners read the following text to the respondent: "You are expected to prepare notes for the presentation of your term paper within five minutes, and then to orally present your paper within exactly five minutes. Your presentation will be recorded. The time starts now!"
During the entire test, vital parameters (heart rate, SPO2 and GSR) were measured as well as environment parameters. After the time of five minutes was up, an examiner took the paper with preparatory notes from the respondent and asked him/her to start with second part - defense of term paper within five minutes.
If respondent paused for about 15 seconds, he/she was told to continue as well as remaining time until the end of that part of the test. After the 5-minutes defense of term papers an examiner asked the respondent five questions related to the paper (approximately 2.5 minutes), and then the mathematical part of the exam started, lasting for approximately 2.5 minutes. The respondent was asked to count backwards, subtracting 13 from 1022. If the respondent made a mistake, they were asked to start from the beginning. They were informed of that by saying: "You are wrong! 1022."

3.2. Participants

The sample consist of students of Faculty of Organizational Sciences. Six students successfully finish the research test. Self-constructed general questionnaire was created for the purpose of this research. The respondents filled it out in the first phase – pre-test. General questionnaire consisted of demographic questions about the respondent and was not anonymous.
Table 1 shows the descriptive statistics of the sample.

Table 1: Descriptive statistics of the sample

Characteristic	Gradation	Frequency	Percentage (%)
Sex	Male	3	50
	Female	3	50
Age group	19-21	0	0
	22-24	4	66.7
	More then 24	2	33.3
Smoker	Yes	2	33.3
	No	4	66.7
Physical activity	Regularly	2	33.3
	Occasionally	4	66.7
	Never	0	0

3.3. Data analysis

Microsoft Office Excel was used to analyse data and interpretation. During the analysis process, frequencies, percentage were used. Data are presented descriptively, in tables and graphs.

4. RESULTS AND DISCUSSION

4.1. General stress level

The measured values show pulse variations during the test, compared to pre-test period. Sampling rate of GSR data was 0.2 Hz and for heart rate was every four readings per one beat.

Figure 2 shows mean values of measured heart rate in respondents.
We compared the average values of the pulse of the respondents in the pre-test and during the test. The average value of the pulse during the test increased by 13 heartbeats.

Figure 2: Mean of heart rate during pre-test and test period

Average relative change value of the pulse during the test compared to the period before the test in the subjects is shown in Table 2.

Table 2: Percentage increase in heart rate during the test compared to the period before test

Respondent	***1***	***2***	***3***	***4***	***5***	***6***
Heart rate increase (%)	11.6	8.1	22.4	15.9	26.2	15.1

Average measured GSR values in most respondents' shows variability, i.e. increase in values during the test according to period before test when respondents waits for testing.

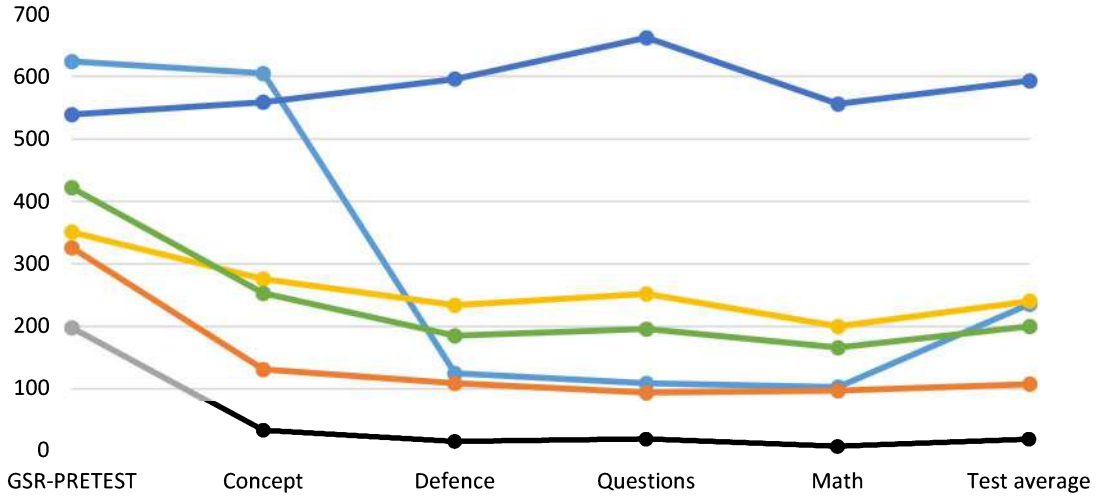

Figure 3: Average values of GSR (resistance changes) during different parts of testing

Reduction in value or drop in resistance begins at the start of the test, where respondents are writing the concepts, then while defense term paper. A slight increase occurs when the interviewer ask questions related to the topic, and continuous decline during the mathematic test.

Table 3 presents the relative GSR value change during the test compared to the period before the test in respondents.

Table 3: Relative changes in the value of GSR during the test compared to pre-test period

Respondent	***1***	***2***	***3***	***4***	***5***	***6***
GSR changes (%)	62	67	91	31	-10	53

Figure 4 shows a schematic of receiving signals through sensors GSR.

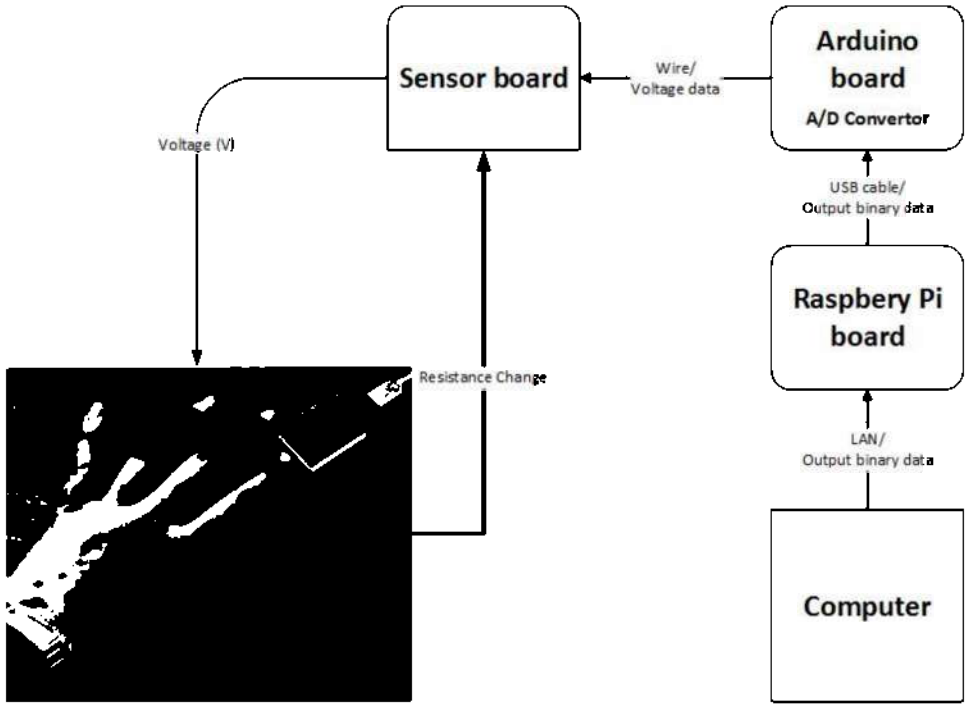

Figure 4: Path of the signal from GSR sensor to computer screen

Skin conductivity is expressed in μS (microsiemens), but output value from the sensor and microprocessor is resistance change. The measurement of resistance changes were measured with resistors of different values. Gain values were compared with output binary values from Arduino processor. Based on calculated values, we come to the exponential equation:

$$y = 125.02e^{0.0036x}$$

Calculated correlation coefficient is $R^2 = 0.9449$.

Based on the state that resistance = 1/conductivity, where the conductivity of the skin is obtained and expressed in μS, skin conductivity is shown on Figure 5.

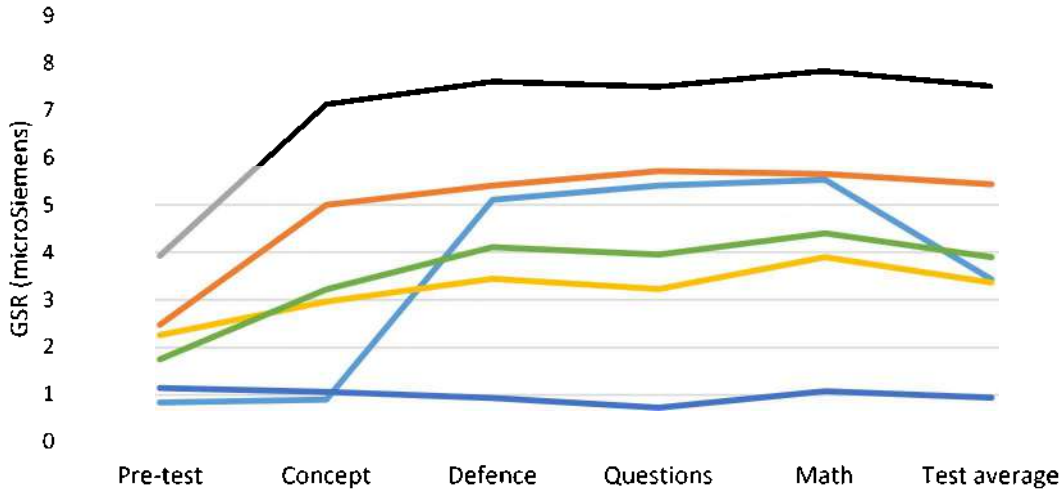

Figure 5: GSR values in microsiemens in period pre-test and different phases of testing

4.2. Well-being app usage

The average time of mobile health application for well-being with relaxation features use was 13 minutes and 1 second.

The overview of time spent on watching different application content is given on Table 4.

Table 4: Distribution of time spent at different contents of well-being application

Content	Total of time spent on content (mm:ss)	Average time on content (mm:ss)
Fun sport	33:22	02:05
SPA music	34:50	01:56
Relax photo	09:52	01:14

The longest time respondents spent listening to SPA music, followed by watching videos of funny sport scenes. Shortest time were spent watching relax photos. The longest average stay was on the funny clips from the world of sport.

4.3. Environment parameters

Sound level, air temperature and CO were measured in the environment. During the test, CO is not registered. Temperature values and sound levels are shown in Table 5 and 6, respectively.

Table 5: Mean of environment temperature values during test

Respondent	***1***	***2***	***3***	***4***	***5***	***6***
Temperature (°C)	28	28	28	28	29	27

Table 6: Mean of sound values during test

Respondent	***1***	***2***	***3***	***4***	***5***	***6***
Sound (dB)	41	41	40	41	41	41

Both, temperature values and sound volume were approximately equal in all subjects. The temperature values were higher than comfort level of room temperature that is around 20 to 24 °C. For a proper assessment of comfort in classroom, it is also necessary to measure the air humidity.

5. CONCLUSION

The collection of data of stress and stressors among students during the examination of their knowledge is a challenge. Each individual reacts differently to stressful events. In addition, many factors affect how a person will behave, or have a stressful event during the observation. In this survey, we examined changes in GSR and heart rate during the test in relation to the period prior to testing. The result indicates the existence of an increase in the value of the heart rate during the test compared to the period before the test. GSR values indicate changes in terms of reducing the resistance or increasing the conductance of the skin that indicates sweating due to intense emotional states.

Future research, in addition to measuring vital parameters, have to be based on other factors that could affect the response in a particular context. Collecting data in a variety of life activities of the respondents can reach steady pattern of behavior and expected reactions in the environment such as the university.

AN APPLICATION OF INTERNET OF THINGS: MEASURING TRAFFIC FLOW

Ivan Jezdović*, Aleksandar Ivković, Sanja Matejić
Faculty of Organizational Sciences
*Corresponding author, e-mail: ivan@elab.rs

***Abstract**: This paper shows an example of an application of IoT for measuring traffic flow. A model of measuring traffic flow based on IoT was shown. An application of IoT is developed in aim to measure traffic flow in real time. A web application for tracking statistical data is shown. The device that follows the sound and registers the number of vehicles that passed is shown. This web application should enable detection of traffic jam and sending notification about alternative routes to drivers. It can be used as a mobile application also. It is also possible to develop system that will send SMS messages and report all users where is traffic jam and ensure them that they will not be part of that jam. The example of implementation is shown by using sensor which measures traffic flow in real time. After the processing, all statistical data can be seen through developed web application.*

***Key words:** internet of things, smart traffic, traffic security, traffic flow, traffic management, web application*

1. INTRODUCTION

With every day number of people living in a city is increasing. Current estimations say that 50% of world's population lives in cities. Today's cities are not projected for these huge amounts of people. Streets are narrow, infrastructure is old, and systems for managing almost do not exist. With the advent of Internet, microcomputers, sensors and actuators it came to accomplishing all necessary conditions for building smart cities (SAS, 2016).

Smart cities are cities which have their own information systems. These systems do different things, from managing traffics to managing hospitals and schools. These systems are connected with each other and it is possible to control all of them from one place. Elements of smart cities are: smart lightning, smart system for trash removal, system for air analysis, smart traffic and many others. It is possible to implement street lightning which turns on only when somebody passes by and in this way saving a lot of energy. Instead of management vehicles (trash removal vehicles) which pass by buildings every day to remove trash randomly and emptying trash cans that are not really full it is possible to develop system that informs workers when trash cans are full. System for air analysis can track air quality and inform people who need these information which parts of the city they should avoid. Important part of smart cities is efficient traffic management (IBM, 2016).

Traffic management is a problem that lots of cities have deal with. Many cities are trying to find a solution to improve public transportation and provide better services inside the cities with smart traffic signs. Responsible for highways also are trying to find new ways how to ensure efficiency to the passengers on long journeys as well as efficient transportation of goods. They are also trying to reduce traffic jam with new parking system. Smart traffic increases capacity, pleasure of travellers and ensures transportation from one to another place as safe as possible. Local police, emergency services and other government organizations can use these networks of sensors to get a quick look about situation in the city, so they could help and milder crowding on the roads, but also quickly react to the accidents.

The model of measuring traffic flow is developed that should enable collecting traffic data in real time. A web app should enable improving traffic flow, reducing delays, increasing security and improving ecological situation. Collected data are shown in real time, so that each change on the road is spotted immediately. With good analysis of these data it is possible to improve traffic flow, reduce delays, increase security and ecological situation.

2. LITERATURE OWERVIEW

Smart traffic includes data processing that sensors collected in the streets and inside the vehicles (Galán-García, Aguilera-Venegas and Rodríguez-Cielos, 2014). Some cities already use different analysis for prevision and traffic reduction. This kind of system helps drivers and authorised personnel. Drivers use different mobile and web applications to detect and avoid traffic jams. Authorised personnel for traffic use collected data to determine where it is needed to include new bus lines or change the traffic lights working order.

One of the cities that invests in smart traffic implementation is Singapore. Singapore adopted intelligent transport strategy. It is one of the cities in which the least traffic congestion occur, with an average speed on main roads of 27km/h, compared to an average speed in London which is 16km/h and Tokyo where is that speed only 11km/h (Batty *et.al.*, 2012). City uses electronic pay toll system where price varies in relation to the traffic flow. Each taxi vehicle has a GPS system which sends data about traffic conditions in the city. Information from all these systems are sent to the main control centre which merges data and provides information about traffic flow in real time.

Intensity of traffic represents interaction between vehicles, drivers, pedestrians, cyclists and other participants and infrastructure including roads, signs and devices for traffic control (Caragliu, Del Bo and Nijkamp, 2009). Purpose of measurement of traffic flow is understanding and development of optimal traffic flow with minimal congestions. For traffic flow measurement as a main information is used average annual daily traffic (AADT) and it is obtained by total number of vehicles for a year on a specific section divided by number of days in a year (Galán-García, Aguilera-Venegas and Rodríguez-Cielos, 2014).

Basic parameters of traffic flow are (Lécué *et al.,* 2014):

- Vehicle flow. Flow is the rate at which vehicles pass a given point on the roadway, and is normally given in terms of vehicles per hour.
- Density of traffic flow. Density refers to the number of vehicles present on a given length of roadway. It is reported in terms of vehicles per mile or vehicles per kilometre.
- Speed of traffic flow. The speed of a vehicle is defined as the distance it travels per unit of time.
- Peak Hour Factor (PHF). The ratio of the hourly flow rate (q60) divided by the peak 15 minute rate of flow expressed as an hourly flow (q15). PHF= q60/ q15.
- Vehicle volume. Volume is simply the number of vehicles that pass a given point on the roadway in a specified period of time.
- Time interval between vehicles. Gap is very similar to headway, except that it is a measure of the time that elapses between the departure of the first vehicle and the arrival of the second at the designated test point.
- Distance between vehicles (Clearance). Clearance is similar to spacing, except that the clearance is the distance between the rear bumper of the leading vehicle and the front bumper of the following vehicle.
- Total distance (Spacing). Spacing is the physical distance, usually reported in feet or meters, between the front bumper of the leading vehicle and the front bumper of the following vehicle.

There are two types of counting traffic flow and they are static and dynamic. Static – vehicles which pass in certain period of time through the certain section of the road are counted. Dynamic – it is counting of traffic flows. Actually it is used to determine intensity, direction and path of traffic flows.

Not only that information are collected from the traffic, one of the great ways to stop traffic jams is improvement of parking systems. It is considered that 30% of city traffic jams are caused by drivers who are looking for a parking spot. In a study 15 city blocks are observed in Los Angeles for a time duration of a year. Researchers have found out that drivers have driven more than 1.500.000 km, produced 730 tons of carbon dioxide and used around 200.000 l of fuel to find a parking spot. Smart parking has a job to find quickly and efficiently parking spot for each user. Some of analysed examples allow users to reserve parking spots directly from mobile application (Wang and Wenbo, 2011).

Smart wireless sensors build in the parking spots can collect data in real time about certain parking spot. Sensors will follow if the parking spot is occupied, empty or expired. Device sends information to competent centre which is connected with mobile application for drivers. Using the application user can find a free parking spot, and the city can thoroughly change traffic patterns and driver's habits.

3. MODEL OF MEASURING TRAFFIC BASED ON IOT

In this work is shown model of measuring traffic flow based on IoT. System allows monitoring of number of vehicles which in certain point of time drive through certain section of the street. Basic component of the system is laser for distance detection. On the basis of work of laser it can be measured how many vehicles have passed. In case of cutting the laser beam, the noise level will be checked with the sound sensor LM393 and it will be determined if the car has passed or some other object. In addition to laser and sound sensor, Raspberry Pi microcomputer and Arduino microcontroller will be used.

In case number of detected vehicles passes the certain point, it is possible to conclude that on a monitored road traffic jam has developed. Another parameter to detect traffic jam is constant cutting of laser beam. In these situations, vehicles are moving slowly which leads to long-term cutting of laser beam.

Using this kind of model it is very easy to determine critical spots of traffic jams in the city. This information is of a great importance for drivers and authorized personnel. It is possible to inform drivers about traffic jams and offer them an alternative route, and authorized personnel can analyse traffic and implement changes that will decrease traffic jams.

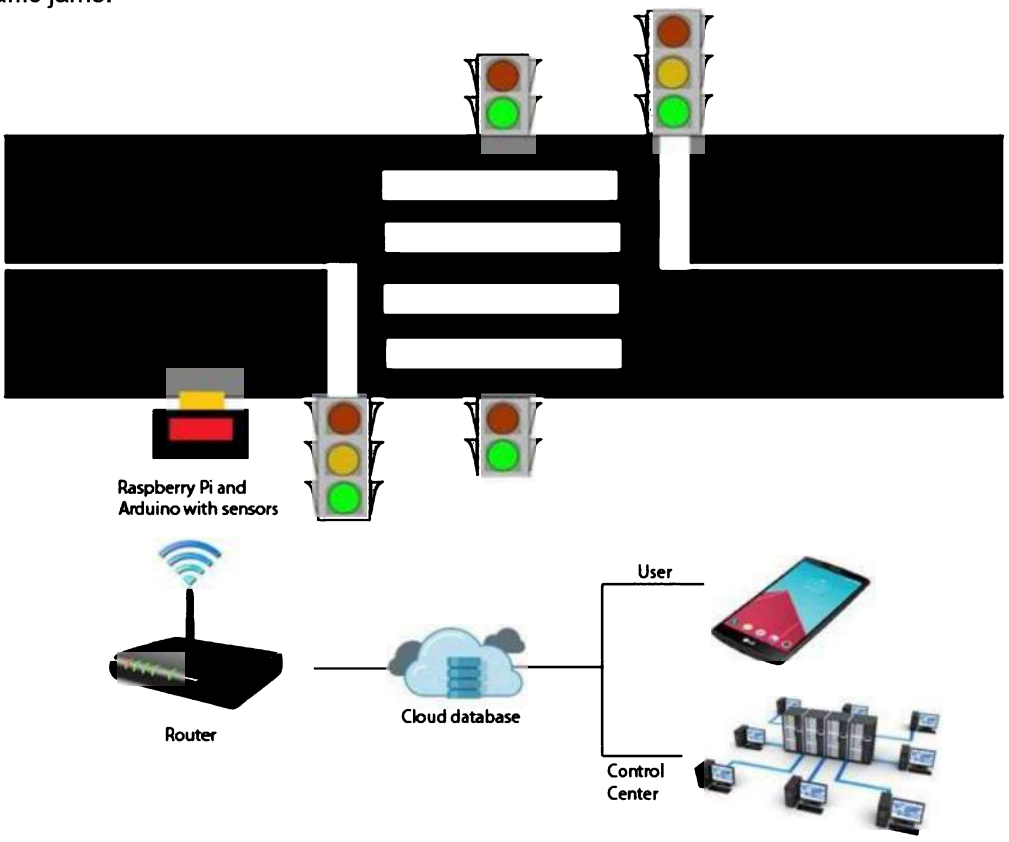

Figure 1: Model of measuring traffic flow based on IoT

Sensibility of the sound sensor is set to minimal, so it would avoid detecting any other sounds other than the sound of vehicles. The device follows the sound and registers the number of vehicles that passed. Remote following of the counter is also possible through web application.

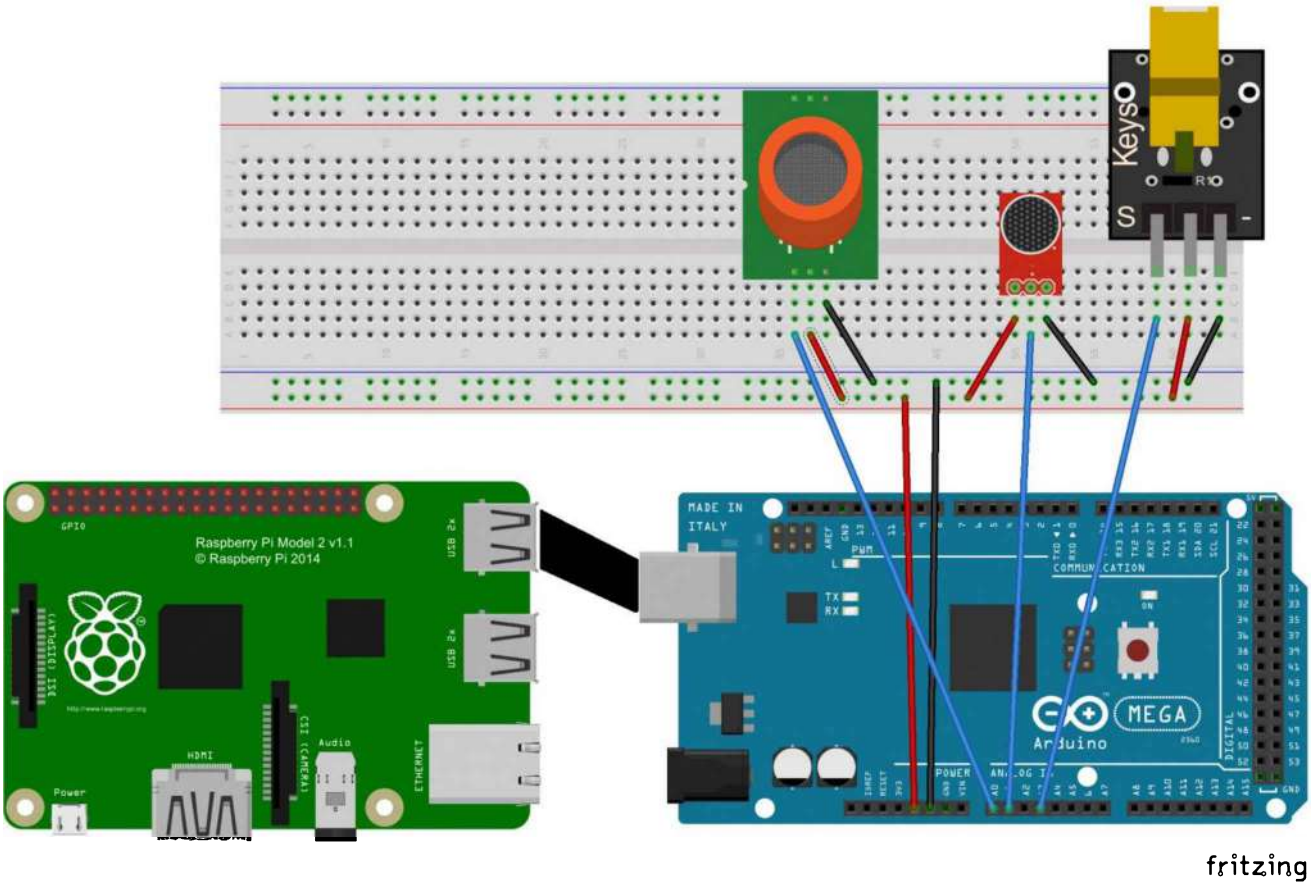

Figure 2: Physical connection of devices

On the picture are shown Raspberry Pi microcomputer and Arduino microcontroller connected with sensors and actuators. Black lines represent cables that are connected to the ground (negative pole) on Raspberry Pi. Red lines represent cables that are connected to power source of 3.3v or 5v on Raspberry Pi. Blue lines represent cables that transfer data between devices.

Raspberry Pi has a web server running. Arduino is connected to Raspberry Pi and sends data read from sensors. Laser sensor, sound sensor, CO2 air pollution sensor are connected to Arduino. Raspberry Pi is running on Linux distribution called “Raspbian”. Web server is developed using “web.py” framework and has a task to send information to service that saves them in database. Because of big amount of data the non-relational database is used (MongoDB) and it is located on the cloud.

4. DEVELOPMENT OF WEB APPLICATION FOR TRAFFIC FLOW MEASUREMENT

This paper shows a web application that allows monitoring the number of vehicles in real time. Based on collected data it’s needed to do analysis and represent results to user in graphical view. The web application is developed by using Bootstrap framework. For graphical view of data is used Chart.js library. Application logic on server side is developed in PHP programming language. Parts of the application logic that are being executed on client’s side are developed using JavaScript. For data insight in real time is used AJAX. All communication with web server takes place through sending and receiving HTTP requests that carry data in JSON format.

Alongside with the insight of traffic flow in real time, it is also possible to filter the data and get more information for previous period of time. Actually it is possible to choose previous day, week, month, year or any other time period. This information can help people who are responsible for highways to make some revolutional changes and make much better traffic system. Also, it is possible to get information about air pollution for certain sections of the road.

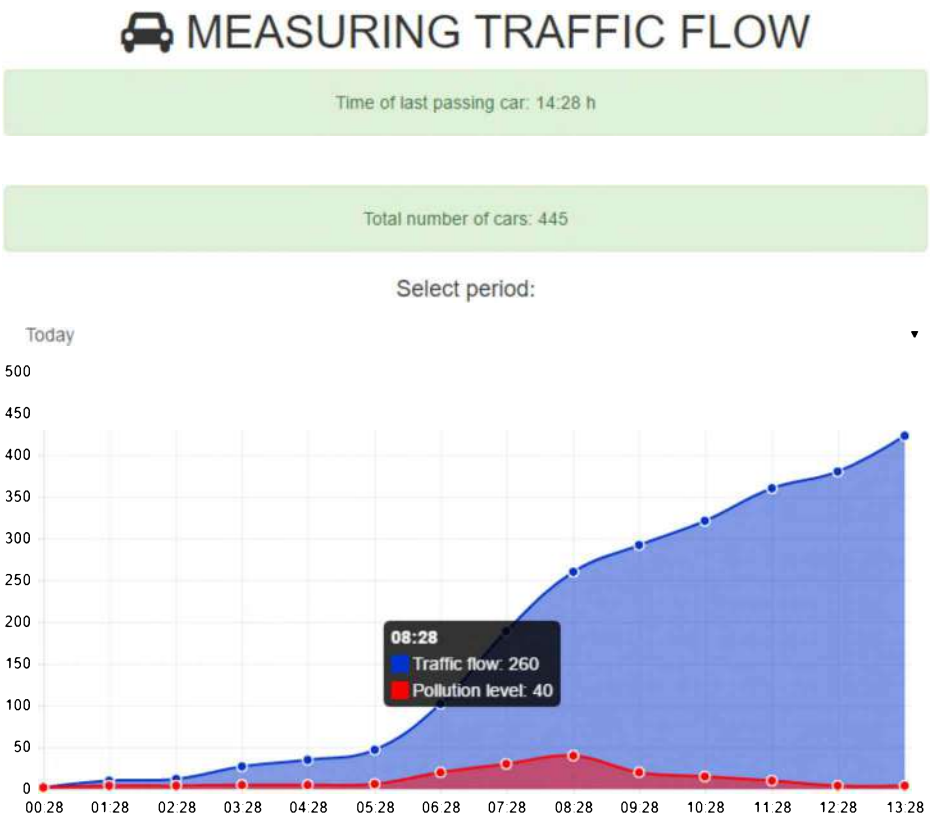

Figure 3: Web application

As an alternative to web application it is possible to develop mobile application. Within mobile application user would have an insight to the same data like in a web application, with some additional functions like push notifications. System would follow current location of the user and in case of noticing that user is moving through route where is traffic jam it would pop up notification with a new route. During suggestion of a new route it should do the selection of users so it doesn't happen that all users get rerouted to the same route. In case of traffic accident in certain street, operator can easily send notification to all users. It is also possible to develop system that will send SMS messages. User can send a message to the certain phone number to get some information about traffic flow and as a replay he/she will get list of the streets where is traffic jam.

Figure 4: Proposal of system with push notifications

5. CONCLUSION

In this work is shown model of measuring traffic flow based on IoT which was developed on Department of e-business at Faculty of Organizational Sciences, University of Belgrade. Architecture of the proposed model is defined. Furthermore, implementation for model for traffic flow measurement and level of air pollution on the roads was shown.

Main advantages of this solution are simplicity, low cost of equipment and possibility of implementation in other smart environments like smart parking. Important advantage of this solution compared to other solutions is collecting information in real time which offers possibilities with smart traffic signs, traffic can be rerouted to less crowded roads and avoid congestions in this way. Model can be improved with additional sensors. Expanding the sensor network will increase data collection which will lead to improvement of system precision and it will allow recognition of driving patterns.

While other solutions relay on data from cameras (Calderoni, Maio and Rovis, 2014) and information from mobile phones (Khoo and Asitha, 2016), this solution is completely relayed to sensor information which is it's advantage. Cameras are more expensive, it is harder to estimate number of vehicles, and applications can undermine user's privacy.

Real-time and historical data collected from network of sensors are used for prediction of travel times. Travel times are usually posted on the web and on signs both on the side of highway and on overhead signs (Bickel, 2007).

All analysed systems are facing the same problem – rejecting users to use alternative routes (Khoo and Ong, 2011). In Malaysia the survey was conducted about using applications to avoid traffic jams. Only 26% of drivers was ready to change their route and use the one that application has suggested. This number is not big enough to make significant difference. Although this percent will grow, it is needed to increase conscience of the drivers about those applications and their advantages.

Today`s main focus is on technologies that are measuring traffic flow of vehicles, but in the future we might see new hybrid systems that are using similar technology to measure flow of pedestrians along sidewalks as well for counting bicycles on the roads.

INTELLIGENT PARKING SERVICE MODEL

Predrag Vuletic*[1], Zivko Bojovic[2]
*Corresponding author, e-mail: pedjanalog@gmail.com

Abstract: *The intelligent parking service model is a part of broader smart city project which was created with the aim to enable more efficient regulation of traffic in cities with reduction of harmful gases emissions and to increase the parking service profit. It is based on drafting of updated database on available parking space, definition of vision and goals of a new parking system, and on creation of conceptual framework for implementation of the intelligent parking system project (marketing, market analysis, improvement of cooperation with clients and extended business). Our forecast is that implementation of smart parking systems and application of Canvas business model with Testbed IoT, assuming reduction of labour force through automation of the majority of business processes, will increase revenues by 20%, while decreasing traffic congestion by 30%.*

Keywords*: IPS, wireless networks, business model, Testbed IoT*

1. INTRODUCTION

The goal of implementation of intelligent parking service in urban areas is related to implementation of plans pertaining to functioning of parking system within a positive balance, reduction of traffic congestion, noise and harmful gases emissions in traffic. Implementation of this idea is a challenge in terms of achievement of ideal balance between mobility, safety and environmental protection requirements. Regardless of greater automation of business environment, implementation of intelligent solutions in traffic, based on IoT technologies, requires the establishment of smart innovative management. The management will face a serious challenge how to solve a problem of inefficient parking space management and reduce traffic density on urban roads in the situation of constant growth in number of residents in urban areas with expressed tendency of further growth. Implementation and flexibility of parking space management model is the main motive which is the basis for business strategy of the parking service management. Implementation of intelligent parking service (IPS) could enable implementation of the following goals:

- Integration of available parking space into a unique parking space base which would be at public parking service disposal. This implies that in addition to state-owned parking space, the aforementioned parking space base would include parking lots owned by physical and legal entities, with definition of contractual obligations between parking space owners and public parking service.
- Implementation of reservation service in parking system which means that user can e-mail, text or call (voice identification) to require reservation of parking space at certain location. The user gets a possibility to define duration of reservation and payment option, applying the system *pay per use* (difference compared to the so far way of calculation based on initiation parking hour).
- Generation of offer of free parking spaces thus providing the clients with possibility of parking lot choice. Clients are offered several free places located in different distances from the required destination. Depending on the distance, the client is also presented a financial offer for each proposed parking place.
- Introduction of parking space classes, economic and business ones, in wider fenced parking lots and garages. Economic class would have more parking places, while business one would have fewer places, which would be wider and longer, with longer period of time available for parking, and would be closer to the exit.
- Central monitoring and configuration of devices from remote location, thus reducing need for hiring of controllers for supervision and enforcement of penalties on parking space.
- Introduction of discounts for certain free places, as well as different advertisements. This would enable direct inflow of funds through stimulation of users.
- Additional introduction of security systems, i.e. protection of information.
- Stimulation of use of electric cars through application of lower parking rates and electricity costs, with subscription on longer period for this type of vehicles.
- Charging of fees while passing, i.e. at the entrance and exit of vehicle to and from the parking lot by introducing RFID readers.
- Introduction of business promotions for other companies, as well as dual market actions.

- Introduction of voice navigation to a parking place, as well as video imaging of free parking places, with possibility to choose zones and places.
- Introduction of day-night charging system, which would offer to clients such parking spaces free during the day but occupied during the night and vice versa.
- Reduction of fuel consumption by implementing a system which enables shorter parking. This would influence reduction of pollution, thus leading to environmental sustainable development.
- Implementation of updated database which in case of disputes provides parking service a possibility to protect business interests of public parking service business based on exact data.
- Networking with police communication systems, which would enable automatic check of vehicle registration.

2. SYNTHETIC INTELLIGENT PARKING SERVICE MARKET

Dynamics of users' requirements and need to find fast and efficient solutions for them, as well as need for more efficient business are the main driving forces for market change. This is why advanced information-communication technologies are ever more frequently applied in different areas of economy, such as transport, energy, industry, trade, etc. Application of these technologies significantly alters processes and entire market, approximating them to achievement of the vision of smart market. Smart markets (SM) are a form of synthetic intelligence which requires a wide array of researches in the area of theoretic formulation and optimization of technical resources, including development of researches about individual users' behaviour and characteristics of market mechanisms. Dynamics and scope of changes in a society caused by the development of new technologies such as IoT impose the need for application of advanced solutions which would provide for high degree of intelligence in real time (Bichler, Gupta, & Ketter, 2010). In this paper, we have addressed the development of intelligent parking system (IPS) model, which would be based on advanced parking space management system in urban areas, i.e. establishment of smart parking space market. This market should function on the following principles:

- centralised disposal of available parking space in urban areas (regardless of the ownership)
- implementation of IoT application and continual updating of data about the availability of parking spaces
- definition of a dynamic pricing set based on readiness of clients to pay for example in auctions for lease of parking space on shorter or longer time period

The need for information exchange between users searching for free parking space and accuracy thereof are of crucial importance for the development of IPS. Traffic generated by vehicles searching for free parking space is a problem in urban areas from the aspect of traffic, but also from the aspect of environmental protection. The existing research indicates that circulation of vehicles increases concentration thereof on roads, especially in central urban zones, where there is a huge demand from drivers (multiple-car-chasing-singlespace phenomenon) (Wang & He, 2011). The need of drivers for recommendations, i.e. for the assistance in finding free parking space, influences expansion of service mobility and improvement of navigation service. Intelligent parking system should be designed according to method of "clients' attraction on the fly". The existing solutions in the area of parking service indicate that providers of this service paid small attention to drivers' needs, their wishes and frustrations. New parking system model should be designed to take care of drivers in order to develop trust in IPS model among them, thus making them ready to pay more for the service. Strategic investments into the technology and marketing of IPS, in accordance with continual development of urban development solutions within the smart city project are prerequisites for sustainability of the smart parking space market project. Functioning of IPS is heavily influenced by reliable system operation, since interruption in communication links would mean loss of revenues and significant influence on operator's reputation. The IPS model can be complex depending on facility type, but electronic payment must be continual and uninterrupted, with minimization of disputable transactions, misuse of credit cards and theft of sensitive information (Bayless & Neelakantan, 2012). The IPS model is based on offer to a new service to drivers, with a possibility of free parking place reservation. The service is implemented in such a manner to have three levels of autonomous functions: coordination level, local parking management level and parking spot level (Babic, Carvalho, Ketter, & Podobnik, 2015). The coordination level should be based on different monitoring sub-systems (Illustration 1), which would collect data from sensors about availability of parking places based on the principle "available-unavailable". Data is analysed in further steps, together with information about the vehicle having sent a request for parking space reservation. The IPS model is designed in such manner to provide drivers with possibilities to pay by card, text message, by invoicing etc. New dimension to IPS quality is provided by possibility to navigate, i.e. a driver can, upon the accomplished reservation of parking place, receive a preferable route through an application on their mobile device, with voice navigation, as well as with image of the parking place from the camera. Smart parking spare market implies a possibility to apply auctions in the stage of parking space reservation. Namely, distance of the parking place from the driver's destination location significantly impacts the driver's motivation to pay certain price for the parking place lease. The time needed to get to the parking place is 10 minutes maximally.

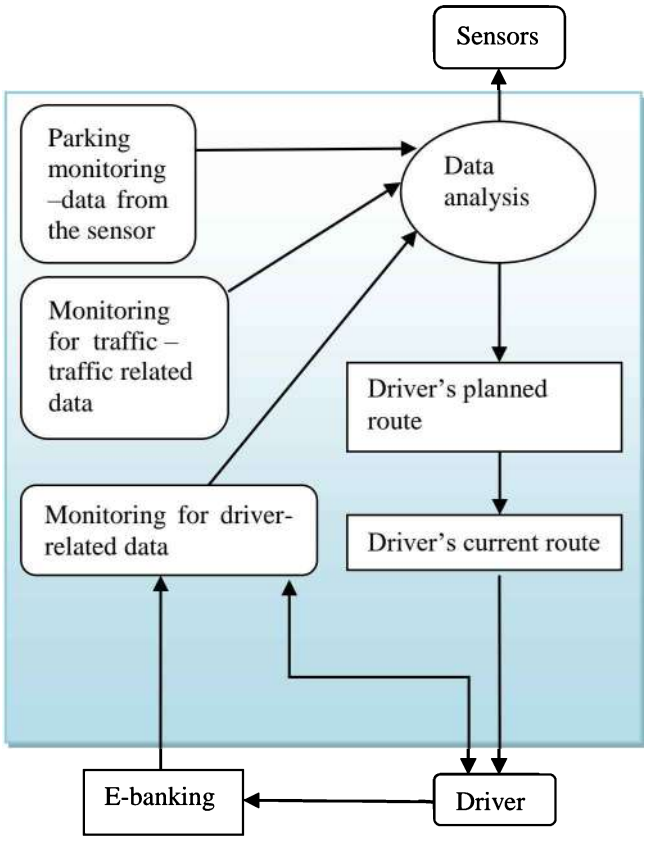

Figure 1: Schematic diagram of the proposed IPS monitoring system

If the driver does not follow the route recommended by the navigation, after the expiry of that period, the driver can request additionally free parking place because they are not entitled anymore to the previous one. The driver is directed to next free place with certain fee charged for the service. In the event that they do not reach that parking place on time, the driver loses the right to request additional parking place in the next two hours, and is not entitled to refunds. Parking time starts from the moment when driver parks their car and confirms the arrival through the application. Special position in our IPS model is given to a system for the protection of reserved parking places. This system implies "lighted" marking of parking place by emitting red light beam from the sensor in cases when other drivers searching for the parking place try to park their car there. In addition to the mentioned solutions, the proposed IPS model implies application of new charging policy which would additionally influence reduction of harmful gases emissions. Our IPS model anticipates stimulation of use of electric cars in order to reduce CO_2 emissions. In order to create technical conditions for the application of this type of stimulation, the parking lots would be equipped with smart battery electricity chargers. The complexity and dynamics of the environment is potential obstacle for the business perspective of this solution. The reason for that is actually the fact that parking transformation process implies the complexity of profit estimation of the smart parking owner and length of time required for the initial investment return (Iordache, Nemtanu, & Cormos, 2015). Electricity market, as a component of this system, would be considerably integrated with its solutions for smart market.

3. INTELLIGENT PARKING SERVICE BUSINESS MODEL

Business model in a usual word in the world of management, but over the past several years it has been attracting great interest for researchers (Morris, Schindehutte, Richardson, & Allen, 2006). Parking service is a system whose functioning is based on linkages of numerous information system segments. This includes data collection, selection, controlling, transferring, processing, distribution and protection. Marketing plan must be open and transparent with the following key and interest approach:

- Basic information about the company, company business philosophy, marketing definition of the company business, company vision and mission, SWAT analysis, business history.
- Analysis of introduction of business automation through wireless network and sensor communication.
- Reduction of costs, increase of revenues, safety in traffic, environmental protection.
- Creativity, use of Serbian and English language in user applications, marketing tactics through use of social networks and Google services.

- Development of new parking system would be designed in phases throughout a certain period of time.
- Graphic layout of cost-effectiveness threshold.
- Defining the needs of the existing and potential users.

The proposed platform, i.e. the model, would increase net profit, at the same time possibility to buy new plots of land for the construction of vertical garages, possibility of business outsourcing and improvement of advertising. The structure of revenues collected from parking subscription fees, sold electronic tickets, additional tickets and from sponsorships and cooperants would greatly influence development of a financial plan in the own funds segment. Nevertheless, credit lines should be involved in addition to own funds, because of the amount of initial investments and relatively fast return of the invested capital. The structure of estimated investment value includes: fixed and current assets. Fixed assets include financial costs for the product development (hardware and software), labour for the product development, market analysis, e-commerce and miscellaneous segment. The costs for labour invested in the product development include: concept and development thereof, documentation, programming, testing, prototype, customer support service, e-mail marketing, website, e-commerce solutions, web marketing, providers' services, advertisements and promotions. In addition to these costs, there are also fixed costs, such as costs for electricity bills, Infostan technologies – utility services, construction land, internet, telephone, stationery, fuel, etc. Operational monthly costs include administrative costs, sales and marketing costs. When it comes to depreciation, it has to be carefully considered, since usage period for sophisticated technology is short, and IPS development stage would take three to five years period. Data about labour force is very important, and implementation of IPS would surely affect the reduction. In order to maintain a "healthy" company while introducing new technologies and IPS model, cash flow should always have positive tendency and scale in balance sheets should always be rising. The value of the proposed is ranked according to consumers, in other words, if customers' needs are met, the value of the proposed system is greater. This means that the first basis should be found in the development part of *Testbed IoT*, incubating the IoT success, which could be subsidised as a part of the financial plan. The second level is implementation in the field, i.e. placement of the results obtained in the first stage through observations and responds obtained from end users. Testbed provides for reasoned guidelines for strategic decisions and investment plans, and it also selects strategic and non-strategic partners. Such logistics pertains to the example of the provision of equipment for Testbed, as well as to indirect call for companies which would develop and test their applications, hardware and communication protocols in real living environment. The interaction in creation of brand must be instrumental to consumers with innovations and support network. What s the most interesting for Testbed stage is double influence on revenues, influence to the IPS preliminary design and impact to attracting of other IT companies which would rent space to research their experimental-oriented services. Traditional business models are designed in such way to focus exclusively on the basic company. However, because of new technological dynamic development environment, companies must quickly adapt to market challenges. As a result of that, innovation business models are becoming a new, additional link or "new routes towards the competitive advantage" (Sun, Yan, Lu, Bie, & Thomas, 2012). With IoT *Get-ahead* and *Catch-up* strategies, companies primarily enable themselves to have the forecast time period. Namely, the get-ahead strategy is a set of actions and plans which enable achievement of a position above the competition, while catch-up strategy is a set of actions and plans which enable monitoring and learning from leaders through operational efficiency and quality. Taking the aforementioned into account, Table 1 demonstrates the process of structuring and evaluating of the IPS business plan, which is composed of four sets: infrastructure, proposed values, clients and finances. Infrastructure is divided into three topics: key partners, activities and resources. In addition, the main topic of customers is also divided into three sub-topics: customer relations, clients and client groups, and approaches to clients. Financial area is divided to the structure of costs and revenues. The identified topics are not autonomous, but are inter-conditioned. Key partners are associated with the common goal, and this is creation of alliance for the improvement of the business model, reduction of costs, risks and uncertainties, with the support of specific resources and activities. Key activities define what the partners are supposed to do and how to do that, e.g. consultancy offer, software development, etc. since every business model must have some sort of resources to create value towards the clients, key resources in this case would be means for maintenance and support of business. Resource type can be intellectual, financial, human or physical, and they should be provided by key partners, based either on ownership or outsourcing from another company. The value proposition will form innovation as new or similar solution for a certain product or service for the area of customers. Wise selection of clients by the company, as well as listening to their needs through adequate access channels generated mutual trust and accomplishment of the expected goals on both sides.

According to data of the Republic statistical office, the number of passenger vehicles in the Republic of Serbia has been increasing constantly over the past several years. For example, the number of passenger vehicles registered for the first time in 2015 was higher by 6.9% than in the year before, while mopeds and motorcycles record certain fall (Republic Statistical Office, 2016). This indicates that need for more parking places, using IoT solutions, is one of primary goals of city administrations.

<tr>
<td rowspan="2">KEY PARTNERS

➢ Institutions dealing with public transport
➢ City transport
➢ Authorised car representatives
➢ Authorised car mechanic services
➢ Auto-motorcycle sport media and organisations
➢ Social networks</td>
<td>KEY ACTIVITIES

➢ Networking with clients
➢ Networking with partners
➢ Coordination
➢ Development and research</td>
<td rowspan="2">INTELLIGENT PARKING SERVICE

➢ Integration of all parking places in the city (state- and privately-owned)
➢ Testbed IoT
➢ Introduction of sensor communication through a wireless network
➢ Remote control with control of parking place
➢ Introduction of pay per use
➢ Introduction of fitting systems for electric vehicles
➢ Gradual phase-out of controllers and paper tickets, i.e. daily tickets
➢ Rationalisation in human resources and expenditure
➢ Construction of vertical garages
➢ Better organisation of traffic
➢ Reduction of traffic congestion and of harmful gases emissions
➢ Greater interactivity with clients and adaptation to their needs
➢ Networking with the police
➢ Outsourcing business</td>
<td>CLIENT RELATIONS

➢ Assisting to clients in purchase of electronic tickets
➢ Automation of services
➢ Specific client relations for clients who often use IPS services, as well as with members
➢ Development of relations with other companies and their staff</td>
<td rowspan="2">CLIENTS AND CLIENT GROUPS

➢ Younger drivers
➢ Elder drivers
➢ Car drivers
➢ Moped and motorcycle riders
➢ Families
➢ Clients with special needs
➢ Employees of specific companies</td>
</tr>
<tr>
<td>KEY RESOURCES

➢ Information and knowledge
➢ Space for the monitoring centre
➢ Hardware and software architecture
➢ Patents and ownerhip rights of the Smart Parking Service
➢ Human and financial resources</td>
<td>CLIENT ACCESS CHANNELS

➢ Internet

➢ Printed advertising material
➢ Media</td>
</tr>
<tr>
<td colspan="3">COSTS STRUCTURE

Reduction of costs through automation
➢ Procurement and maintenance costs
➢ Activity costs
➢ Partnership costs
➢ Costs for the development of client relations</td>
<td colspan="3">REVENUES

➢ Website with electronic purchase model, purchase of products, services and contents
➢ Web business – advertising space would be ceded to other companies charging a proper fee for that, i.e. sale of advertising banner space
➢ Subscription model for access to certain facilities or services – e.g. motor racing, Nascar racing, etc. Subscription would be on monthly, semi-annual and annual levels
➢ Transaction sale could be applied in e.g. auction sale of spare parts and service offer, thus bringing commission to the parking service from salesmen who would gain revenues from the sale
➢ Sales model would be implemented through ticket, information and service sales
➢ Affiliation model would be implemented by referring the buyers to other companies who would buy products and get certain discount on them, and parking service would gain commissions for such referrals once the sale is finished</td>
</tr>
</table>

4. CONCLUSION

Application of advanced solutions leads to the improvement of the existing and introduction of new services for more efficient fulfilment of users' needs. One of these services includes possibility to reserve parking places at any time, from any location, and in any way. Implementation of this service would enable the users to plan and implement their activities more efficiently, but also to reduce fuel costs. From the aspect of city authorities, this model is an efficient solution for the reduction of congestions on urban roads and harmful gases emissions. However, implementation of IPS is complicated by the following: impossibility to complete the database due to the lack of regulatory provisions pertaining to which entity offers parking space (whether it is only the Parking Service or specific private and business owners), as well as regulation of mutual obligations. Would it be better to develop a separate system or an integrated platform, or to go through a network of telecom operators? Separate system based on cloud and SDN solutions is a better and long-term option, because it eliminates the dependence on telecom operators. The question is whether telecom operators would let that happen. How to make a good business plan to justify the investment if you cannot see the relation thereof to the operators? Is there legislation that would allow the use of stock exchange for the lease of parking spaces at busy locations? The need for qualified staff, in addition to all of these issues, is a bottleneck at the moment, but it is also a good starting point for modern traffic.

AN APPLICATION OF TEXT TO SPEECH IN SMART HOME

*Đorđe Knežević, Pavle Lošić, Živko Bojović
Faculty of Organizational Sciences, University of Belgrade
*Corresponding author, e-mail: djordje@elab.rs

Abstract: *This paper shows an example of implementation of Internet of Things in smart house. The model for managing the smart house through voice commands is developed as purpose of increasing pleasure of those living inside the smart house and making the everyday situations easier. This paper shows an example of implementation of lightning, alarm system, fire extinguishing system as well as system for increasing environmental awareness. All these systems can be managed through voice commands or through a web* application.

Keywords: *smart house, IoT platform, TextToSpeech application, augmented reality*

1. INTRODUCTION

With everyday technology progress, first of all increasing processor's power and decreasing their size, totally new generation of computers has emerged – microcomputers. These devices have enabled us to create smart environments. The concept of smart environments represents "physical world that is richly and invisibly interwoven with sensors, actuators, displays" (Weiser, Gold and Brown, 1999.). Main purpose of smart environments is increasing user's pleasure (Cook and Das, 2005). Concept of smart environments is achieved by using Internet of Things.

Internet of Things (IoT) is a network of smart objects connected to the Internet which can communicate with each other (Tan and Wang, 2010.). As the number of smart devices connected to the Internet is exponentially rising, so is rising our ability to send, receive, collect and analyze data from any device at any moment (Hanne, Ovidiu, Tracey and Roy, 2012).

One of the elements of smart environment is a smart house. Smart house enables us to simultaneously manage large numbers of devices using lots of different services and applications. Definition of smart house is changing with the development of new technologies. Previously, it has been thought that the smart house is the one that has devices which are connected to the Internet and which we can access using the Internet. However, today smart house is the one in which devices are not only connected to the Internet, but they can also communicate between each other (Wu *et al.*, 2010).

This paper shows a development of a system for managing the smart house through the voice commands. Web platform and mobile application are developed so the voice commands could be given to the system. Apart from the display of read values and actuator states on both applications, users will be provided with additional functionalities within the mobile application, like sending an e-mail or SMS messages. The main purpose of web platform is to assist the administrator in defining the environment, sensors and actuators. Web platform will provide a secondary way for managing the system.

2. LITERATURE OVERVIEW

A smart house is the house that includes advanced automatization of the system with the purpose of enabling more sophisticated surveillance and control over the functions inside the smart house. For example, in smart houses lightning, temperature, multimedia and security systems can be easily controlled. Users can not only manage these devices but they can also get feedback from the house with

their state and history. Smart house can be managed in many ways, the most common ways are: Web application, mobile application, SMS message, remote controller and voice commands.

One of the interesting ways of managing the smart house is using voice commands. Not only that it is very interesting and intuitive, but it enables it's user to simultaneously do more than one thing. For example, user can, while leaving the house, simultaneously activate the alarm, shut down the lights and get dressed. Feedback is provided through sound which enables user to stay focused on the thing that he is doing at the moment.

Automatic voice recognition is a process in which the computer is processing human voice and creating a textual representation of spoken words. Control over the voice commands is getting more and more popular with it being used not only in smart houses, but also in smart phones, smart cars, smart tablets and smart TVs.

After analysis of the literature, it can be concluded that the smart houses are different depending on technical equipment and technologies that they are using. Wireless technology, mobile applications, multimedia control and fast Internet access are usually used. Some papers highlight the importance of the smart medicine and e-health in smart houses. The focus of these works is facilitating life of the people who live in the house, increasing their security, information availability and managing the devices even though the user is at the remote location.

Some solutions are focused on decreasing the costs through user detection (Makonin, Bartram and Popowich, 2013). It is necessary to detect when users are not at home, so the smart house could adjust the environment, to be more precise decrease the temperature and shut down the lights. Result can be improved if the system knows when the user needs to come back home, that way more energy can be preserved. The energy efficiency of the house can be further improved by detecting the user's sleep phase (shutting down all the unnecessary devices).

An important element of the smart houses is health of household members (Juniper research, 2014). Internet of Things provides data about user on the level that was just not imaginable until now. Implementing different medical devices, it is possible to greatly increase the life quality of people with physical disability and it is also possible to detect symptoms of different diseases even before they occur.

Large number of studies are focused on security of the systems itself. During application development for smart houses it is necessary to pay attention to network security on which devices are connected, data privacy, communication security, identification and authorization of the user and many other parameters (Enisa, 2015)

3. SMART HOUSE SOLUTION DESIGN

In this work is shown development of the model for managing the smart house through voice commands. The model consists of: microcomputer, microcontroller, sensors, actuator which on request of microcomputer and microcontroller change the state inside the smart house. Communication with microcomputer is enabled through web service. The model is shown in Figure 1.

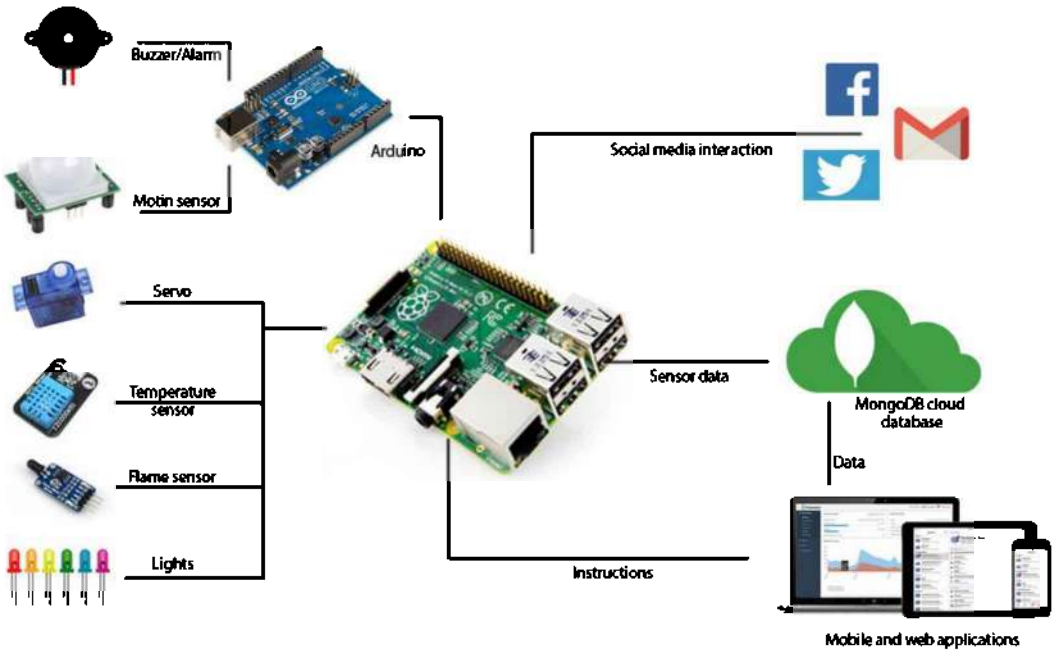

Figure 1: Model for managing the smart house through voice commands

The main purpose of the smart house is to provide to its household members the best and the most secured life style. It's supposed to provide way to managing the lightning, multimedia system, security system, system for maintaining temperature and air moisture inside the house as well as integration with social media.

Centre of the system is Raspberry Pi microcomputer. Temperature, moisture sensors, lightning and flame detector sensors are directly connected to the microcomputer. Except of these sensors, Arduino microcontroller is also connected with the purpose of working on security system. To the Arduino is connected motion sensor which is activated when something is moving. The Raspberry Pi microcomputer runs on Linux distribution called "Raspbian". Web server is located on the device and it is created using "web.py" framework. Because of the huge amount of data, two types of databases are used, relational MySQL database and non-relational MongoDB. In relational database are kept all information for the user and his/hers privileges, sensors and actuators, while in MongoDB database are kept all information from sensors. Within web server is a controller which, based on user's requests, decides which operations will be executed and on adequate way informs user about that. Physical connection of devices is shown in Figure 2.

Figure 2 shows Raspberry Pi microcomputer and Arduino microcontroller connected with sensors and actuators. Black lines represent cables which are connected to the ground (negative) on Raspberry Pi microcomputer. Red lines, in the picture, represent cables which are connected to output of 3.3V or 5V on Raspberry Pi microcomputer. Blue lines represent cables which are used for data transfer between devices.

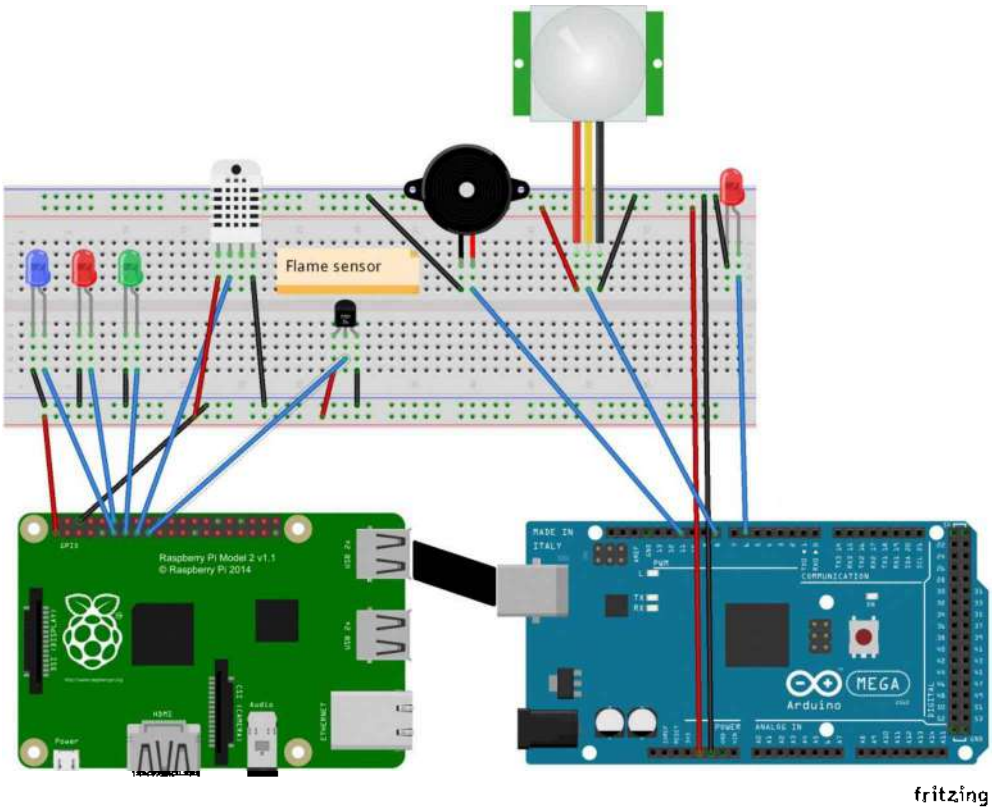

Figure 2: Physical connection of devices

4. DEVELOPMENT OF TEXT TO SPEECH APPLICATION FOR SMART HOME

Project of the smart house consists of 4 main parts. First part is a web server that's set up on Raspberry Pi microcomputer, it is developed in Python programming language. Second part is a web application. Third part is a mobile application for Android OS, which user uses to give the voice commands. Fourth part consists of an application for augmented reality.

Raspberry Pi microcomputer takes the central part in the system. It has the web server which on user's request sends information about current state of sensors. All values read from sensors are kept in non-relational MongoDB database held on cloud (Cyrus and Nayak, 2016). In addition to checking the state, Raspberry Pi manages different actuators like step motor. User with voice commands has availability to check notifications and messages on social media like Facebook, Twitter and Instagram. User can check number of unread messages on its mail account. With the sequence of voice commands it is possible to send an e-mail or SMS message to some of the contacts, as well as get the content of received SMS messages.

Web application consists of two parts: administrative and user part. Administrator can create main account and account for every household member. In addition to creating an account, administrator can change and delete existing accounts, as well as change their level of privileges. The application contains three levels of privileges: parents, kids and guest. User with the privilege parent has an access to every option of the smart house system. User with the privilege kid has an access of insight to a current state of the house and options to manage the systems which parent allows it. Guest privilege is just a temporary privilege which is created by the parent and has limited possibilities. Administrator gives proper sensors and actuators to each client to which he will have insight. Each sensor is given a name and unit of measurement. For actuator, name is defined and set of states which that actuator can have. For sensors

and actuators administrator can define the room which they belong to. Admin panel of the web application is shown in Figure 3.

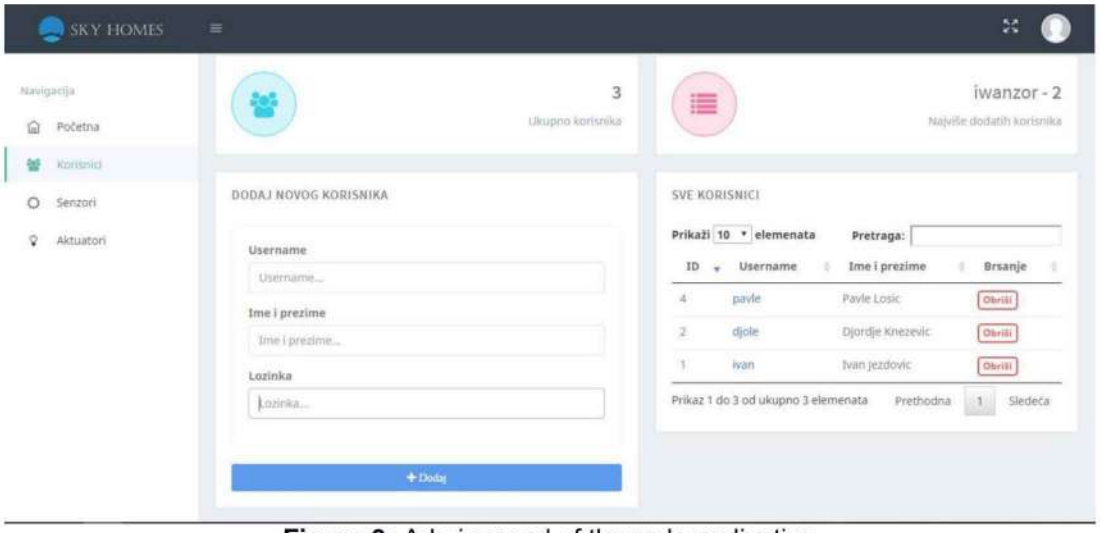

Figure 3: Admin panel of the web application

User is shown the state of sensors in real time in proper part of user interface. Main information are current temperature, air moisture and level of lightning. Also, user is given the possibility of filtering the results as well as graphical view of those data. Depending on the level of privileges, user can manage lightning inside the smart house. Also, on the user panel there is an option for lightning automatization, for example, turning on the lights in previously defined moment of time. User with privilege parent has an option of managing the alarm. On user interface panel there is an option of zoning the house, where it is possible to activate the alarm only in certain rooms.

Web application is developed using Bootstrap framework. Charts.js library is used for graphical interface of data. Logic of the application is set on server side and it's developed in PHP programming language. Parts of application logic which are executed on client's side are developed in JavaScript. For display of actuators in real time is used asynchronous JavaScript (AJAX). All the communication with web server is carried out trough sending and receiving HTTP requests where data is transferred in JSON format. User interface is shown in Figure 4.

Figure 4: User interface

Mobile application is intended for the client and it provides possibility of information review as well as giving the voice commands. For each sensor, user is shown proper information in real time. Same as with the web application, for chosen sensors information can be shown as graphic view for previous period of time. The application provides a way of managing the smart environment with simple speech. These commands are analysed and sent to Raspberry Pi microcomputer which executes them. User has access to these commands: turn on the light, turn off the light, is the light on, current temperature inside the house, temperature in Belgrade, alarm armed, alarm disarmed, check mail, check notifications, convert Dinars to Euros and commands for sending SMS messages and e-mails. Each voice command will give a feedback to the user in a voice format.

Augmented reality is integrated as a part of mobile application. Users can use their mobile phone to scan the marker to get insight in state of sensors in virtual space. When marker is detected, Raspberry Pi reads the value from sensor and sends this information to mobile application, which shows this value above the marker. Value of the sensor is visible only through the phone camera. Text to speech application and augmented reality is shown in Figure 5.

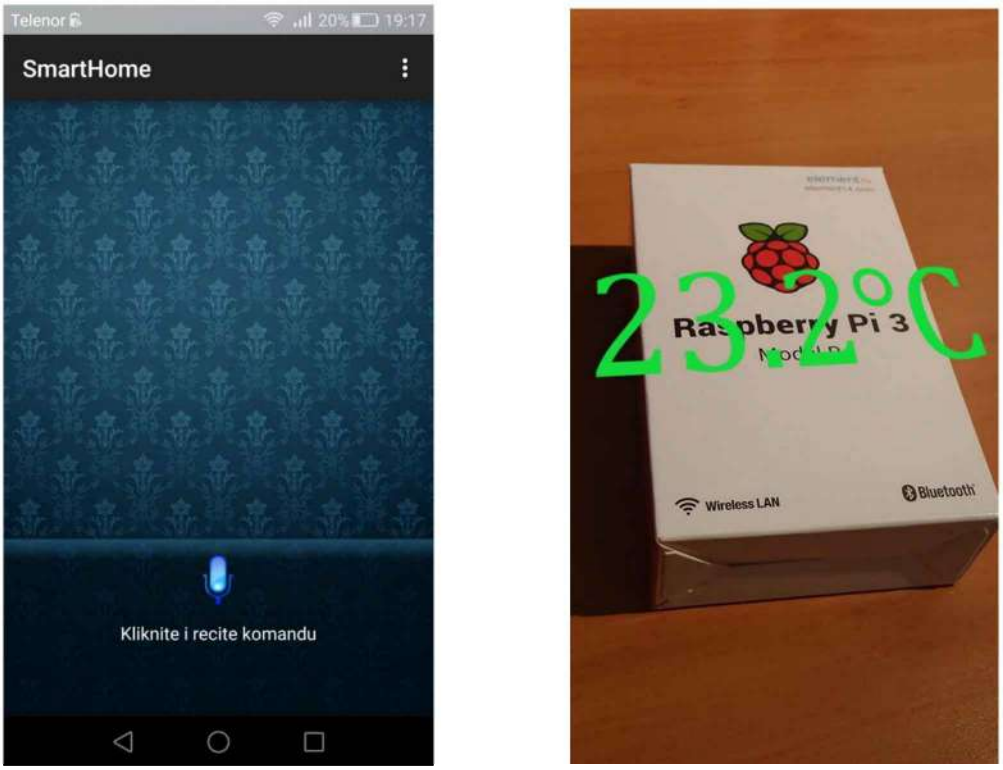

Figure 5: Text to speech application and augmented reality

Android application is developed in Android Studio IDE development environment. Within application is integrated Google's API for SpeechToText, which goes to Google's server and converts speech to text. Text is returned to Android application which sends it further to the web service on Raspberry Pi microcomputer, from which it gets feedback about executing proper action. Application notifies user in two ways, in text and voice formats.

5. CONCLUSION

This paper shows a solution for managing the smart house through voice commands. Model architecture is defined and implementation is shown through development of web and Android application. Advantages of shown solution are simplicity, low price of the equipment and possibility of easy

implementation in other smart environments. Shown application can significantly ease life of people with disabilities, and it represents complete solution compared to the other analysed applications. Applications analysed during writing this paper are focused on certain parts of the smart environment while defined application has control over most of the elements of smart houses.

During development we used large number of technologies and programming languages (Linux, Python, PHP, Android, Mongo, Vuforia) which is at the same time a flaw and virtue of the application. This work proves that large number of technologies can be used simultaneously to achieve concept of smart environments, but if application keeps developing it is necessary to limit the number of technologies.

Further development of the application can go in two ways. First way is expanding number of supported sensors and actuators. This way of development has no limits because it is possible to implement all devices that can communicate through the Internet. For example, we can create a smart heating system which would read information from different sensors and then control temperature and thus significantly decrease costs.

Other way of application development is focusing on augmented reality. It is believed that virtual/augmented reality is next step of human-computer interaction (Dong, Hyun, Jae and Jae, 2016.) so this way of development can be very interesting and challenging. It is possible to develop mobile application so that all information are shown in virtual space. Besides insight in current state, user can activate certain devices, so with only one gesture of the hand it's possible to manage music volume in whole house or shut down the light only by looking at it.

Abstract: *This paper describes the advantages of using technical and technological achievements and their implementation in a centralized and integrated management system of smart buildings. It also defines smart buildings and gives basic features, functionality, and integrated management and monitoring by implemented technical systems, which contributes to saving energy consumption. It gives an example of an integrated technical system of a smart building of a business premises of the National Bank of Serbia.*

Keywords*: smart building, automation, technical systems, management, energy*

1. INTRODUCTION

Climate change, which is an active topic today, marks above all the negative consequences of the impact of humanity on the factors of the climate system. More than 40% of the global energy (mostly made of fossil fuel) is consumed in commercial and residential buildings. The goal of any construction is to provide conditions for life and work in economically acceptable conditions in complete harmony with nature. Using technology and processes for creating a building that is safer for its users and more effective in operational terms for its owners is more frequent. There is a need for automating business-residential facilities primarily with the aim of saving energy. The intelligence deployed at buildings, together with the integration of renewable generation sources, has brought in new concepts, such as Smart Buildings and Smart Environments. These new environments imply deploying interconnected sensors and intelligent devices in order to obtain energy efficient buildings (Smart Buildings) and make the life of the users easier (Smart Environments) (Hernandez et al., 2014:1462).

Smart buildings can automatically adjust its internal temperature or the temperature of each specific entity within to external conditions or to interior inactivity in individual parts by automatic control of heating, cooling and ventilating. The same principles apply to other subsystems that integrated and centralized system management controls, such as interior, exterior and facade lighting, access control, fire alarm system and air quality control system, monitoring security system, pumps control, generators, elevators, fuses, windows and other equipment in the building (Kambić, 2014).

Smart building can be controlled by: PC, tablet, mobile or landline phone, universal remote control and other modern devices that have the ability to receive and send executive signals. The primary task of the embedded automation is to satisfy the need for better quality of a modern man`s life, but at the same time to accomplish significant energy savings. In achieving the optimum balance between these two apparently correlative sizes, automation achieves its full meaning and usefulness. Finally, the concept gets its full meaning by creating a safe, comfortable, economical and secure environment, while simultaneously saving energy, reducing maintenance costs, and longer life cycle of the equipment.

2. SMART BUILDINGS

Smart buildings are those objects with built in materials and systems that contribute to lower energy consumption and simplify the operation of all equipment. Office buildings, hotels, hospitals, schools and housing facilities are in need of cost savings and greater comfort.

The brain and central nervous system of the smart building consist of central computer servers and databases, which gather large amounts of information, which are analyzed, processed and consequently sent to executive devices that carry out activities. Numerous and various sensors and cameras are surrogates for the senses, which collect information and initiate action, where the blood circulation, neural networks or spinal cord could be imitated by some of the protocols and buses for the transfer of data and control signals, while many zonal controllers represent a kind of peripheral nervous system. Finally, there are the Internet and Intranet networks that connect individual organisms with the entire community (Marković, 2010:285). Central system for managing the building (Building Management System - BMS) refers to a large

number of management systems in the building, from special purpose controllers to larger systems that include central computer and printers. BMS consists of several subsystems that can be connected in different ways in order to form a complete system, such as a system for heating, ventilation and air conditioning, electrical systems, lighting system, fire alarm system, security system. BMS can be used for monitoring, control and management of the entire system or parts of the system.

The basic need for the introduction of the BMS:
- Increasing the reliability of technical systems;
- Reduction of costs;
- Increasing the productivity of employees;
- Increase the safety of employees and property.

Centralized and integrated building management aims to make possible proper work of implemented technical systems with a minimum number of fails. The fails in the system components almost always require higher costs due to repair or replacement, than would be required with the periodic maintenance. Additional costs are caused also by the interruption of business processes due to the fail of individual components or the system as a whole. In this sense, BMS makes a significant contribution by continuous monitoring and preventive maintenance of components.

BMS communication network that is installed throughout the building is used for reception of all alarm signals and sending executable commands. By using an integrated system in a quick and easy way, we are able to provide comfortable conditions for work and, with these positive effects, influence the increase in employee productivity.

3. SMART BUILDING – THE NATIONAL BANK OF SERBIA

In the mid seventies, it was decided that, for the purposes of the former National Bank of the SFR Yugoslavia, a new office building would be constructed on Slavija Square, in Nemanjina Street. It was officially put into operation on 21 March 2006. The decision that the building should be constructed was made by the Council of Governors of the former Yugoslavia in 1976, and a detailed urban plan for area of "Slavija" from 1980 determined the location of this building. The investment program was discussed for 9 years and finally adopted in 1989. With the dissolution of SFR Yugoslavia, the National Bank of Serbia inherited all the problems and costs associated with construction. Construction started in 1992 and it was attended by about 60 companies.

Figure 1: Office building of the National Bank of Serbia, Nemanjina 17, Belgrade

The building is an imposing modern building of about 53,000 m2, with four underground and eleven floors above ground. On four underground floors there are parking, warehouses, safes, printing office, power stations, diesel generator, various workshops and the like. At eleven floors above ground, in addition to the three cabinets for vice-governors and office space, there is a hall with 200 seats, a specialized library, a safe for numismatics, as well as centers for facility management and security, kitchen and restaurant.

This facility has modern equipment for security systems, KGH control, telecommunication systems, access control, lighting control, multimedia systems, electrical control system, the system of structured cabling, IP

network and the Internet, management and visualization, integrated BMS software and systems for special purpose facilities.

3.1. Electronic security facility

The electronic security system of the building of the National Bank of Serbia in Slavija consists of multiple systems that are inter-related by hardware and software, which is managed and controlled individually and is supervised centrally via SMS system (Security Management System) that other systems are hierarchically subordinate to.

Electronic security system consists of the following systems:
- Anti-burglary system;
- Closed-circuit television (CCTV);
- Access control;
- The system for managing and controlling the status of doors in restrictive areas;
- Central monitoring of the security systems.

3.1.1. Anti-burglary system

Anti-burglary system consists of the computer, central units, operating consoles, gateway, printer, address input elements, address control elements, sensors, cable installations and components for assembly.
There are two anti-burglary panels with 8 addressable loops each, out of which 14 were used. The panels are located in the Control Center (KOC – Kontrolni centar), under the supervision of employees from physical and technical security (FTO) and anti-fire alarm security (ZOP) departments. Supervision of the work of the entire system as well as the management is carried out via a PC which is also in the Control Center. There is a gateway for the concentration and flow of information between the panels, PC and central monitoring system. Address loops connect 176 addressable elements with four addresses or about 700 zones. The loops are fully controlled and monitored.

There are sensors installed, such as infrared ultrasonic motion detectors, passive infrared motion detectors, glass break detectors, ambient, seismic detectors, alarm rails, magnetic contacts, alarm buttons and other. Sensors are installed in all places where it is possible or where unauthorized entrance is expected into the building premises and facilities whose content and purpose is of special importance. Installation is carried out with halogen-free signal cables. Installation and distribution cables are laid at S shelf of the cable tray envisaged for the installation of weak electricity. The power supply for central units is realized via rechargeable batteries that are found in panels or through diesel generators.

PC Computer and Gateway is powered via UPS placed in the room of the Control Centre. This system allows for each event or incident, either automatically or after a call of the operator to get a graphical representation of the micro and macro location of the incident, emergency plan and the like. Anti-burglary system is connected with hardware connections (RO-PP) with a CCTV system so that the selected monitor gives an image of the place of incident.

3.1.2. CCTV

CCTV system is designed for video surveillance of all entrances to the building, perimeter (adjacent to the building), protective inner circumferential channels in the underground part of the building, entrance halls and vital corridors, communication in underground garages, entrances to the premises and the rooms with vital contents regardless of their type, doors in restricted areas, area in front of the treasury, and the like. There is video surveillance system consisting of a central video matrix 176/32, 2 PCs, 10 quad processors, 4 multiplexers, 11 digital video recorders, video printer, monitor wall (6x55"), the power block for continuous operation (RO-E and UPS), 155 camera places in the building, 46 infrared reflectors, cable installation, components for assembly.

Central units are located in three RACKs in the Control Center where there is 24-hour duty. The CCTV system, besides permanent control, responds to each incidental situation so that the monitors show images of the incident area. The system performs continuous capture of images from all the cameras to digital hard recorders which are high quality and reliable. All cameras and video monitors are in color, except the cameras in circumferential channels, which are black and white and communications that have the ability to transfer from black and white to color, depending on the brightness levels. There are also IC reflectors that provide visibility to the cameras even in complete darkness. The position and optics of the programmable cameras can be controlled remotely from a PC (RO-DK).

CCTV system is connected with hardware connections to the anti-burglary system (RO-PP) and the interphone system (RO-I), and via the central monitoring system with the access control system for the management and control of the status of doors in restrictive areas (CF9000) so that the selected monitor shows the image of the incident place.

3.1.3. Access control

The system is designed to control entry to the building, certain facilities and premises of importance. In addition, this system registers time attendance and movement of the employees in the Security Department during regular facility checks. This system controls access to more than 90 doors in the building. The system consists of a PC, hub, 31 controllers, "proximity" readers, fingerprint readers, "proximity" card and cable installations. Central PC controls the system, receives data from the reader and programs the right to use employee cards. Central PC is located in the Control Center and the terminals at checkpoints are connected through an autonomous computer network of the facility.

PC Computers are powered by the UPS, while controllers have their own rechargeable batteries and are powered via a diesel generator. Through the CF9000 system, access control system is integrated into the central monitoring system for facility security. Access control system is connected to the system for calculating the salaries through the computer network of the facility.

3.1.4. The system for managing and controlling the status of the door in restricted area

This system includes a door that is security door (locked permanently or outside working hours) and, in case of fire, it serves as an evacuation door (continuously open), and doors which require remote control from the Control Center (lock/unlock), which have a special regime of entry, chamber door at the entrance to the area pertaining to the Control center, at the entrance to the very center, at the entrance to count rooms, the revolving door at the entrance to the building and others. The system operates and controls 29 doors in the underground area, 10 facade evacuation, 11 in restrictive areas above ground, 3 pairs of chamber doors at the entrance to the Control Center area, at the entrance to the very Center, at the entrance to count rooms, and 6 rotating doors at the entrances to the building.

The doors are equipped with special electric or electromagnetic locks that automatically or manually unblocked remotely, via the automatic fire detection system, the control board or a personal computer through which it continuously monitors the status of the doors. Command desktop, personal computer and the controllers are located in the Control Center. Through modules for data acquisition, CF9000 system for managing and controlling the status of doors in restrictive areas is integrated into the central monitoring system for facility security.

3.1.5. Central security monitoring system

Central facility security monitoring system (Security Management System) is the integration of all the above mentioned systems in a single unit. The electronic security of the facility of the National Bank of Serbia, on Slavija, consists of multiple systems that are inter-related with hardware and software, which is managed and controlled individually and supervised centrally via the central monitoring system which other systems are subordinated to. Central monitoring system, the so-called LMSmodular system from Siemens, which is used in the building, consists of a central communications gateway (GW20.08) LMSModular software package (V2.46), two workstations (PC of high performance), protocol and a graphic printer and software license for employees control system and license PAK. All the equipment of the central monitoring system is located in the Control Center.

The central communication gateway GW20.08 provides network management, which consists of 8 different sub-systems and up to 4 workstations. Subsystems are two central devices for signaling burglaries and raids, central video matrix, the controller network of controller access (31 controllers), digital input/output system for connection to the control system of evacuation and security doors, and it can optionally connect fire-alarm system. Two units are connected to the Central monitoring system as workstations, one unit of the anti-burglary system and a network of units of access control system. The system can be easily expanded to support up to 20 subsystems in one-stage configuration, and up to 80 subsystems in a two-stage configuration.

Connection of the CCTV and the central system

As part of an integrated system of electronic security, the project envisages connection between the CCTV system and central monitoring system which is carried out via the appropriate port on the workstation for interactive and graphical access to all the electronic security systems, via a central communication gateway. The operator has the possibility to display the desired camera on the selected monitor by issuing a command or simply by clicking the mouse. Also, the operator should receive all the alarms from a central matrix, and should also have the possibility to certify and reset them. Color graphic terminals with the text part display automatically, after the outbreak of the incident, the location and layout of the facility, the base of each floor to the level of the said premises and, after the call of the operator, the image from the camera that monitors the endangered area. On the basis of any level, there are symbols that affect or form an integral part of the facility security system.

Connection of anti-burglary system and central monitoring
At the level of central monitoring of the microprocessor burglar alarm control panel, connection is made via the appropriate port to a workstation for interactive and graphical access to all the electronic security systems, via a central communication gateway. Color graphic terminals with the text part display automatically, after the outbreak of the incident, the location and layout of the facility, the base of each floor to the level of the said premises and, after the call of the operator, the image from the camera that monitors the endangered area.

Connection of the access control system with the central monitoring
At the level of the central monitoring system, the access control is connected via the appropriate port to connect to a workstation for interactive and graphical access to all the electronic security systems, via a central communication gateway. Color graphic terminals with the text part display automatically, after the outbreak of the incident, the location and layout of the facility, the base of each floor to the level of the said premises and, after the call of the operator, the image from the camera that monitors the endangered area.

Connection of system to manage and control the status of evacuation and security doors in restrictive areas with the central monitoring
At the level of the central monitoring system, the system to manage and control the status of evacuation and security doors in restrictive areas is connected via the appropriate port to connect to a workstation for interactive and graphical access to all the electronic security systems, via a central communication gateway. The corresponding number of status information from the system to manage security and evacuation door will be collected via a digital multiplexing i/o system. Color graphic terminals with the text part display automatically, after the outbreak of the incident, the location and layout of the facility, based on each floor to the level of the said premises and, after the call of the operator, an image from the camera that monitors the endangered area.

3.2. Automatic fire alarm

Automatic fire detection system protect all areas except sanitary and toilets, their hall, the waste channel, circumferential channels that are flame-resistant and space between floors that have the following characteristics:

- Ceiling height of less than 0.8m;
- No lines for security devices;
- The units which have maximum dimensions 10x10m;
- The fire load of less than 25MJ/m2.

In particularly high-risk areas, inergen fire extinguishing or fire fighting sprinkler systems with water or ansulex fire extinguisher is activated. In spaces that are extinguished with inergen, there is complete protection with automatic fire detectors that automatically trigger the extinguishing. In the space which is equipped with water sprinkler systems in the underground part of the building (it is activated by thermal ampoule), automatic fire detectors are not provided. In these areas, there are handheld fire detectors and automatic report of the fire through registering extinguishing using signals from indicators at the appropriate fire-alarm report panel. In the space which is equipped with water sprinkler systems in the above ground part of the building (it can be activated with thermal ampoule),it has also the fire alarm systems with automatic fire detectors and extinguishing registration using signals from indicators at the appropriate fire-alarm report panel. Flow indicators are arranged so as to correspond to the fire sectors. In space where fire is extinguished with ansulex in the thermal kitchen, and are activated automatically or manually, regardless of the applied system of automatic fire report, automatic fire detectors are not provided, but registering the beginning of fire extinguishing with the signals from the control cabinet. Due to the exceptional importance of the object, as well as the high concentration of equipment and a big number of employees, devices of the latest generation of microprocessor technology are implemented.

This system includes the following equipment:

- In the place of possible fire incident, setting up "intelligent" fire detectors uniquely addressed;
- D-BUS to connect detection lines;
- Anti-fire panels (PPC);
- Control console located in the Control Center and the intervention group;
- C-BUS to connect the PPC;
- Concentrator (gateway) for communication between panels with workstations;
- Workstations;
- Relay module for the management of systems for secondary fire protection;
- Input module for the confirmation of executive functions or the status of the door.

Consequently, a distributed system of organization of the panels for automatic fire detection and extinguishing activation with inergen was implemented. There are two communication C-BUSs, which form two independent loops, one for alert report, other one for the activating fire extinguishing. Each loop is closed physically through two vertical ascents. This solution provides a high degree of safety in systems in case of accidents and outages of devices, for example cable break on the C-BUS is immediately registered in the central panel, and communication is continued, even in the event of total failure, C-BUS PPs continue individually with their autonomous operation. This solution is applied to the detection line, D-BUS's.

Logical and physical structure of the applied system are completely separate, which allows the actual physical structure, i.e. detectors to connected in lines with the rational management of cables (shortest route), and within logical structures to be addressed and grouped in a software-defined fire zones and fire sectors that further dictate executive functions of PP systems.

3.3. Chiller plant room

The facility also includes two independent chiller plants depending on the work regime of individual consumers who use cooling energy. Chiller plant 1 is used for providing cooling energy of all spaces for general purpose (offices, halls, restaurant, etc.). Chiller plant 2 is used for providing cooling energy to the computer center and other facilities which operate 24 hours (on-call service, etc.).

Chiller plant 1
It consists of water-cooled centrifugal chillers. There are three chillers with power of 754 kW. The units are parallel connected. Through the evaporator of each aggregate, flow is made with independent pumps. The flow through the network to the consumer is achieved with network pumps. Terminal units (chillers) are regulated via motor pass-through valves which gives a variable flow in the network. Some of the chillers are provided with three-way motor valve which prevents the possibility of network pumps working without the flow. There are three possible network pumps (two working, one standby) with variable flow. Variable flow rate is achieved by changing the pump speed by varying the frequency of the power supply. Water for cooling the chiller condenser is prepared in cooling towers placed on the roof of the building. There are three cooling towers (one for each aggregate) coupled in such a way so that each of the three towers can work with any unit. The towers are controlled via two-speed fan. Prior to filling the water in the towers, there is chemical treatment in terms of adding polyphosphates to prevent the formation of scale and dosing of biocides to prevent the formation of algae. The pressure in the system is made through the water pressure booster system with pumps with overflow safety valve and the water tank.

Chiller plant 2
It consists of two air cooled chillers located on the roof of the building. Chillers have additional heat exchanger for cooling water in winter mode without the compressor ("free cooling"). The chillers are packaged type with built-in centrifugal pumps and expansion vessel. Within the cold water, the system is filled with a mixture of water and glycol of concentrations of 35% in order to prevent freezing in winter mode.
Cold water from these aggregates supply chillers of air-conditioners in the computer centre and chillers of chambers of duty services.

In summer mode, cooling energy is provided by compressor operating in aggregates. In the transition regimes, cooling energy is provided in part through the "free cooling", and in part with compressor operating in the winter mode only via "free cooling", without the compressor. Since this chiller plant cools locked rooms with a large internal heat gains that require cooling throughout the year, such mode of operation provides the maximum operating economy.

3.4. Electricity lighting management

Management of electric lighting is done:

- Locally via pushbuttons and pulse switches;
- Automatically (turning off) by the presence detector and microprocessor devices;
- Remote (turning on/off) permanently or periodically.

In most of the offices, there are two circuits to power lamps (network and diesel engine). For each circuit, there is a switch by the door which acts on impulse switch mounted in the junction box in the cabinet, in the false ceiling of the corridor. Touch switch is for voltage control of 230V, 50Hz and is a bi-stable device with a contact for signaling the status on and contacts for remote control. Local control is done by pressing the switch, where the light is on or off depending on the previous state. For the purposes of automatic control of FAN-COIL units in each room, there is one microprocessor device mounted below the parapet mask of the window. This device is used, besides regulation, for power savings, in such a way as to have one presence detector in each room, which is connected to the microprocessor device. In the event that nobody is present in the room for a certain time (adjustable to a desired value), the microprocessor device turns off the lamps. When re-entering the room, an employee may, if needed, turn on the light.

Remote control of the lighting in the offices is done through impulse commands, which are realized through a central system for remote monitoring and management of technical systems (CSNU). Control is performed as a function of time (time of day) and the reference brightness levels in normal working conditions in the facility. In case of emergency actions of the security services, the entire lighting in offices and other facilities on the floor can be activated. During the holidays, it can remotely turn on all the lights on the facade walls of the facilities.

Remote control allows that, in certain times of day and on the basis of the reference level of brightness, the electric lighting be reduced, in such a way that the impulse command turns off the first network light that is turned on, and then the light that is supplied through diesel generators. After turning off the light, it can be turned on again in every office locally as desired and needed.

3.5. Central monitoring and management system

For the purpose of automation of work, remote monitoring and management of technical systems in the facility, central system for monitoring and control is implemented (CSNU).

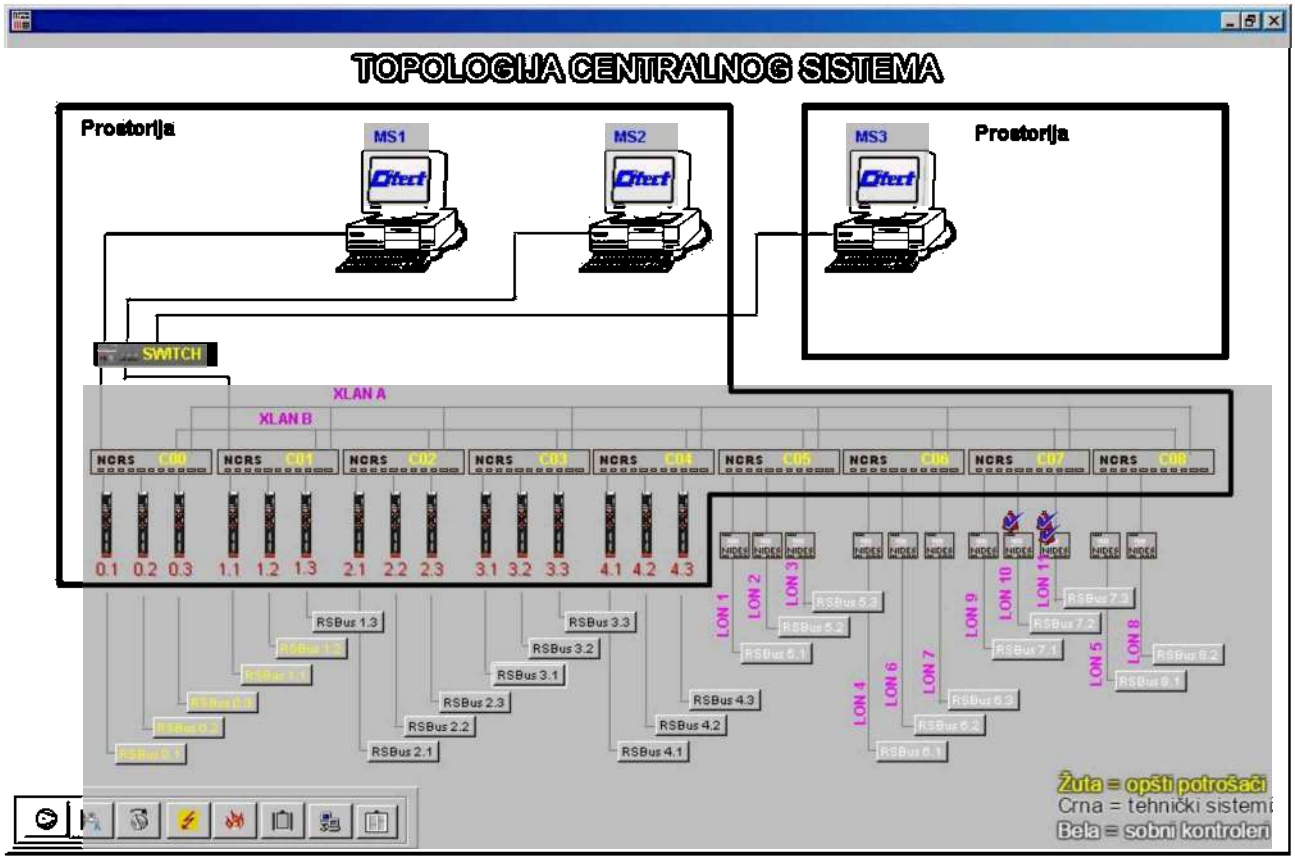

Figure 2: Topology of the central system (CSNU)

Central monitoring and management system (CSNU) performs the following functions:

- Remote control of all technical systems in terms of measurements (temperature, humidity, pressure, etc.); counting hours of operation, signage system operation (status), signaling the state of emergency, alarms (frost, motor protection, voltage failure, etc.);
- Remote software management of systems as a function of time and events;
- Direct (digital) control of parameters of the air and water to the desired set value with the possibility of remote control changes of the set value from the central computer;
- Optimization of consumption of heat, cooling and electricity (without disturbing the comfort conditions in the facility);
- Automatically collect data about conditions and events in the technical systems in time to analyze the work of preventive maintenance and servicing;
- The ability to represent the operator, in real time, all events on the color display in the form of a dynamic images with the current conditions of controlled sizes;
- Automatic printing and the protocol of the printer;
- Display graphics based on data collected in time;
- A modem (network) communication;
- Different levels of access to system functions depending on the jurisdiction.

The central communication gateway GW20.08 provides network management with different sub-systems and workstations. Interactions are possible between the subsystems connected directly to gateway and the locally connected I/O modules. Incoming messages can trigger one or more command messages to other subsystems.

Supported protocols:

- CDDL/CMSDL for LMS/CMS — up to 9600 baud;
- Cerban (CZ10, CC11, CS4, CS440, CC6, CC60) — 300 or 600 baud;
- ISO 1745 MK-7022/Cerloop — 1200 or 2400 baud;
- CMX-DL — up to 9600 baud;
- CCTV Burle (Philips-Burle) — 1200 baud;
- CCTV Siemens — 9600 baud;
- SEEP (Westinghouse SExxx) — up to 9600 baud;
- CerPass — up to 9600 baud;
- CDDL/CDSF (other control units) — up to 9600 baud;
- Stäfa port V2.0 or V3.0 NISE — 9600 baud;
- CDDL/CDSF FHI-pad (other host) — up to 9600 baud.

4. CONCLUSION

The energy crisis and the need for energy conservation, has resulted in a very rapid and remarkable development of technical systems that help us to effectively manage energy consumption. Buildings are the single largest consumers of energy, and thus the major pollutant of the environment.

Serbia is in Europe one of the countries with the highest level of energy consumption in buildings. The middle consumption per square meter of the building is about 2.5 times higher than in northern Europe, while half of households consume 340 kWh/m2 per year, which is 3 times more than in Western Europe. Chronic diseases, including respiratory diseases, are directly linked to significant pollution of the interior space. Serbia has an international obligation to save at least 9 percent of gross final energy consumption by 2018, and it should also reduce carbon dioxide emissions by the same amount by 2030. Using scientific and technological development, we are able to save significant amounts of energy in buildings.

The system for automatic control of smart buildings accounts for only three per cent in the price of the facility, and after five to seven years, it begins to "to earn". The savings that the system can achieve is in a range of 15 to 35 percent. If it is a large business facility, such as building of the National Bank of Serbia in Belgrade, there are huge savings in money and energy consumed. With automated and integrated technical systems, we realize significant cost savings and energy consumption, but also increase comfort. With the development of internet technologies (ADSL, cable DSL, satellite and mobile internet, etc.), there is a possibility of connecting smart buildings to the Internet and remote access devices in the system. This means that in a

simple way, wherever you are, you can access any device in the system to obtain information about the current status of all devices and control any of these devices.

RESHAPING THE FUTURE THROUGH SUSTAINABLE BUSINESS DEVELOPMENT AND ENTREPRENEURSHIP

AMBIENT INTELLIGENCE TOOL FOR MULTIMEDIA USER PROFILING

Igor Đurić*[1], Zorica Bogdanović[1], Božidar Radenković[1]
[1]Faculty of organizational sciences, University of Belgrade, Belgrade,
*Corresponding author, e-mail: igor@elab.rs

Abstract: *This paper presents a model for creating a multimedia user profiling tool. The idea is to create an open source profiling tool that is mainly for developers and users with advanced computer knowledge Multimedia user profiling tool should be a very important part of a personalized intelligent home media center. Presented model is Linux based, easy to implement and easy to enhance. Additional user profiles can be introduced and existing ones can ban configured on a way user wants. In addition, rules for certain behavior can be configured and rules can be assigned to a user profiles. System is using ambient intelligence as well as rich users' database to record environment variables and user's behavior in correspondence to the variables. Presented model is distributed and each of the components has its own settings and it can be easily configured, enhanced or, even, replaced with a new component. At the end, system is using external APIs to gather the data about the movies in order to find an appropriate content for the user and to offer multiple movie titles for the user. Default system settings are using Netflix API, OMDB database and movies trailers API.*

Keywords*: Ambient intelligence, user profiles, artificial intelligence, smart home, multimedia center.*

1. INTRODUCTION

This paper presents a model for creating multimedia user profiles based on user habits, free time, expectations and things users like. Presented profiling tool should be a part on a personalized intelligent home media center. The idea is to track user's behavior, habits and all accessible data about the user in order to create a user profile that is as rich as possible. A well-formed user profile gives an opportunity to offer an appropriate multimedia content to the user. Also, predefined user profiles can offer new users a content that might be interesting to them. That means, for example, if user loves to watch thrillers with a good IMDB grade on Friday night, exactly that kind of content should be offered to the user. The tool should store all the data that can be found about the user. In that purpose, a lot of external APIs should be contacted. External APIs connectors should be modular and easy to develop and configure. In that purpose social network APIs (LinkedIn, Facebook, Twitter...) and as well as others accessible (YouTube, forums...) APIs are contacted and used. Introducing new APIs is easy configuration part of the system. Tool is, on scheduled time, contacting all available APIs and gathering the data about the user. Data is stored in MySQL database which is implemented on a very modular way. User profiles and prediction rules are available in the system. Second peace of the puzzle is user's behavior. Each time user plays some multimedia content, content length, genre, age, actors, producers, etc., is stored as well as external factors such are time of the day, weather, date, amount of light in the room, etc... Combination of these parameters allows the system to track what user likes or dislikes. Also, based on existing user's data and data gathered from external APIs, when new user is logged in, or a user without no too much data already stored is using the system, tool can automatically offer some multimedia content to the user which may or may not be appropriate to the user, but from the very beginning forces the user to enrich his profile. For displaying multimedia content and searching multimedia content database system uses external APIs. This part also is, also, very modular and easy to change. Default system configuration is using OMDB movie database and YouTube APIs to gather multimedia content data, Movie Trailer API for getting movie trailers and Netflix and YouTube APIs to play multimedia content.

2. LITERATURE OVERVIEW

Precise identification of users, their attributes and interests is the most important thing of the prediction and personalization systems. There are theories that say that what users do on social networks is highly connected with their interests and approaches in real life. For example, pictures users are posting on social networks can tell about their interests and how they feel currently. *You, Q., Bhatia, S., & Luo, J. (2015).*

User experience with some software is highly connected with how software adopts to the end-user. Categorizing users by their behavior and creating user categories out of their common habits brings end-user experience on a highest level and helps users easily adapt to the software. *Katerina, T., Nicolaos, P., & Charalampos, Y. (2014).*

With today's technique it's very easy to gather user's data out of everywhere. For example, new approaches are using a smartphone application to gather data about the user. Background applications that does not bother user are used to collect data about the user. Different sensors and components which smartphone has, such are GPS receiver and Bluetooth can be used in order to collect data about the user. *Eskes, P., Spruit, M., Brinkkemper, S., Vorstman, J., & Kas, M. J. (2016).*

User profiling is a commonly used approach. It helps users to feel comfortable using application, but it has some privacy concerns. Personalized informational systems and user profiles, bring on one side, great user experience, but on the other hand big privacy risks in terms of sharing your habits and data with third parties. *Parra-Arnau, J., Rebollo-Monedero, D., & Forné, J. (2014).*

Smart homes are becoming more and more common thing. But, now challenges are different. It's not anymore the idea to adopt users to a smart home. Now the idea is to have a smart home that adapts to the user. Smart home providers should survey needs of a user and create a smart home that fits user's needs. *Luor, T. T., Lu, H. P., Yu, H., & Lu, Y. (2015).*

Intelligent home media centers are becoming more and more convenient. Comparing to a classic home media center or a dvd player, an intelligent home media center has more options, better user control and user experience as well as better coverage of multimedia formats it can play. *Đurić, I., Ratković-Živanović, V., Labus, M., Groj, D., & Milanović, N. (2015).*

There are several researches about how user's mood can be connected with their opinion about some movie. For example, depending on user's current mood, they can like or dislike some movie. Also, depending on user's mood, users will want to watch different genres of movies. Recommendation approaches for movies should be changed and now it should take into the account user's mood in order to offer an appropriate content to the user. *Winoto, P., & Tang, T. Y. (2010).*

Choosing a movie to watch can be a boring and long work. It happens to users that they don't have any idea what they would like to watch and they cannot find a good recommendation online. One of the approaches for recommending appropriate movie content to the users uses hybrid combination of movie tags and ratings in order to offer the users a movie title they would like to watch. On that way time is saved and users can expect a movie title that could fit to their expectations,*Wei, S., Zheng, X., Chen, D., & Chen, C. (2016).*

Also, there are approaches using data mining in order to offer an appropriate movie to the user. One of such approaches uses as input arguments both movie attributes and user preferences in order to offer the right movie title to the user, *Thrasher, J. F., Sargent, J. D., Vargas, R., Braun, S., Barrientos-Gutierrez, T., Sevigny, E. L., ... & Hardin, J. (2014).*

Depending on a country we are, we can find different opinions are multimedia content appropriate for some users. For example, in some countries we can find an attitude that movies containing drugs, sex or violence are not an appropriate for young people to watch. On the other hand, in some countries that are more liberal such movies are considered an appropriate for all people to watch, *Moreno, M. N., Segrera, S., López, V. F., Muñoz, M. D., & Sánchez, Á. L. (2016).*

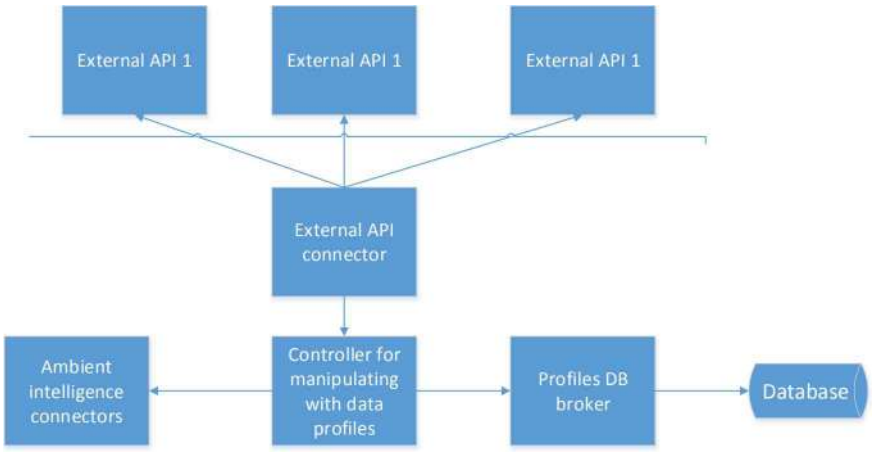
Thanks to increasing number of online multimedia services, users are each day less watching TV and turning to online TV services. Some of benefits online TV services are: watching what users currently want to watch, absence of commercials and some advanced features that are not present on the classic TV, *Lee, S. Y., & Lee, S. W. (2015).*

3. DEVELOPMENT

It is required to create a model for collecting user's data in order to make a user profiles database and a mechanism working with the database that is capable of distinguishing users by their profiles and to offer an appropriate content for the user based on his profile.

System should have the following components:

- External APIs connector
- Controller for manipulating with the data and profiles
- Ambient data collectors
- Profiles database broker
- Profiles database



Picture 1: System components

3.1. External APIs connector

External APIs connector should communicate with external APIs. It should represent the connection between Intranet and Internet. These APIs should be used to get the data that is appropriate to the user based on the requests received from profiles controller. External APIs connector should have a possibility to communicate with multiple APIs in order to get the content that is the most appropriate and as comfortable as possible for the user to evaluate and understand. External APIs connector does not need to have too much application logic behind it. It should have registrations for all the APIs that is contacting and order in which APIs should be contacted to maximize data quality and occurrence. On a high level of abstraction, we can split all contacted APIs to two major groups:

- APIs for collecting information about the user and
- APIs for getting multimedia content

APIs for collecting information about the user should be, mostly, social networks. These APIs should give the data about the user in order to find out as more as possible user habits, social and bio data.

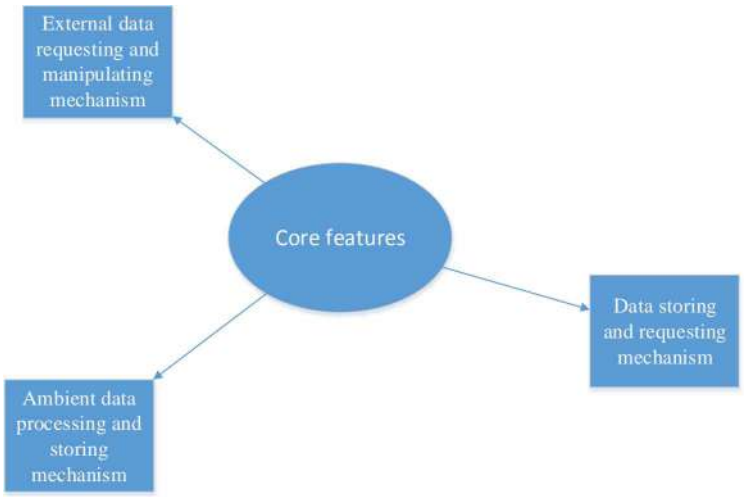
On the other hand, APIs for collecting multimedia content are not user specific. They should provide data such are movie trailers, movies and multimedia meta data such are IMDB grades, movie titles, length, directors, actors, etc.

3.2. Controller for manipulating with the data profiles

Controller for manipulating with the data profiles should do the most of „magic“. It should be the heart of the system and communicate with external APIs connector, profiles database broker and with all present ambient data collectors. Also, controller for manipulating with data profiles should contain all logic that is needed in order to process all the data.
It should contain several sub components:

- Data storing and requesting mechanism
- External data requesting and manipulating mechanism
- Ambient data processing and storing mechanism
- Core features

Model showing Controller’s components is displayed below:



Picture 2: Controller for manipulating with data profiles - components

The main idea of each of the components will be described in detail:

3.2.1. Data storing and requesting mechanism

Data storing and requesting mechanism will be in charge of communicating with profiles database broker. It should prepare data for sending to database broker to be stored or to prepare requests for getting data from the database broker.

Also, it should contain extensible components for mapping user profile data with the user habits. Data storing mechanism should have a possibility to store any data about the user.

3.2.2. External data requesting and manipulating mechanism

External data requesting and manipulating mechanism should do very similar thing as data storing and requesting mechanism, but with external APIs connector. It should prepare appropriate requests for external APIs connector and to manipulate with the data received from the external APIs connector.

3.2.3. Ambient data processing and storing mechanism

Ambient data processing and storing mechanism should process the data received from an ambient data collectors. It should investigate all the data, eliminate non useful and prepare all the data that could be useful for the system for sending to data storing and requesting mechanism.

3.2.4. Core features

Core features should balance with all sub components of controller for manipulating with the data. It should be „the brain„ of controller. All the data processed inside the controller for manipulating with data should be transferred over core features. That means that core features should be a connection between all other components in the controller for manipulating with the data profiles. This component should also have mechanisms to convert the data in all forms that are required to be understood by all other sub components of the controller for manipulating with data profiles.

3.2.5. Ambient data collectors

Ambient data collectors should receive all available data from environment and pass it to the controller for manipulating with data profiles. Ambient data collectors should be modular and easy to extend. These components should not contain any logic. They should simply transfer all collectible data to the controller for manipulating with the data profiles.

3.2.6. Profiles database broker

Profiles database broker should be a very simple component. It should be modular and easy to change or enhance. It should be unique for each database type that could be present in the system. Profiles database

broker should have CRUD operations implemented in order to allow core features to manipulate with the data from database.

3.2.7. Profiles database

Profiles database should be in a tight connection with the profiles database broker. Profiles database broker should communicate with the profiles database by storing data in the database and returning in on request from Core features. Profiles database should be implemented on a way that allows quickly getting the data from the database and easily storing the data.
Also, profiles database should have a structure that allows introducing new fields without changing the database structure. Structure should be implemented on a way that allows introducing new sensors, APIs and user attributes without a need for changing database structure or introducing new fields.

4. IMPLEMENTATION

This chapter explains how each of the components is implemented, in which technologies and why exactly each of the technologies is used and what benefits it has for the system. Common thing for all the components is that they are implemented on CentOS operating system. CentOS is chosen because it's stability, easy maintenance and big community that helps user's seeking for stable operating systems to find what they are looking for. All scheduled tasks are performed as cron jobs. For web interfaces Apache web server is used with modPERL because all the web interfaces are written in PERL. For frontend development HTML, CSS and JavaScript are used. Since system is made out of scalable components and it is not in user's interest that something goes wrong, a log of logic is placed on client side and it's a part of JavaScript code. This approach enhances scalability because it allows weaker servers to run the system because a lot of logic is done on a client side. Since, system is planned to be a part of internal user's network, there's no risk of hurting the system from the user's side. Also, Python programming language is used for collecting some data from the controllers.

For settings and configuration files XML notation is used. And, for web services, both REST and SOAP protocols are implemented in order to cover all the possible web APIs. Database engine that is used is MySQL.

4.1. External APIs connector

External APIs connector is a component made of one Perl script and several additional XML files. The idea is to allow users to register an additional API connectors. Since external APIs connector does not need to have knowledge on how to process received data, only thing it needs to understand is what to connect and what data to expect. That's why additional APIs can be registered as an additional XML files. PERL script, after receiving a request of which API to contact, replaces passed arguments with already defined placeholders and returns a response from an external API to the requester. It also has some mechanisms to prevent malicious data to enter.

Request can be sent out via two web service protocol REST and SOAP.
When new API is registered via XML, preferred web service protocol should be chosen. For contracting external APIs, this script uses REST::Client Perl library to contact REST services and SOAP::Lite library to contact SOAP based web services.
Preferred mechanism for replacing input arguments for web requests with data is through PERL template toolkit. Template toolkit is a Perl developers preferred way because it allows users to send different variables in any wanted order, as long as their names are unique. External APIs connector is returning a hash of response values.

4.2. Controller for manipulating with the data profiles

Controller for manipulating with the data profiles is also written in Perl and uses xml files for configurations as well as web interface. Each of the controller's components will be described in detail.

4.2.1. Core Features

Heart of controller for manipulating with the data profiles is core features. Role of Core features is to do an orchestration: to control all the other components and to contain all the logic on how to deal with user profiles. Since understanding of user's behavior can be changed, all conclusions and further actions after conclusions are configurable and easy to extend or maintain. This is done also through configuration files. User can add new configuration file or edit an existing one. Configuration files are XML files. Configuration file should contain the following information:

- Rule priority - As higher rule priority is, this rule will be considered more important.
- Rule conditions: List of conditions that should be accomplished or not accomplished In order for rule to kick in.
- Number of occurrences for rule to kick in: Depending on this parameter, rule will kick in when number of occurrences is breached
- Actions: Actions which will be performed after previous conditions are accomplished

Rules can be assigned to user profile. That means, if user has some profile assigned, all rules assigned to a profile will be applied for a user. User can have zero or more profiles assigned to him. Profiles are assigned when user's behavior is accomplishing all the profile conditions. Since checking profile conditions takes a lot of time and resources, it is done once per day on a scheduled time. Profiles rebuild script is running as a cron job.

For example, profile might be called "Youngster" and have the following conditions:

- User is younger than 22 years
- User has Facebook and Twitter profiles
- User is watching more than 70% his movies after 22h
- User is watching mostly comedies (more than 60% movies that user is watching are comedies)

Also, several default profiles are be provided. These profiles are used for users who still do not have a lot of data collected in the system. These rules are simpler and their main point is to predict how user will behave based on actions of previous users that used the system.

4.3. Ambient data collectors

Ambient data collector is an expandable list of the components. It contains one main script for running data collector files that are already configured. When new script is added, an xml registration should be introduced. XML registration contains name of the script that should be run and expected output data. For example, default setting contains script for amount of the light in the room. Each time user starts a multimedia content amount of light in the room is measured and stored. At the end, ambient intelligence data collector is returning all possible data information to the core features and waiting for a new request. When request is received, this component is opening all configuration files and running each of the configuration files on a selected way. Using PERL Template Toolkit is also supported.

4.4. Profiles database broker and profiles database

Profiles database broker is storing all collected data in the database. It is also returning all the requested data about the user. Profiles database broker represents a PERL script which is selecting the data out of the MySQL database. Script has only CRUD (Create, Read, Update, and Delete) operations. All additional and more complicated operations should be performed on the Core features side.
Since, user's data is highly configurable, only basic user information is stored in separate columns. All configurable user data is stored in one column in JSON format. On that way user's data can be easily expanded with new information without changing database structure. Database, by default, has only two tables:

- Users and
- UsersBehavior

Users table contains all the data about the users. It has several fields like user name, id, gender and date of birth and additional field called custom user data. Custom user data contains all custom user data collected by external APIs. This might be user's Facebook, Twitter on LinkedIN profile data as well as data user has entered manually through web interface.

Other table is called UsersBehavior. UsersBehavior has columns id, user_id, date_time and custom_data. Same approach for storing custom data in JSON format is used.

5. CONCLUSION AND FUTURE PLANS

Presented framework is an open source, easy to maintain, self-hosted solution.
Benefits that presented approach has are:

- If new social network is introduced, framework will easily adopt to it
- It can be easily combined with Internet of Things
- User can configure the system by his own needs
- System can learn from the users and as much it is used, it will work better

- Any movie player can be used with the system because prediction and play mechanisms are separated
- System does not require an expensive hardware
- It does not require licenses or any payments
- It is distributed in several separated units
- It is highly scalable and can work on almost the same way with any number of users
- Thanks to Linux operating systems in background, it is highly reliable and should not stop working in any conditions

Constraints of the presented framework are not big, but implementation like this definitely has them. They are the following: Since a lot of components are used and system is highly distributed, it takes a lot of developer's or, at least, Linux administration knowledge to setup the system. That's why this implementation won't be attractive to the users who do not have a big Linux knowledge. Other similar solutions have their own installers that are easy to run and setup. On the other hand, setting up a system like this will take several hours of setting up components and installing missing Linux packages System upgrade and setup is very easy thing to do, but it's not simple at all. To setup an additional API for receiving the data, user at least must understand XML files to setup host name to contact, web services to choose an appropriate way of contacting the service and PERL template toolkit in order to choose which components will be sent to the server and which will be received and how will they be processed Additional profiles are also a little bit complicated to introduce because they require XML knowledge and good prediction mechanisms in order to predict how system will react on new settings. Also, adding a wrongly configured user's profile could cause whole system to work on inappropriate way

Some extensions require Python or PERL knowledge in order to introduce additional data received from sensors and, optionally, to involve some actuators to make an environment more comfortable for the user

If we take all the previous points in to the count, we can say that presented framework is a highly configurable system, mostly made for power users who have a solid developer's knowledge. On the other hand, it's a nice starting point for new developers or students who do not want to start from stretch with creating their own implementations, but have nice ideas that could be easily implemented and could have some benefit in multimedia world. Since whole project is an open source and available to change or enhance, the author hopes that other developers will join the project and try to make it even better.

Similar solutions relay on heuristics and systems usually try to learn what user's want to see and get. Presented solution uses a different approach. Instead of telling users what they want, it allows them to configure what they want to get based on their behavior. This approach is harder, but it might lead to precise suggestions.

Similar solutions are mostly working like black boxes with their own APIs and hidden logic. Presented solution is fully opened to the users and tries to motivate the users to configure it by their own needs and wishes.

In future, framework should be much better and bigger. It should come up with fa lot of predefined profiles by default which could help users to start using the system on a right way after installation. It should also be preconfigured to work with several external APIs in order to help user's to set up the system by their own needs.

Regarding settings, new version should use web interface for introducing additional settings and profiles instead of XML files. Also, all other possible setting and configurations should be done through the web interface.

Since system installation is very complicated, system should, in the next versions, come with an installer which can install all the components on several Linux distributions, and as well, to setup it's own Linux distributions out of an image. It should also install automatically all dependencies and components in order to work on a default way.

And last, and maybe the most important thing to introduce in the system is a central Cloud storage for the data. Cloud storage should contain new profiles, rules, API connectors and scripts for manipulating with sensors. The main goal of this approach is to allow user to choose a component or a rule they like and to automatically install in from the Cloud.

Also, Cloud should work and vice-versa. Users should have an option to share their own code and settings in order to help other users to easily configure the system and to get the best possible user multimedia user experience.

New version approach should motivate users who do not have too much experience in development to start using the system and to interest them in multimedia user profiling.

*Corresponding author, e-mail: mrastko@gmail.com

Abstract: *Large dams are structures of great importance. Dams are used for power generation, irrigation, water supply and control of water flows. Improvement of the system for monitoring dams increases the number of data for collecting. Existing relational database can't handle large amounts of data and it is necessary to implement new technologies like big data, Cloud, Iot (Internet of Things). Use of Big data allows processing of large amounts of data in real time and it is possible to get real state of dam. The goal of this paper is to describe big data concept and present possible application of big data on large dams in order to improve the system for monitoring and data analysis.*

Keywords*: Big data, Large dams, Serbia, hydrology, monitoring, IoT*

1. INTRODUCTION

Process of monitoring and collecting data is very important for dam management. The collected data are used to predict the behavior of dam which is very important for dam safety management. Dam safety and reliability of instruments are affecting the entire eco-system in the area of the dam.
Risk of dam damage increases with dam age, so it is necessary to constantly improve the system for monitoring and dam safety, in order to avoid unwanted disasters (Association of State Dam Safety Officials, n.d.).
Most dams in Serbia were built in the 60s and 70s of 20th century. Most dams have monitoring systems which dates back to the time when the dams were built. Because of the age of dams it is necessary to improve the system for monitoring. One way of improving system is the implementation of big data concept in process of storage and data process. Big data is generated from everything what surround us in every moment (Big data, n.d.). It is produced by every digital process and exchange of social data. Systems, sensors and mobile devices are all used for data transfer. Big data comes from different sources with alarm speed in large volume and different variety. To process big data it is necessary to have computers with optimal process power, analytic ability and skills.

2. GLOBAL USE OF BIG DATA

Big data is a term which means large and complex sets of data, where traditional application for data process can't be used (B. Radenković, M. Despotović-Zrakić, Z. Bogdanović, D. Barać, A. Labus, 2015). Those sets of data are characterized by the diversity of formats, high speed processing and access and large amounts of information.
Big data have found different application in various fields. Further in the paper big data application in the world will be explained.
Rao, BBP et al. describes application of IoT (Internet of Things) in combination with Cloud and Big data (Rao, BBP ; Saluja, P; Sharma, N; Mittal, A ; Sharma, SV, 2012). Authors describe IoT as set of all data which surround us connected to the Internet. When all devices are connected to the Internet and between themselves, they enable complex and smart processes and services which give support our basic needs, economy, environment and health. Devices connected to the Internet offer different services which produce large sets of data and information. Cloud computing is explained by the authors as a model which enables on-demand access to shared configurable resources. Cloud platform enables access to the devices which surround us anywhere anytime. Application which communicates with devices like sensors, requires large storage to store big data, big process power to process data in real time and high throughput network which enables streaming of audio and video. In this paper, authors also describe Sensing as a service on Cloud which use several application like Augmented reality, Agriculture monitoring and environment.
Sowe, SK et al. explain appearing big data as key point of connecting between objects and things on the Internet (Sowe, SK; Kimata, T; Dong, MX; Zettsu, K, 2014). In that cyber-physical space, different type of sensors affect through the wireless network, collecting data and providing services for monitoring of

environmental pollution, management and recovery of disasters, improving of home life and enabling operation of smart cities. Usage of smart devices brings with it certain challenges like designing infrastructure to collect and store different types of product, finding practical application of collected data from sensors and management of IoT community so the end user can easily search, find and use the information. Authors propose IoT integrated architecture which combines functionality of Service-Controlled Networking (SCN) and cloud computing.

Big data is topic that is studied and will be studied for many years. Sets of data increase more and more, because they are collected with ubiquitous computing, mobile devices which read data, technologies of antenna sensors, remote reading data, logs of software, camera, microphone, RFID readers, wireless sensor networks (WSNs), etc. (Huang, Y; Ma, XQ ; Zhang, YD; Liu, YY, 2015). Big data has changed the way we collect and store data, enabling devices for data storing, architecture of data storage and mechanisms for data access. Cloud computing migrates application software and database on large centers of data, where data and service management may not be entirely reliable. Storage is one of problems that stop growth of Cloud. To solve the problem facing big data authors discuss about Cloud storage platform based on MapReduce for Big data.

Big data is concept of modern age that is used for processing large amounts of data from different fields medicine, remote monitoring, support services, etc. (Srivathsan, M; Arjun, KY, 2015). Prognostic computing is connected with Big data analytics and like a process, can require collecting, processing and analyzing extreme large amounts of structured and unstructured biomedical data, which comes from different experiments collected form hospitals, laboratories, pharmaceutical companies, and even social media. The results of predicting can improve efficiency in providing a better life for people.

In this paper authors give overview of background of Big data and overview on related technologies like Cloud computing, IoT, data centers and Hadoop (Chen, M; Mao, SW; Liu, YH, 2014), then focus on 4 phases of the chain value of Big data, generate data, acquisition, data warehouse and data analyses. Each phase is covered in detail along with description of the latest developments in these fields. At the end of paper authors describe several reprehensive application of big data including company management, IoT, social networks, media application, collective intelligence and smart networks.

Recently, water policy direction is changing from a typical plan for water usage and flood control to a sustainable water management, in order to improve quality of life (Kim, Yonsoo; Kang, Narae; Jung, Jaewon; Kim, Hung Soo; , 2016). These changes consist of information which is associated with water resources like data sets, management and supplying. All those resources are very important for deciding about water resource policy. Rae, Kang Na et al. have analyzed structured data according to type of usage. This study suggests an application of big data and cloud computing in field of water resources and usage of water. Data in this study are related to Korea and nearby countries.

3. MONITORING

Monitoring of the dams is important in process of dam management. Monitoring of dams is very important because it effects on dam operation and safety. If dam safety is disrupted, catastrophic consequence can happen for the people and surrounding eco-system. The process of dam monitoring includes significant number of sensors, which measurements are stored in database. In Serbia, system of monitoring dates to the tame when the dams were built.

Several dams (Djerdap I (Iron Gate I), Gruza …) started process of modernization of system for monitoring using new technologies and software (Lj. Petrović; S. Djurić, 2008).

Most dams use relational databases. Relational database can store limited set of data. Using new technologies like WSNs (wireless sensor networks) and intelligent sensors, amount of data is extremely increasing, which complicates the storage process and processing.

Data processing is also an important item for dam management safety. With data processing and simulation models, it is possible to predict the behavior of the dam and help in dam management.

On dams, there are different types of sensors which perform a variety of measurements. Some of sensors (instruments) are shown in next table.

Table 1: Measuring instruments

Measuring value	Measuring instrument
Pressure of groundwater	Piezometer with manometer Tele-piezometer
Relative movement of dam	Coordinometer Tele-coordinometer
Change of dam slope	Clinometer with vertical base Clinometer with horizontal base Tele-clinometer
Work of expansion joints	Deformeter
Air temperature	Thermometer for air

The following figure shows current mode of operation of piezometer, i.e. how piezometer collects data. Piezometer measures value and temporarily store data in Data taker in XML format and then acquisition server takes raw data and stores them in relational database. Central server takes data from acquisition server, validates data and store them also in relational database. End-users use utilities for taking data and analyze them and report on their computer.

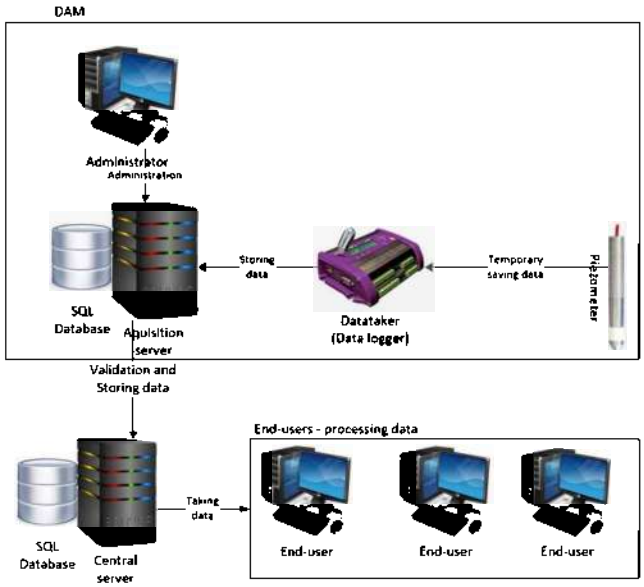

Figure 1: Monitoring on Large Dam

This way of collecting and processing data can work for databases which are smaller than 1TB and whose process doesn't require real time data process and use of current measured data. For processing large amounts of data and use of current measured data it is necessary to implement big data concept.

4. BIG DATA

There are "four V's" that characterize big data: Volume, Velocity, Variety and Veracity (Sathi, 2012).

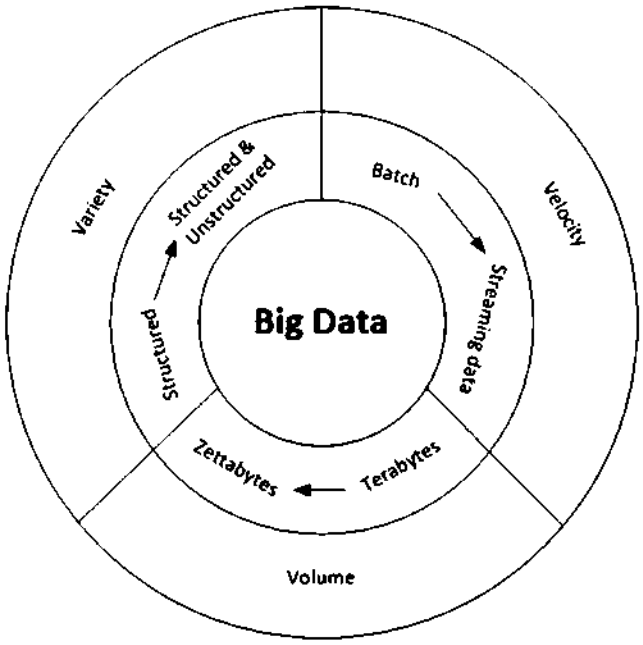

Figure 2: Big data (adopted from (Patel, 2013))

4.1 Volume

Most large companies are faced with the problem of increasing amounts of data. According to Fortune magazine, until 2003, 5 Exabyte of digital data was created. The same amount of data was created in 2 days

in 2001. For 2013 it was expected that this amount of data will be created in 10 minutes. In the past decade, organizations have had databases that are used for analytics and measured in terabytes. Today those organizations have databases measured in petabytes.

4.2 Velocity

There are two aspects related to the speed. One presents speed of data flow, and another latency.
The amount of global data that is transmitted through mobile devices rose up to 78% of total growth and is expected to reach 10/8 Exabyte per month in 2016, because users share more pictures and videos. To analyze this data, it is necessary to improve the infrastructure, which requires larger pipes and doing more parallel process.
Latency is the second measure of speed. Earlier, analytics operated on the principle of "store and data report" and makes reports with yesterday data. Today, analytics is included in business processes using fresh data with reduced latency.

4.3 Variety

In the last decade of 20th century, when the technology of Warehouse was rapidly introduced, the initial movement was to create Meta model which will represent all data in one standard format. Data was collecting from different sources and processing with the help of ETL (Extract, Load, and Transform) process. The basic idea was narrow range and structured content.
Bid data has greatly expanded the horizons, which allowed for new data integration and analytics technologies. Data sources contain unstructured text, sounds and videos as opposed to structured data. An example of enabling technologies is IBM's InfoSphere Streaming platform, which faces with various sources of real analytics and decision making, including medicine instruments for neonatal analyses, seismic data, CDR's, network events, RFID tags, patterns for traffic, time data, mainframe logs, voices on different languages and videos.

4.4 Veracity

Unlike the carefully ordered intern data, the most of big data comes from sources outside of control. Such data are not reliable and one is facing a defective and incorrect data. Veracity of data presents both credibility of data sources and similarity of the data for the target audience.

5. HADOOP

The Apache Hadoop software library is a framework that allows for the distributed processing of large data sets across clusters of computers using simple programming models (Hadoop Apache, 2016). It was made to scale up from single servers to thousands of machines. Local computation and storage can be made on each machine individually. Rather than rely on hardware to deliver high-availability, the library itself is designed to detect and handle failures at the application layer, so delivering a highly-available service on top of a cluster of computers, each of which may be prone to failures.

The project includes these modules:
- Hadoop Common: The common utilities that support the other Hadoop modules.
- Hadoop Distributed File System (HDFS™): A distributed file system that provides high-throughput access to application data.
- Hadoop YARN: A framework for job scheduling and cluster resource management.
- Hadoop MapReduce: A YARN-based system for parallel processing of large data sets.

Other Hadoop-related projects at Apache include:
- Ambari™: A web-based tool for provisioning, managing, and monitoring Apache Hadoop clusters which includes support for Hadoop HDFS, Hadoop MapReduce, Hive, HCatalog, HBase, ZooKeeper, Oozie, Pig and Sqoop. Ambari also provides a dashboard for viewing cluster health such as heat maps and ability to view MapReduce, Pig and Hive applications visually along with features to diagnose their performance characteristics in a user-friendly manner.
- Avro™: A data serialization system.
- Cassandra™: A scalable multi-master database with no single points of failure.
- Chukwa™: A data collection system for managing large distributed systems.
- HBase™: A scalable, distributed database that supports structured data storage for large tables.

- Hive™: A data warehouse infrastructure that provides data summarization and ad hoc querying.
- Mahout™: A Scalable machine learning and data mining library.
- Pig™: A high-level data-flow language and execution framework for parallel computation.
- Spark™: A fast and general compute engine for Hadoop data. Spark provides a simple and expressive programming model that supports a wide range of applications, including ETL, machine learning, stream processing, and graph computation.
- Tez™: A generalized data-flow programming framework, built on Hadoop YARN, which provides a powerful and flexible engine to execute an arbitrary DAG of tasks to process data for both batch and interactive use-cases. Tez is being adopted by Hive™, Pig™ and other frameworks in the Hadoop ecosystem, and also by other commercial software (e.g. ETL tools), to replace Hadoop™ MapReduce as the underlying execution engine.
- ZooKeeper™: A high-performance coordination service for distributed applications.

Next figure presents related technologies to Hadoop.

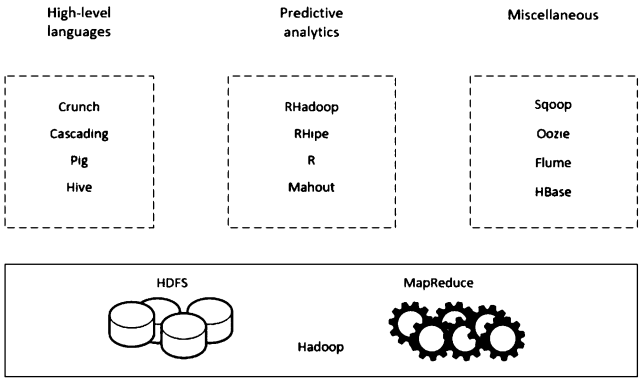

Figure 3: Hadoop related technologies (adopted from (Holmes, 2012))

Hadoop proper, as shown in Figure 4, is a distributed master-slave architecture that consists of the Hadoop Distributed File System (HDFS) for storage and Map-Reduce for computational capabilities. Traits intrinsic to Hadoop are data partitioning and parallel computation of large datasets. Computational capabilities scale and store with add in of hosts to a Hadoop cluster and can reach volume sizes in the petabytes on clusters with thousands of hosts (Holmes, 2012).

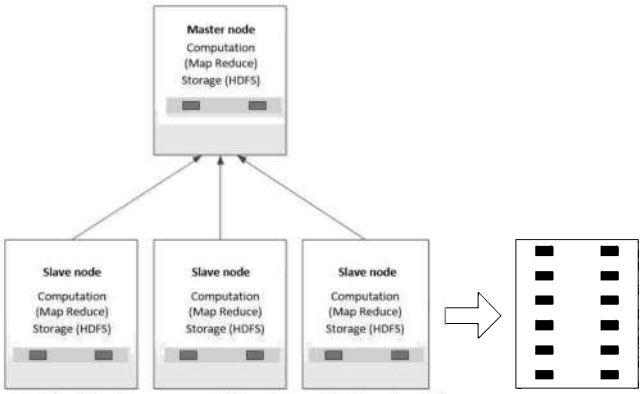

Figure 4: Hadoop architecture (adopted from (Holmes, 2012))

6. BIG DATA ON DAMS

Modernization of the instruments for monitoring requires the use of big data. Use of new, advanced and modern measuring instruments generates much larger amounts of data than the current situation, which can multiply size of database. Databases with hundreds of gigabytes will reach the size of over 1 terabyte. For processing these databases it is necessary to have computers with excellent performance, i.e. big process power. Implementation of Cloud concept would solve the problem of data processing.
Following figure shows suggestion of big data architecture on large dams.

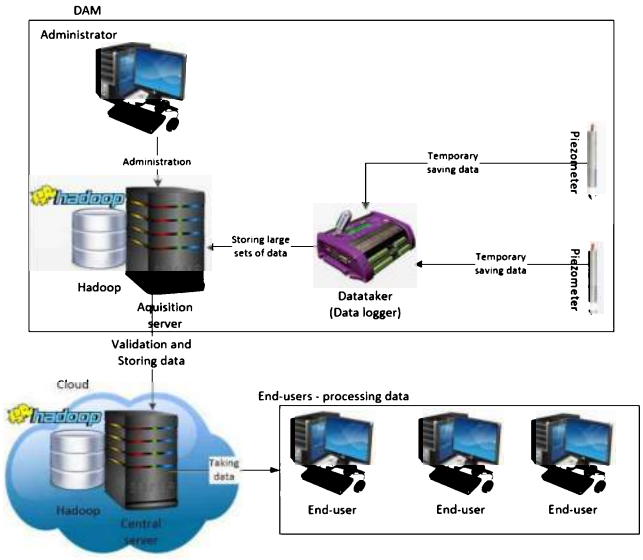

Figure 5: Hadoop integration in monitoring of dams

Process of collecting data is the same as before the implementation of big data. New process of monitoring is different because it uses big data concept and Cloud computing instead of relational databases. Use of Cloud computing allows the use of computer with better performance. Cloud enables faster data processing. Data processing in real time is of paramount importance for the prediction of the behavior of dams. Figure 5 shows measuring instrument Piezometer, which measures pressure of ground water. Measured data are temporarily recorded in data logger. From data logger, data are being transferred through computer network and stored in Hadoop database (HBase). The synchronization process is performed between Central and Acquisition server. End-user executes different tools (Mahout, Ambari, etc.) on Central server to analyze and utilize data in real time. Analyzed data will be used as input parameters for further simulation models of dam's behavior. In the case of natural disasters, such as floods, data processing in real time can help in the water resource management and reduce the possibility of damaging the dam to a minimum.

7. CONCLUSION

Dam monitoring is very important in dam management. Since dams in Serbia are old and of good quality, it is necessary just to improve the monitoring process.

Monitoring process can be improved by implementing new measuring instrument, which requires new approach in dam operating. Data process in real time and use of simulation models can predict dam behavior in some cases, which can lead to a more effective response in the event of natural disasters and save thousands of lives as well as the eco-system.
Use and application of big data concept improves process of dam management to a much higher level, increases dam safety, enables data process in real time and better prediction of dam behavior.

Abstract: *Monitoring traffic flow is very important not only for monitoring purposes, but also for predicting possible causes of traffic accidents. Use of sensory devices allows easy data collection, but involves processing of large amounts of data, also called Big Data. Data query and statistical analysis are becoming less efficient with the growing amount of data. The aim of our paper is to present a new approach to data storing and processing in the traffic field. We collected data from automatic traffic counters (ATC) at ten checkpoints and stored it in a NoSQL MongoDB database. The main features of such database are flexibility, strength, speed and ease of use that have enabled us to create a reliable web application for monitoring traffic flow in real time. Applying this model, we were able to overcome the problems connected with rapid and efficient processing of collected data.*

Keywords*: Web application, MongoDB, NoSQL, Big Data, Traffic flow*

1. INTRODUCTION

Contemporary information and communication technologies and intelligent devices such as sensors provide traffic and transport systems, a steady inflow of enormous amounts of data. Intelligent transportation system (ITS) is a real-time, accurate and efficient integrated system for transport, traffic monitoring and management (Xiao et al., 2009). ITS have received much attention in recent years (Tarapiah & Atalla, 2015). Nowadays, the problem is not collecting data, but the difficulties in storing and processing of continuously increasing amounts of data. Big Data has been swiftly expanding into the transportation arena (Vlahogianni, Park, & Van Lint, 2015) and sensors are becoming ubiquitous (Aydin, Hallac, & Karakus, 2015). The enormity of Big Data is not confined only to velocity and volume, it is also reflected in the variability, variety, and complexity of the data. The velocity and volume of the data within traffic systems make it difficult for typical algorithms to scale and retain their real-time characteristics (Hayes & Capretz, 2015). The emergence of Big Data technology has changed the view of many scientific fields, including the field of transport (Shi & Abdel-Aty, 2015). It is expected that Big Data technology in traffic systems will make possible advanced behavior monitoring of the traffic system, identification and analysis of anomalies in its functioning (Hayes & Capetz, 2015), as well as automatic rerouting of traffic in case of congestion prediction, dynamic change of speed limits, detection of hazardous road conditions, more efficient processing of heterogeneous traffic accidents data and their consequences (Kumar & Toshniwal, 2015), construction of smart cities, faster reacting to damage to roads, etc.

In order to collect traffic data, automatic traffic counters are used (ATC). ATC devices measure relevant traffic parameters such as the number of vehicles, vehicle length, vehicle classes, vehicle speed, the lane in which the vehicle is moving. The model of ATC that we used, QLTC C-10, has a 1 GB SD card for data storage. Memory capacity enables the device to capture 1 (one) year of traffic data. After this period, the data is automatically overwritten. In addition, the device integrates a GSM / GPRS module, that connects one or more devices via the public network GSM 900/1800. It allows the user to monitor and collect traffic information from a distance. Traffic data and system information may be obtained remotely or manually using a PC and a GSM modem or automatically using a QLTCnet server. However, this device enables powerful and modern solutions for surveillance and traffic monitoring.

After data collection, the next thing that needs to be reliable in the application is certainly the database. Regardless of the application which is created for any device type, there must be an appropriate database. Applications store more and more data and access it at higher rates. However, the larger the amount of data, the slower the relational database operates. That is one of the reasons for the increased utilization of NoSQL databases in recent years (Khan & Mane, 2013). Generally speaking, a NoSQL database is one that uses a different approach to data storage and access when compared to relational database management systems (Lourenço et al., 2015). These databases provide the ability to store data in a single file so that multiple processors do not slow down operation of the database. Because of that, read and write functions operate more rapidly. NoSQL databases are used to solve two major problems: Big Data problem and searching

large amounts of data. As regards the type of data, MongoDB can incorporate any data while providing all the features needed to build any apps. If the database runs on a single server, it will reach a scaling limit. MongoDB scales adding more servers, and it was designed to work with commodity servers. MongoDB is relatively new in information systems which are not based on tables, schemes, SQL Query Language, or columns and rows. Likewise, transactions, ACID properties, joining functions do not exist in the MongoDB. The essential characteristics of the MongoDB are flexibility, strength, speed, and ease of use. For these reasons, we have decided to work with NoSQL MongoDB, which will enable us to handle the large amounts of data collected by automatic traffic counters.

The aim of our paper is to present a new approach to data storing and processing in the traffic field. The concept of the system is based on precise traffic counters, namely the QLTC-10C, and on modern telecommunications and information technologies, which enable reliable publishing of traffic data in real time on the web. First, we collected traffic data from ten measuring points, that are the result of traffic counts throughout 2015. The data generated by traffic counters are stored in textual (.txt) files. After that, we created a web application, which enables traffic flow monitoring and reporting on the state of traffic through automatic counter devices. With the appropriate technology, rapid and efficient processing of collected data is provided. The web app contains the main indicators of traffic flow and graphically displays data for the selected measuring point in the observed period. Some of these indicators are average daily traffic (ADT), annual average daily traffic (AADT) and monthly average daily traffic (MADT), as well as minimal speed, maximal speed, average speed of vehicles, etc.

2. TRAFFIC DATA AND IMPORTANT INDICATORS FOR MONITORING AND CONTROL

In the model that we propose, we decided to use the aforementioned automatic traffic counters. For each registered vehicle, ATC creates a record in the text file during the whole day (24 hours). An example of a text file generated by ATC is presented in Table 1. The first column shows the *Vehicle ID*, followed by *Date*, *Time*, *Channel* which takes a value of 0, 1, 2, 3 depending on the order in which the vehicle runs into the loop, *Lane*, which takes a value of 0 (vehicle in lane 1) or 1 (vehicle in lane 2), *Vehicle category* which refers to one of eleven vehicle classes, *Vehicle speed* in km/h and *Vehicle length* without correction factor measured in cm. At 10 measuring points during 2015, all ATCs generated 365 files, each file containing between 4.000 and 14.000 records, more than 35 million records in total.

Table 1: Daily data text file generated by ATC

Vehicle ID	Date	Time	Channel	Lane	Vehicle category	Vehicle speed [km/h]	Vehicle length[cm]
00001	01.01.15	00:04:30	0	0	A1	46	473
00002	01.01.15	00:05:16	0	0	A1	34	363
00003	01.01.15	00:06:19	0	0	A1	36	407
…	…	…	…	…	…	…	…
02467	01.01.15	23:58:15	0	0	A1	45	380
02468	01.01.15	23:58:23	0	0	A1	58	428
02469	01.01.15	23:58:28	0	0	A1	84	325

The following indicators are important for monitoring and traffic control that will be implemented in the web application: minimum vehicle speed, maximum vehicle speed, average vehicle speed for each measuring point, the total number of vehicles, average daily traffic (ADT), monthly average daily traffic (MADT), annual average daily traffic (AADT). Also, an overview of velocity distribution and a graphical overview of the total daily flow of traffic compared to the same period of the previous year will be enabled.

AADT estimation is fundamental to the analysis of transportation data sets and the management of transportation systems. AADT is used as an important basic data in the traffic and road sector (Ha & Oh, 2014). By monitoring these indicators, anomalies in the traffic system can be detected, and identification of factors that influence causing of traffic accidents on the observed road section can be made.

3. MODEL DESIGNED FOR MANAGING BIG DATA IN TRAFFIC

The total amount of collected data by automatic traffic counters is 15.4 GB. Due to a large amount of collected data that needs to be stored, as well as the speed of data processing, we decided to consider Hadoop Big Data platform and MongoDB database. It should be noted that if the data model is not flexible, it can slow down development.

Using the collected data, we considered which of these solutions is more appropriate for web application development. We chose MongoDB, which unlike Hadoop, is designed for real-time processing, and can also store a massive amount of data, while data processing at the time is performed on a small subset of data. Another advantage is processing time, which is measured in milliseconds.

QLTC-10C, the model of sensor that is used, can be equipped only with the unit solar cells (16 to 20 W), as can be seen in Figure 1 and the battery cell (12 Ah), which is sufficient for autonomous operation. It is designed for low voltage, with an electric power consumption at an integrated GSM / GPRS module of less than 120 mW.

The device is placed in a plastic roadside cabinet that protects the hardware against mechanical and atmospheric influences.

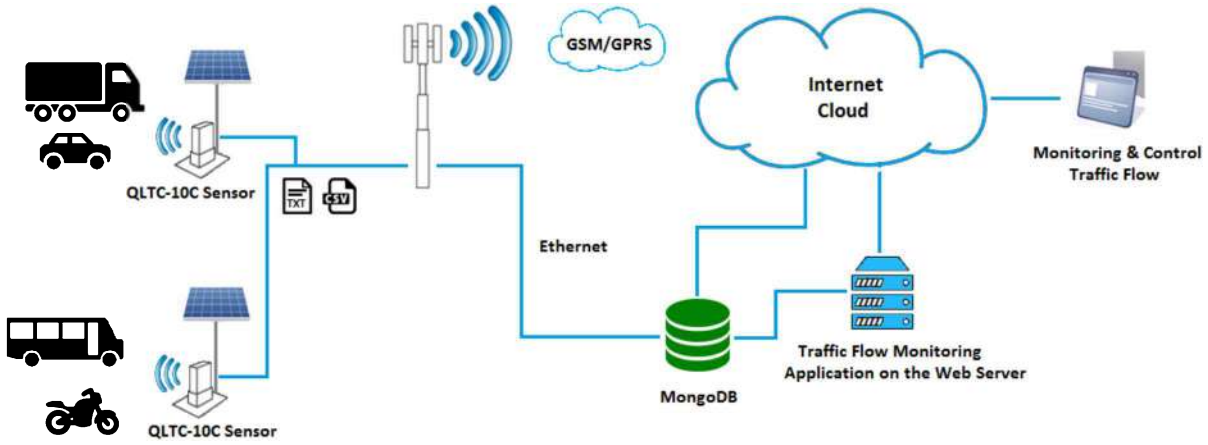

Figure 1: Model for managing Big Data in Traffic

By using the product software QLTCnet for a sensor device, it is possible to adjust the options that will execute transfer of the collected data in the required format. QLTCnet allows automatic transfer of data from remote locations using a public GSM / GPRS or private Ethernet network. Data is stored in a powerful NoSQL database. The database can be local, or it can be stored in the cloud.

Maintenance software enables fast handling of vehicle counters QLTC-10C. It allows configuration of device parameters, control of the device operation, data transmission in the standard .csv format. The device can be handled directly from the USB interface or remotely via a public GSM / GPRS network. The software consists of several modules. Each module is a standalone application that can be used separately from the other modules. Such an approach means that administration can be simplified since it requires less powerful laptops. Also, it allows faster loading of data, and enables easy adaptation to the specific needs of users.

The generated files are sent in the proper format .txt, .csv via the GSM / GPRS network or Ethernet to MongoDB as shown in Figure 1. Another key concept of MongoDB is that there must always be more than one copy of the database. If one database ceases to operate, the system will immediately take a copy from another server, and will continue to function normally. MongoDB uses JSON, XML or BSON, which is the binary-encoded serialization of JSON format to query and store data (Rupali & Aggarwal, 2013). It is important to note that MongoDB is not ideal for all types of problems. However, for many things, such as web application development, MongoDB is a great solution for the implementation of the database.

4. PROGRAMMING THE WEB APPLICATION AND MODEL IMPLEMENTATION

In this section, representative parts of the web application code, as well as its GUI will be shown. In the model implementation, we have used PHP language that is especially suited to web development and can be embedded into HTML.

Connection to the database.

```
function db_connection(){
                $conn_string = new MongoClient("mongodb://147.91.183.26:27017");
                $db = $conn_string->selectDB("traffic_db");
                return $db;
        }
```

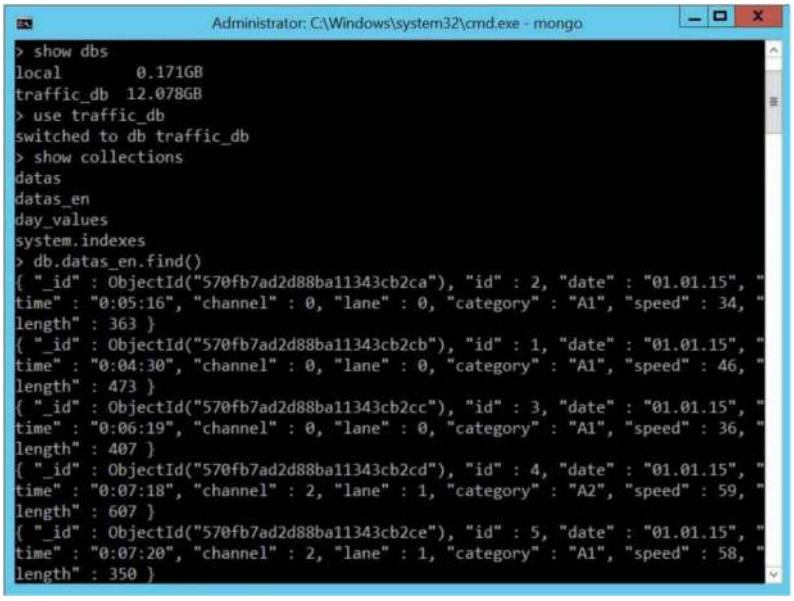

Figure 2: Review of collected data stored in MongoDB

Figure 2 shows traffic data collected by ATC. If we want to list all existing databases and chose the database that will be used, that can be done with the following code.

```
showdbs
use traffic_db
```

Two more lines of code, in order to show all collections and data respectively.

```
show collections
db.datas_en.find()
```

In order to use the web application, the user must log into the system. After the user successfully logs in, the startup screen appears as shown in Figure 3. At the top of the form, there is a menu that has three options: Data, Chart, and Exit. Data is related to the initial screen that the user can return to at any time. To view traffic indicators, the user enters the checkpoint parameters (selected from the combo box) and the period of observation. All checkpoints are loaded at startup form. In the fields for the observed period; the user must enter the start and the end date. Afterwards, he must check lane, at least one category of vehicles and an indicator such as a minimal speed, maximal speed, average speed, total number of vehicles, traffic volume. If the user checks velocity distribution or traffic flow, these indicators will be displayed in charts. By clicking on the submit button, the results will be shown on the right side of the same form as shown in Figure 4.

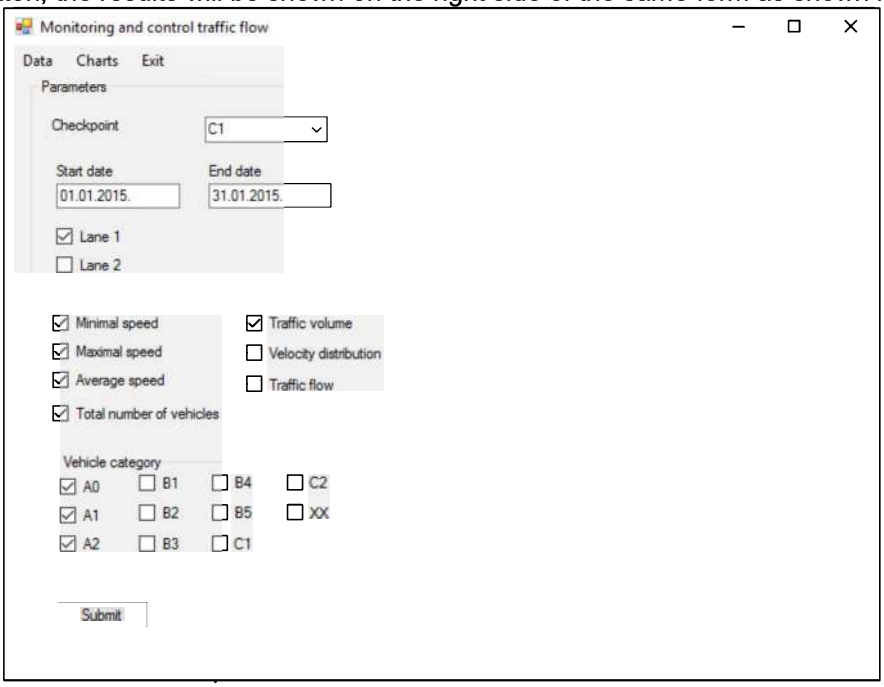

Figure 3: Startup screen of the web application

If the traffic volume is selected, parameters such as average daily traffic, monthly average daily traffic, and annual average daily traffic are shown as a group. These indicators are one of the essential for measuring air pollution (Jerrett et al., 2014).

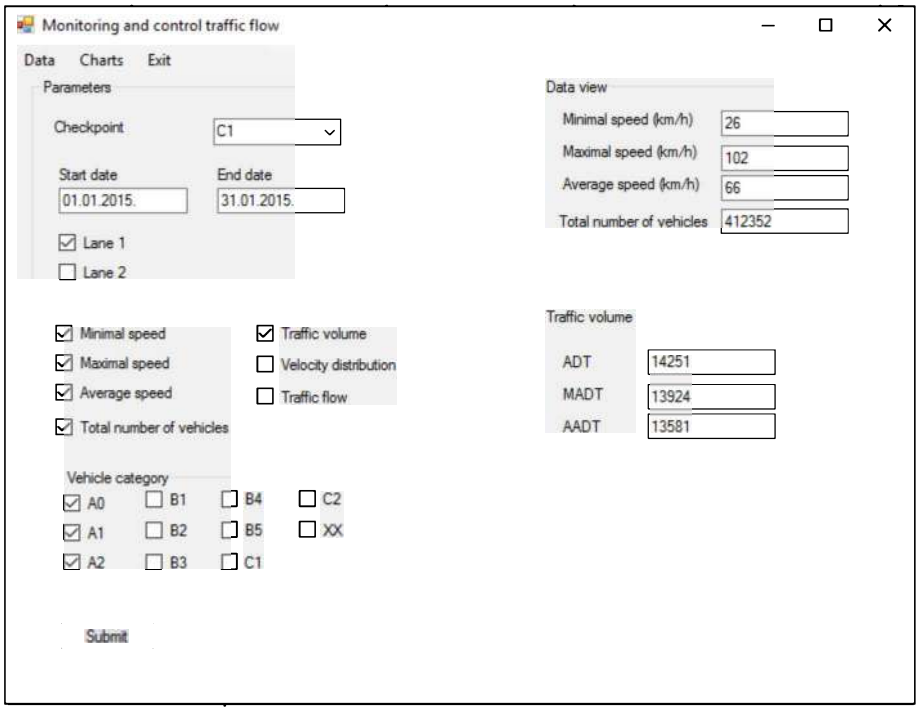

Figure 4: View of selected data

The user can easily change parameters within the same form and click on the submit button for a new view of the data. Displaying the charts is possible by selecting the velocity distribution and/or traffic flow within the parameters in Data window. The same chart view is enabled by selecting the menu item Charts from the top menu.

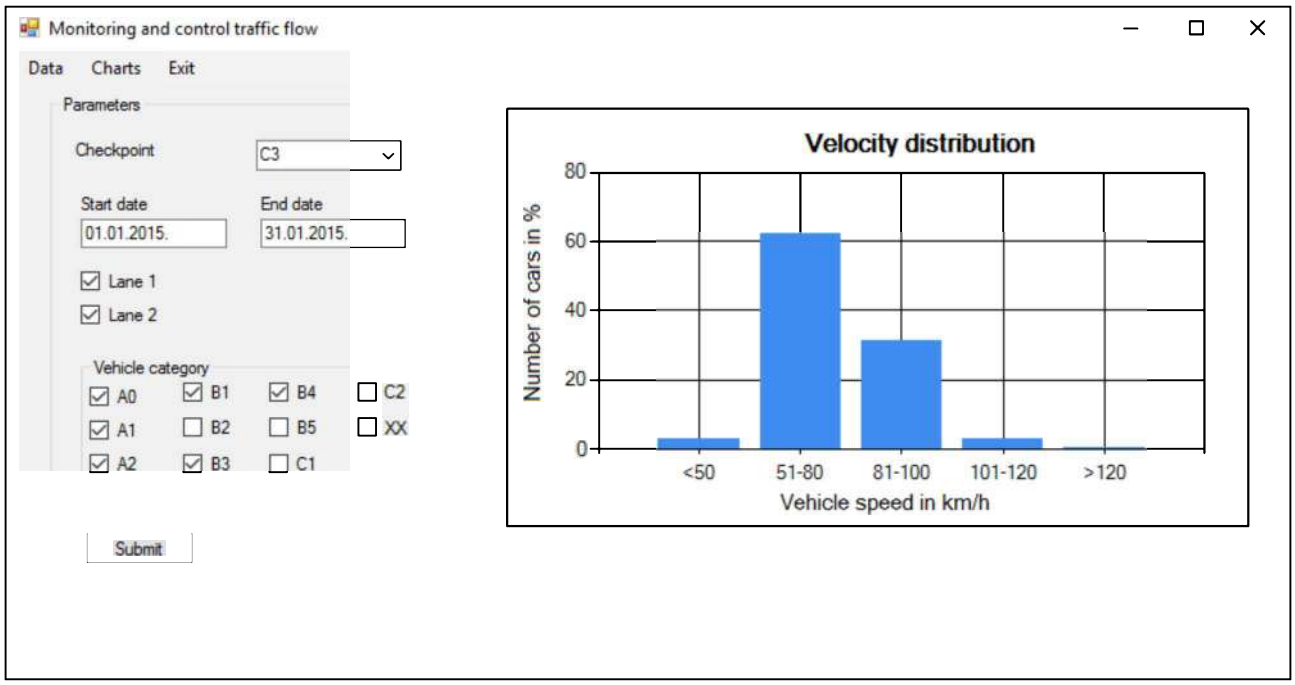

Figure 5: Chart of velocity distribution

Figure 5 shows a column chart for vehicle velocity distribution for the observed period, more specifically January 2015, checkpoint C3, lane 1 and lane 2, for categories of vehicles A0, A1, A2, B1, B3, and B4.

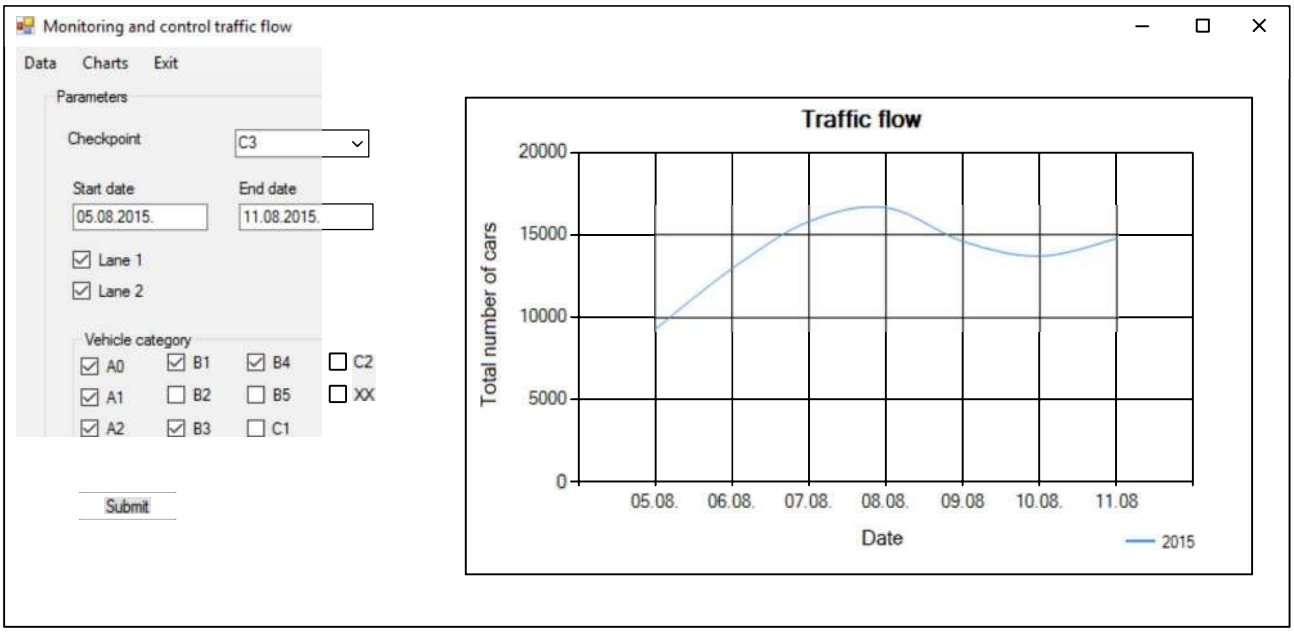

Figure 6: Chart of weekly traffic flow

The line chart shown in Figure 6. allows the user to monitor the daily traffic flow. The chosen observation period is the month of August 2015, when there can be more congestion due to vacations. The chart clearly shows that the highest number of vehicles occurred on August 8. This review of data is very convenient if we want to compare the traffic of the current year with that of the previous year. To end the work session, the user clicks on Exit in the top menu, and the application terminates.

5. CONCLUSION

Traffic is becoming one of important problems in our society (Cao, Li, & Zhang, 2011), which is possible to be resolved by the application of ITS and web monitoring. Web applications based on the use of sensory technologies place high demands regarding scalability, availability, and continuity that relational databases have difficulties in meeting. On the other hand, availability and scalability are two highly desirable properties pertaining to the reliability of a web application (Khan & Rao, 2014). A new trend in storing and processing of data is NoSQL open-source MongoDB database that is designed for very fast big data processing measured in milliseconds.

In this paper, we demonstrate the model for collecting and processing Big Data and develop a web application for traffic monitoring and control. As a result, we show that using MongoDB database as a data container and management with a web application represents an excellent solution that achieves high performances with large volumes of sensory data. The developed web application allows the user to monitor all significant traffic parameters such as average daily traffic, monthly average daily traffic, annual average daily traffic, the total number of vehicles, minimum, maximum, average vehicle speed. At any time, the user can observe any preferred checkpoint for an overview of the current state on the road and for predicting possible traffic jams. The reliability of the web app and high data processing speed is based on the NoSQL database.

The future research and development are directed to comparative analysis of traffic flow web monitoring implemented in relational and NoSQL databases. The presented model can be scaled to support a large number of traffic sensors as well as big data sizes. Moreover, it can be used to support further research in the application of Mongo database for real-time big data processing.

ACKNOWLEDGEMENT

The authors are grateful to the company MHM – Project, which provided the data generated by automatic traffic counters.

Abstract: *The paper gives an overview of the concept of big data and its significance in the health system. Big data is a new term that refers to the large amounts of data that are found in different forms and at different bases. Managing this data makes the entire business process more efficient and more effective, which is the case with the health care system. More specifically, applying of big data in the health care system leads to better health care to the exact diagnosis, more effective decision-making, better quality of work of health care institutions, etc. The paper points out that Big data in the health system has the potential to improve patient care, save lives and reduce healthcare costs. That potential in the health system lies in combining the traditional data with new forms of data at the individual level and at the population level.*

Keywords: *health system, big data in healthcare, Big Data Analytics, Volume, Variety, Velocity*

1. INTRODUCTION

The health system is now faced with a large amount of data. Given that we all strive to keep our health, it is necessary at every moment to have precise and accurate information (Jovanovic Milenkovic, Jeremic, Martic, 2014, Mr. Zhang, Ou Sh.X., Huang YH, Wang Ch.R., 2015). However, today in the health care system there could be found the large amounts of data that are not updated and that appear in different forms. The authors of the modern era have introduced a new term big data. Big Data in healthcare is being used to predict epidemics, cure disease, improve quality of life and avoid preventable deaths. The drive now is to understand as much about a patient as possible, as early in their life as possible – hopefully picking up warning signs of serious illness at an early enough stage so that treatment is simpler and less expensive (Forbes, 2015). For the patient it will mean better, quicker and cheaper diagnosis and treatment, and better information about health care providers. In the following section of this paper it will be explained what *Big data* is and what is the potentional big data in health system.

LITERATURE REVIEW

Digital healthcare solutions have promised to transform the whole healthcare process to become more efficient, less expensive and higher quality (Liu, Park, 2014). Modern business indicates that all health data should be in electronic form. Electronic health system (eHealth) is allowed to be easier and faster access to such data.

But in some case, electronic health data is unavailable, inadequate, or unusable. The healthcare databases not link all data. Other challenges related to big data include: the exclusion of patients from the decision making process, and the use of data from different readily available sensors (Gaitho M, 2015).

Development and improvement of Big Data Technologies has opened up a gateway to its introduction in e-health, and also is becoming increasingly urgent to initiate its integration, as, simultaneously, other technologies are being developed to solve many of the problems in the sector (as tele-monitoring, tracing and labeling of patients, staff, drugs, equipment, etc..) that will be generating even more data (Díaz, Juan, Lucas, Ryuga, 2012).

In the healthcare of the future, it is necessary to manage more and better, both patients and supplies, whether internal or external. Furthermore, the use of Big Data technologies together with concepts such as Health Cloud will allow to change the data structure of the sector, focused on health centers or institutions, into one more focused on patients as individuals with a track record that are attended by centers in a time stamp. One of the strong points of the Big Data is that there are various specifications, which can be adapted to the particular needs of the different fields of the e-health, to give very specific and efficient solutions (Díaz, Juan, Lucas, Ryuga, 2012).

2. BIG DATA

What is *Big data*? Although in literal translation it means "a large amount of data," Big Data is a complex phenomenon (Vukmirović, Vukmirović, Jovanović Milenković, Vukmirović, Brbaklić Tepavac, 2016). Today there are many definitions. One of them is from the report which was submitted to the US Congress in 2012 that defines Big Data as "large amounts of data, high-speed, complex and variable data that require advanced techniques and technologies to enable the capture, storage, distribution, management and analysis of that information".

According to another definition, *Big data* is a set of techniques and technologies that require new forms of integration in order to detect hidden large data values (Abaker, Hashem, Yaqoob, Anuar, Mokhtar, Gani, Khan, 2015).

The term *Big data* should not to be identified only with the large amounts of diverse data, but with the techniques used in the processing of these data and the ways of making conclusions and important business decisions based on that. Due to this characteristic the more often used term is Big Data Analytics or "analytics of the large amounts of data," as its purpose is that by the application of advanced technology and statistical techniques finds the hidden patterns in data and generate information for making important business decisions (Chawla, Davis, 2013).

Big data is based on three basic dimensions that make up the "3V concept'': Volume, Variety, Velocity (McAfee, Brynjolfsson, Davenport, Patil, Barton, 2012).

- Volume – high speed of growth in volumes of new data and storage of the existing data leads to the situation that hundreds of terabytes or even more are now stored. According to IBM, 90% of the data that exist today have been created in the last two years. On the other hand, according to the McKinsey Global Institute, it is expected that the amount of data generated globally to grow at an average annual rate of 41% and that in the period from 2008 to 2020, this amount will increase by 44 times, from 0-8 zettabytes in 2008 to 35 zettabytes in 2020. The best indicator about the quantity of data is the fact that every day on Facebook generates 10 and Twitter 7 terabytes of data (McKinsey Global Institute, 2011).
- Variety - is no longer enough to keep only structured data, but also images, data from social networks, logos, sensor data ... Thus there are the following data (Ronk, 2014, Syed, Gillela, Venugopal, 2013):
    1. Unstructured data – the data by which the classical arithmetic operations can not be performed, account for over 80% of the data. These are the various data such as audio files, video files, text files, etc..
    2. Semi-structured data - make up about 10% of the data. These are mostly data that can easily be transformed into the form suitable for the performance of conventional arithmetic operations, such as, for example, information obtained through the Web analytics.
    3. Structured data - make up only 10% of the data. These are data that are created by using a variety of analytical tools such as business analytics, databases, etc.
- Velocity – the new data are generated at high speed, which is far greater than the speed of data processing. For example, within one minute in the world (Al-Taie, 2016):
    1. over 3,500 transactions on stock exchanges are performed,
    2. over $ 3 million is spent on online shopping,
    3. over 200 million e-mails are sent,
    4. over 2 million searches on Google (3.5 billion daily)
    5. over 700 thousand new content are published on Facebook
    6. over 400 thousand on Twitter,
    7. over 600 new video content on YouTube,
    8. over 400,000 minutes of talking on Skype and
    9. over 1,500 blog posts are published.

To these three dimensions some authors add other dimensions, creating an expanded concept of Big Data. Some authors add the dimension of reliability data (Veracity), making the "4V concept", while on the other hand, some authors add another dimension and value (Value) and effectiveness (Viscosity), making extended "6V concept".

Most researchers concerned with the traditional methods of research suggest the following (Mishkin & Hodson, 2014):

- Traditional research reveals why customers feel the way they do. Big data reveals what customers do.
- Big data can tell you a lot about people: When they do it, What they do, Who they are doing it with, Where they are doing it but it can't tell you why.

3. *BIG DATA* IN THE HEALTH SYSTEM

3.1. The types of data

Most of the data is useless from the standpoint of quality and timeliness, but their availability is the imperative that makes the companies to: find the right data (Big Data), save them (Cloud), process them (Map Reduce) and finally analyze them (Data Scientists) in real time. The time factor plays a key role because today's users are very well connected (online) and informed (social media) and communicate with each other in real time (smart phones, tablets) (Vukmirovic, Vukmirovic, Jovanović Milenkovic, Vukmirovic, Brbaklić Tepavac, 2016).

As abovementioned, in the healthcare there are large amounts of data that are kept for one patient. The volume of health data is expected to increase dramatically in the coming years. Data are increasing with 80% of unstructured medical data.

A lot of these data are in paper form with the trend towards the digitization of these data. These data are of different structures and are located in different databases. The data is located in different places in the patient records, in the form of laboratory data, notes, doctor ... The basic characteristic is that data are becoming more and more "unstructured" (Vukmirovic, 2015):

- Texts,
- Audio,
- Video,
- Images,
- Geospatial and
- Internet data (*slick streams, log* files).

Big data in the health care system is becoming dominant, not only because of the size of data but also because of the diversity of types of data and the speed which must be managed. The health care industry needs to identify and establish proven strategies and best practices for big data management data. The totality of the data related to the health care of patients includes:

- Clinical data, systems for decision support, written notes of doctors and prescriptions, medical imaging, laboratory data, insurance data and other administrative data;
- Data on patients in an electronic patient file;
- Monitoring the data on social networks, including Twitter (aka. Tweets), blogs, Facebook and other platforms;
- Web pages where you can find information, news and articles in medical journals.

From the above we can conclude that the sources and types of data can be found at (Raghupathi, Raghupathi, 2014):

- *Web* and on social media: Interaction on *Facebook, Twitter, LinkedIn*, blogs, etc.
- Loading data by using the devices;
- *Big data* transaction: The institutions that have the transactions perform with semi-structured and unstructured data;
- Biometric data: fingerprints, genetics, handwriting, blood pressure, medical imaging and other similar types of data;
- Human-generated data: unstructured and semi-structured data, such as electronic patient record, physician's notes, *e-mail*, paper documents...

3.2. The potential of big data in health system

Collecting all the information from those sources creates the access to monitoring the health status of an individual or the entire population. However, different stakeholders have different goals and hopes for Big data and its analysis:

- Patients - want daily use of new technologies in order to get better care with the correct diagnosis;
- Providers – the access to the patient data by the clinics in order to improve decision making, achieving efficiency in the work without error;
- The researchers - want a new tool to improve the quality and quantity of the work flow. These include the various statistical tools, algorithms;
- Pharmaceutical companies - they want to better understand the causes of disease and thus get the safer drug market;

- Companies for the production of mobile devices – integrate the users data with the data they can collect about them via the data collected by using mobile devices;
- Governments – are trying to reduce the costs, introduce the regulations;
- Software development companies - see opportunities to serve the wholesale market, to develop software that will find its application in the health system.

Big data has the potential to improve patient care, save lives and reduce healthcare costs. The potential in health system lies in combining the traditional details with new forms of data at the individual level and at the population level. In Table 1 we can see the differences between traditional analytics and Big Data analytics in relation to data sources, processing techniques, intensity, time and purpose of data processing.

Table 1: Traditional analytics vs. *Big data* analytics (Lazarević, 2015)

Parameter	Traditional analytics	*Big data* analytics
Volume of data	The analysis of the part of data (*Partial Data*)	The analysis of all data (*All Data*)
Sources	A small number of homogeneous data sources	A large number of heterogeneous data sources
Data processing techniques	Standard tools and techniques (classic software, classical statistical techniques)	Advanced tools and techniques (advanced software, advanced statistical techniques)
Data processing time	After generating the data (Ex-Post)	In the course of generating the data (Real-Time)
Data processing intensity	Occasional data processing (Ad-Hoc)	Continuous data processing
The aims of data processing	Diagnosis and description of the event	Behavioral analysis and forecasting of events
The types of reports	Standard uniform reports	Complex reports

Therefore, all these data should be aggregated into a single integrated system that will contribute to an efficient and well managed health data in order to help doctors be able to timely and accurately provide health services to each patient. The components and architecture of *big data* in the health system are shown in Figure 1.

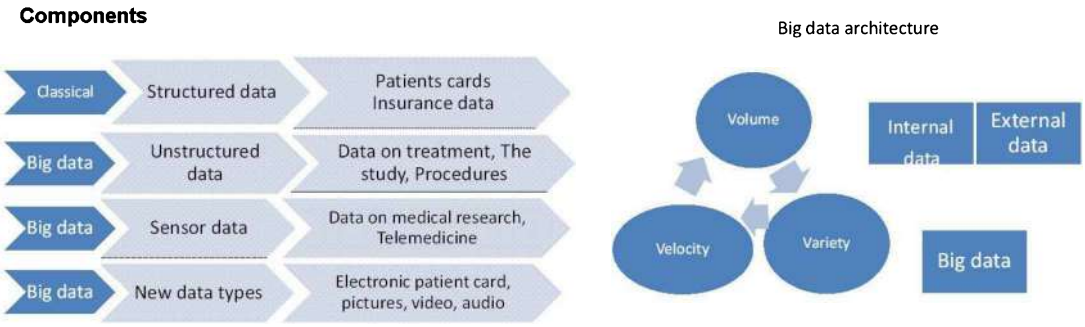

Figure 1: The components and architecture of *big* data in the health system

The *open source* platforms like Hadoop/MapReduce, available on the cloud, encourage the use of big data in the health sector. Fortunately, the advances in data management, especially virtualization and cloud computing, facilitate the development of platforms for the efficient capture, storage and manipulation of large amounts of data.

MapReduce is designed by Google as a model of efficient execution of a set of features over a large amount of data in *batch* mode. The first component of this solution is the "Map" component. Its function is to distribute the problem of programming or task that inevitably occur due to excessive number of data in the system, and manages the set tasks in a way that balances the load, as well as to manage the process of recovering from mistakes. After the process of distributed calculation is completed, the second function of this solution gets activated which is titled "reduce" that connects all the elements together again, in order to provide the results (Figure 2) (Vukmirovic, 2015).

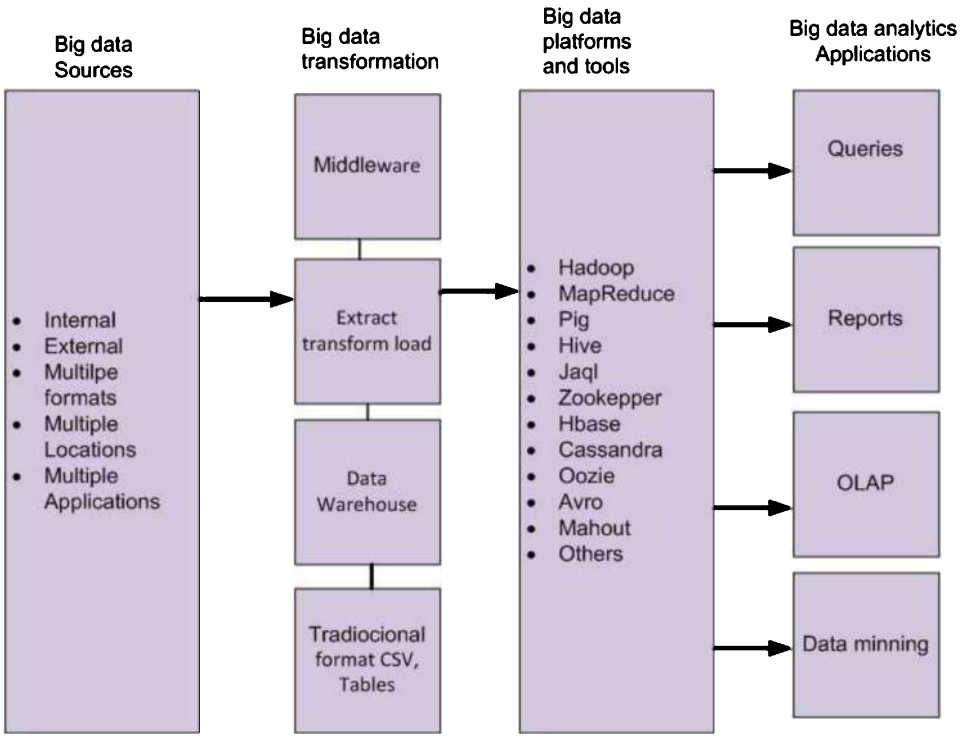

Figure 2: The conceptual model of *Big data* (Raghupathi, Raghupathi, 2014)

By using *Big data* databases the medical institutions may save the money, increase revenue and realize a multitude of business goals:

- Developing of new applications. *Big data* enables the organizations to collect real-time billions of data related to their products, resources and users, as well as on the basis of these data immediately optimizes the user experience and the use of resources.
- Improvements in efficiency and cost reduction of existing applications. *Big data* technologies are generally "open source" that can be used, exchanged and modified by everybody. Therefore the implementation and use of Big Data technologies is much cheaper compared to the development of proprietary technologies..
- The outputs of new sources of competitive advantage. Big data allows the organizations to quickly adapt to changes in relation to its competitors. For example. MongoDB platform has enabled one of the largest providers of support for human capital management to develop in record time a mobile application that integrates data collected from multiple unrelated sources.
- Increase customer loyalty. Increasing the amount of data exchanged within the institution and the speed at which they are updated allows the organizations to quickly and accurately respond to user demands.

4. CONCLUSION

Big data in the health system has the potential to transform the way and to contribute to health care workers use sophisticated technology on the basis of which they will be able to make better decisions in health care. *Big data* and applications in healthcare are emerging development, but the rapid progress in the platform and tools can speed up the ripening process of work and contribute to better decision-making in health care. This will bring the more accurate diagnosis of patients. In this way the efficiency and effectiveness in the implementation of big data in the health system are achieved.
A lot of health data are in paper form with the trend towards the digitization of these data. These data are of different structures and are located in different databases. The data is located in different places in the patient records, in the form of laboratory data, notes, doctor ... The basic characteristic is that data are becoming more and more "unstructured".

Big data in the health care system is becoming dominant, not only because of the size of data but also because of the diversity of types of data and the speed which must be managed. The health care industry needs to identify and establish proven strategies and best practices for big data management data. The totality of the data related to the health care of patients includes: clinical data, systems for decision support, written notes of doctors and prescriptions, medical imaging, laboratory data,

insurance data and other administrative data; data on patients in an electronic patient file; monitoring the data on social networks, including Twitter (aka. Tweets), blogs, Facebook and other platforms; Web pages where you can find information, news and articles in medical journals.

Big data has the potential to improve patient care, save lives and reduce healthcare costs.

IMPROVING E-COMMERCE SYSTEMS WITH BIG DATA TECHNOLOGY

Nenad Stojić*, Aleksandra Dacić-Pilčević
University of Belgrade, Faculty of Organizational Sciences
*Corresponding author, e-mail: neshcko@gmail.com

Abstract: *This paper presents one of the aspects of using Big Data technology in e-commerce systems. The main goal of this document is to present a solution of how a non-relation database can be integrated to e-commerce platform. Mongo database is used, as a Big data storage solution, to improve data scalability and search performance with enormous amount of products data on Magento platform. The first part of this document describe Big data technology and present a Magento platform. In this document also is presented a solution model of how big data technologies works on practical application in real electronic store. Document will be analyzed problems of electronic store which related to search and analytics of products data. Results can help another e-commerce systems to improve their services and continue to work on further technology improvements.*

Keywords*: Big Data, Magento, Mongo DB, Non-relation DB, E-commerce*

1. INTRODUCTION

With a grater amount of data comes a bigger problems, therefore, the more data the company holds, it is going to be harder to manage them, from the perspective of keeping the data and form the perspective of analyzing the same. Big data is designed to offer to companies a huge business insight. Today, the available amount of data reach units of petabytes and exabytes where traditional architecture and infrastructure simply don't gives a good results.

These days, in hyper-competitive business environment, companies do not need only to find and analyze a particular data, they also must do it as soon as possible. In the last few years, as a results of the expansion of electronic stores and e-commerce as a whole, there was a need for better application quality development and optimal use of technology to achieve a better results. Big data in e-commerce has received a special attention and provoked many questions which are opened the door for the future business opportunities.

2. BIG DATA TERM

Big data comes with their dimensions. Different authors emphasizes different dimensions, but common elements are: Volume, Variety and Velocity and they will be explained in this research, but before continue with dimensions it's important to mention a couple of facts that are characteristic for Big data.

When is talking about big data and a huge data information, it is necessary to point out a few facts:

- Big data are ideal for the analysis of both, structured and non-structured data, which come from a different sources.
- It help us in situations where the traditional relation databases are unusable.
- It will manage data better.
- Benefit from speed, capacity and scalability of cloud storage.
- Data analysis methods, capabilities will evolve.

Volume: Differences of storage have changed through time, year by year, and today are reached the size of zettabyte. Beside the growth in size there comes to a decline in price of memory. The expected growth of memory is a huge and with this information we get the fact that someone must analyze this amount of data. All this does not mean that scientists or analysts have problem to store the data, this indicates more to possible problem in the analysis of these data, where the Big Data technology simply can help.

Variety: Special attention relates to the diversity of the analyzed data. We have structured data stored in databases and semi-structured and unstructured data which makes the most of it and which we concerned. This is not suggest that unstructured data don't have a structure, it's about their subcomponents do not have the structure by default (comments, pictures…). It's important to focus on all the data and with their combination increase the value. In fact, the example of this can be found in e-commerce solution. The companies all the

time receive the calls from customers, which represent an unstructured data, and they can combine them with structure data (orders, transactions and so on) and from this we get personalized model of customer, which represent combination of structured and unstructured data.

Velocity: The Velocity, actually is the speed of creating, storing, analyzing and visualizing the data. Big data allows a real time, work with orders, products and customers even better. There was a time when the users just used information from day earlier, similar to newspapers, where information was collected and analyzed for the next day. Today, with new technology and availability of large number of services, user just won't wait even the few seconds and everything after that is considered as old data. Products that we present on our service must be analyzed and presented to the right buyer in real time, this high velocity data, represent big data.

3. NON-RELATION DATABASE

In recent years, NoSQL or non-relational databases have gained great popularity in terms of storing large amounts of data and their ease of expanding. There is debate about whether the non-relation database in the future will replace the relational databases. With the increasing number of social and other unstructured data, the following questions began slowly but surely to be placed over relational databases.

- Are the relational databases able to cope with large amounts of data (Big Data)?
- Are the relational databases is able to reduce the large amount of data?
- Are the relational databases suitable for the modern era of data?

The technology which used for big data storage are non-relation databases. For this document research we used Mongo database engine as database system based on non-relation database technology.

3.1. Mongo Database

One of the most well-know open source of NoSQL databases is Mongo database. It's design by company 10Gen, written in C++. Query language is written in JavaScript and reminiscent on SQL. It's licensed by GNU Affero GPL license and from popular company used by Foursquare, SAP, Github and others.

Indexing: It allows a high performance of operation executing on most used queries. Mongo database index represents the structure of data which allows very effective document positioning based on particular value in fields of document.

Aggregation: Mongo database provides a function aggregate() which is used for data aggregation and it used on particular collection. It also using additional operators: sort (document sort), skip (ignoring the particular number of document on start of collection), match (document filtering based by value of field), group (document grouping), project (defined fields from the document, which will be included in the result) and unwind (transforms a string).

Replication: This mechanism allows data synchronization between more Mongo database instances. There is just one primary instance and all others are secondary. Replication must to provide redundancy, increase availability and facilitate some administrative tasks such as backup. Mongo database provides a mechanism where if crash the primary instance, with the mechanism of votes it select the new primary instance.

Auto-sharing: This mechanism allows participations collection of documents and their distribution to larger number of instances. The idea of this mechanism is to improve a capacity of the system.

Map Reduce: Allows parallel processing of large amounts of data.

Ad-hoc query: Dynamic (ad hoc) queries allow working with Mongo database infection in a similar way as to RDBMS. Therefore, this feature is ideal when switching from RDBMS system on Mongo database.

GridFS mechanism: This mechanism allow storage of large documents. In particular, MongoDB can work with the document size of 16MB. Because of this limitation, GridFS mechanism is used as mechanism which separate document into series of pieces. For storing the large documents there are use two collections: collection of 'files' which represents a meta data of document and collection of 'chunks' which contains parts of document. Size of the parts of a document is usually 256 KB.

Mongo database offers very good performance for situations that containing very high write loads, but where data integrity isn't a pressing concern; a good example are the comments sections of large, busy websites like Craigslist or The New York Times, both of these use Mongo database.

4. SOFTWARE SOLUTION FOR THE IMPLEMENTATION OF ELECTRONIC STORE

E-commerce represents a business model that allows management business via the internet and with using applications that are located on the internet. Online business is a clear advantage because it is available all the time and provides efficient service to customers.
One of the most important parts of an e-commerce portal is the fact that you can explore a large number of products and services, consider their fully purposes and view the price without physical presence in stores. Today, users want to be able for ease use and access to systems, where they can finish the shopping by a few clicks. This fact will completely change the approach to trade and allow purchases anywhere and at any moment through different devices.

Magento represents a very powerful and flexible e-commerce platform that is now one of the most developed and fastest growing platform in the world of e-commerce solutions. Magento is an e-commerce platform that allows employers to the various modules that are flexible, which have dynamic content, and which the seller can control and adapt to their needs. It represents an open source technology that has strong marketing tools, which support the search and optimization to meet and adapts to any type of business. It is vary scalable and widely available platform because of its stability and flexible nature.

Magento is e-commerce CMS platform is based on a PHP/MySQL structuring and relying on a Zend framework. With Magento, customers are able to completely manage their online store, display specific product and provide customers various payment methods and shipping, and many other options.

Magento benefits:

- Open source platform
  It represents an open source system which is available on the Internet. As such, the system allows developers access to the core of the system and allows the use of new functionality through its extensions.
- Easier way of content management
  Magento has functionality that can allow a management of more stores under the same platform. It also supports multiple sites management that are the part of a particular store. The main functionality is reflected in the use of the common Admin panel for the overall management. All sales may be administered through a single base. With their flexible contain management system, Magento is very useful for those who want to sale 10 products or a 10 million products. In the moments when sales grow dramatically, with the help of Magento you can more easily manage the sales process so that in the event of an increase in sales and profits.
- Scalable platform
  Magento is a flexible platform. It's available for both, small and large companies. It can be adapted depending on the business and the complexity of the requests. As a scalable and flexible system, with its customization they can be delivered to any business model.
- User friendly
  Introducing products through Magento platform is simple and offers different functionality. Allows customers a great experience in terms of purchases. Efficient design allows for easy navigation and an ideal system which customers can easily manage. Zoom image product, the review comments of other customers, a large selection of images for such a product as well as other functionalities are Magento system user simple and inspire visitors to buy and re-visit the web site.
- Optimized for search engines
  Optimization and search are also one of the strength of Magento platform. Different search mechanisms easily using the Magento structure. Magento defines very clear URL names, and also adding tags and keywords in the description. These functionalities directly assist and contribute to improved purchasing and services implementation. Magento uses the powerful tools such as Up-Sells and Cross-Sells to stimulate users to purchase more.
- Mobile devices support
  Web technologies are integrated and supported by the Magento system. Magento platform provides better access to the shopping experience for visitors of different mobile browsers and systems. Systems online sales written in Magento support functionality such as image scaling, integrated video and audio, drag-and-drop functions intended purchase baskets and many other functionalities.
- Analysis and reports
  Analytics and reporting system is also one of Magento strength in business which can identify the best sellers on the site, in terms of brand, manufacturer and profit. Furthermore, this SaaS system can provide

vital insight into which customers, products and regions generate the most profit, making it easier in future decisions on product management and sales forecasting.

- Security and payment
  Magento is very secure platform. Implementation of SSL protocol and dedicated IP address is simple. Using the portal allows the beneficiary easy and secure shopping with using various methods of payment. Because of its structure, enables easy implementation of different models and services for a payment, in the standard package comes with services such as PayPal, Authorize.net, Google checkout and other popular payment systems.

5. INTEGRATION MONGO DATABASE ON MAGENTO PLATFORM

Magento use ORM (Object-relational mapping) approach. Most of the data access will be via the build in Magento models and models which was build from different sources, customized. Magento models, the default one, can be categorized in two ways, there is a basic 'one object one table' model and there is also an Entity Attribute Value (EAV) model. Each model also get a model collection. In PHP programing collection are objects which used to hold a number of individual Magento Model instances.

Magento has a highly flexible and abstract, concept of what the model is. Therefor, Magento models do not contain any connection to the database. Each model use resource class that communicate with the database server. This solution where logical Model and the code that talks to the database are separated, allow us to create the new resources classes for a different database schemas while the keeping the default Magento Model logic structure. (Magento for Developers; www.devdocs.magento.com. 2016)

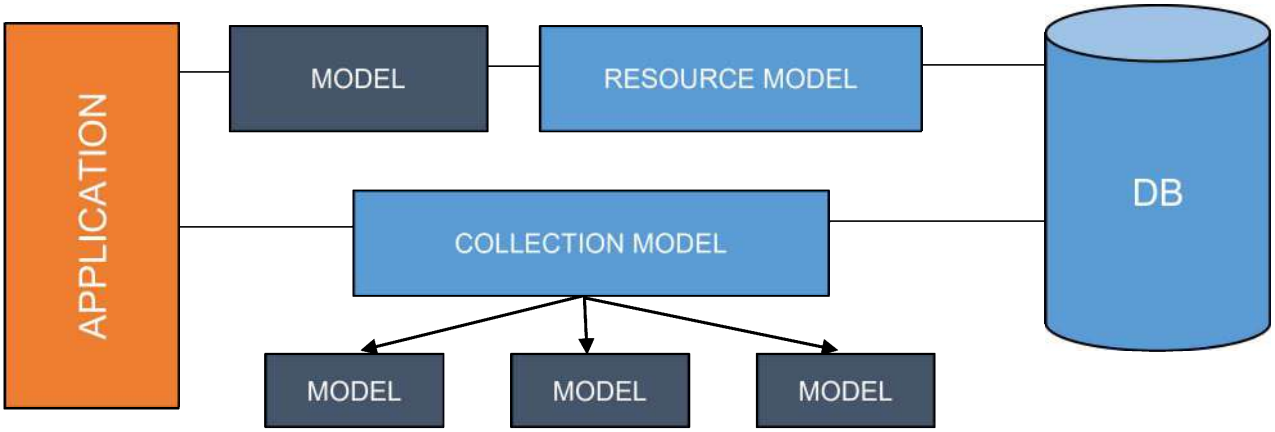

Figure 1: Magento model

Flexibility of EAV (entity-model-view) database model turns into a wound when Magento used it in projects with a very large number of products. At least while using classical relational database. Practice has shown that the classic RDBMS is not quite suitable for large-scale projects, however, be sure to look back a little to other ways of storing data and implement Magento integration with databases of the next generation.

Magento flexibility in terms of product attributes by EAV model maybe the best paint application document-oriented model non-relation databases. Based on the functionality that should be provided, access to the application Mongo database among other documents-oriented databases like NoSQL database that integrates with Magento.
When Mongo database is used, all information regarding a product will be presented as a document. The document in Mongo database can be used to store any kind of data structure, representing different types of products that can be easily extended with new attributes or simplified by removing the attributes in the database. In addition to the flexibility obtained by using document-oriented design Mongo database, we can also count on the scalability and high performance that provide these types of databases.

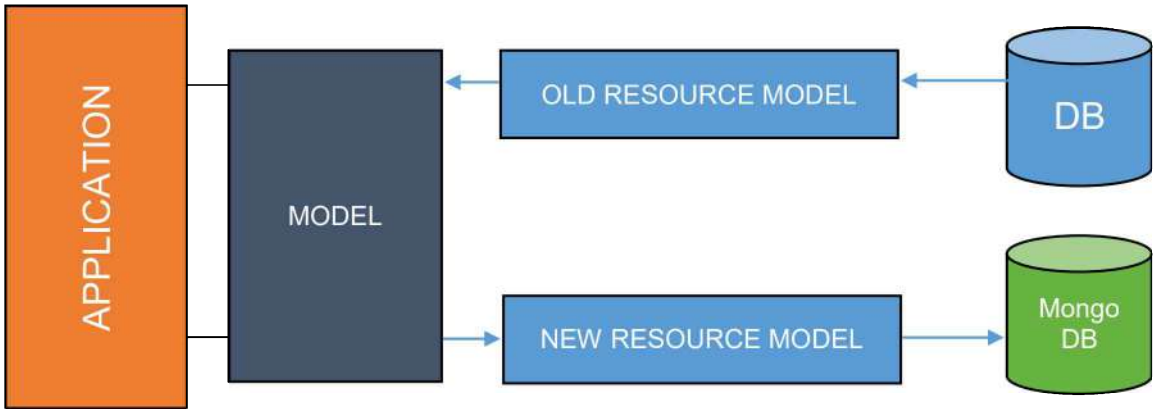

Figure 2: Data migration

The resulting model allows us to go far beyond the limitations of Magento in terms of product management. The changes are significant when it comes to creating products in a single request can see the difference. The collection of products from a huge database of products with a lot of attributes is far more efficient than ordinary connecting table (join) that the use of the classic RDBMS. Often referred to horizontal scalability of NoSQL (Mongo database), but the biggest advantage here is actually related to an improved data model that perfectly suits this purpose.

Through the integration of Mongo database the size and use of database is significantly reduced. Thus, giving more availability for dealing with other tasks and facilitating maintenance. Magento was designed to operate on heterogeneous catalogues containing millions of products, while reducing the impact of the Magento EAV model. The use of the NoSQL Mongo database for storing product attributes reduces the load on the MySQL database while retaining the flexibility of the document model. (Scaling Magento with MongoDB. 2016).

6. FUTURE MODEL IMPROVEMENTS

Future improvement of model is to create resources classes for another Magento entities. Beside product entity, customer model has very big potential to be represented as non-relation data. Analyzing this kind of data can be crucial for business purposes.

7. CONCLUSION

Characteristic of non-relation database (NoSQL) is that it can be easily distributed and infinitely expanded. With combination of infinitely possibilities NoSQL with Magento, we can achieve scalability as we expect.
Today, the standard Magento platform using dedicated servers they'd gone pretty far in databases resources, and reached full capacity. We consider the possibility of replacing a standard relation databases. But, overall, NoSQL databases are not implemented to replace MySQL (relation database). By combining Mongo database as the data warehouse Magento trendsetting products and MySQL database for other data, it came to the optimization in loading the MySQL so the possibility of expanding the base went away a lot further. When we integrate Magento with Mongo database, MySQL database can handle a lot of front servers, make sure these features must be tested in advance. In the future, looking to deploy Mongo database integration NoSQL databases in the Magento platform will become the practice in order to achieve far better results.
With this kind of implementation, when Mongo database integrate with Magento, results can be implementation and support the 30 or 50 million a products at the current time and here big data solutions become solutions that we need.

ACKNOWLEDGMENT

The author would like to thank to the team of Faculty of Organizational Sciences, Department of E-business and management systems, for their support and commitment in the context of the work itself.

BIG DATA IN POSTAL TRAFFIC AND POSSIBILITIES OF USE

Đorđije Dupljanin*[1], Slaviša Dumnić[1], Predrag Atanasković[1]
[1]University of Novi Sad, Faculty of technical sciences
*Corresponding author, e-mail: ddjordji@uns.ac.rs

Abstract: *The term "big data" has become very popular lately. Universal Postal Union has huge amounts of data and treats these data as a public good. In the past few year and more, postal organizations are talking about the concept of "big postal data". Big postal data are messages about electronic data interchange between postal administrations, ie. real-time scanning of parcels between postal administrations. The aim of this paper is to show where big data are used in postal traffic, as well to explore where they can be used too. It also analyzes the Serbian post and segment that are generating big postal data.*

Keywords*: Big data, big postal data, electronic data interchange, new segments, real-time scanning*

1. INTRODUCTION

The term big data is becoming more and more important. There is a number of people who are interested in it, especially interdisciplinary scientists. To understand what is big data, it is best to start from the definition of that term.

There are many definitions related to big data, but one of the most accepted definition that is commonly found in the literature is: "Big Data is a phenomenon defined by the rapid acceleration in the expanding volume of high velocity, complex, and diverse types of data. Big Data is often defined along three dimensions - volume, velocity, and variety. Big Data is a term that describes large volumes of high velocity, complex and variable data that require advanced techniques and technologies that enable the capture, storage, distribution, management, and analysis of the information (Agarwal et. al, 2012).

If we keep this in mind, it is clear that the postal sector has huge amounts of data, which can be very easy to use to improve their own operations. The paper is divided into several parts. The part big postal data talks about big data in postal sector, where they are generated and how can they be used. The special focus is placed on the POST * Net network of the Universal Postal Union, a special Postal telecommunications network for the exchange of information between the post office, customs, etc. The United Nations, through its Global Pulse initiative, spread awareness of the use of big data. Also, they have a special task force who is investigating new sources of big data, like postal data. Part of the paper is devoted to the use of big data in logistics with concrete examples. The most important part of the paper is identification of big data in Serbian postal system. At the end of the paper everything is summarized in the conclusion.

2. BIG POSTAL DATA

Big data include electronic collection of bits of information through various sources, such as sensors, track and trace systems and more. Post offices are the main generators of big data. Big postal data can help overcome the information gap in areas that are not connected (Anson, J., Helble, M. 2014).

Miguel Luengo-Oroz's speech about big postal data in Geneva at TedXNations event on Dec 11th 2014 pointed to the huge potential of postal data to identify human and economic trends(Universal Postal Union, 2014). Post office processes about 1 billion letters and 16 million packages around the world on a daily basis. Each item is marked with barcodes, postal codes and other bits of information, and that information are followed by the Universal Postal Union and through special electronic networks exchange data with a variety of entities (customs, airports…). The main conclusion of meeting in Geneva is to follow trends that can lead to warnings before the crisis happens in order to take corrective measures (Universal Postal Union, 2014).

More than 100 million records circulated through the POST*Net network in the form of EDI messages. On an annual basis, international postal exchange generates more than 2 billion events, and they are recorded in real time and each event has from 20 -100 records as separate pieces of information, for example: the weight of the postal item, code, city name, postal code, time etc. Figure 1 shows real time scanner of United States postal service. Real time scanning enables the monitoring of postal flows in real time, finding

bottlenecks in the international postal routes, identification of critical barriers and their impact over time (Universal Postal Union, 2013).

Figure 1: Real time scanner

Universal Postal Union has a global postal telecommunications network called the POST * Net, which is used for the transmission of electronic information between airports, customs, post office or other transport organization. The telecommunications network is used exclusively for the purposes of the postal community. Flexible POST * Net infrastructure can meet any postal company. Within this network is circling the huge amount of data that can be used for the improvement of international postal services.

Postal Technology Centre, together with several postal companies, created the International Postal System in 1995. It is an integrated email management application that combines mail processing, operational management and EDI messaging into one application (http://www.ptc.upu.int/ps/ips.shtml).

3. GLOBAL PULSE INITIATIVE AND BIG DATA PROJECTS

Global Pulse is an initiative of the United Nations Secretary-General on big data. The main objective is to discover, develop and adjust big data innovation for sustainable development and humanitarian action. There are numerous Global Pulse's projects in various fields: Climate resilience, Food & Agriculture, Humanitarian Action, Public Health, Real Time evaluation etc (Figure 2) in various regions of the world. The goal of pulse labs, that make the network, the joint efforts of government experts, various UN agencies, academic institutions and private sectors, is to develop new methods of using big data for achieving stated objectives. Labs are located in different parts of the world, with the main labs in New York, Jakarta, Indonesia, Kampala and Uganda. The experts are made up of people from different disciplines: data scientist, data analytics, data engineers ...(http://www.unglobalpulse.org/).

Global Pulse initiative was launched by the UN Secretary General in 2009. By 2014 they have over 25 innovative big data projects and issued 135 press articles. Through various partnerships, Global Pulse gets access to big data which will be used for innovation projects. One of the biggest advantages is that the partnership expands the necessary expertise. Innovation process begins with brainstorming in which everyone participates. After that they create multidisciplinary teams, conducting various analyzes and develop prototypes, then the results are presented to the public. There are various projects carried out by the Universal Postal Union. Through collaboration with the Universal Postal Union, they uncover the new data sources. One of them is “Discovering a new proxy for economic activity”, which analyzes the postal data and the postal sector is being seen as the main economic activator in the community, especially in regions where there is no access to modern information communication technologies (United Nation Glubal Pulse, 2014).

Figure 2: Global Pulse Project Series

4. BIG DATA APPLICATIONS AND CASES FROM THE PRACTICE

Many postal operators create various applications based on big data that enable them to reduce costs, improve interaction with customers, create new products, and that is how they introduce innovations in the postal sector. In the future, the goal is to set up low-cost sensors on vehicles, mailboxes, sorting centers to collect valuable data. DHL has created a tool for the analysis of the correlation between external factors such as weather, flu epidemics, Google trends and shipment data. Result is model that allows predicting volume of packages and determine the number of vehicles and requirements for staff. Italian post set up low cost sensors on electric vehicles to gather the necessary information. Some postal companies are using big data to help those who send direct mailings to better target their campaign. DHL has introduced geomarketing GeoVista tool, that serves companies to identify and analyze the location and potential of the product (U.S. Postal service office of inspector general, 2014).

Special attention is devoted to big data by DHL, and this company emphasizes that logistics and big data are made for each other. They use big data for the last mile optimization using DHL Smart Truck, Crowd-based pick-up and delivery, Predictive network and capacity planning, Parcel Volume Prediction (Jeske, M., Grüner, M., Weiß, F., in cooperation with Detecton consulting 2014).

We also analyzed the Track and trace system of Serbian post and possibility to use big data. Items are scanned and in this way is obtained valuable information like weight of item, postal codes etc. The possibilities for their use are numerous, and they are primarily related to the creation of new services, increase customer satisfaction, innovation, improving efficiency etc. It would be interesting to consider the introduction of modern applications like GeoVista in near future.

5. IDENTIFICATION OF BIG DATA IN SERBIAN POSTAL SYSTEM

In this section there will be represented the parts in which big data are generated during the transfer of postal items. In the production cycle of transfer of postal items, there are 5 production phase:

- Receiving of item
- Shipping of item
- Transport of item
- Arrival of item
- Delivery of item

Production-technological processes of postal services begins with *receving of item*. This phase begins from the moment of acceptance of item from the sender and ends up with stamping the item. The most important conditions that users must be introduced to in order to postal organizations receive a item are:

- Addressing of item
- Packaging of item
- Pay postage

Data at item must be indicated in the following order:

- Name of recipient
- Street, port number, apartment number and zip compartment with a number
- Postal code and the name of the destination post
- Sending destination country for international traffic

The next task for this item is that it must be packed in an appropriate manner to ensure the content of the item. The beneficiary has to pay postage.

Shipping of postal item includes the preparation of items received in units of the postal network for transport towards the destination.

Transport of item is the phase that includes the process of dispatch to arrival.

Arrival of postal items includes the download of packages and the opening of the conclusions by the postal centers or mail in order to delivery.

Delivery of postal item includes delivery to the recipients (Kujačić, M., 2010).

Figure 3. shows the main phases:

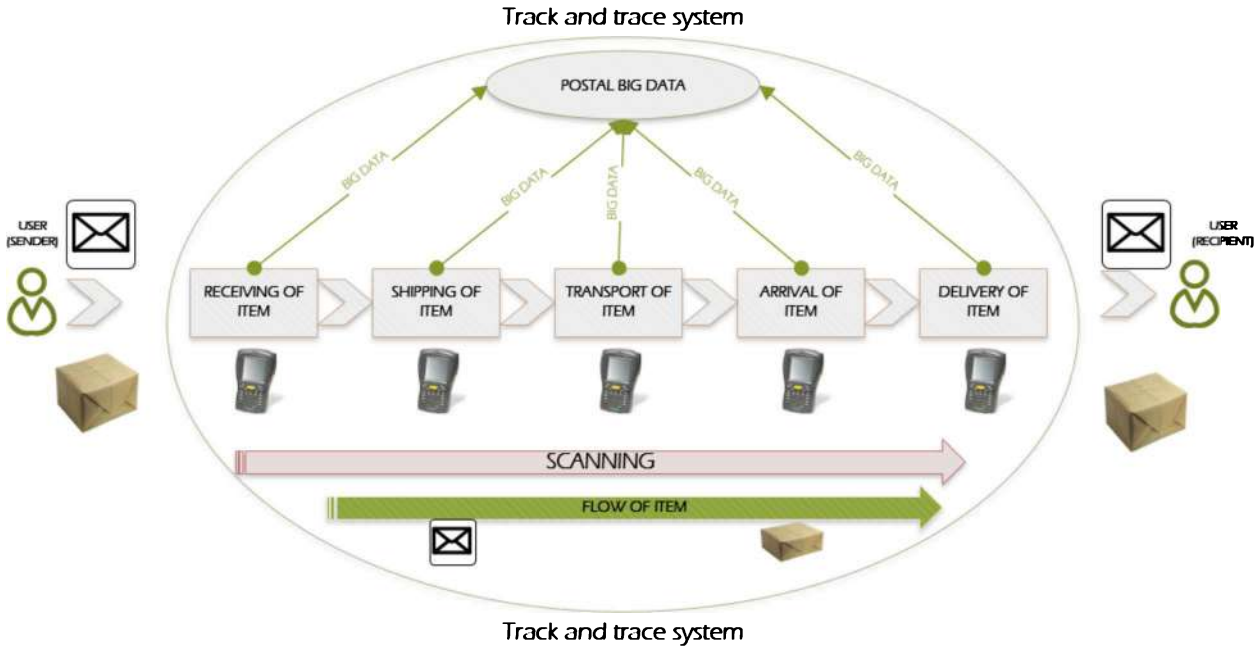

Figure 3: Transfer of postal items and system for tracking

Most of the system for the tracking of parcels and mails (Figure 4) are consisted of the following components (Kujačić, M., 2012):

- Portable Data Terminal (PDT) - handheld computer that is used to scan bar code labels on the items and containers, making sheets of delivery and delivery of item with acceptance of signature and name of the recipient in electronic form
- Workstation for monitoring and control. It consists of computers, printers and printer for bar codes and communication pad
- Host computer system for monitoring and control

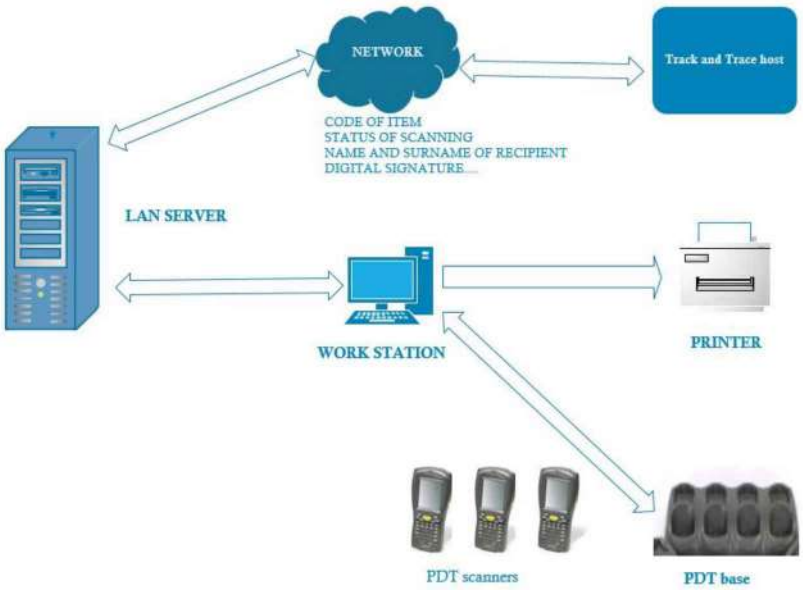

Figure 4: The main components of track and trace system

Items are scanned in all phases of transfer in this system. There is a large amount of postal data such as:

- Code of items
- Address of users
- Full name of the recipient
- Digital signatures
- Sending time
- Weight of items

Such data can be used in various applications:

- Optimization of different internal processes in the company
- Identifying bottlenecks in the system
- Workforce optimization
- Identifying key users
- Determination of the most important regions, municipalities and cities depending on the number of sent items
- Prediction number of items and the active fleet
- Reducing the various types of costs etc.

6. CONCLUSION

Bearing in mind all that is mentioned in previous chapters, it is clear that big data occupy an important place in the postal sector. Large companies realized in time the significance of big data and the use of it in various ways, primarily to create a competitive advantage through the creation of various applications. This is firstly related to leading postal organizations. Postal operator of Serbia can, through various partnerships with these companies, gain the necessary experience, modernize its range of services, and therefore much faster launch innovation. In the near future is expected more intensive development of e-commerce and for this reason the development of some of these applications will be a competitive advantage.

COMPARATIVE OVERVIEW OF JAVASCRIPT FRAMEWORKS USED IN E-BUSINESS APPLICATIONS

Dušan Zdravković
University of Belgrade, Faculty of Organizational Sciences
e-mail: dusan_zdr@yahoo.com

Abstract: *In this paper I presented the current development and experience using JavaScript and pointed particularly to the two additional functionality as improvement of JavaScript, focusing especially on its use as a real, general-purpose programming language. Since 1995 JavaScript gave web browsers the power to do more than just load web documents. Now, JavaScript programming language is the industry standard client-side scripting language that is used in web applications. JavaScript is supported by all major browsers and is increasingly the foundation of new web development technologies such as Ajax and JSON. Two main improvements of JavaScript language are in the form of library and frameworks. Framework is a web application framework written in JavaScript and describes the structure of the application with main goal to make your app more flexible and scalable and JavaScript library which offers a lot of useful predefined functions that you can call to improve and expand your application. In the market they appeared many projects with the aim to create JavaScript libraries and frameworks that would facilitate writing JavaScript code. I will list the most used libraries and frameworks that exist in the market and their main characteristics and benefits as well as the difference between a library and framework. Many developers do not recommend using a JavaScript library, I will try to show that they can still be useful in projects.*

Keywords: *JavaScript, framework, library, programming, WEB, plugin*

1. INTRODUCTION

With the increasing popularity of the World Wide Web, scripting languages and other dynamic languages are currently experiencing a renaissance. A whole new generation of programmers are growing up with languages such as JavaScript, Perl, PHP, Python and Ruby. The attention that dynamic languages are receiving is remarkable, and is something that has not occurred since the early days of personal computers and the BASIC programming language in the late 1970s and early 1980s. At the same time, the web is becoming the de facto target platform for advanced software applications, including social networking systems, games, productivity applications, and so on. Software systems that were conventionally written using static programming languages such as C, C++ or Java, are now built with dynamic languages that were originally designed for scripting rather than full-scale application development.

JavaScript is a scripting language developed in 1995 by Netscape and added to the Netscape Navigator browser in the same year. JavaScript gave web browsers the power to do more than just load web documents. While JavaScript, as first developed by Netscape (and later Mozilla), has long had a presence on the Web for many websites, it gained a particular pitch with the rise of the Web 2.0 era of computing, in which JavaScript became increasingly used for the development of user interfaces for applications, both web-based and desktop-based. The majority of web sites in the world now use JavaScript and other aspects of the internet such as advertising and analytics and widgets almost depend on its existence.

Now, JavaScript programming language is widely used for web programming and, increasingly, for general purpose computing. JavaScript become the industry standard client-side scripting language that is used in web applications. Scripting is easier to learn and use than many other kinds of programming, and provides a convenient way of automating repetitive tasks or extending applications to provide additional tools for other users. As the industry-standard, must-know scripting language, JavaScript is supported by all major browsers and is increasingly the foundation of new web development technologies such as Ajax and JSON. As AJAX applications gain popularity, client-side JavaScript code is becoming increasingly complex. However, few automated vulnerability analysis tools for JavaScript exist (Saxena et al., 2010).

A variety of projects have sprung up to build reusable JS libraries and frameworks — and at this point, a good number of them have matured and shown staying power that they're worth taking a serious look at and relying on in professional projects. The development of object-oriented frameworks and product line architectures was one of the most important technological leaps forward in the field of computation. This led to the implementation of standardized software architecture which can be specialized by application-specific code, and also

considerably decreased the length of the source code. However, one must take account of the extra effort required for framework development, plus the higher cost input. Framework development seems still to be in its infancy, despite significant developments in the tools and technologies, because of a uniformity of efforts and absence of standards. The recent efforts towards standardization of the UML have led to the hope of harnessing it as a notational basis for projects dealing with framework development, but it is not without lacunae in its constructs (Suman, 2014).

A JavaScript framework is a web application framework written in JavaScript and it differs from a JavaScript library. A library offers a lot of useful predefined functions that you can call to improve and expand your application. A framework describes you the structure of the application and gives you a way to organize your code to make your app more flexible and scalable. You can't call a framework, but it is the framework that will call and use your code in some particular way.

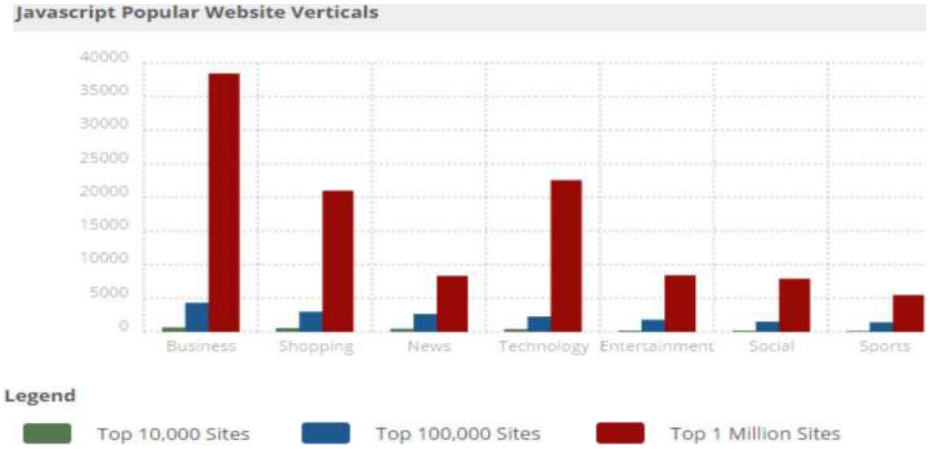

Figure 1: JavaScript popular website

2. JAVASCRIPT LIBRARIES

A JavaScript library is a library of pre-written JavaScript which allows for easier development of JavaScript-based applications, especially for AJAX and other web-centric technologies. With the expanded demands for JavaScript, an easier means for programmers to develop such dynamic interfaces was needed. Thus, JavaScript libraries and JavaScript widget libraries were developed, allowing for developers to concentrate more upon more distinctive applications of Ajax. This has led to other companies and groups, such as Microsoft and Yahoo! developing their own JavaScript-based user interface libraries. Some JavaScript libraries allow for easier integration of JavaScript with other web development technologies, such as CSS, PHP, Ruby, and Java. Many libraries include code to detect differences between runtime environments, and remove the need for applications to allow for such inconsistencies. Almost all JavaScript libraries are released under either a copycenter or copyleft license to ensure license-free distribution, usage, and modification. Some JavaScript libraries, such as YUI, are classified as frameworks since they exhibit full-stack capabilities and properties not found in general JavaScript libraries.

The main arguments against using any JavaScript library have always been speed and size: some say that using a library adds too much download bloat to pages, while others claim that libraries perform poorly compared with leaner custom code.

First, as far as size is concerned, jQuery (for example) is lightweight. The core jQuery library has always had a fairly small footprint—about 19KB for the basics, less than your average JPG image. Any extras your project needs (such as plugins or components from the jQuery UI library) can be added in a modular fashion—so you can easily count your bandwidth calories.

Speed (like size) is becoming a decreasing concern as computer hardware specifications rise and browsers' JavaScript engines grow faster and faster. Of course, this is far from implying that jQuery is slow. Every new release is faster than the last, so any benefit you might derive from rolling your own JavaScript is shrinking every day.

When it comes to competing JavaScript libraries (and there are more than a handful out there), jQuery is the best at doing what jQuery does: manipulating the DOM, adding effects, and making Ajax requests. Still, many of the libraries out there are of excellent quality and excel in other areas, such as complex class-based programming.

jQuery
jQuery is a powerful JavaScript library that can enhance your websites regardless of your background. Creators of the popular jQuery learning resource, share their knowledge, experience, and enthusiasm to make one of the most widely used JavaScript library and to help you to make your web applications shine. For designers, jQuery leverages existing CSS and HTML skills, allowing you to dynamically find and change any aspect of a page. For programmers, jQuery offers an open-source, standards-compliant, unobtrusive approach to writing complex JavaScript applications (Chaffer & Swedberg, 2007). JQuery is the most detected JavaScript library in use on the web. It provides features and functions of JavaScript that not only make JavaScript browser agnostic but also ease the development process.

jQuery makes it easy to play with the DOM, add effects, and execute Ajax requests. In fact, it makes it so easy that you'll often need to pull back from some craziness you just invented, put on your web designer hat, and exercise a little bit of restraint. But there are a multitude of notable factors you should consider if you're going to invest your valuable time in learning a JavaScript library.

Aside from being a joy to use, one of the biggest benefits of jQuery is that it handles a lot of infuriating cross-browser issues for you. Anyone who has written serious JavaScript in the past can attest that cross-browser inconsistencies will drive you mad. For example, a design that renders perfectly in Mozilla Firefox and Internet Explorer 8 just falls apart in Internet Explorer 7, or an interface component you've spent days handcrafting works beautifully in all major browsers except Opera on Linux. Even when cross-browser problems are relatively simple to handle, you always need to maintain a mental knowledge bank of them.

The jQuery team is keenly aware of cross-browser issues, and more importantly they understand why these issues occur. They have written this knowledge into the library—so jQuery works around the caveats for you. Most of the code you write will run exactly the same on all the major browsers, including everybody's favorite little troublemaker: Internet Explorer 6.

This feature alone will save the average developer a lifetime of headaches. Of course, you should always aim to keep up to date with the latest developments and best practices in our industry—but leaving the task of hunting down obscure browser bugs to the jQuery Team (and they fix more and more with each new version) allows you more time to implement your ideas.

Making today's technologies cross-browser compliant is all well and good, but jQuery also fully supports the upcoming CSS3 selector specification, even in Internet Explorer 6.0. Selecting elements you want to change lies at the heart of jQuery's power, and CSS3 selectors give you even more tools to work with.

Separating script behavior from page presentation is best practice in the web development game—though it does present its share of challenges. jQuery makes it a cinch to completely rid your markup of inline scripting, thanks to its ability to easily hook elements on the page and attach code to them in a natural, CSS-like manner. jQuery lacks a mechanism for adding inline code, so this separation of concerns leads to leaner, cleaner, and more maintainable code. Hence, it's easy to do things the right way, and almost impossible to do them the wrong way (Castledine & Sharkie, 2010).

Also included is an assortment of utility functions that implement common functions useful for writing jQuery: string trimming, the ability to easily extend objects, and more. These functions by themselves are particularly handy, but they help promote a seamless integration between jQuery and JavaScript which results in code that's easier to write and maintain.

One noteworthy utility is the supports function, which tests to see if certain features are available on the current user's browser. Traditionally, developers have resorted to browser sniffing—determining which web browser the end user is using, based on information provided by the browser itself—to work around known issues. This has always been an unsatisfying and error-prone practice. Using the jQuery supports utility function, you can test to see if a certain feature is available to the user, and easily build applications that degrade gracefully on older browsers, or those not standards-compliant.

The jQuery team has taken great care in making the jQuery library extensible. By including only a core set of features while providing a framework for extending the library, they've made it easy to create plugins that you can reuse in all your jQuery projects, as well as share with other developers. A lot of fairly common functionality

has been omitted from the jQuery core library, and relegated to the realm of the plugin. Any additional required functionality can be included easily on a page-by-page basis to keep bandwidth and code bloat to a minimum. Thankfully, a lot of people have taken advantage of jQuery's extensibility, so there are already hundreds of excellent, downloadable plugins available from the jQuery plugin repository, with new ones added all the time. Whenever you're presented with a task or problem, it's worth checking first to see if there's a plugin that might suit your needs. That's because almost any functionality you might require has likely already been turned into a plugin, and is available and ready for you to start using. Even if it turns out that you need to do some work yourself, the plugin repository is often the best place to steer you in the right direction.

jQueryUI
jQuery has already been used to make some impressive widgets and effects, some of which were useful enough to justify inclusion in the core jQuery library itself. However, the jQuery team wisely decided that in order to keep the core library focused, they'd separate out higher-level constructs and package them into a neat library that sits on top of jQuery.

That library is called jQuery User Interface (generally abbreviated to just jQueryUI), and it comprises a menagerie of useful effects and advanced widgets that are accessible and highly customizable through the use of themes. jQueryUI is a collection of GUI widgets, animated visual effects, and themes implemented with jQuery (a JavaScript library), Cascading Style Sheets, and HTML. jQueryUI is used on over 197,000 of the top one million websites, making it the second most popular JavaScript library.

Accordions, sliders, dialog boxes, date pickers, and more—all ready to be used. You could spend a bunch of time creating them yourself in jQuery but the jQueryUI controls are configurable and sophisticated enough that your time would be better spent elsewhere—namely implementing your unique project requirements rather than ensuring your custom date picker appears correctly across different browsers.

3. JAVASCRIPT FRAMEWORKS

In computer programming, a software framework is an abstraction in which software providing generic functionality can be selectively changed by additional user-written code, thus providing application-specific software. A software framework is a universal, reusable software environment that provides particular functionality as part of a larger software platform to facilitate development of software applications, products and solutions. Software frameworks may include support programs, compilers, code libraries, tool sets, and application programming interfaces (APIs) that bring together all the different components to enable development of a project or solution. Frameworks contain key distinguishing features that separate them from normal libraries. In a framework, unlike in libraries or normal user applications, the overall program's flow of control is not dictated by the caller, but by the framework. A framework has a default behavior. This default behavior must be some useful behavior and not a series of no-ops. A framework can be extended by the user usually by selective overriding or specialized by user code to provide specific functionality. The framework code, in general, is not supposed to be modified, while accepting user-implemented extensions. In other words, users can extend the framework, but should not modify its code. Frameworks and tools have been built to make using JavaScript easier or to provide specific functionality for other website functions. However, since JavaScript is such a flexible and dynamic language, each framework can present very different approaches to the problems of web development — each with its own pros and cons. As such, improving the correctness, security and performance of JavaScript applications has been the driving force for research in type systems, static analysis and compiler techniques for this language (Richards et al., 2010).

In the times of rapid app development, we need better ways to quickly develop interactive web applications and that is where JavaScript frameworks come to the rescue. JavaScript frameworks are the backbone of single page web applications development and provide superpowers to plain HTML and JavaScript. Use of JavaScript frameworks give you space to focus on developing interactive elements of the user interface without worrying too much about code structure and code maintenance. All JavaScript frameworks can be written in an accessible way with graceful degradation, frameworks seen here which imply out-of-the-box accessibility have made a special effort to document best practices for their particular framework. In web application development, framework is a collection of technologies for building dynamic web pages on the client side. Most of the JavaScript frameworks work on MVC design paradigm and enforce structure to ensure more scalable, reusable, maintainable JavaScript code. It however is not necessary that all frameworks ride on MVC pattern.

These are some JavaScript frameworks that are most advanced, feature rich, popular among developer community and make it possible to build complex and feature rich single page interactive web applications.

Prototype
Prototype was one of the first JavaScript libraries to gain prominence during the Web 2.0 resurgence. When the term AJAX was first coined in 2005, making cross - browser XMLHttpRequests was a minefield of browser - specific code. Prototype assists you in your quest for cross - browser compatibility by smoothing out the rough edges of event handling by providing a common method for binding events to their respective handlers and providing a common interface for creating AJAX requests that work in all browsers. It also gives you a cross - browser way to manipulate the DOM, by handling the special cases in all browsers, and allowing you to focus on just writing code without cluttering up your code with browser - specific " if - else " statements. Prototype extends the JavaScript language as well as the elements. The native JavaScript object is extended to include methods for determining the type of data the object represents as well as helpful serialization methods. The enumerable class allows you to easily traverse and manipulate your arrays of both JavaScript objects and DOM elements by providing useful methods such as each() and map() directly on your arrays. The native function object is also extended with useful methods, such as wrap(), which let you write interceptors for your methods that provide useful features like logging. Prototype eases inheritance with the class object. You can easily extend your objects and create hierarchies without the headaches associated with normal inheritance in statically typed languages.

All of these features make Prototype the best choice for writing logic in JavaScript, and it provides you with an excellent base for writing your own JavaScript library. Since Prototype does all of the heavy lifting for you, you can focus on the fun parts of library development — creating new widgets and data structures. Prototype is an excellent framework to use either as your main JavaScript library or as the foundation of another library.

Part of the magic of Prototype is the extension of DOM elements by the framework. By adding new methods to elements, Prototype makes it easier to write cross - browser code in a more eloquent manner. It is easier to write unobtrusive JavaScript by taking advantage of helper methods such as getElementsByClassName and getElementsBySelectors, making it easy to apply styling or events to groups of elements with something in common. By extending the elements you are working on, Prototype is able to centralize all of the cross - browser hacks that make JavaScript programming such a chore. Prototype keeps its extension methods for all elements in the Element.Methods and Element.Methods.Simulated object. If the element is an input, select, or textarea tag, the methods in Form.Element.Methods are also included. Form elements themselves are extended with the methods in Form.Methods. Most of these methods return the original element, so you can chain together methods like so: $(myElement).update("updated").show();. It is important to note that not only is the element you choose extended, but all of the child elements of that element are also extended. In browsers that support modification of the HTMLElement.prototype, Prototype adds the methods to HTMLElement for you. That means you don't have to call Element.extends() on any element you create by hand. The easiest way to extend a DOM element is to use the $() function to get a reference to the element rather than using document.getElementById or some other method.

Prototype was one of the first major JavaScript libraries to make cross - browser AJAX calls less painful. It can automatically interpret JavaScript and JSON responses from your server. It makes it easier to update your user interface with data requested from your server at periodic intervals and controls how often requests are made to your server. With Prototype, your form elements are extended the same way your other HTML elements are, but with a few specific methods. Using the $F() method, you can quickly get the value of any form element on your page. The Form.Elements object contains methods that Prototype uses to extend your form elements. You can easily serialize all of your form elements into an object literal or a string suitable for passing into an AJAX call (Orchard et al., 2009).

AngularJS
It was first released in 2009 and made available as open source framework under MIT license. Ever since its release, Angular ecosystem has grown beyond imagination. It currently boasts the biggest community of developers and is the most used JavaScript framework for developing Single Page Web Applications.

AngularJS framework gives a set of functionality to HTML by adding all the necessary features required to build dynamic views (interactive user interface). It gives option to extend HTML attributes by the use of Angular directives. Extending HTML with AngularJS is very simple, one can use standard AngularJS directive or develop a custom directive and mount it on any div. When AngularJS compiler compiles and renders the HTML on user interface, it does the DOM manipulation and attaches all features provided by the directive used. Of course, this is just one aspect of how AngularJS can be used to empower web applications. When user interacts with the interface and provides an input, the view and the model (JavaScript objects) are synchronized, the logic in the model is executed and the DOM gets updated. The reverse is true as well, if model gets updated, view is re-rendered. This essentially takes away all the problems of writing manual code for DOM manipulation.

Recently released Framework ReactJS is giving tough competition to AngularJS but AngularJS is holding the ground tight and growing in demand as ever before. The main reason behind Angular's continuous growth is the improvements and advancements it brings in with every new release.

React
React JavaScript framework is behind the user interface of Facebook as well and Instagram. This gives us a quick idea about how powerful is React when it comes to building large scale applications of extreme dynamic nature. React was first released as open source in 2013 under BSD license. The community is growing rapidly ever since its release and probably it is one of the fastest growing JavaScript framework as of today.

React is best at rendering complex user interfaces with high performance. The basic fundamental behind React is the concept of virtual DOM. React utilizes a virtual DOM, which can be rendered either at client side or server side and communicate back and forth. When the data manipulation is much more dynamic and complex, client side DOM manipulations become performance intensive. The React approach to handle this is – render the DOM at server side, the virtual DOM. Update only the selective/changed nodes of browser DOM instead of re-rendering the entire DOM. Another biggest advantage of React is the re-usability it brings on the table in the form of reactive components. React component libraries can be created and used across applications or made available for public use.

MooTools
MooTools (My Object-Oriented Tools) is a lightweight, object-oriented JavaScript framework. It is released under the free, open-source MIT License in September 2006.

MooTools provides the user with a number of advantages over native JavaScript. An extensible and modular framework allowing developers to choose their own customized combination of components. MooTools provides a detailed, coherent application programming interface (API) as well as a custom downloads module allowing developers to download only the modules and dependencies they need for a particular app. An advanced effects component, with optimized transitions such as easing equations used by many Flash developers (Newton, 2008). Enhancements to the DOM, enabling developers to easily add, modify, select, and delete DOM elements. Storing and retrieving information with Element storage is also supported. The framework includes built-in functions for manipulation of CSS, DOM elements, native JavaScript objects, Ajax requests, DOM effects, and more.

Ember.js
Ember.js is another powerful MVC JavaScript framework. Ember.js was initially released in 2011 as open source JavaScript framework by Yehuda Katz under MIT license. It competes with AngularJS and React when it comes to building interactive frontend user interfaces and also has a very active community of developers.
Ember.js also rides on the principal of two way data binding like AngularJS, i.e. update view when model changes and update model when the view changes, keeping both in sync all of the time. It is coming up with Fastboot.js module that allows server side rendering of DOM, the concept similar to what React is already using for better performance in complex UI rendering. Ember.js targets the best of both AngularJS (two way data binding) and React (server side rendering).

Aurelia
Aurelia is the creation of Rob Eisenberg and team who come mostly from the world of AngularJS and Durandal. Aurelia though is an open source product is officially managed by Durandal Inc., a startup company that creates libraries, tools and frameworks to support next generation of web development.

Aurelia is released in January 2015, and is ready for production use. It extends the capabilities of Durandal and is termed as NextGen version of it by Eisenberg. For the existing developers who work in Durandal or Angular1 and 2, Aurelia comes with a clear migration path. It is managed by highly professional community and carries a great legacy.

A power fact about Aurelia is that it is highly modularized and comprises of many independent small libraries. One can use entire framework in the project, use few of the required libraries, or extend the selected libraries to create custom framework. Aurelia is self-contained package and doesn't have any external dependencies except for polyfills.

Meteor
Meteor is the magical full stack platform for building end to end mobile and web applications completely in JavaScript. Meteor is the power player and comes equipped with all the features you need for front-end rendering, back-end development, business logic and database management. It was first released in 2012. by Meteor Development Group as an open source JavaScript framework under MIT license.

The best thing about Meteor is that you use only JavaScript for end to end application development, no need to invest time learning anything else. Meteor is modular and the packages and libraries can be used on demand.

The server side packages run in the Node.js and you do not need anything else but Meteor packages to access the database, all in JavaScript. This makes Meteor applications real time web applications. From performance perspective, any changes in the database are reflected back on the user interface in the real time and vice versa without the handshake between different languages or without major overhead of server response times.

Backbone.js
It was first released in 2010 by Jeremy Ashkenas as open source JavaScript framework under MIT license. The popularity and power of Backbone.js can be judged from the fact that biggies like Pinterest, Foursquare, Walmart, Disqus and Delicious are using Backbone.js. This is just a small subset of Backbone.js users.

The good thing about Backbone.js is that it is simple, small size package and easy to learn. You can get started building apps with Backbone.js JavaScript framework within no time. Backbone.js is very flexible in a way that it comes with just the minimal and you can build anything on top of it, by writing your own code or by using third party JavaScript frameworks. One can even build a fully functional opinionated framework with Backbone.js at the core. It is very useful but more as a side framework rather than the core framework of your web project.

Polymer
Polymer was released by Google back in 2013 Polymer uses the concept of web components to extend HTML capabilities.

Web components is the browser technology released by W3C using which new custom HTML elements can be created. For example <audio> is a standard HTML5 element but with the web components and related technologies you can create your own custom element - like <my-audio>. Polymer gives powers and brings structure in building custom HTML elements using browser based technologies that includes web components.

Knockout
Knockout was initially released by Steve Sanderson in 2010 as open source JavaScript framework under MIT license. Knockout works under the MVVM design paradigm and that makes it a little different from Ember.js and AngularJS.

Knockout has had its golden time but as of now it is growing at a much slower pace as compared to the earlier competitors like AngularJS, Ember.js or Backbone.js. The slow growth is simply because it lags way behind in terms of improvements and adding more features. Knockout has a great legacy and can definitely make a come back but only if someone else adopts it and starts nurturing it with the latest and greatest of the world of JavaScript technologies.

Vue.js
Vue.js is the creation of Evan You. It was first released in 2014 as open source framework for public use under MIT license. Vue.js is relatively new and is gaining lot of traction among the community of developers. Vue.js works with MVVM design paradigm and has a very simple API. Vue.js demonstrate minimalism to the extreme and allows you to use selective modules, as required. Vue.js is inspired by AngularJS, React and Knockout and updates model and view via two way data binding. While Vue.js is not in the league of AngularJS or Ember.js but conceptually has all the potential to be the JavaScript framework of future and hold respectable market share.

Figure 2 shows the percentages of websites using various JavaScript libraries and frameworks. A website may use more than one JavaScript library or framework. JQuery is used by 70.1% of all the websites, that is a JavaScript library market share of 96.0% and 27% of the websites use none of the JavaScript libraries or frameworks.

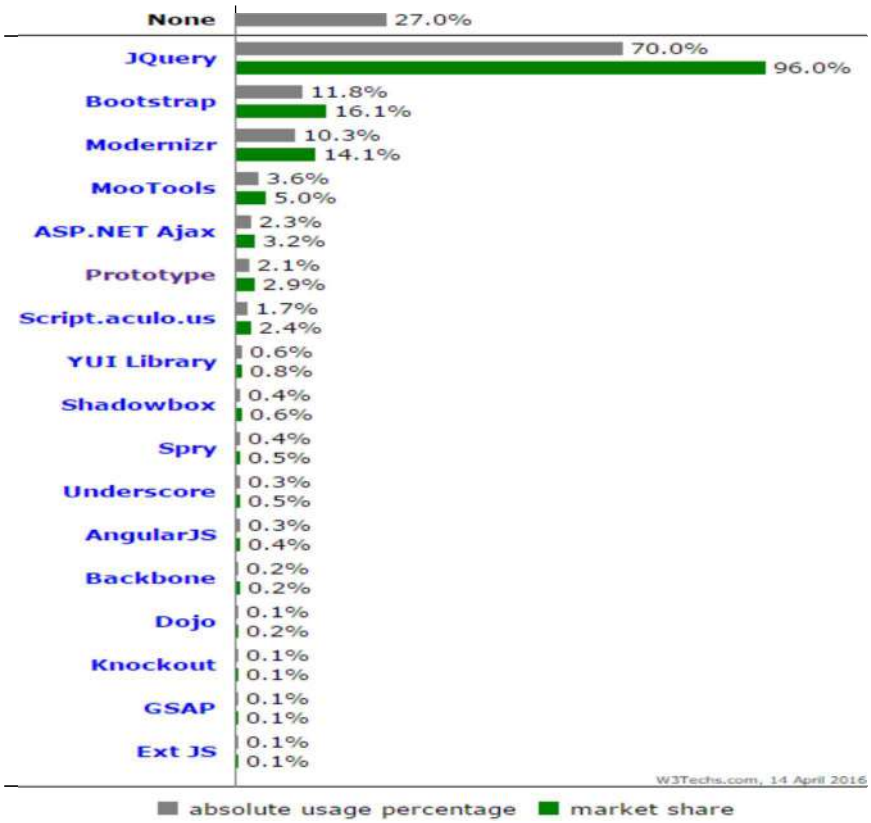

Figure 2: Usage of JavaScript libraries and framework

3.1. Frameworks to build mobile application with HTML, CSS & JavaScript

The emergence of mobile and ubiquitous technologies as important tools to complement formal learning has been accompanied by a growing interest in their educational benefits and applications. Mobile devices can be used to promote learning anywhere and anytime, to foster social learning and knowledge sharing, or to visualize augmented reality applications for learning purposes. However, the development of these applications is difficult for many researchers because it requires understanding many different protocols, dealing with distributed schemas, processes, platforms, and services, learning new programming languages, and interacting with different hardware sensors and drivers. For that reason, the use of frameworks and middleware that encapsulate part of this complexity appears to be fundamental to the further development of mobile learning projects. There been a study to analyze the state of the art of frameworks and middleware devoted to simplifying the development of mobile and ubiquitous learning applications (Martin et al., 2011).

One key advantage of using web technology to build your app is portability. Using a packager/compiler, like PhoneGap, you will be able to port and install your app on many different platforms. There are a number of frameworks that make this possible. They also have done half of the hard work to bridge the gap between web and mobile platforms. PhoneGap provides a set JavaScript APIs that connect to the device's native functions such as camera, compass, contacts, and geolocation. PhoneGap lets us build a mobile application without the native programming language. Instead we can use a framework like jQuery Mobile. It will compile your app using the platform's SDK and will be ready to install on the platform it supports including iOS, Android, Windows Phone, Blackberry and Web OS.

The mobile app development landscape is changing very rapidly with developers moving from native to HTML5 based hybrid app development options. The biggest advantage of hybrid mobile apps is "write once and run everywhere" approach.

JQuery Mobile

jQueryMobile suite is still in the game and holding the ground tight against the feature rich hybrid mobile app development frameworks like Ionic, Onsen UI and Framework 7. The die-hard jQuery fans community has built this minimalist jQueryMobile package on top of solid jQuery and jQueryUI foundation. The focus of jQueryMobile is to empower developers to build web apps and mobile apps that run seamlessly and with unique user experience across mobiles, tablets and desktops. It doesn't focus much on providing native look and feel to apps for individual platforms like iOS or Android. jQueryMobile is a robust mobile development

framework to build cross-mobile-platform app. jQueryMobile support a wide range of different platforms, from a regular desktop, smart phone, tablet, or an e-reader device like Nook or Kindle. Similar to its sibling, jQueryUI, jQueryMobile comprises a number of UIthat, in this case, is optimized for mobile and touch-enabled devices.

Mobile Angular UI
This one is for the fans of Bootstrap and AngularJS. With Mobile Angular UI, you get best of both Bootstrap 3 and AngularJS framework to build HTML5 mobile applications. Angular UI is more like an extension to Bootstrap 3 but without any dependencies to bootstrap.js or jQuery. It utilizes Fastclick.js and Overthrow.js for smooth and better mobile experience. Mobile Angular UI provides directives for building UI component like overlays, switches, sidebars, scrollable areas and absolute positioned navbars that don't bounce on scroll. These essentially are the components that you find missing in Bootstrap 3 for building mobile apps. Mobile Angular UI is available as open source and free to use under MIT license.

Sencha Touch
Sencha Touch is a mobile framework powered by HTML5 and CSS3, providing APIs, animations, and components that are compatible with the current mobile platforms and browsers. Sencha Touch supports both Cordova and PhoneGap. You can compile your app, and submit your app to the respective platform's app stores. In addition, Sencha Touch provides a set of themes for iOS, Android, Blackberry, Windows Phone, Tizen, and a variety of other platforms to help your app feel like a native app.

Ratchet
Ratchet was originally used by Twitter as an internal tool to create their mobile app prototype which is then released publicly as an open source project. Ratchet comes with a collection of User Interface and JavaScript plugins for building simple mobile apps, providing reusable HTML classes. In version 2.0, Ratchet is also shipped with its proprietary font icon set named Ratcheticon and two pre-made UI themes for iOS and Android.

Ionic
Ionic is an HTML5 mobile framework with focus on performance, by leveraging hardware acceleration, and it requires no third-party JavaScript library. It works best together with AngularJS to build an interactive app. Similar to Ratchet, Ionic is shipped with a nicely crafted font icon set, Ionicons, and a bunch of reusable HTML classes to build the mobile user interface.

Lungo
Lungo is a lightweight mobile framework based on HTML5 and CSS3. It has very nice default styles that you can use as a starting point to design your mobile app. Aside for the mobile user interface components, Lungo brings a number of JavaScript API to control your app. Lungo supports the following platforms: iOS, Android, Blackberry and Firefox OS.

Famo.us
A new mobile framework block, Famo.us promises to eliminate HTML5 performance issue on mobile devices with its lightweight JavaScript engine (only 64k). Famo.us, reportedly, will also launch a cloud-based service to package your app to publish to the AppStore. Famo.us is another powerhouse HTML5 apps development framework and targets to provide near native experience in hybrid apps. The main difference between Famo.us and other hybrid HTML5 frameworks is that it focuses more on graphics rendering, 2d and 3d and hence is more suitable for games development.

4. CONCLUSION

Phenomenon of JavaScript frameworks is not very old but has grown at a very fast pace in the last couple of years. JavaScript frameworks have become the default choice for creating complex user interfaces, specifically for Single Page Web Applications.

Different frameworks offer different concepts and methodology but attempt to solve the common underlying problem of rendering complex user interfaces dynamically and making single page applications much more useful and fast. The frameworks mentioned in this article are among the best and most widely used JavaScript frameworks on the market today. They all help to simplify writing code, but each of them is oriented towards a concrete problem and according to these characteristics the developers use different frameworks in their projects. New frameworks are constantly appear on the market while some disappear from use depending on the support and continuous development that the founders provides. Open source frameworks are more common in usage because they provide the programmer ability to adapt them to himself. It is difficult to allocate some of these frameworks as the best to use because each of them offers its own characteristics which more or less means in different projects so I did not do a comparison of frameworks but only mentioned the most

frequently used and cited their improvements of basic JavaScript. On the programmer is to choose the framework toward its affinities and needs.

At the other side, the main arguments against using any JavaScript library are that using a library adds too much download material to pages, while others claim that libraries perform poorly compared with leaner custom code. I wrote this text from my experience of using JavaScript libraries. In my projects I use jQuery library that gives me all the benefits of writing easier and simpler code with fewer lines. Its producers are trying to continually improve their product and constantly new versions are available to download. Each subsequent enhancement reduces the unnecessary content and adds a new features that are required for use in practice. I do not think it complicates the project and that makes it massive, quite the contrary, it helps in simple programming. I hope that listing type JavaScript library successfully reassure all those who were skeptical of using JavaScript libraries.

ANALYSIS OF STAGES IN THE LIFE CYCLE OF FAMILY SMES IN THE REPUBLIC OF SERBIA

Marko Mihic*[1], Sinisa Arsic[1], Milos Arsic[2]
[1]Faculty of organizational sciences, University of Belgrade, Belgrade, Serbia
[2] Faculty for Traffic, Communications and Logistics, Berane, Montenegro
*Corresponding author, e-mail: mihicm@fon.rs

Abstract: *This paper aims to analyze the operating life cycle of small and medium-sized enterprises (SMEs) in Serbia, with a special focus on family businesses. After an empirical research, it was concluded that the problem stems from the uniqueness of different stages in the life cycle of family-owned SMEs in Serbia. The main presumption of this analysis is that most (newly-founded) family firms are currently facing a decline stage in their life cycles, as well as that the most common strategy for exiting this phase seems to center around layoffs or other drastic measures. After examining the results of the study, the authors analyzed typical strategies used by owners of family businesses in order to reinforce their firms and encourage growth. The main conclusions of this study are presented with the fact that the majority of family businesses in Serbia are currently in the decline stage of their life cycle.*

Keywords*: life cycle, family business, entrepreneurship, strategy*

1. INTRODUCTION

The entire operational life cycle of an SME is influenced by the owner, across five stages: from starting the business venture, through growth, professionalization and integration, to the consolidation of operations. The sixth stage, i.e. decline or stagnation, is the least desirable stage for any owner, but once it starts, it is necessary to create an adequate business revitalization strategy immediately, i.e. the owner must devise a plan that would lead the business to a new expansion (Smithson, 2004).

This paper focuses on family-owned SMEs in Serbia. Its aim is to analyze the stages of their life cycle, both those they have passed and those they are currently facing. The main challenge in front of the authors was to identify the features of the six abovementioned stages in business life cycle. The task was performed in two stages: through a theoretical overview of available literature, as well as through the identification of questions relevant for Serbian family SME sector and adequate for empirical evaluation. In Literature Review, the authors will present the first (theoretical) part of the analysis using a synthesis of survey questions. The questions that were identified as vital and relevant for this research will be examined in the Empirical Research chapter. Previously to this, the authors will define the research problem in a separate chapter, as it is insufficiently presented in the existing literature and studies. This theoretical gap will be studied using an adequate representative sample. The Discussion on the results of this research offers authors' opinions relating to the conclusions they adopted, as well as to available strategies aimed at helping SMEs overcome the decline/stagnation stage. This section of the paper also presents conclusions from other similar studies, and explains identified literature gaps, which this study aims to fill. The limitation of this study is the relatively small number of surveyed companies, but that limitation was compensated for by selecting companies evenly distributed throughout the territory of Serbia, in order to provide the best possible territorial representativeness of the sample.

2. LITERATURE OVERVIEW

In the initial stage of a company's life cycle, the firm's structure is still not completely defined, responsibilities are not properly established and distributed, and there is no coherency in following the initial plan, since these firms tend to implement temporary and simple solutions. (Abdesselam, Bonnet & Le Pape, 2004). In this stage, companies are extremely vulnerable; many of them never overcome this phase and simply disappear. Therefore, it is necessary to detect and analyze problems that prevent a business from developing and continuing into the next stage of its life cycle.

The next stage, if the firm gets to it, is the one where employees and the owner create a base the firm will rely on in the future and foster important prerequisites for succeeding on today's competitive market. In this stage, business operations are at their very beginning; the owner is performing most of the tasks and has,

sometimes, a few employees to help him. The main problems and tasks revolve around attracting new customers and delivering products and services. Some companies never enter the expansion stage because the owner, lacking ambition, decides to keep the operations at the same level, further implementing the stages of professionalization and integration (Sharma & Salvato, 2011). Nevertheless, the companies that strive towards expansion will start to glance outwards, looking for new possibilities and business ventures. Still, these prospects only represent the extension of the already existing activities and not the search for completely new activities and cooperation with third parties. The company's structure will begin to take form, relying on the already existing base it can return to at any moment (Barbero, Casillas & Feldman, 2011). It is necessary to establish whether the owners of family SMEs mainly opt for expanding their product or service range (outside of Serbian borders, if possible), or for remaining at their current business operations level, implementing professionalization and integration, hoping to achieve success on the market.

The professionalization and integration stage is analogue to the growth and development of a human between adolescence and maturity. The ideas advocated by the firm in this stage are indisputable, even stubbornly defended, although they change in frequent intervals. One of the greatest dangers in this stage is the success of one employee, most often the owner, who controls the entire structure. The company is financially stable with average or above-the-average profits; an opportunity arises to hire functional managers who will take over certain activities previously performed by the owner. If the company does not adjust to the changes, it can shut down or return to the previous stage (the expansion stage). As long as the owner is there in person, he brings revenue and everything works fine. When he is gone, there is a danger of creating a vacuum, generated by the lack of a true leader in the organization (Peiser & Wooten, 1997). Professionalization and, later, integration are very important for a company because relations between employees can create a challenging environment for understanding and maintaining everyday business operations. The expansion of a company has to precede professionalization, since professionalization is there to support the new, changed structure. The entire business operations system has to be systematic; this process is achieved through integration. Managers now need another level of management and professionalization process is there to establish a clear structure for responsibilities, delegation of tasks, establishing of roles, etc. (Jovanovic, Petrovic, Mihic & Obradovic, 2012). New experts are joining the firm, and the organization starts to prepare for consolidation, i.e. stabilization of current operations. The owner now needs experts for managing finances in order to deal with debtors, creditors and bank managers. Every small firm, striving to become a medium-sized company, i.e. big company at some point, has to make this leap in order to ensure long-term development. In this stage, the owner invests cash and borrowed assets aiming to invest in the company's further development (Johnsen & McMahon, 2005; Muhlbacher, Nettekoven & Kovac, 2011). Strategic management is becoming critical and the owner is involved in every stage. At this point, any failure can push the company back into the stagnation or survival stage to such an extent that it can even be sold.

Consolidation stage further determines operational directions from a safe point. Nevertheless, it is only up to the owner and his plans whether his business will enter the next downhill stage, i.e. whether the business will expand even further. A consolidated company offers security and sense of determination to its employees, encouraging them to achieve their goals. The company that overcomes this stage knows what to expect from its employees, and they know what is expected of them. Among other things, this is a result of increasingly formal relations in the company, something less consolidated companies do not have. In this stage, there is a danger of turning formalities into burdening bureaucracy, smothering all good effects in excessive paperwork and formal procedures. The best possible way in which an owner and a team of managers can protect their business is to constantly train and develop their staff. This strategy should be aimed at developing creative employees who do not perform their tasks always in the same manner and repetitively every day. In this way, they make positive contribution to the system with their results and always look for new solutions and approach in order to prevent stagnation and delays caused by rules and procedures. Lucky companies, the ones that are successful in the long run, reach consolidation and remain in that stage as long as they exist (Dodge & Robbins, 1992; La Rocca, La Rocca & Cariola, 2011; Barbero & Casillas, 2011).

From this point, the company usually slides into decline or stagnation stage. The key problem is how to finance growth and whether the owner is ready to delegate responsibilities to others. If the efforts made during this stage fail, the company closes or returns to a previous stage. In most cases, such company will lay off employees and lose projects, until the owner decides to close it or sell it to someone. Stagnation can last for years, due to the false conviction that not all is lost yet. However, in the end, such sequence of events always leads to closing the company (Smithson, 2004; Rutherford, Muse & Oswald, 2006). Therefore, we first need to establish what percentage of companies is in the decline or stagnation stage, and then to determine what is the cause of such state, i.e. whether it is a consequence of failure to expand the range of products/services or failure to export to foreign markets. Another critical issue analyzed by the authors of this paper is the owners' plan for exiting the crisis – either by shutting down production or by other means.

With all the above mentioned, it can be said that since the founding of a company, during its development and in its maturity stage, it undergoes a diversification of business operations, expanding its client portfolio and activities, while the downward trend during the last stage of a company's life cycle reduces the number of its business activities and clients, leaving the company to operate only in a limited number of areas. The same rule applies to labor force – up until a company reaches maturity stage, it takes in more non-professionals, while after this stage, more and more of these employees leave the company. (Graafland, van de Ven & Stoffele, 2003; Masurel & van Montfort, 2006; Muhlbacher et al., 2011). In addition, the productivity of employees increases until the maturity stage, and experiences a downward trend as the company enters the final stage of its life cycle. According to (Headd & Kirchhoff, 2009; Herbane, 2010; Sharma & Salvato, 2011), the most common causes of closing a business in the decline stage are managerial incompetency (inexperienced managers found startups without a proper background and training), limitation of business operations to a single market (failure to offer new products in the market), inadequate control (losing the perspective and control processes focus), and insufficient capital (company debt is enlarged due to new loans).

Unfortunately, there are much fewer reasons why a company will succeed. According to (Walker & Brown, 2004; Johnsen & McMahon, 2005; Scritchfield, 2006; Brinckmann, Grichnik & Kapsa, 2010), some of the more prominent reasons why new companies succeed are hard work and dedication, pursuit of market demand for products and services, as well as adequate business planning (better forecast of yields, performance and business results).

During the decline stage, a company is provided with an opportunity to test its plans and strategies relating to cushioning crisis effects and assessing the time left to new expansion stage. Nevertheless, not many companies are able to launch themselves into a new expansion stage. According to (Cooper & Edgett 2010), cooperative strategies represent a very powerful tool for a company's development/expansion. According to this principle, several companies join forces in order to achieve a common goal. Companies work together in order to create a bigger value which, in turn, will lead to lower operating expenses than when a company is isolated on the market. Strategic alliance is a type of cooperative strategy where companies combine their resources and know-how in order to achieve competitive advantage, these alliances are very common when it comes to certain companies' limitations in terms of size, market share, and annual capital turnover or profits (Sharma, Chrisman & Chua, 1997; Walters, Priem & Shook, 2005). Sometimes, companies join forces in order to achieve greater success in risk management and avoid unwanted outcomes. This strategy is implemented in order to defend companies from risks and uncertainties as much as possible. SMEs implement such strategies when entering new markets or launching new products (Marino, Lohrke, Hill, Weaman & Tambunan, 2008).

3. DEFINITION OF RESEARCH PROBLEM

The existing literature overview does not offer answers to many questions concerning the life cycle of family SMEs. Therefore, the authors identified several issues that might represent the definition of the problems to be examined and subjected to empirical analysis:

- Main problems when founding a company,
- Obstacles for labor force professionalization and promotion of organizational structure,
- Main challenges in the process of professionalization and organizational integration,
- Main factors for expansion in founding stage and expansion stage,
- Analysis of a company's slide into decline/stagnation stage,
- Analysis of strategies and plans for fighting crisis.

Having in mind these issues, it is possible to define survey questions aimed at examining the accuracy of hypotheses presented in this paper. The main hypothesis in this paper, which can help us provide answers for the previously performed analysis of current state in family SME sector in Serbia, is:
"Most family companies in Serbia are in the decline stage of the life cycle, which results in layoffs".
It is possible to extract three auxiliary hypotheses, whose empirical confirmation would also prove the accuracy of the main hypothesis. They are defined in the following way:

H1.1 – Most companies in the decline stage of life cycle are newly-founded family firms (founded less than five years ago);
H1.2 – The most common strategy for exiting crisis (decline or stagnation stage in the life cycle) is laying off a certain number of employees;

H1.3 – A company's failure to initiate export, added to inability to launch new products and services, results in that company's entering the decline stage of the life cycle – and staying there.
The authors of this paper will use a sample in order to prove (in)accuracy of the main and auxiliary hypotheses.

4. EMPIRICAL RESEARCH

The authors of this paper designed a survey consisting of 20 questions aimed at helping them analyze the identified problem and examine all properties of the stages in family SMEs' life cycle. The survey contained closed-ended questions (where respondents had to opt for only one of the answers), as well as questions based on Likert scale (1-the least important, 5-the most important). The five introductory questions related to basic sample features, presented in Table 2. The respondents were contacted in three ways: via e-mail - by sending them an online questionnaire, via telephone and personal contacts (contacts provided by the Serbian Chamber of Commerce), who have later been provided with the survey, between February 2014 and April 2014. The overall potential number of respondents was 4.000. The sample contained excellent distribution throughout the territory of Serbia (reason for this kind of distribution is a large scale of economic differences between four regions of Serbia), with a satisfactory number of family firms (see Table 1).

Table 1: Regional distribution of enterprises

Region	Overall number of enterprises	%	Overall number of family enterprises	Sample used in this research
Belgrade region	38.093	44,0	30.475	584
Vojvodina region	23.487	25,2	21.180	256
Sumadija and West Serbia region	17.152	19,0	15.426	220
South and East Serbia region	8.871	11,8	8.327	94
Republic of Serbia	**87.603**	**100,0**	**77.608**	**1.154**

Source: Authors' data and statistical yearbook of the Republic of Serbia 2013

The number of respondents who successfully completed the survey was 1,154 (29% of the overall number of contacted companies).

5. RESULTS OF THE RESEARCH

Basic characteristics of the sample are presented in table 2. Most companies from the sample are micro businesses (up to 9 employees), while only 1,1% of surveyed companies have between 51 and 100 employees. The majority companies in the sample are service companies (58,7%), while others have production (13,5%), or combine services and production (27,8%). The owner of the company, in most cases (99%), is also its general manager.

Table 2: Basic characteristics of surveyed enterprises

Number of employees	***answer***	*1-9*	*10-20*	*21-50*	*51-100*	*101-250*
	percentage [%]	65,9	17,5	13,5	0,8	2,4
Annual income	***answer***	*less than 500.000 EUR*	*btw. 500.000 and 2mn EUR*	*btw. 2mn and 5mn EUR*	*btw. 5mn and 27mn EUR*	*no response*
	percentage [%]	42,1	17,5	16,7	9,5	14,3
Annual turnover	***answer***	*less than 1mn EUR*	*btw. 1mn and 5mn EUR*	*btw. 5mn and 27mn EUR*	*more than 27mn EUR*	*no response*
	percentage [%]	39,7	21,4	15,1	13,5	10,3

Main survey questions, as well as answers, are displayed in table 3.

Table 3: Research questions, answers and statistics

Question	Answer	Result (1-5; 0-100%)
what were the biggest problems during the establishment of the firm	identification of target audience for the company's products/services	2,92
	improvement of existing products/services in the company	2,88
After overcoming initial problems, what were the following experiences	A slight increase in the number of employees occurred	3,38
	A moderate increase in sales of goods/services occurred	2,79
Did the owners experience resistance to change	Yes, regarding professionalization and promotion of organizational culture	32,3%
What do the owners perceive as the way to decrease resistance to change	Improvements in organizational culture	52,3%
Did you fail to internationalize your operations after entering the decline stage	Yes	90%
What was the direct cause for your firm to enter the decline stage	Failure to expand goods/services portfolio	100% **(H1.3)**
After entering the decline stage, did you manage to further develop firm operations	No, failed	51%
How did you foster further development	By yielding a new cycle in production/services portfolio	43,7%
	By opening new job positions	26,2%
What had the biggest influence on your company's operations	Generation of new products/services	1,6%
	We never expanded our company goods/services portfolio	28%
What was your main strategy to combat business crisis	Lay- offs	41%
What was your vision for overcoming business crisis/decline stage (contingency plans) (multiple answers)	Lay-offs	48% **(H1.2)**
	Reengineering of production/services processes	50%
	By initiating new cycle of production	20%

Cross referencing of data, regarding decline phase and company period of functioning has been presented in table 4. It can be seen that most companies in the decline stage of life cycle are newly-founded family firms (founded less than five years ago), which directly confirms the first hypothesis **(H1.1)**;

Table 4: Question about decline/stagnation phase

		Company exists:			
Decline stage:		Less than 5 years	Between 6-9 years	Between 10-20 years	Over 20 years
Yes	81,5%	65,8%	15,3%	13,07%	5%
No	18,5%	34,2%	84,7%	86,9%	95%

All three hypotheses have been verified using available statistical methods, as presented in table 5.

Table 5: Testing of three auxiliary hypotheses

Test / Hypothesis		H1.1	H1.2	H1.3
Chi-square test	*Pearson Chi-Square*	12,792	111,123	35,797
	Likelihood Ratio	14,030	121,773	48,867
ANOVA (standard mean error)		0,041	0,742	0,064
Pearson Kendall-tau b coefficient		,080	-,505	-,501
Gamma coefficient		,133	-,619	-1,000

Source: Authors' data

The tests confirmed that hypotheses were correctly set, i.e. that their definition is an accurate reflection of surveyed state of family SMEs in Serbia. Chi-square tests examined the correlations between questions used to prove the hypotheses. T-test successfully examined sample deviations relating to probability of error in standard deviation, while coefficients (Pearson-Kendall and Gamma) tested the correlation between answers.

6. DISCUSSION ON RESEARCH RESULTS

In 2008, the global economic downturn caused potential investors to give up on Serbia; the country's export to CEFTA region, the EU and other markets dropped significantly. The main problem was the fact that the state failed to stop negative trends during 2009/2010. This downward trend had a devastating influence on the SME sector, since it represents 95% of all companies in Serbia. The lack of preparations for the crisis influenced Serbian economy and export – it is astounding to hear that more than 50% of surveyed companies (GfK survey encompassing 400 small and medium-sized enterprises in Serbia) haven't made any investments in their business during 2012, while 60% do not have investment plans for this year either. In 2013, the European Investment Bank (EIB) earmarked a EUR 318mn loan aimed at helping the Serbian SME sector.

One of the reasons for failing to diversify the range of products and services to a multinational level, can be the fact that family firms have no connections to big systems that can offer new markets and salvation to SMEs. This could be achieved if a small family business was to be a part of a big company's supply chain. According to data from Doing Business (issued by the World Bank), Serbia's rise on the list of world economies was very slow since the beginning of the global crisis (91st place in 2008, 90th place in 2009, 90th place in 2010, 89th place in 2011, 95th place in 2012, 87th place in 2013, 93rd place in 2014, 59th place in 2015). Since it was established that mostly small companies experienced the decline stage, the research clearly shows their strategies for combating the crisis. As much as 90% of surveyed managers in micro companies believe that letting go extra workforce is the best strategy. Another addition to the generally weakened state of the SME sector in Serbia is the fact that only 3% of surveyed companies have been implementing innovations in order to get to the diffusion stage. According to (Radonjic Petrovic, Jakopin & Ezdenci, 2009), only 9% of companies in Serbia have an innovation plan involving cooperation with other companies. Only 25% of companies is implementing innovation activities, while 30% of them introduced innovations in products/services or technological processes. As far as management's reaction to a company's entering the decline/stagnation stage is concerned, the paper examines strategies involving layoffs, whose goal is to restructure operations and reorganize the company. Reorganization, as a strategy for exiting crisis, can be performed by hiring new employees. Nevertheless, in this surveyed sample, only a small percentage of companies opted for this strategy. In addition, two strategies, also presented in this study, which can help companies survive the downward trend, are changes in market orientation, as well as changes in production/service provision. Other authors (Walters et al., 2005; Beaver, 2007) have also been examining these strategies and wrote about differentiation of products/services (new markets and approaches), as well as the strategy of cost effectiveness (reorganization of business operations). Nevertheless, contrary to the abovementioned authors (as well as authors of this paper), there are other interpretations regarding the strategies that should be dominantly used for mitigating the effects of the decline stage in a company's life cycle. One such example is a study written by (Verreynne & Meyer, 2010), that mentions a different approach to the creation of a business strategy for an SME. The uniqueness of this approach is the fact that there is no specific strategy for every stage in the life cycle – the company's management is in charge of securing participation in decision making, as well as encouraging the ability to adapt to external changes. This approach aims to decrease business risks and prevent the company from ever facing any problems. This study pointed to the possible causes (certainly not the only causes) for a company's slide into the decline/stagnation stage. In this phase the company is usually recording

unfavorable business results and/or has a lower production volume. The identified causes are: company's failure to cross national borders, as well as its inability to expand the range of products or services in order to avoid bad results caused by the declining sales of a single product/service. These conclusions are an excellent addition to the research performed by (Marino et al., 2008). According to them, the main causes of a company's bad business results are the lack of resources necessary to "combat" the environment, as well as failure to join forces with other similar companies in order to have better chances in the market game.

The authors have performed a series of tests on all three auxiliary hypotheses in order to confirm the validity and diversity of sample. Having in mind the limited reach of the study (family-owned businesses in Serbia), in case of positive reviews, the authors would be inclined to expand the research to all SMEs in Serbia; this research would, of course, imply a bigger sample and a wider analysis of life cycle factors.

7. CONCLUSION

This paper presents the characteristics of the decline stage in family businesses, as well as strategies for combating crisis and improving business activities. It also presents a good addition to existing studies, such as a research paper from (Mihic et al., 2015), where the authors conducted a family business research in Serbian SME sector, dealing with different impacts on business success. The main hypothesis of this paper has been successfully confirmed, on three auxiliary hypotheses that define it, i.e. hypotheses with a closer connection to the survey from this study. A future research, that could represent a quality addition to the present one, would involve observation and monitoring of surveyed companies over a period of several years in order to get a trend of indicators pointing to properties of certain life cycle stages. This would enable the evaluation of adopted strategies and generation of plans for exiting the decline/stagnation stage of the life cycle.

Acknowledgments

This paper is a result of the project no. 179081 founded by Ministry of education and science of the Republic of Serbia: Researching contemporary tendencies of strategic management using specialized management disciplines in function of competitiveness of Serbian economy.

ARGUMENTS FOR DESIGNING PROGRAMMES FOR ENCOURAGING THE YOUTH IN SERBIA TOWARDS ENTREPRENEURSHIP

Jasmina Omerbegović-Bijelović*[1], Predrag Mirković[1], Zoran Rakićević[1]
[1]Faculty of Organisational Sciences, University of Belgrade
*Corresponding author, e-mail: omeja@fon.bg.ac.rs

Abstract: *This paper points out a way to help with solving the high levels of unemployment amongst the young in Serbia – by designing and realising programs which would allow their inclusion in the entrepreneurial waters - either self-employment and/or employment of others. The idea is to identify and recommend to stakeholders competencies and motives driving the young entrepreneurs nowadays – as models for enabling and motivating unemployed youths to engage with the entrepreneurial world. On the basis of facts obtained by research – which pinpoint the competencies - both practical and theoretical - and the motives of the young entrepreneurs in Serbia, as well as on the basis of their beliefs/attitudes about the same aspects of starting and undertaking entrepreneurial projects, some recommendations have been generated for designing programs to encourage those young people to join the ranks of entrepreneurs. That which remains is for the relevant authorities - in the legal and even family settings, i.e. all those who can recognise some self-interest, to get started and dedicate themselves to the young and their entry into the world of entrepreneurship. The contribution of this paper is in the packages of suggestions for the different types of stakeholders which would help them design programs to bring the young generations into the entrepreneurial sphere. We also consider useful even the very fact of pointing out the different roles of the various social subjects/stakeholders in bringing the young in Serbia into the world of entrepreneurship, as a form of care for the young generations.*

Keywords*: young of Serbia, competencies for entrepreneurship, motives for entrepreneurship, programmes for encouraging the young towards entrepreneurship*

1. INTRODUCTION

From the second half of the 20th C there is an increased "piling up" of young people in the unemployed category. The sudden world population growth (and therefore the numbers of young people too) as well as the growth of better equipped and more automated workplaces, ICT and standardisation, have brought about a relative decrease in the number of available work places (especially in the area of production) – measured in percentages (as seen against the overall number of people in the world). The migration of capital (especially to Asia) has caused, especially in the highly developed parts of the world, the "extinction" of big parts of industries (like the automotive industry of USA, for example). Although the service sector has been developing quickly, it has not proven capable of absorbing the entire excess of the workforce so that, for decades now, the period of waiting for one's first job is extended and there is a growing "unemployed army".

Serbia is also a part of this "trend" where the young, for decades now, increasingly have to wait to find a job and their numbers (those unemployed) in the employment centres just keeps – growing; that can be seen both in absolute terms and in relation to the overall population numbers. Unemployment rate in Serbia 2013 was 22.1%, according to World Bank Indicator; in 2014 was 18.9% (Labour Force Survey, 2014).

It is for that reason that the theme of this paper is connected to the idea of solving the problem of youth unemployment in Serbia: 49.4% for total labour force ages 15-24, according to World Bank Indicator (2013). The idea is to encourage the youth to greater inclusion in the world of work and business – through entrepreneurship – both by self-employment and the employment of others. Namely, although it may be possible to solve the above stated problem in other ways, it may be worth bearing in mind that 2016 was voted the *Year of entrepreneurship in Serbia.* We attempt to contribute to the solving of youth unemployment problem through the use of "entrepreneurial climate support". As the climate on its own is not enough, we point out in this paper that anyone who is truly interested (stakeholders) in solving the youth unemployment problem must begin with a serious, systemic and systematic, work to address the problem.

Entrepreneurship can be defined as the process by which individuals follow opportunities without regard to resources they currently control, and as "art of turning an idea into a business" (Barringer & Ireland, 2010, p. 30). Entrepreneurs recognize opportunities (i.e. discover market needs as opportunities) and turn them into

successful businesses (launch new firms to meet those needs) (Hsieh et al., 2007; Moore et al., 2008, p. 6). According to Omerbegović-Bijelović (2010, p. 234), entrepreneurship can be defined as "a social function of creating new values through the creative combination of business resources". Zampetakis et al. (2013) claim too that entrepreneurship is linked with the value creation, and has a significant impact on economic growth and employment. Due to the fact that entrepreneurial activity is a key engine of economic growth, promoting youth entrepreneurship has become a priority for policymakers throughout the world (Sobel & King, 2008). Kasim et al. (2014) review global trends and practices from past research on regenerating youth development through entrepreneurship, listed existing youth empowerment programs, marked major stakeholders for this issue, and give some interesting prepositions. Sobel & King (2008) found positive influence of school voucher programs (government funds for school tuition and expenses) on a rate of youth entrepreneurship.

In solving the problem of youth unemployment in Serbia there are the following "interested parties" (stakeholders): the State and the ministries (above all: Ministry of Education, science and technological development, Ministry or commerce, Ministry of work, Ministry or youth and sport, Ministry of culture), Local communities, Businesses and institutions (at least national ones), Family businesses (owners and their progeny), Media, Other stakeholders (Banks, Youth organisations, Employment centres…). All of them could give support by desisting with the "firing strategy" and instead started the "strengthening internal/corporative entrepreneurship" (with the understanding that they have a lack of ideas and not an excess of employees) and "everything that is not a core competency should be outsourced" strategy (which would in turn create a "business satellites orbit" for "excess"/experienced workers, as well as for young entrepreneurs/employees).

Every one of them could generate a package of their own strategies for helping with the unemployment problem (including youth unemployment which is the main focus of this paper) in which there would unfailingly be different ways of support for future youth entrepreneurs. In that way, for example, every stakeholder in the employment of the young through entrepreneurship could create their own "package of recommendations", i.e. The Programme for encouraging the young (in Serbia) to take up entrepreneurship. (It would be especially good if their activities could be coordinated – which would avoid one-sidedness in allowing the young generations to truly utilise all their potential.)

In designing such programmes, every stakeholder, as a good manager, ought to start with establishing the current status in the area of youth entrepreneurship: the number of young entrepreneurs, their competencies and motives etc. One should also bear in mind the circumstances for that particular entrepreneurial branch: the structure of needs, opportunities for including the young and their companies, availability of resources to those youths and their companies, available and needed support to young entrepreneurs... Also, it would be useful to tie in projections of the social/state development with roles of young entrepreneurs.

The idea is to create the basis of programmes (meta-programme) to support youth entrepreneurship - in Serbia and elsewhere. It - the basis - could be seen as a meta-programme for creating programmes to support youth entrepreneurship, applicable everywhere - in every country and for every stakeholder. The other aspect of this idea has to deal with the uniqueness of stakeholders, especially bearing in mind national characteristics; they should be offered examples/suggestions of stakeholder's programmes or, at the very least, some ideas for their content - to stimulate youth entrepreneurship.

This idea is intended for "the group of stakeholders who support (would like) some change in the entrepreneurial spirit": the State and its ministries (of: education, commerce, youth, as well as the culture ministry and others!), local and organisational communities (supply/value chains and networks, business incubators/hubs and parks, clusters etc.), companies and institutions, family businesses (especially the owners and their heirs!), media and other stakeholders (banks, youth organisations, job seeking institutions).

The intention is for the stakeholders to be inspired to design their own programmes for encouraging the young to entrepreneurial efforts (including through cooperation with a specific stakeholder). For that they need a meta-programme, examples and/or ideas for the design of the Programme as well as their own decision (if they can recognise their self-interest). Through the observed stakeholders it would be possible to obtain some sort of national consensus for the fight against youth unemployment and for their introduction to entrepreneurship and the world of work, i.e. it would be possible to promote and spread the entrepreneurial spirit/culture further.

2. THE IMPORTANCE OF INCLUDING THE YOUTH IN SERBIA IN ENTREPRENEURSHIP

Long term benefits of promoting entrepreneurship among young in Serbia are presented in (Hutchinson et al. 2012): Creating employment opportunities for young entrepreneur and they future employees; Involvement of youth marginalized groups into economic flow; Helping youth develop new skills, knowledge and experiences that can be applied to various challenges in life; Promoting the recovery of the local community especially those that are rural; Capitalizing on the fact that young entrepreneurs may be particularly responsive to new economic opportunities and trends.

Apart from the stakeholder side of solving unemployment, it is also important to become aware of the interests of the young. They, in the here and now, choose long term career plans, but also to make families (and the number of children in the future), to deal with their housing situation (and to enter into a long term debt for it!), to "look after their parents" in their old age, as well as to further educate themselves, to name just a few.

For that reason it is important to understand what keeps them here - in Serbia - and what they find discouraging (i.e. regarding jobs and entrepreneurship). It is important to understand how to best help them in making their dreams a reality, as well as to work out how to bring the societal needs for implementing the latest scientific findings into the field of vision of the young, in order to encourage those young for entrepreneurship in those -creative, promising and profitable industries/fields. (In closest connection with that we find the educational-development perspective of the young generations and therefore some new demands ahead of the educational system itself - in which it is important to create curious, flexible, wise yet enterprising workers, entrepreneurs and managers).

The young should be made to feel closer to the work culture as well that of entrepreneurship. If we could alter the view of Work as something that is compulsory, that must be done ("a fight against Nature", if you will) to a view of Work as the normal state of healthy people - who work with and coexist with the Nature, it would increase the understanding of the need for adjusting work circumstances, it would strengthen the desire and readiness to "play" different roles in business systems and also for life long personal (and collective) development. Such a community would surely "dream" of changes, improvement, development... It is to be expected earnings that such a culture and such relationships could ensure a value system which would guarantee a permanent survival.

It is for that reason that it is important, right now, for all subsystems of the State to start to work on their own, publically announced and transparent promotion of the value system and on their own contributions to that very system. Entrepreneurial young people are, even as we speak, keenly following what goes on in their surroundings, where it all leads to and where there is a place for them; they are surely willing to share their observations with their environment and contribute to its promotion.

3. RESEARCHING THE COMPETENCIES AND MOTIVES OF YOUNG ENTREPRENEURS OF SERBIA

Motives for starting business and entrepreneurship might be influenced by many factors. Papulová & Papula (2015) have been sumarized motives into four groups. 1) Motives that are connected to profit - entrepreneurs interests in gaining an economic effect on the basic of their work; 2) Professional self-realization and emotional motives (non-motiveted by profit directly) - people that are professionals in certain area which want to gain a full satisfaction without managers limitations. Also these motives can be linked with emotions and effort to achieve something. 3) Social motives – in passive economic regions entrepreneurs can be motivated to create jobs for others, family, relatives, friends. 4) Motives which are result of external stimulations - through funding programs of local authorities, states, European Union, business agency. Besides motives for entrepreneurship, Robles & Zárraga-Rodríguez (2015) explore with Delphi method the next key individual competencies of entrepreneurs: risk assumption, initiative, responsibility, dynamism, troubleshooting, search and analysis of information, results orientation, change management and quality of work.

In order to solve the problem of youth unemployment (of Serbia), we suggest they be guided towards entrepreneurship. Youth entrepreneurship is a practical application of entrepreneurial characteristics of young people, such as initiative, innovation, creativity and risk taking in a working environment (either self-employment or work in small enterprises), using appropriate skills (Delgado, 2004, p. 99).

According to Nabi et al. (2010), higher education reduces the likelihood of entrepreneurship. Opposite to this,

Zhang et al. (2013) state that relationship between high education and entrepreneurship is positive. Solesvik et al. (2013) showed that there is positive relation between entrepreneurship education and entrepreneurial intention. Farashah (2013) differ tree types of entrepreneurial education: learn to understand entrepreneurship, learn to act in an entrepreneurial way and learn to become an entrepreneur. Vilcov and Dimitrescu (2015) analysed entrepreneurship education and the development of entrepreneurial competencies of young people in Romania. They concluded that entrepreneurial education leads students to understand daily life problems, helping them identify and assess the consequences of personal decisions.
From the research presented in Roberts (2008), the most common sources of different forms of support for young entrepreneurs comes from entrepreneur's close environment. Primarily, family of young entrepreneurs is the main source of support (71% of support comes from the family). After that, 20% comes from close friends. Unfortunately, modest share came from banks, the state and other organisations.

Into creating a favourable entrepreneurial environment, for growing the spirit of entrepreneurship, the already mentioned stakeholders are required (the State and its ministries, companies, institutions etc.). The idea is that they could create their own programmes for encouraging the young to enter the world of entrepreneurship - bearing in mind their own interests too. Those programmes should be in accordance with the missions (and the visions) of stakeholders and be relevant to including the young into the waters of entrepreneurship.

Bearing in mind the publically proclaimed and available missions of all categories of viewed stakeholders, what remains is to ask the young about their idea(s) of entrepreneurship. Following on from that, it should be possible to start generating recommendations for programme designing - and for generating the meta-basis for programme creation and the specifics for stakeholder programmes to encourage youth entrepreneurship.

3.1 Research methodology

In the aim of checking the idea about the possibility of designing set of stakeholders' programmes for encouraging youth entrepreneurship, in addition to an overview of theoretical achievements, circumstances related to making the idea come true and the specific missions of individual stakeholder categories (which all is not within the purview of this paper), it is also important to become acquainted with the experiences and views/motives of today's young entrepreneurs. They need to show and evaluate their own experiences and motives, pointing out the acceptable and unacceptable aspects of behaviour towards young entrepreneurs they have themselves experienced.

For this purpose we have generated the basic/general hypothesis H(0): It is possible from young entrepreneurs in Serbia to find out about the competencies (knowledge/theory and experience/practise) and the motivation which the youth of Serbia requires for self-employment (being included in entrepreneurship).
From this, we have deduced two specific hypotheses:

- The specific hypothesis H(1): It is possible from young entrepreneurs in Serbia, to find out about the competencies for the youths (in Serbia) which would make self-employment possible (and becoming entrepreneurs in the process).

This specific hypothesis further divides into two individual hypotheses:

  - H(1;1): It is possible from young entrepreneurs in Serbia, to find out about knowledge/theory for the youths which would make self-employment possible (and becoming entrepreneurs in the process).
  - H(1;2): It is possible from young entrepreneurs in Serbia, to find out about experience/practice for the youths which would make self-employment possible (and becoming entrepreneurs in the process).

- The specific hypothesis H(2): It is possible from young entrepreneurs in Serbia, to find out about motives which direct and drive the youths (in Serbia) towards entrepreneurship.

Therefore, the basic hypothesis H(0) was deconstructed into three individual ones (as in Figure 1): H(1;1), H(1;2) and H(2). All three will be tested through field research, using questionnaires - with between 8-32 research based questions per individual hypothesis. The special hypothesis H(1) and the basic/general one H(0) will be induced – from the lower hypotheses.

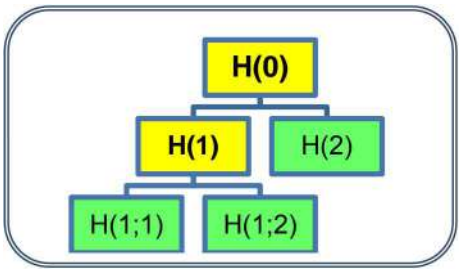

Figure 1: The hypotheses structure

For this occasion we made a considerable questionnaire about the competencies (theoretical knowledge and experience from practice) as well as the motivation for embarking into the world of entrepreneurship. The questions were grouped by areas: about the subject (16 questions), the subject's company (9 questions), experience with learning about and becoming enabled for entrepreneurship (32), attitudes in learning about entrepreneurship (11), experience in becoming motivated for entrepreneurship (9) and attitudes for becoming motivated for entrepreneurship (8 questions). The questionnaire contained altogether 85 questions.

The sample group participants who filled out the questionnaire consisted of 35 young entrepreneurs in Serbia. The research was conducted 2016 in Serbia. Filling out the questionnaire was done electronically.

3.2. Research results and discussion

The basic data on the (mostly young) entrepreneurs of Serbia (Table 1) prevail men (58% of the sample), highly educated (86.2%), the founders of the companies (50%), with experience in entrepreneurship (80%), with no formal education for entrepreneurship (38.8+25=63.8%) - or with a permanent (or non-formal) education (for entrepreneurship and management), a former high school students (58.3%), with the entrepreneurial tradition in the family (63.9%) and with entrepreneurs in the region (88.9%) . They are (Table 2) aged of 28.31 years (Mean (M)=28.31; Std. Deviation (SD)=5.89), with 0.75 based companies, average (M=0.75; SD=0.69).

Table 1: The attributes structure of the survey sample with frequencies of categorical variables (Part 1)

N°	Categorical variables about respondents		Percentage
1	*Respondent's gender*	Male	58.0 %
		Female	48.0 %
2	*Respondent's education*	Bachelor degree	55.6 %
		Master degree & PhD degree	30.6 %
3	*Position in company*	Founder	50.0 %
		Successor	36.1 %
		Employee	13.9 %
4	*Entrepreneurial experience*	Yes	80.0 %
5	*Entrepreneurial education*	Without education	38.8 %
		Courses and seminars	25.0 %
6	*Finished secondary school*	Grammar school	58.3 %
		Schools of economics	13.9 %
7	*Family tradition for entrepreneurship*	Yes	63.9 %
8	*Any entrepreneur in your surrounding?*	Yes	88.9 %
9	*Do you continually educate while employed (for entrepreneurship and/or for management)?*	Formally	42.4 %
		Informally	51.5 %
		Both	6.1 %

Table 2: The attributes structure of the survey sample with frequencies of categorical variables (Part 2)

	Scale variables	Mean (M)	Std. Deviation (SD)
1	*Respondent's age*	28.31	5.89
2	*The number of established enterprises*	0.75	0.69

Information about companies in which respondents work (Table 3) show that 91.7% of respondents work in their own or in a family business (other more "apprenticeship" in other people's businesses), and 66.7% of these enterprises are in Belgrade; the most common type is "Ltd" (58.3%) and mainly is engaged in the provision of services (13.9+36.1=50%). The majority (77.7%) are micro-enterprises - including

entrepreneurial shops, agencies and the others, with average of 11.34 employees (M=11:34; SD=8.15). They are mainly (Table 4) older than 1 year (83.3%), with 52.8% in the phase of ascent/rising (Table 3).

Table 3: The attributes structure of the survey respondents' enterprises

N°	Categorical variables about respondents' enterprises		Percentage
1	*Business owner*	Respondent	50%
		Respondent's parents	41.7 %
2	*Location*	Belgrade	66.7 %
3	*Enterprise type*	Limited liability company	58.3 %
4	*Activity*	Services	36.1 %
		Mostly services	13.9 %
5	*Enterprise size*	Micro enterprise	44.4 %
		Entrepreneur	33.3 %
6	*Enterprise life cycle*	Climbing phase	52.8 %

Table 4: Statistical data about the number of employees in the enterprise

Scale variables	Mean (M)	Std. Deviation (SD)
The number of enterprise employees	*11.34*	*18.15*

The experiences and recommendations on theoretical knowledge of entrepreneurial ventures and the establishment of enterprises, according to the sample of young entrepreneurs of Serbia, are given in Table 5. It can be seen that, since high school, they got and they expect that other young people should also be taught discipline and work habits – which is, as one of the three most important areas of high school education, from comprehensive list of authorities, elected by 39% respondents. The following are general knowledge/culture (25%), ICT (25%), and then the knowledge of the business and others; that indicates further that of the (compulsory) high school practices they get exploring business (18%) and manufacturing/service process (15%), learning about the proper attitude toward customers/clients (13%) and others. Young people are recommended a gradual entry into professional life - through the general living and scientific knowledge and through practice that introduces them to the basic flow - when it comes to high school education.

Table 5: Relevant entrepreneurial knowledge types and practice

N°	Frequencies of respondents' answers		Percentage
1	*Important secondary school knowledge for entrepreneurship*	Discipline and work habits	39 %
		General Knowledge (from general culture)	25 %
		Information and communication technology	25 %
2	*The most useful knowledge from Secondary school practice*	Exploring business process	18 %
		Exploring of production / service process	15 %
		Exploring customer/buyer relationship	13 %
3	*Important academic knowledge for entrepreneurship*	Marketing and sales	27%
		Finance and Accounting	24%
4	*The most useful knowledge from faculty practice*	Verification of theoretical knowledge	21%
		Exploring the own preferences	12 %
		Exploring the business process	12 %
5	*The most important entrepreneurial know-ledge and skills after starting business phase*	Operations management (operations and reso- urces in manufacturing and service delivery)	64 %
		Human resources	50 %

From University institutions, in the start-up phase of entrepreneurial ventures, mostly appreciate and expect from youth (Table 5), training (theoretical knowledge) to engage in marketing (27%) and finance (24%), while from the practice in Universities, as most important, they recognize and expect for young people: the verification of theoretical knowledge (21%), Introduction to their own preferences/interests (12%) and Introduction to business processes (12%). When a company exists, young entrepreneurs realize that the competitiveness of the work depends on the knowledge and skills in all positions, but expect the competence to manage the operational function, operations management and resources management in producing and servicing (64%), followed by the Human Resource Management (50%), and by the other functions.

Table 6: Respondent opinions about knowledge of entrepreneurship

N°	Frequencies of respondents' answers		Percentage
1	*Entrepreneurship in teaching programs of primary and secondary schools*	Yes	91.2 %
2	*Method of education for entrepreneurship*	School + Practice	22.9 %
		School + Practice + Media+ Different informal ways of education + Entrepreneurial culture in society	37.1 %
3	*The most important entrepreneurial knowledge and skills in starting a business*	Identifying business opportunities	64%
		Creating a business plan	50%
		Recognition / generate business ideas	42%
		Determining market potential of entrepreneurial ideas (planning and price range)	42%
		Providing money for the founding costs	33%
		Planning of providing staff	31%
4	*Is there a need for training of future entrepreneurs?*	Yes	94.4%
		No	5.6%
5	*The cooperation with young entrepreneurs will be useful for future entrepreneurs*	Yes	97.2%
		No	2.8%

The idea of introducing the subject Entrepreneurship in primary and high schools (Table 6), respondents support (91.2%), where as a method of education for entrepreneurship they choose combination of "School+ Practice+Media+Various informal methods of education" (37.1%); the first variant is the next "School+ Practice" (22.9%). When they were asked about the most important entrepreneurial knowledge and skills for starting to work, they choose (Table 6): Business opportunities identification (64%), Preparation of the business plan (or, at least, Co-operation in preparation…) (50%), Recognition/generating entrepreneurial ideas (42%), Determination of market potential of entrepreneurial ideas (42%), Providing money for the founding costs (33%), Planning security staff (31%) and the other - in descending order. For the family support in preparing future entrepreneurs "voted" 94.4% of respondents, and that the help of young entrepreneurs for future entrepreneurs is welcome agreed 97.2% of respondents.

Table 7: The attributes structure of the survey sample about motives for entrepreneurship

N°	Categorical variables about motives for entrepreneurship		Percentage
1	*Motives for entering entrepreneurship*	Realization / Approving own ideas	44%
		Inheritance (preservation of family tradition)	31%
		Self-employment	28%
		Earnings / Money	19%
2	*Do you have any role models while you are engaging in entrepreneurship?*	Yes	82.4%
		Successful entrepreneurs	47%
		Family members	39%
3	*How entrepreneur in your surrounding motivates you*	Motivated me to start discovering business opportunities and ways to use them	50%
		Aroused my interest in business, economicy activities, ractice	33,3%
4	*Do you think that young people should be involved in entrepreneurship?*	Yes	97.2%
		No	2.8 %
5	*If the previous answer is YES, tell the right time for it?*	During studies (20-25 years)	33.2%
		During high school (16-20 years)	27.1%
		After studies (25-30 years)	21.3%
6	*Do you think that young people should be motivated to entrepreneurship?*	Yes	100 %
7	*If the previous answer is YES, tell the right time for it?*	During high school (16-20 years)	52.9%
		During his studies (20-25 years)	32.3%
8	*What can motivate young people for entrepreneurship?*	Independence (in work and / or living by their own	53%
		Earning (money)	50%
		Gaining experience / Skills / Competencies	36%
		Companionship (expanding circle of acquaintances, enrichment intelligence ...)	36%
9	*What do you consider as the reasons for their entrepreneur dissatisfaction of their enterprise / company?*	Lack of support / help	30%
		Low profits	25%
		Lack of preparedness / capability	25%

Talking about their own experiences/characteristics, respondents from the sample represent the status of youth entrepreneurship in Serbia; their attitudes provides arguments for the design of educational programs (and theoretical and in practice) for the introduction of entrepreneurship into the new generation of young people (not only Serbia). The possible use of information about the experiences and attitudes of the respondents (the theoretical training and on the practice) is to generate/design programs prepare young people for the introduction of the entrepreneurship confirms individual hypotheses H(1;1) - the theoretical knowledge and H(1;2) - Education through practice. This might suggest that it is certified by the hypothesis H(1) – the possibility of obtaining data for future programs for preparing youth to enter entrepreneurship.

In order to test the H(2) - the young entrepreneurs from Serbia we can get arguments about the motives and motivation for entrepreneurship, useful in planning/designing programs to prepare young people - future entrepreneurs, some questions were asked and some answers were received - shown in Table 7. From there, we can see that young people are mostly motivated to achieve/prove their own ideas (44%), and (in Serbia in 2016!) to preserve the family tradition (31%) and more. They have "entrepreneurial idols" (82.4%), and most often successful entrepreneurs (47%) and family members (39%). The environment motivates the discovery of business opportunities and ways to take advantage of those (50%) and arouses interest in jobs, economic activities and practices (33.3%). They find that young people should be involved in entrepreneurship (97.2%) during the study (33.3%) high school (27.1%) and business doing (21.3%). Everybody (100%) agrees that young people should be motivated for Entrepreneurship: During high school (52.9%), during the studies (32.3%), but also in other age groups. The most successful "tools for motivating" consider: autonomy (53%), earnings/cash (50%), gaining experience/knowledge/competence (36%) and socializing (26%). They warn to the danger of discouraging (the reasons for their dissatisfaction entrepreneur's venture/enterprise), which stand out: lack of support/assistance (30%), lack of preparedness/ capability (25%) for entrepreneurship (and management - in the later stages of the development of entrepreneurial ventures) and low profit (25%).

Based on the results (Table 7), it is possible to recognize and use the arguments for designing programs to encourage young people to get involved in entrepreneurship - in terms of their motivation in ways that they consider most suitable or the most appropriate. In this regard, the hypothesis H(2) can be considered as proven.

As hypotheses H(1) and H(2) are established, the general hypothesis H(0) can be regarded as proven.

4. ARGUMENTS FOR DESIGNING A PROGRAMME FOR ENCOURAGING THE YOUNG TOWARDS EMBARKING ON THE ENTREPRENEURIAL PATH

Concluding on the basis of the provided answers (to the research questionnaire described in the above text), the general hypothesis H(0) was proven. However, as only Practise can be considered the highest form of criterion when it comes to truth, we point out some examples of the application of the developed arguments from the given research for designing and constructing the Programme for encouraging the young (in Serbia) towards entrepreneurship; this, in a practical sense, proves the hypothesis H(0).

As was claimed, it is possible to quote (only some of) the facts and recommendations for the Programme (meta-programme):

1. The young should be enabled entry into the world of entrepreneurship through the development of their competencies (knowledge and skills);
2. Entrepreneurial knowledge to be transferred using both theory and practise (through developing skills and gaining experience);
3. Family and the environment play a significant role in the fostering of and enabling one for the entrepreneurial approach;
4. The young expect the entire society (the State, enterprise, media) to be supportive of entrepreneurship...

In addition to this, every one of the stakeholders could specify their own elements of his Programme. Below are given some examples of the programme elements they might generate:

The State: on the level of the State it would be possible to (as expressed by the entrepreneurs who completed the questionnaire):

1. Create a National programme for the creation of the "entrepreneurial climate" (promotion and support of entrepreneurship);

2. Ensure a well planned-out, affordable support for SMEs, lasting the entire life cycle and support for entrepreneurs;
3. Use the media at the State level (public media, Internet, distance learning tools etc.) for affordable dissemination of new and relevant knowledge to the SME and Entrepreneur sectors (SMEE);
4. Create a network of local centers for the support of SMEE – in which they could meet and exchange experiences;
5. Create opportunities for young entrepreneurs to work with potential entrepreneurs ("peer support")(Table 6, Point 4: "Yes" was the response by 97.2% of the questionnaire participants!), creating opportunities for work and success;
6. Create and make publically available the long term plans (and strategic) development of the State – as an orientation guide for entrepreneurs;
7. All the participants agree that the youth need to be motivated towards entrepreneurship (T7, P6)...

The Ministry of Culture: Since culture is, according to the "Metamanagement" concept (Omerbegović-Bijelović, 1998), seen as the highest form of management, it is hereby given some very important tasks:

1. The promotion of the entrepreneurial culture, of work and the responsibility for one's own position in society (T7, P2);
2. The awakening of the interest of the young for work, commerce and practise... (T7, P3);
3. To show entrepreneurship in the context of becoming self reliant, freedom of choice, gaining competencies (experience and knowledge), socialising (meeting others, enriching one's intelligence...) – according to (T7, P8);
4. To inform the young about the latest scientific findings and their implementation (T7, P3)...

The Ministry of Education: Since this ministry is in charge, together with the Ministry of youth and sports, of solving the problems of the youths, there are numerous possibilities for them to be involved with the promotion and support of entrepreneurship:

1. In the educational programmes – include curriculum for entrepreneurship – for all ages (from kindergarten to post doctoral studies) – according to (T6, P1), (T6, P5), (T5, Ps1,3,5...);
2. The theoretical education programmes for entrepreneurship should be made relevant to the age of the students, the overall climate, local communities, culture... (which can be seen in several Tables: 1, 5, 6, 7);
3. Entrepreneurship is also learned through school practise (dual education) with the proviso that it should be planned out (with a clear task for the student and with mentors in both the institution doing the teaching and the insitution in which the pratical experience takes place) – on which there is more information in both the tables and the original data;
4. From the exhibited tables it can be seen that there are different areas of knowledge which needs to be taught to the young – depending on their age and life cycle phase of their company (it is interesting that, after the very first steps in entrepreneurship, the educational needs tend to focus on specific work related functions: operations (64%), human resources management (50%) etc. (T5, P5);
5. In the knowledge of entrepreneurship different themes have a different level of importance (hence "recognising the business opportinuty" was seen as paramount by 64% of the participants, according to T6, Ps2-9...

Media: They could (if they are at all entrepreneurial themselves and able to recognise a business opportinuty) to aid greatly the promoting of entrepreneurship nad entrepreneurial culture, either on their own or networked with other stakeholders of encouraging the young towards entrepreneurship in many ways:

1. By developing entrepreneurship induction programmes (for primary and secondary school pupils, for students and for already proven entrepreneurs), by following entrepreneurial undertakings... (T6, P6);
2. Together with the ministries of education, work, commerce and culture, they could help the spread of the entrepreneurial culture (and every other culture worth promoting) as well as pointing out the successful examples and lessons to be learnt from entrepreneurs who were less so, as well as spreading the knowledge and the drive to learn and work;
3. They could accept and maintain programmes (of life-long) long distance learning in the area of entrepreneurship – thus ensuring their own relevance, interactivity and availability...

Parents: The owners of the companies can also draw conclusions from the conducted reasearch and the available take, which would enable them to:

1. Prepare their own successors (in family run businesses), especially bearing in mind the fact that the young in Serbia care deeply about family tradition (Tab. 7, P 1,2);

2. Define the contents and the ways of preparing the young through a combination of environment programmes and "family programmes";
3. Ensure the survival of the family business by directing the creativity and enthusiams of their heirs and successors towards the areas which are of significance to the family business;
4. Find areas of entrepreneurship which are compatible with the personality of the (future) family business heirs...

The remaining stakeholders in encouraging the young towards entrepreneurship have their own (and/or common) "packages of specific programme recommendations, which are deliberately left out here (for space and scope reasons).

The above examples, again – in practise, confirm the general hypothesis H(0).

5. CONCLUSION

This paper has pointed out the possibility of solving the problem of youth unemployment (not only in Serbia!) by way of encouriging those youths towards entrepreneurship. It has been shown that today's young entrepreneurs (with their experience and their views) can contribute towards a better understanding of the needs of the young for entrepreneurial competencies (for theory/knowledge and experience/skills), as well as towards better understanding the motivation which drives the young towards entrepreneurship in the first place. We have also shown the dynamic of the above needs (eg. According to the life cycle phases of the entrepreneurial undertakings, but also according to the age of the „entrepreneurial candidate").

We have also pointed out the different stakeholders of entrepreneurship culture spread, as well as the possibility for tchem to apply a Programme (a meta-programme) for encouraging the young to become entrepreneurs; we also make a suggestion that in the proces they further complete it by generating their own, specific, stakeholder requirement programmes – according to their own interests and circumstances. On the examples of some of the arguments for creating stakeholder programmes, it was shown that the experience and views of the young entrepreneurs (participants in the reasearch conducted) are useful in defining the programmes and encouraging the young (in Serbia) towards entrepreneurship, by which the general hypothesis H(0) was confirmed in practise.

Naturally, the research resulted in many more and a much wider number of insights (applicable in practise), outside the purview of this paper, of which – for the sake of illustration – only a choice was presented (the authors hope: enough to be understood and perhaps even adopted). (The remaining data and ideas - will have to wait for another opportunity).

Decades of experience warn that this paper could, despite all its usability (and possibly even significance and modern day relevance), end up as merely „letters on a page". Those of us who – in Serbia – dwell in academia and research, still yearn for an environment where every kernel of knowledge will be greeted with enthusiasm (if only because it has been discovered marginally earlier than one's competition) and an eagerness to be put into practise, to enable even a small increase in competativeness, of life, of progress. It is beatiful, and also sad at times, to be a scientist – if there is no-one to understand and apply that science.

Abstract: *Key research objectives of the study were to empirically test how the independent constructs representing entrepreneur's creative abilities are connected to the construct of company's growth and to develop and empirically test a structural model linking these constructs. A two-country survey was made on a sample of entrepreneurs from Slovenia and USA. Findings showed that the entrepreneur's creative abilities are positively related to company's growth. Results of this study can be used both for further research and in practice.*

Keywords*: creativity, company growth, HRM, SEM, entrepreneurship.*

1. INTRODUCTION

Entrepreneurs are creative at work because they are expected or required to be (Unsworth, Wall and Carter, 2005; Antonio, Lanawati,Wiriana,&Christina, 2014).Bai, Lin and Ping Li (2016) define deliberate creativity as a proactive approach toward the production of novel and useful ideas that address a predicament or opportunity. Since creativity is a highly complex concept, one approach that has proven effective models creativity as a process (Chen, Chang and Lo, 2015). Entrepreneurs are role models for creativity and then continue to orchestrate opportunities (Albort-Morant, &Oghazi, 2016) for novel and unexpected behaviours (Jaussi and Dionne, 2003), which makes them successful (Tee Suan Chin, Raman, Ai Yeow, &Cyril Ezea, 2012). Entrepreneurs are a driving force (Ismail, 2014) by creating possibilities (Hjorth, & Holt, 2016), which gives them a leading role in economic development worldwide (De Vitaa, Mari, &Poggesi, 2014).

Our approach builds on the Basadur approach (2004) of creative problem solving and recognizes entrepreneur's creativity as a continuous, circular process, beginning with problem finding, followed by problem conceptualization, problem solving, and solution implementation, which is especially present when it comes to entrepreneurs (Baron, & Tang, 2011). The creative process is a creative cognitive processing of problems which consists of analysing and articulating the exact nature of the problem to be solved, preparing to solve the problem by gathering information and improving required skills, generating ideas for solving the problem, testing the chosen solution, and communicating the solution to others (Amabile and Mueller, 2008). Byrege and Tang (2015) even propose creativity training.

Creativity can be seen as generation of new ideas and innovation as commercialization of new ideas (Harris, 2009, Basadur, 2004), which fosters an entrepreneurial culture (Edwards-Schachter, García-Granero, Sánchez-Barrioluengo, Quesada-Pineda, & Amara, 2015) and therefore we can expect, that it leads to company's growth. For the purpose of this paper, we use the definition of creativity as a process (Basadur, 2004) that involves continuously finding and solving problems and implementing new solutions.

2. THEORETICAL REVIEW

2.1. Entrepreneur's creative abilities

Entrepreneurs are confronted with high uncertainty, which means more ill-defined and ambiguous problems that are characterized by multiple possible goals and multiple ways of solving the problem; also in the function of intermediation (Peng, Lee, & Hong, 2014). Creativity involves the generation of novel and useful ideas (Sarooghi, Libaers, & Burkemper, 2015) and entrepreneurial minds for continuous improvement (Kabukcu, 2015).The creative problem solver first constructs the problem to be solved, therefore, problem finding (Basadur, 2004) or problem construction or problem definition is the first step in the creative process (Basadur, Runco and Vega, 2000; Lubart, 2001). The way the problem is constructed has an impact on solution generation (Adelman, Gualtieri and Stanford, 1995) and is related to the quality and originality of

solutions to real-life problems (Reiter-Palmon, Mumford and Threlfall, 1998). Cognitive processes associated with creativity are central to the generation of creative output (Reiter-Palmon and Illies, 2004). Problem finding activity is intended to enable people to think in innovative ways, since discovered problems are more likely to be solved creatively than presented problems, and problem discovery itself is an important part of creativity.

After problem-finding activities are finished, a diverse and large amount of information has to be gathered and integrated. Problem solving integrates the thinking and behaviour we engage in to obtain the desired outcome we seek (Treffinger, Selby and Isaksen, 2008). Two main processes are used in problem solving activity: (1) search and collection of existing concepts and (2) the creation of new concepts through the connection and modification of existing concepts (Reiter-Palmon and Illies, 2004).

The utility of convergent and divergent thinking styles (Ashton-James and Chartrand, 2009) varies with social demands. Convergent thinking facilitates collaboration and coordination (Bahar and Hansell, 2000) while divergent thinking facilitates improvisation and innovation (Nemeth and Goncalo, 2005). Butler and Scherer (1997) found that the largest number of solutions are generated when goals are presented sequentially, one at a time to the problem solver and the highest quality solutions are generated when two conflicting goals are presented simultaneously to the problem solver.

Processes involved at the last phases have gained less attention than processes involved early in the creative cycle (Mumford, 2001). Solution implementation activity involves mainly persuasion and social skills (Reiter-Pulmon and Illies, 2004) and is subject to criticism, which involves fear of failure and the unknown. Creative solution implementation is supported by domain-relevant skills (knowledge and expertise), creativity-relevant skills and task motivation (Amabile, 1997). Elements of the work environment affect individual creativity by influencing expertise, task motivation, and creative skills (Amabile, 1997). Some (Chen, Chang, &Lee, 2015) even use the term creative entrepreneurs.

2.2. Company's growth

Since Lee (2010) argued that recently the study of the patterns and determinants of company's growth has re-emerged as one of the key research topics on firm dynamics in industrial economics (Sleuwaegen, & Boiardi, 2014) and management strategy this paper focused on the relations between the entrepreneur's creative abilities and company's growth. There exists also a term growth companies for those companies that generate significate positive flows, which increase faster than the overall economy (Growth Company Definition | Investopedia, 2016) and other companies.

When analysing company's growth, a common starting point is to specify a company's growth model that considers the impact of the size and age of the firm (Cucculelli & Ermini, 2012). Current study extends this area of research with following variables: average annual growth in number of employees in last three years; average annual growth in sales in last three years; and growth in market share in last three years. Companies must achieve sustainable growth (Sidik, 2012).

3. RESEARCH METHODOLOGY

3.1. Hypothesis

Creativity is a significant determinant of growth in modern economies (Sokol, Gozdek, Figurska, & Blaskova, 2015); based on this and on written above, we formulated three hypotheses to determine relations between the proposed constructs in the proposed model.

H1: Problem finding activity is positively related to company's growth.
H2: Problem solving activity is positively related to company's growth.
H3: Solution implementation activity is positively related to company's growth.

At the beginning of the next chapter, we present the data gathering process and the sample properties and thereafter continue with the results of current study, which we later on discuss and interpret.

3.2. Research setting and participants

For the purpose of this research the surveys were made available to entrepreneurs (i.e. founders or owners who participated in the start-up process of their company) from Slovenia and the USA. For the Slovenian

sample, the survey was administered in the Slovenian language, for the USA sample the survey was administered in English. The primary form of the questionnaire was in English language and translated for the Slovenian sample.
Emails with a link to the survey and a specific token for each respondent were sent to 4,000 entrepreneurs in Slovenia and to 5,000 entrepreneurs in the USA. Email addresses and addresses were selected randomly from public registers in both countries. Before completing surveys, entrepreneurs were assured that all answers provided would be kept anonymous. The survey included measures of entrepreneur's creative abilities and company's growth. Of the 331 questionnaires that were returned online, all were fulfilled fully because entrepreneurs could not continue on the next site of online survey if not all questions have been answered. At the beginning of the survey entrepreneurs had to select their gender, age and the country they reside in. The sample consisted of 237 (71.6%) male and 93 (28.1%) female respondents (one person did not declare about gender, as it was possible not to provide an answer in that particular question). The average age of the respondents was 46.51 years. 158(47.73%) of the respondents came from Slovenia and173 (52.27%) from the USA. Entrepreneurs' level of education is presented in Table 1.

Table 1: Sample structure by level of education

	Frequency	Percent
High school	4	1,2
High school graduate	9	2,7
College	33	10,0
Associate`s degree	71	21,5
Bachelor`s degree	60	18,1
Master`s degree	59	17,8
Doctoral degree	33	10,0
Professional degree	48	14,5
Other	14	4,2
Total	331	100,0

In addition, entrepreneurs also had to indicate if they are the founder or co-founder (Table 2) of the firm to where the survey had been send, and if they own such a firm (Table 3).

Table 2: Is the respondent a founder or co-founder of the company where the survey was sent?

	Frequency	Percent
Yes	231	69,8
No	100	30,2
Total	331	100,0

Table 3: Is the respondent owner in the company where the survey was sent?

	Frequency	Percent
Yes	254	76,7
No	77	23,3
Total	331	100,0

Further on we present the sample structure in regard to the respondents' companies by sector (Table 4).

Table 4: Sample structure in regard to the respondents' companies by sector

	Frequency	Percent
Banking, investment, insurance	29	8,8
Manufacturing industrial goods	31	9,4
Retail or wholesale trade	36	10,9
Construction	38	11,5
Engineering, research and development	17	5,1
Transportation or public utilities	9	2,7
Consumer services	25	7,6
Mining, extraction, oil	7	2,1
Tourism	21	6,3
Manufacturing consumer goods	12	3,6
Management consulting & business services	41	12,4
Other	65	19,6
Total	331	100,0

4. RESULTS

Combined analysis was performed for Slovenia and USA, because Slovenia and USA are relatively developed countries, with relatively high GDP, relatively low unemployment rate, with developed infrastructure, free market, peaceful development over decades, and high added value per employee.

The statistics for the variables included was conducted for both, the Slovenian sample and the US sample together and is presented in Table 5. The variables were divided into four researched constructs: problem finding, problem solving, implementing new solutions and company's growth.

Table 5: Statistics for the variables included in research (Slovenia and USA)

	Variable name	Mean	Median	Mode	Std. Dev.
Problem finding activity					
I can say that I like to "jump" into a new problem, without any previous analysing.	Q6a	3,31	3,00	4	,987
I am very fond of in circumstances where it is always full of changes.	Q6b	3,52	4,00	4	,871
Problem solving activity					
The best solutions come when I am working with others or when we talk about solutions.	Q6c	3,68	4,00	4	,941
I solve more tasks, if I work in a team.	Q6d	3,61	4,00	4	,989
Solution implementation activity					
My proposals for the solution of work problems are routinely translated into action.	Q6g	3,62	4,00	4	,809
I like to carry out experiments in practice - in the real world, i.e. the "business world".	Q6h	3,74	4,00	4	,831
In my work, I devote a lot of my time to improving work practices.	Q6i	3,66	4,00	4	,870

Company's Growth					
Average annual growth in number of employees in last three years	Q14	2,50	2,00	2	1,400
Average annual growth in sales in last three years	Q15	2,53	2,00	1	1,436
Growth in market share in last three years	Q16	2,75	3,00	2	1,147

In continuation, we present a method to test the model by applying structural equation modelling. That operation was made by building a model in Lisrel Student Edition 9.20, which is an analytical statistics program. For Slovenia and USA, the standardized solutions of the model are presented in Figure 1 and the T-test values in Figure 2.

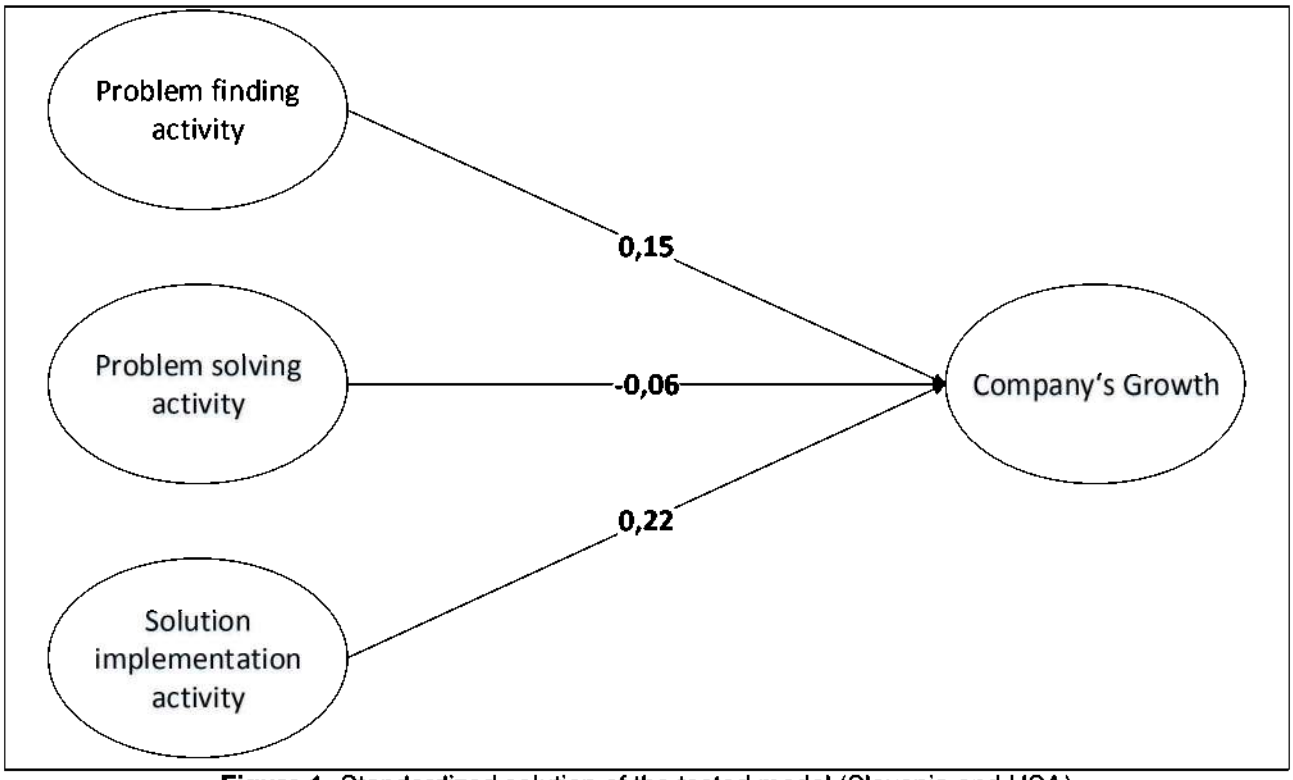

Figure 1: Standardized solution of the tested model (Slovenia and USA)

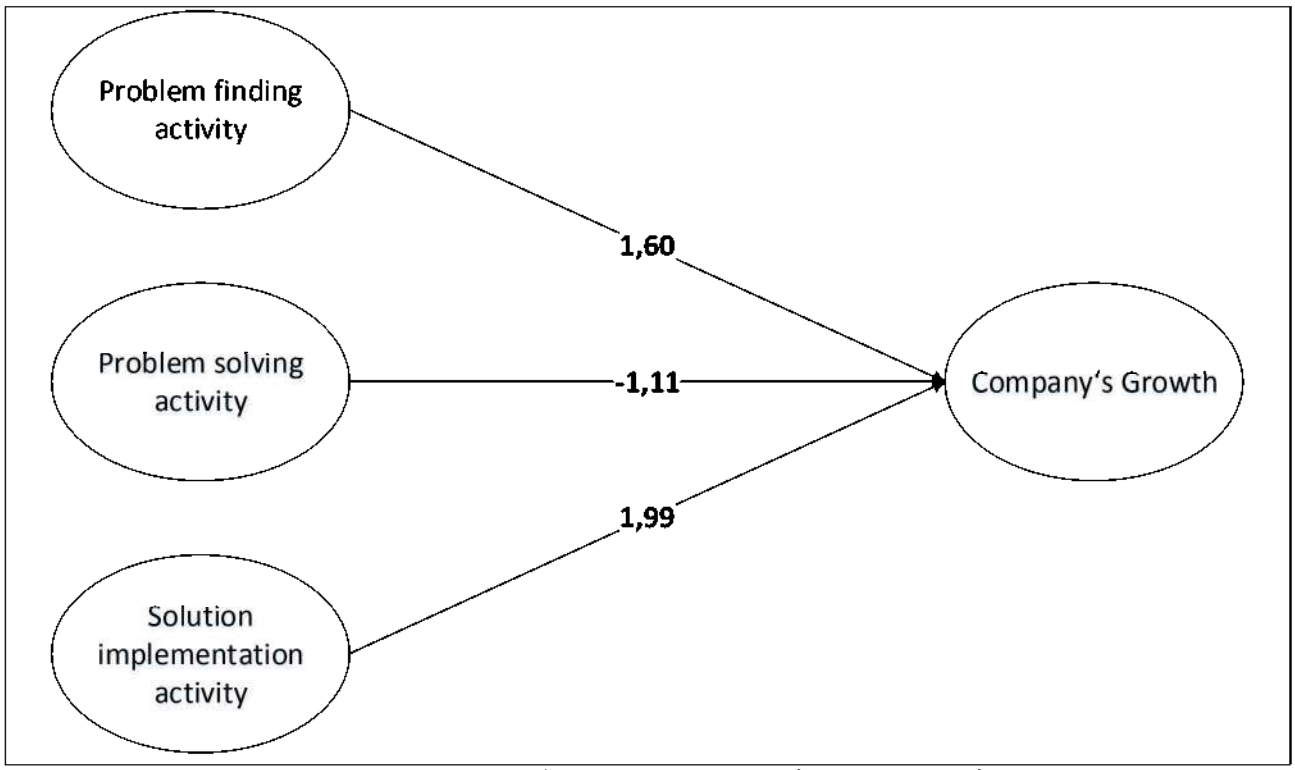

Figure 2: T-values for the tested model (Slovenia and USA)

5. DISCUSSION

Our research intended to test the structural relations between entrepreneur's creative abilities and company's growth from the viewpoint of entrepreneurs. Our main aim was to test three hypotheses. Therefore, we launched the diagrams and presented the course of the research model, which tested these relations (Figure 1). The standardized coefficient values are presented in Figure 1, and the t-test values in Figure 2. We used a combination of exploratory and confirmatory methods with the goal to develop a model, which complemented theoretical predisposition and fit the data.

The fit indices of the structural model (Figure 1) present a good model fit for developed countries (Slovenia and USA), which is indicated by the values of $\chi 2/df = 2.602$ and RMSEA=0.070, NFI = 0.900, CFI = 0.935, SRMR = 0.0689, GFI = 0.957. With defined hypotheses we wanted to test the relations between the constructs in this model; one of three shows a statistical significance according to the t-test values whereas the whole model shows statistical significance of P-value=0.00001.

As seen from Figure 1 in developed countries (Slovenia and USA) higher level of entrepreneur's creative abilities is positively related to company's growth, whereas we cannot confirm that with statistical significance regarding the relations between the problem finding activity and company's growth (H1) and problem solving activity and company's growth (H2) and we can confirm with statistical significance the positive relation between the solution implementation activity and company's growth (H3); the influence is low to moderate (0.22), positive and statistically significant (**t=1.99**).

6. CONCLUSION

Entrepreneurs that are more creative (Bredvold, &Skålén, 2016) are also more capable of evaluating solutions and identifying the most creative solutions (Basadur, Runco and Vega, 2000). Company's growth is what all companies strive for. Entrepreneur's creative abilities are therefore important determinants of company growth; as shown, entrepreneur's creative abilities lead to company's growth (Groza, Locander, & Howlett, 2016), which is why we must enrich entrepreneur's creative processes (Sigala, & Chalkiti, 2015). Creativity is simply a requirement in today's competitive market (Sönmez, 2013). According to this research, entrepreneur's creative abilities are definitely a promising research field and it needs to be taken into consideration. The question that comes to mind instantly is on how entrepreneurs can implement these results in practice. Combining the different but intertwined constructs gives us better insights and enables

practitioners to further improve their efficiency, effectiveness and their chances for success in the real world and tough world of entrepreneurial ventures.

There is an increasing tendency for government policy to promote entrepreneurship for its apparent economic benefit (O'Connor, 2013; Marič, Jeraj and Pavlin, 2009); development of entrepreneurship can present possible model for decreasing unemployment rate (Čudanov, Jaško and Săvoiu, 2012). Based on that knowledge, the same effort should be invest to the scientific research related to this field. Entrepreneurship should be presented not only as an alternative but also mainly as the first choice of professional engagement in order to make it more accessible and rewarding.

Several limitations of this study need to be considered before interpretations of the results can be explored. First; the discussed findings and implications were obtained from a single study; generalizing the results should be done with caution. The fact that the research was conducted in USA and Slovenia where economy is based mostly on private ownership and freedom of entrepreneurial initiative. In these two countries, the main restraint for entrepreneurial activity is financial capital beside the entrepreneurial inspiration. Second; the whole research was focused mostly on how entrepreneurs creative abilities influence company's growth, whereas other determinants were not considered.As mentioned entrepreneur's creative abilities are not the only determinants of company's growth, therefore we can only propose that entrepreneur's creative abilities in part affect company's growth whereas there are also other factors involved in the process of success. It also does not mean that creative entrepreneurs succeed with their ideas (Gicheva, & Link, 2015).

For further research, we suggest investigating the effects of the determinants omitted or to put in other words not included in our study. These determinants could be divided into those influencing company's growth besides entrepreneur's creative abilities such as situational and other attributive determinants.

Abstract:*This paper presents a studyof entrepreneurship with the focus on female entrepreneurship, its main challenges and the impact of gender inequality. So called gender gap in entrepreneurship is present in almost every country and there are no signs that the situation is going to change. In order to achieve equality for women compared to men and to prove the potential of these women, it is necessary to join forces much broader than one country. The aim of this paper is to show that in spiteof many barriers which women are facing, there is a great unlocked potential of self-employed women. Examples from Serbia and abroad were analyzed as part of monitoring progress in this areas.*

Keywords*: entrepreneurship, female entrepreneurship, gender gap, self-employment, empowering women*

1. INTRODUCTION

Female entrepreneur may be defined as a woman or group of women who initiate, organize, and run a business enterprise. Women enter entrepreneurship due to economic factors which pushed them to be on their own and urge them to do something independently.We see a lot of women professionals in engineering, medicine, law etc. They are also setting up hospitals, training centers, etc. Women entrepreneurs are risk bearers, organizers and innovators too. (Sharma, 2013)

Female entrepreneurship needs to be studied separately for two main reasons. The first reason is that female entrepreneurship has been recognized during the last decade as an important untapped source of economic growth. Women entrepreneurs create new jobs for themselves and others and by being different also provide society with different solutions to management, organisation and business problems as well as to the exploitation of entrepreneurial opportunities. However, they still represent a minority of all entrepreneurs. Thus there exists a market failure discriminating against women"s possibility to become entrepreneurs and their possibility to become successful entrepreneurs. This market failure needs to be addressed by policy makers so that the economic potential of this group can be fully utilized.(OECD, 2004)

The purpose of this paper is to prove that female entrepreneurs are really recognized as big part of economy and economic growth, but in spite of that there is still big gender gap when it comes to entrepreneurship and the only way to make that gap smaller is to encourage female entrepreneurship all over the globe and keep the percent of self-employed women raising. Also, research on distribution of self-employed women across industrieswill be presented in this paper.

2. ENTREPRENEURSHIP

The business literature differentiates entrepreneurs from business people by including statements such as: entrepreneurs “create needs”; while business people “satisfy needs”.(Kelley, Bosma, & Amorὸs, 2011) Entrepreneurs are conceptualized as individuals who see the world differently and envision the future better than others do. They seize opportunities that otherwise would go unnoticed. They perceive and accept risks differently than others. (Abu-Saifan, 2012)Entrepreneurship is the process of designing, launching and running a new business, i.e. a startup company offering a product, process or service.(Yetisen et al., 2015)The entrepreneurial organization is opportunity-focused, without neglecting important problems, it must give priority to the new and innovative.(Drucker, 2015)

List of personal characteristics that make some people better at recognizing business opportunities than others are by (Barringer & Ireland, 2012): 1) Prior experience in an industry (which helps entrepreneurs to recognize business opportunities); 2) Cognitive factors (opportunity recognition may be an innate skill or a cognitive process); 3) Social networks (the extent and depth of an individual"s social network affects opportunity recognition); 4) Creativity (encourages the process of generating novel or useful ideas). No

matter what type of business they're in, no matter their gender, and no matter their age, entrepreneurs of all kinds face challenges in starting and growing companies. Not surprisingly, the types of challenges they face tend to be similar.

3. TYPES OF ENTREPRENEURS

Not all entrepreneurs are the same. The term entrepreneur is used to describe any person launching and managing his or her own business, but in reality there are many different types of entrepreneurs. There are four broad categories of entrepreneurs as (Fisher, 2011) points out: survivalists, lifestyle entrepreneurs, growth entrepreneurs and revolutionaries.

1) Survivalists are in business merely as a means of economic survival. They operate micro enterprises to feed themselves and their families. They create very little long-term wealth in their operation; they are merely keeping the business afloat while living on the profits from one day to the next. Examples of survivalist entrepreneurs can be found all across South Africa – they are the basket sellers on Durban beachfront, the people selling sunglasses on the corner of William Nicol Highway and Republic Road and the person selling Stormers flags outside Newlands Rugby ground.

2) Lifestyle entrepreneurs get into business as a means to a particular lifestyle. Being in business for themselves means that they can live in a certain place, have the freedom to pursue another passion (such as music, sailing, writing) and the autonomy to dictate when they do and don't work. They tend to engage in higher value activities and use more infrastructure compared to survivalists. They therefore usually need to make a larger upfront investment in the business than survivalists but they get better returns. In most cases these people are forgoing the certainty of being an employee in an existing business for the freedom of autonomy and choice that goes with being an entrepreneur. The owner of a thriving guesthouse in Plett, the coffee shop owner who needs time for his music and the local nail parlour owner who wants afternoons off to spend with her kids are all examples of lifestyle entrepreneurs.

3) Growth entrepreneurs are driven by the competitive nature of business. They get into business for themselves to create something of long-term value and they continually seek to make the business bigger and more competitive. They usually need to make a larger investment in the business than lifestyle entrepreneurs, both in terms of upfront capital investment and the time they invest in managing the business as it grows. They often take on more risk than lifestyle entrepreneurs but that risk comes with financial rewards if the business succeeds. The consultant who keeps hiring more associates to service more clients, the media entrepreneur who is continuously launching new products to sell more advertising space and the estate agent who is franchising her operation to facilitate growth are all examples of growth entrepreneurs.

4) Revolutionaries create a business as a means to change the world. They are driven to disrupt and reshape markets. They look to make big bets and if these pay off they usually become famous. Globally, Steve Jobs, Richard Branson and Bill Gates have left indelible marks on the industries they entered. In South Africa, Raymond Ackerman reshaped the retail industry, Adrian Gore disrupted the healthcare sector and Gidon Novick turned domestic airline travel on its head. Such entrepreneurs often need to invest substantial amounts of capital in their businesses to facilitate growth; with that comes high expectation. They are notorious for working hard and for demanding much of those who work for them.

These four kinds of entrepreneurs can be represented in a simple diagram which depicts the investment required and the revenue generated by the different categories of entrepreneurs.

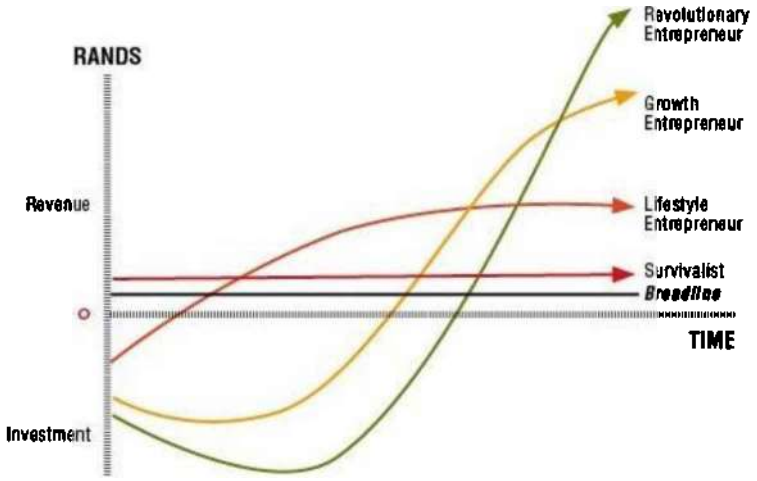

Figure 1: Types of Entrepreneurs (Fisher, 2011)

4. POTENTIAL FOR FEMALE ENTREPRENEURS

Economic development cannot be achieved without active participation of women in all aspects of life. There is consensus among scholars that women can play key role in the entrepreneurial phenomenon.(Revenga & Shetty, 2012) Women entrepreneurs have been designated as the new engines for growth and the rising stars of the economies in developing countries to bring prosperity and welfare. A variety of stakeholders haspointed at them as an important „untapped source" of economic growth and development.(Maria Minniti & Naudé, 2010)The share of women's contribution to the economic and social development depends on the promotion of gender equality and gender blind support from the institutions. Although women constitute about fifty percent of the world population, compared to men, they have less opportunity to control their lives and make decisions. (Revenga & Shetty, 2012)

Women entrepreneurs are self-employed mostly in the services sector which it can be seen in OECD research. About 80% of self-employed women work in the services sector compared to less than 60% for men. In Germany, Israel and the United Kingdom, the share of self-employed women working in the services sector is above 90%.

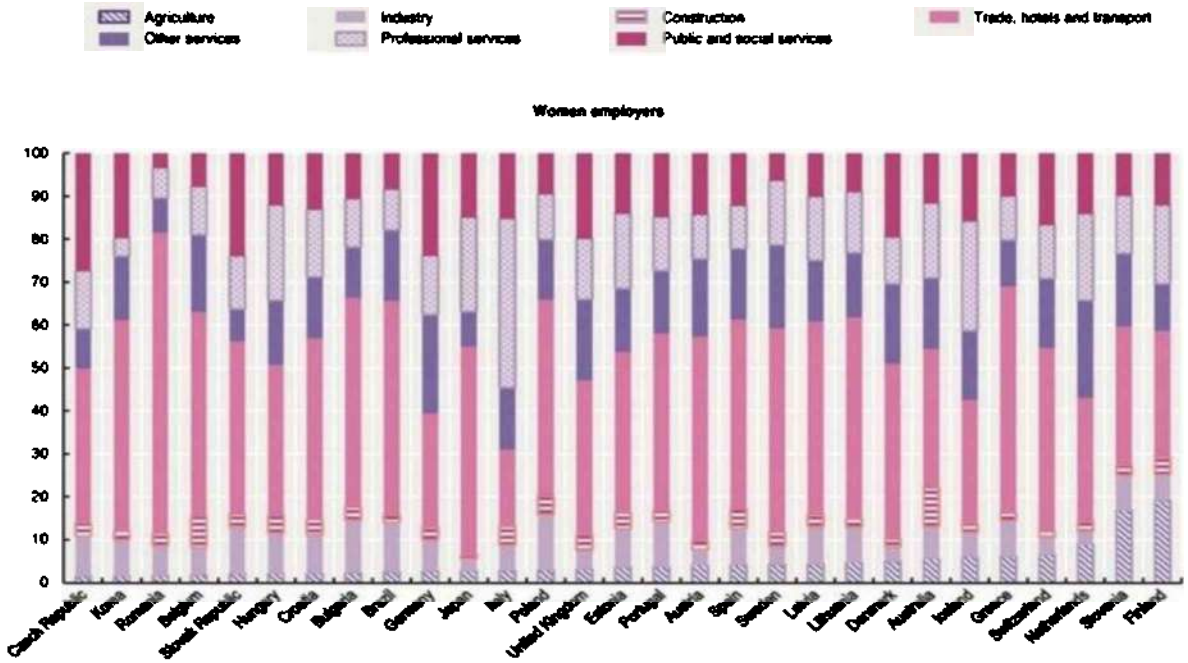

Figure 2: Distribution of self-employed women by sector – Women employers (percentage)(OECD, 2015)

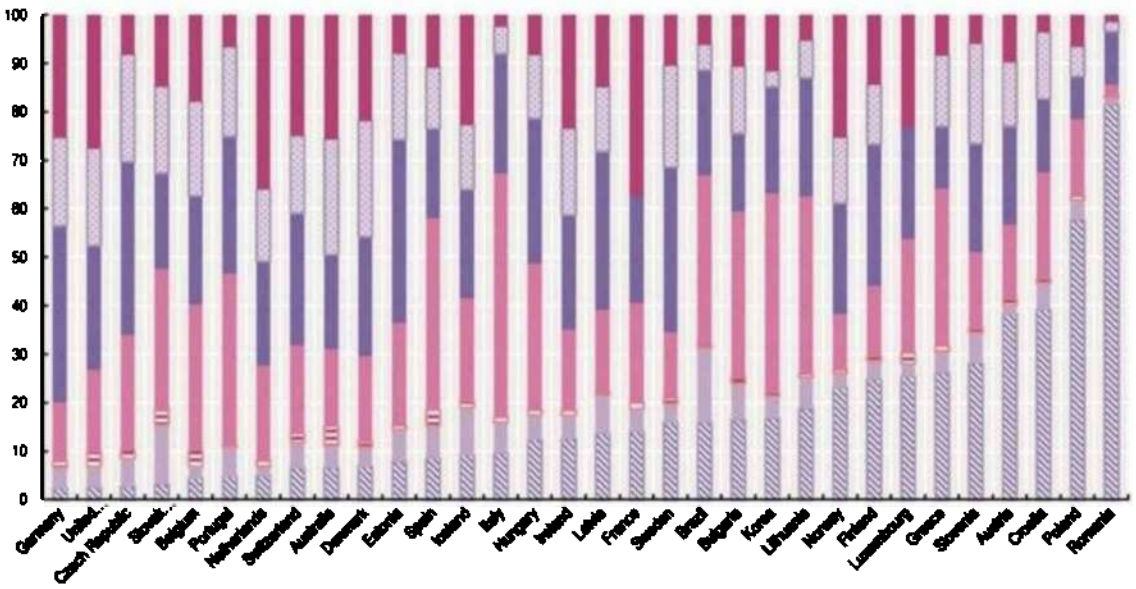

Figure 3: Distribution of self-employed women by sector – Women own account workers (percentage)(OECD, 2015)

Based on population census data agriculture includes agriculture, forestry and fishing; industry includes manufacturing, mining and quarrying, and other industries; trade, hotels and transportation include wholesale and retail trade, transportation and storage, accommodation and food service activities; other services include information and communication, financial and insurance activities, real estate activities and other services; professional services include professional, scientific, technical, administrative and support service activities; public and social services include public administration, defence, education, human health and social work activities. Not all the self-employed are "entrepreneurs". Self-employment statistics include for example, craft-workers and farmers. Care is thus needed in interpreting the data in analyses of entrepreneurship (OECD, 2015). This shows that women find the greatest potential to work in Trade, hotels and transportation sector.

5. DRAWBACKS AND INCENTIVES FOR FEMALE ENTREPRENEURSHIP

Entrepreneurship can be a very rewarding, and yet difficult, path to take. The inherent uncertainty of starting and running a business can be especially daunting for poor women in developing countries.Nonetheless, many do try – a testament that speaks to the intensity of their drive, the allure of economicempowerment, and the strength of their commitment to improving life for themselves and their families, butoften also speaks to the scarcity of employment and other opportunities for many women.For example, property rights in some countries are very weak or poorlyprotected – and worse still for women. Lack of secure knowledge that one can keep what one owns and earnsis a major disincentive to entrepreneurial activity. A nontransparent investment climate or discrimination can discourage women from striking out on their own and make it harder for them to start and maintainbusinesses.Credit, above all, can be hard for women to obtain, and terms can be so unfavorable as to make loanscounterproductive. Some women may be unable to access credit because they may lack a credit history orthe official documentation needed to do business with a formal financial institution, or have no collateral dueto legal or cultural barriers that prevent them from having assets titled in their names.

Most women entrepreneurs need some form of support in developing their businesses. Access to capital isusually the most important need, but mentoring from other businesspeople can convey valuable skills andlessons to the entrepreneurs and can be a valuable source of employee engagement and renewal for the privatesector.There are a number of important ways in which the private sector can support and sustain female entrepreneurs(McKinsey&Co, 2010):

- Extend credit to female entrepreneurs, on terms that recognize the unique challenges and circumstancesfaced by women in developing countries and emerging markets
- Advocate for credit standards, property rights protections, and asset documentation rules thatdo not disadvantage women
- Provide mentoring to women entrepreneurs
- Encourage or create equal opportunities for women entrepreneurs
- Encourage supply chain diversity (e.g., actively seek women-owned enterprises as supply chainparticipants, support women's inclusion in supply chain opportunities).

6. GAP BETWEEN GENDERS

6.1. The phenomenon of inequality between the sexes

The concept of gender describes the socially created roles, norms, behavior, expectations and activities attributed to women and men. Gender equality has been highlighted as one of the eight Millennium Development Goals, and as a key to achieving the other seven goals by(UNFPA, 2013). There is consensus that women can play key role in the entrepreneurial phenomenon. Gender inequality exists in terms of economic development as well as the rates of entrepreneurial activity. There is a significant gender gap in the entrepreneurial activity rate across the world. (Allen, Elam, Langowitz, & Dean, 2008) A GEM (Global Entrepreneurship Monitor) study of 18 economies from 2002 to 2010 suggests that women's entrepreneurial activity is lower than that of their male counterparts at different stages of development.(Kelley et al., 2011) Treating women as the second gender means ignoring and underestimating huge potential human resources. Women entrepreneurs can play crucial roles in the process of economic development if they have equal opportunity and access to resources. In spite of the growing number of female entrepreneurs, the share of female entrepreneurship is still significantly low compared to their participation rate (Minniti & Arenius, 2003). Especially in Less Developed Countries with high female unemployment rate, for some women who need to work at home, entrepreneurship can be a practical solution to earn income and reduce their unemployment rate and poverty (Sarfaraz, Faghih, & Majd, 2014).
GEM Women's Report, 2011 shows that over time, the gender gap between entrepreneurs increased in some countries and decreased in others. Overall, as the economies move to a higher level of development, the rate of entrepreneurial activity decreases, regardless of gender. So, in more developed economies that both men and women have different options for employment, individuals seems to be more interested in having secured jobs rather than starting their own businesses. However, in general, the entrepreneurial gap between women and men decreases with economic development level (Kelley et al. 2011).

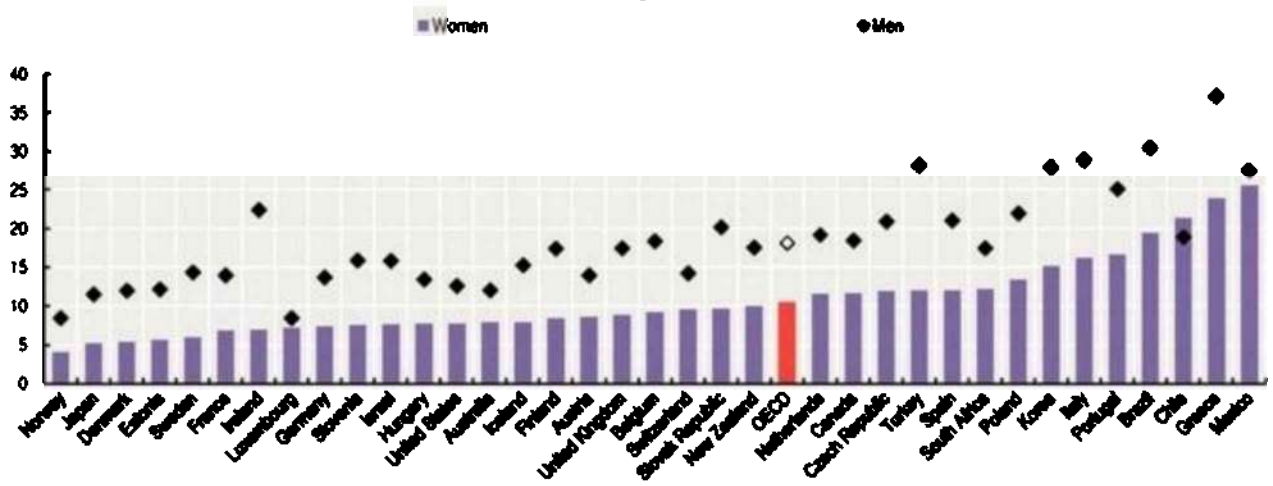

Figure 4: Share of self-employed men and women (OECD, 2015)

6.2 Gap in taking risk

There are inherent risks when choosing to set-up a new business. However, some of these risks, like attaining a satisfactory work-life balance are often more inhibiting for women than for men. In fact, independently of a country's economic context and the overall cultural attitude toward entrepreneurship, women always appear less prone to take the risk of creating their own business than men. The share of men who would rather take a risk and build their own business than work for someone else is larger in virtually all countries, from high income OECD countries to least developed low income economies.

The sentiment of not having the adequate education and finances to be able to create one's own business is one important factor explaining this gender gap. Typically, lower shares of women than men declare having access to training or funding to create or grow a business. Policy initiatives that encourage women's participation in formal and informal training, enlarge or adapt the offer of training courses, and enable their access to suitable funding, including through financial education, should constitute key elements in the promotion of female entrepreneurship(OECD, 2015).

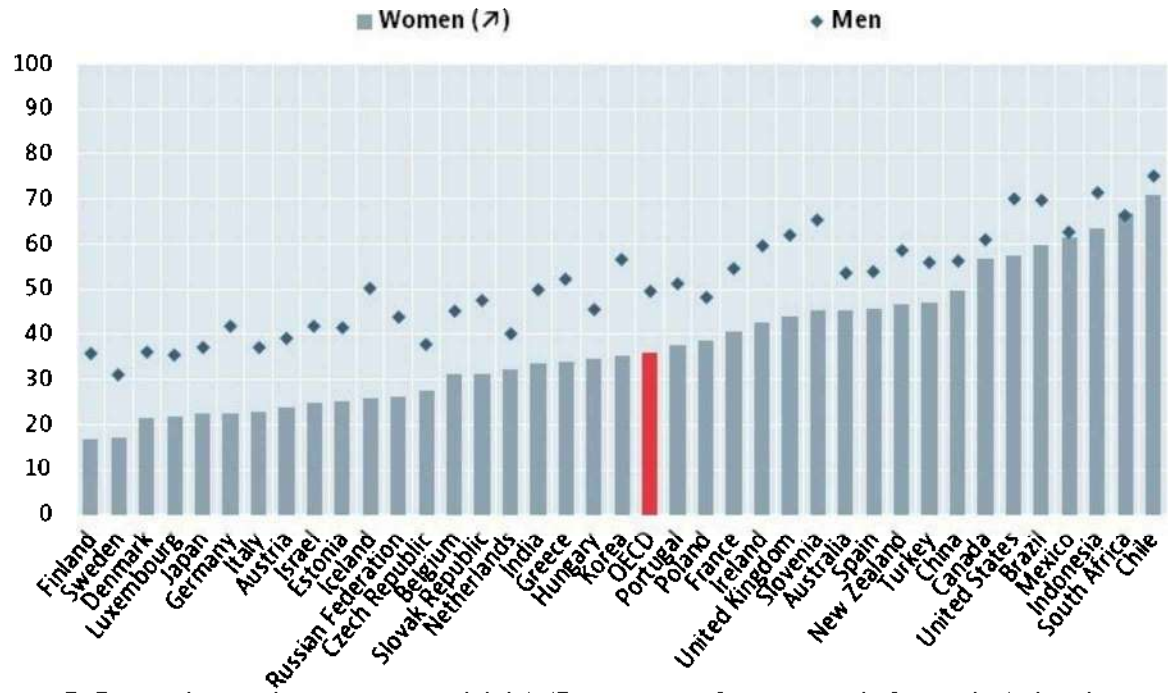

Figure 5: Perception on the entrepreneurial risk (Percentage of women and of men declaring they would rather take a risk and build their own business than work for someone else, 2013) (OECD, 2015)

6.3. Gap in earnings from self-employment

Women remain substantially underrepresented as entrepreneurs. Men are two to three times more likely to own businesses with employees than women. The most striking difference between men and women in entrepreneurship is the scale of their business operations. Self-employed women earn much less than men. In all countries, the gender gap in earnings from self-employment is greater than the wage gap; typically, women work on average fewer hours in their businesses.(OECD, 2015)

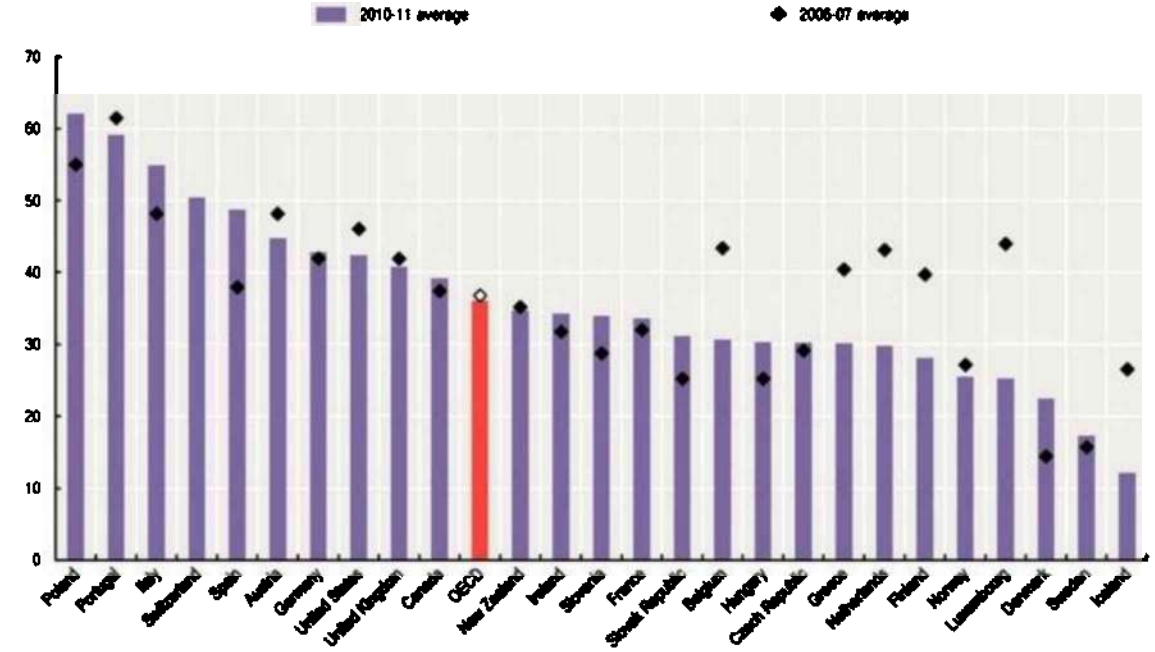

Figure 6: Gender gap in self-employment earnings in percentage points (OECD, 2015)

7. ENTREPRENUERSHIP IN SERBIA

Serbian government announced year 2016 to be theYear of Entrepreneurship. This decision was made on the fact that sector of SMSC is the most vital part of the economy, but this development opportunity has not been used enough. There are 320 000 small and medium-sized companies (SMSC) in Serbia. Majority of

them stated that they need governmental help. Growth in the sector of small and medium-sized companies and founding of new micro-companies are imperative for employment, and management of the transitional changes in economy based on the knowledge is key challenge to the entrepreneurship. The trend of entrepreneurial mindset, living and doing business is a challenge for creation of truly entrepreneurial society in which the key development carriers are creative businessmen, enduring innovators, young entrepreneurs and managers. However entrepreneurs don"t feel the state"s support. The biggest problem that managers faced so far are non-liquidity in the economy, no discipline in the financial transactions, monopolized market, disloyal competition, grey economy, chronic lack of financial incentives for investment and business sustainability, lack of market and demand, as well as lack of qualified work force. Observing the entrepreneurial structure Serbia could create developing technological paradigm of innovative profile in almost all economy sectors. Having in mind high level of SMSC sector"s influence on the economy growth in the EU, in Serbia we lack trends that are present in the EU due to long-term wandering in strategies and inadequate implementation of Act on small business, which negatively presented in the years since the beginning of the financial crisis.

Table 1: Structure of small and medium-sized enterprises in Serbia(Chamber of Commerce and Industry of Serbia, 2016)

Entrepreneurship in Serbia			
99,8% is participation of the entrepreneurial sector in Serbian economy (320 000 SMSC)		**33%** is GDP contribution	
64% of the population is employed	**42%** participates in export		**4,5%** SMSC is export-oriented
Number of Employees			
40% are micro and small forms with 1 employee	**36%** has 2 - 5 employees	**21%** employs 6 – 20 people	**4%** has over 20 employees
Ownership Structure			
70% of companies has 1 owner	**27%** has 2 owners		**5,7%** has 3 or more owners
The Management			
73% of owners directly manages the company	**28%** has managerial role	**4%** do not manage the company although they are employed	**1%** of owners do not work in the company they founded
Educational Profile of the Businessmen			
65% has high-school	**18%** has elementary school		**22%** has high and higher education

According to the report of the World Economy Forum for 2015/16, Serbian businessmen stated access to the funds as 2nd business hurdle, just behind inefficient state bureaucracy, and in front of corruption, taxation rates and regulations. Serbia is by ease of getting credit ranked low: 120th of 140 participating countries. Majority of small and medium-sized companies does not use credits from the formal sources, and when they use them those are small amounts, usually cash loans and overdrafts. Banks" offers are inacceptable for them: high interest rates, expensive and complicated procedures, requirements for collateral, lack of long-term credits…

Sectors in which there is great potential for development in Serbia are IT, agriculture – organic food and creative industry. In Serbia there are a lot of good examples of successful small companies. One of them is Zoran Ilic, CEO of the Biomelem company, who says for himself that he is entrepreneur from the moment when he got self-employed few decades ago. He thinks that state should appreciate and promote entrepreneurship much more so young people would desire to also become entrepreneurs.(Chamber of Commerce and Industry of Serbia, 2016)

As it is stated in the National Youth Strategy 2015– 2025 for Serbia (National Youth Strategy 2015– 2025, Ministry of Youth and Sports, Republic of Serbia) youth entrepreneurship is not properly developed, while the contribution of entrepreneurship to the reduction of youth unemployment has not been sufficiently recognised.There must be some conditions provided for the development of entrepreneurship in Serbia, especially for the young people. Some of the expected results and planned activities are:

- Developed supportive public policy framework that defines youth entrepreneurship and its environment
- There are mechanisms in place for the acquisition of entrepreneurial knowledge and skills and financial literacy within the framework of education
- Developed sustainable programmes for supporting young people who opt for self-employment
- Created conditions for the development of social entrepreneurship among youth, based on social understanding and support to entrepreneurship and innovation.

8. RESEARCH OFFEMALE ENTREPRENEURSHIP IN SERBIA

As (Babović, 2012)points out, GEM research is one of the few initiatives that allows monitoring of entrepreneurship on an international level according to standardized indicators and methodology. Unfortunately, the data which provide a systematic international comparison with insights into gender differences are only available for 2007. According to these data, in Serbia, in 2007, among women aged 18-64 years was 7.9% entrepreneurs, while among men of the same age was 19.9% of entrepreneurs. In addition, 5% of women of that age were being established job or in the early stage of business (as opposed to 12% of men), while 2.8% of women of that age were at the head of a business based (as opposed to 7.7% men).Based on this, we can see that situation with female entrepreneurship in Serbia is similar as in other countries – gender gap is present, and also not many of women in Serbia are motivated and strong enough to start their own businesses and that's why they need support from specific institutions.

There are many associations in Serbia which encourage femaleentrepreneurship in Serbia, and one of them is "Association of Business Women in Serbia". They've had several projects for promoting and helping women in Serbia so far such as: "Inclusion in employment", "See my story and become a Woman Entrepreneur", "The development of women's entrepreneurship", "Service development for women's start-up promotion" etc (Association of Business Women in Serbia. 2015). Association of Business Women in Serbia awards every year the „Success Flower" Award to the best female entrepreneurs in Serbia.The „Success Flower" Awards are being given in two categories: "most European women's company" and "the best model for employing women," as well as in a sub-category "self-employment/start-up". In addition to basic, they are award special honors to successful entrepreneurs for contribution to the development of female entrepreneurship in the various business segments where they have achieved significant success in both domestic and foreign markets such as: Special award for corporate social responsibility, Special award for supporting enterprises in business, Special award for innovation, Special recognition for the development of entrepreneurship in rural areas and Special award for sustainable business model. This association is led by successful ambassadors of female entrepreneurship in Serbia:

- Anja Ivana Milić, architect, founder and owner of projecting and building company "Arhi pro";
- Afrodita Bajić, who is engaged in the production of sales of women's fashion garments' AMC-"Afrodite mode collection"
- Dragica Božinović, founder and owner of the trade company "Novitas"
- Zorica Selaković, founder of firm of home-made cakes and cookies "DESSERT"
- Jasmina Knežević, Director of General hospital "Bel Medic"
- Ljiljana Stanojević, director of the company, she is engaged in metal processing, production and trade of machine elements, "Stanojevic"
- Marija Stevanović, the owner of the Agency for consulting and management "MS Employment"
- Marina Milić, director and owner of the company, engaged in the production, processing and sale of honey products "Maja promet"
- Nataša Milanović, owner of the company, engaged in the production and processing of organic food "Biosil"
- Sanja Knežević, the owner and manager of a tourist and cultural center "Ethnoselo Latkovac"

Those are all very successful women who try every day to support and encourage other unemployed women to take step forward and to gain strength to start their own businesses.

Also, there is Association of business women "Nadežda Petrović" from Čačak, whose main project is "Let's learn production occupationsin order to become employed and independent". During this project, the

association gives opportunity to young and inexperiencedfemale entrepreneurs to attend many useful trainings about business and self-employment, to meet with experienced entrepreneurs in order to learn about their experiences, to promote their business idea etc.

9. CONCLUSION

Women are wise, worthy, working, courageous, strong, persistent, persevering, successful mothers and wives. One thing is certain that it is difficult to be a woman entrepreneur, but a lot of the challenges and the limits will certainly change. The theme of equality between men and women is very popular nowadays and everything points to the fact that this gap will be smaller in the future, but in order to make that real, women can't make that on their own, they need support. Support from government institutions or different associations for encouraging female entrepreneurship can cause the increase in the percentage of women who are self-employed for a reason that many of them are not aware of the possibilities, and even those who are aware often do not have the financial resources to enter into such an adventure. Situation in Serbia is similar to other countries when it comes to both men and female entrepreneurship, and the fact that this year, 2016 is pronounced as The year of entrepreneurship in Serbia shows that the awareness and the number of entrepreneurs is getting a bit bigger, but crucial changes in percentages of self-employed women are not going to happen if they don't get more opportunities regarding financial resources and moral support.The greatest help for women can be new mechanisms for financial support in starting new businesses across the globe and also to give them proper formal education of entrepreneurial skills and knowledge and financial literacy skills so they can become more independent while starting their businesses.

Abstract: *Due to its specific performances, small and medium enterprises have very significant role in contemporary economic development. Specifics of their organizational structure have led to development of new marketing approach which is, compared to traditional marketing approach, more suitable for small and medium enterprises. Relationship marketing, which results in marketing network created by entrepreneur and enterprise management, is most commonly associated with marketing of small and medium enterprises. Results of the research conducted in this paper indicate that relationship marketing and marketing network concept, in comparison with classic marketing mix concept, is more adequate for implementation in small and medium enterprises.*

Keywords: *organizational structure, entrepreneurial venture, small and medium enterprises management, entrepreneurs, marketing feature*

1. INTRODUCTION

Avlijaš (2008) states that in overall structure of business entities in developed countries, small and medium enterprises share is usually up to 99%. Likewise, their share in GDP structure exceeds 60% and in overall structure of the employed exceeds up to 80% (p. 1). These statistical data indicates that small and medium enterprises are very important feature in national economy development. Accordingly, Krivokapić and Jaško (2014) claim that modern economy is actually based on entrepreneurial ventures, due to the fact that entrepreneurship provides solutions for many economic problems, and improves national economies (p. 1332).

Scarborough (2014) discusses thatbusiness efficiency, as well as small and medium enterprises growth, greatly depends upon efficiency of their organizational structure and organization of key business activities (p. 127).Gibson et al. (1997)state thatenterprise dimensionality has a great significance in process of designing its organizational structure (p. 194).The aim of this paper is to put emphasis on significance of organizational efficiency of small and medium enterprises, which influences their growth, development and contribution to overall economy development. According to Ferrell and Hirt (1996) performances which determine role and significance of small and medium enterprises are connected with production assets, human resources, business scope, business orientation etc. (p. 86)Deakins and Freel (2012) state thatdue to these factors, small and medium enterprises are commonly orientated towards external organizations in performing significant activities such as marketing, import, export, market research etc. (p. 63)Hatten (2014) claims that, according to management guru Peter Drucker, business has two, and only two, basic functions: marketing and innovation (p. 79). Thereby, special attention will paid to specific organization of marketing function of small and medium enterprises, which enables them to improve collaboration with all stakeholders, especially with consumers whom contemporary marketing theory defines as value creators.

This paper presented organizational specifics of small and medium enterprises, which significantly influence their growth, development and work efficiency. Furthermore, particular attention will be paid to organizational specifics of marketing feature, and its significance for small and medium enterprises development.According to Gutić and Rudelj (2009) this topic is very interesting to observe due to the fact that organization of marketing, in most domestic enterprises, is visibly falling behind development of corporate organization, in all of its aspects (p. 262).In accordance with this unfavorable trend, authors of this paper conducted a research among 54 small and medium enterprises in Republic of Serbia, in order to obtain information about marketing organization development in domestic enterprises. Information was gathered by using questionnaire method. Results of this research indicate that, even though a large number of small and medium enterprises in domestic market conduct certain form of marketing activities, a small percentage of enterprises that were involved in this research conduct marketing activities regularly and consistently in accordance with specific marketing plan.

Hatten (2014) states that each entrepreneurial venture presents the result of the entrepreneurial intentions of individuals or groups(p. 43).Rakićević et al. (2014) claim that success of an enterprise is, to a large degree, defined bythe individual's entrepreneurial intentions andmanagerial competences, as well as willingness to "sacrifice" themselves for achieving business objectives (p. 551).Due to specific organizational structure of small and medium enterprises, main hypothesis in this paper is related to the role of entrepreneur in marketing decision making. Authors' assumption is that domestic entrepreneurs do not develop marketing feature of their enterprise to a significant extent due to their perception that all the important decisions in the enterprise should be made by them. Furthermore, most entrepreneurs in domestic market observe marketing function as non-decisive factor for achieving business success. Results of the research reaffirm these hypotheses to a large degree.

2. KEY FEATURES OF SMALL AND MEDIUM ENTERPRISES AND THEIR PHASE DEVELOPMENT CHARACTERISTICS

Milošević et al. (2014) state that small and medium enterprises development ensures the largest contribution to the increase in employment, gross added value and turnover, and is, therefore, considered to be the backbone of growth and development of a national economy (p. 520). Even though there is not a unique approach towards defining concept of small and medium enterprises, yet Siropolis (1995) states that largest number of countries uses these following criteria for defining small and medium enterprises:

- Total assets (total financial means, supplies, land, real estate, machines etc.),
- Number of employees,
- Invested capital or gross income,
- Equities (p. 8).

In accordance with valid legislation in Republic of Serbia (Accounting Act "Official Gazette of Republic of Serbia"No. 62/2013, p. 5) enterprises are classified into micro, small, medium and large according to average number of employees, total income and asset value on the day of financial report composition in the latest financial year. In order to be categorized as micro, small or medium enterprise, legal entity must fulfill at least two of three following criteria:

For micro enterprises

- Average number of employees is 10,
- Average business income is 700.000 € in Dinar counter value,
- Average value of business asset (calculated as an arithmetic average value at the beginning and the end of the financial year) is 350.000 € in Dinar counter value.

For small enterprises

- Average number of employees is 50,
- Average business income is 8.800.000 € in Dinar counter value,
- Average value of business asset (calculated as an arithmetic average value at the beginning and the end of the financial year) is 4.400.000 € in Dinar counter value.

For medium enterprises

- Average number of employees is 250,
- Average business income is 35.000.000 € in Dinar counter value,
- Average value of business asset (calculated as an arithmetic average value at the beginning and the end of the financial year) is 17.500.000 € in Dinar counter value.

Avlijaš (2008) discusses that small and medium enterprises represent factor of stability in the market, due to the fact that they fullfil blank niche space which cannot be filled by large enterprises, especially in period of great demand when they are capable of creating rapid supply increase, unlike large enterprises which

maintain stable demand value (p. 8).Deakins and Freel (2012) discuss that, in an opposite situation when demand is decreased, small and medium enterprises can easily adapt their business operation volume, unlike large enterprises which do not adjust its business to market demands due to larger fixed costs per product (p. 45).Milošević et al. (2014) state that main characteristics of small and medium enterprises are the reason for much easier adaption to continuous changes in consumer demand and business conditions in the global market. Those characteristics primarily refer to their size, flexibility, propensity for innovative and risky ventures, as well as greater opportunity for specialization (p. 552). Therefore, Kuratko (2014) claims that small and medium enterprises cause strengthening of competition, which leads to improvement of product quality, lower prices, innovations and development of new technologies, and the growth of overall national economy (p. 63). Their significance is especially noticeable in countries in transition, such as Serbia, which are usually struggling with high rates of unempolyment, as well as low level of foreign investments and reduced economic activity. Therefore, it can be stated that small and medium enterprises represent an important factor for social and economic stability of a country. Hatten (2014) verifies this statement by stating that numerous surveys indicate that small and medium businesses have created 64% of net new jobs over the past 20 years, employ half of all private sector employees and create more than 50% of GDP (p. 47).

Scarborough (2014) discusses that small and medium enterprises management has its specifics which are caused by nature and characteristics of small business development. In initial development phase, entrepreneurial ventures are usually confronted with lack of funds which significantly influences their organizational structure creation (p. 134).Reijonen(2010) states that small and medium enterprises are characterized by small number of employees who simultaneously perform more than one business activity, including the owner himself (p. 283). Enterprise development and its capacity increase lead to changes in its organizational structure. Vučenović et al. (2009) discuss that, in the initial development phase, enterprise is defined as entrepreneurial organization, in which one person, entrepreneur, dominates the organization in order to achieve personal purposes (p. 231).Initial development phase is crucial for product development and its market placement. In this phase of venture's development, knowledge, skills and experience of the entrepreneur are of decisive importance. Furthermore, Hatten (2014) state that, as a key factor in the organization, entrepreneur is responsible for most of managerial activities, as well as decisions which are related to production, purchase, sales, financial means providing and organizational structure creation(p. 117).

Cvijanović (2004) states that initial organizational problems occur when the enterprise broadens its activities. Meanwhile, enterprise expands its capacities, but business activities management models remain the same (p. 99).Vučenović et al. (2009) claim that, due to its growth, enterprise faces issues which exceed one person's capability to efficiently manage business activities (p. 232). However, theentrepreneur rejects a possibility to leave responsibility for entrepreneurial risk to associates. Meanwhile, there are still not enough financial possibilities for engaging professional managers or consultants. Radić et al. (2015) state that, due to these reasons, initial development phase of management is mostly based on knowledge and experience of the entrepreneur and less on applying scientific methods of enterprise management and business organization (p. 333). Entrepreneur individually makes decisions on all matters which can result in negligence of strategic issues of enterprise development and growth.

Vukmirović (2006) discusses that, due to the fact that enterprise development and growth is becoming accelerated and is not coordinated with development of managerial knowledge and skills, business activities stagnation may occur as a consequence (p. 194).Radić et al. (2015) suggest thatthis problem could be solved by engaging a team of managers who would reassess theowner's decisions, and objectively make decisions, due to the fact that they do not participate in the ownership structure(p. 334). More precisely, enterprise is forced to develop functional organizational structure, because of the fact that every business activity demands active managing.Jaško et al. (2013) state that functional organizational model is suitable for small and medium enterprises, since their focus is usually oriented towards specific product or market. This structure is suitable for enterprises which create its competitive advantage with distinctive competence in one or few business functions, such as production for example(p. 555). The following development phase leads to overcoming one product and onemarket orientation, which requires implementation of organizational structure modification. Functional organizational structure should be adjusted to markets or products, i.e. conduct division of organizational structure. Krivokapić and Jaško (2014) state that, in accordance with market changes, i.e. dynamism and instability of the environment, it should be remembered that once established mode of behavior might be changed, since the organization must continuously follow possible changes in the environment (p. 1338). Higher level of adjustment to changes in the environment provides enterprise with better business results.

3. SMALL AND MEDIUM ENTERPRISES ORGANIZATIONAL FUNCTIONS

Enterprise organizational structure represents one of main management functions which implies designing organization and its inner systems.According to Gibson (1997) organizational structure implies manner in which organization's activities are distributed, gathered and coordinated between managers and employees and represents an asset for management goals accomplishment (p. 104). Designing organization includes forms which mutually connect employees, as well as forms in which employees are connected with their assignments. Cvijanović (2004) states that, with the aim of designing optimal organization model for certain enterprise, it is necessary to observe its structure, processes and context (p. 17).Enterprise structure includes decentralization of authorities, formalization, and standardization of work operations as well as a number of hierarchy levels and geographical sites in which business operations are conducted. Processes refer to activities of decision making, coordination and communication inside the organization. Context implies circumstances and conditions in which organization is doing business, such as main aims of the organization, technology, human resources, environment etc. Jaško et al. (2013) discuss that efficient and effective organization provides rational resources usage as well as development, which integrates adequate methods and models which should fulfill expectations of different stakeholders (consumers, employees, owners, partners, competitors, society etc.)(p. 417). Organizational design of a certain entrepreneurial venture requires presence of adequate organizational knowledge and skills, as well as competent organizational project team. Designing organizational structure of small and medium enterprises which have entrepreneurial development and management orientation significantly differs from designing organizational structure of traditional firms. Audretsch and Thurik (2004) claim that this can primarily be noticed through significantly simpler and more flexible organizational structure which rapidly adapts to changes in business environment(p. 145).

Hills (1996) states that, since every enterprise's business purpose is to find adequate market for its products and therefore materialize business idea on which it is based, creating adequate organization of marketing activities represents key factor for achieving market success. (p. 62) Gerber (2010) claims that, by distributing its products on the market and finding customers, enterprise can acquire verification of the innitial idea on which it is based (p. 55).Reijonen (2010) discusses that the necessity for marketing sector existence within an organization emerges from the need for business plan creation, which includes market research, competitor analysis, development opportunities research etc. (p. 282). Likewise, Kotler (2001) states that marketing sector should provide creation of distribution channels, organization and improvement of sales system, creation of price policy, planning of promotional activities, as well as creating trade mark and brand development (p. 279). Organizational structure, enterprise capacity and circumastances in which business is being managed are factors which are defining a manner in which marketing sector is organised within an enterprise. Gutić and Rudelj (2009) claim that marketing organization is not a general scheme or pattern which can be applied in every entreprenurship byfollowing the same model due to the fact that every organization is specific and shaped by numerous internal and external factors which sould be monitored and explored(p. 262).

3.1. Organization specifics of marketing function in SME

Reijonen (2010) states that, since marketing theory has been developed on the basis oflarge organizations studies, it cannot be applied directly to small and medium enterprises, due to the fact thatthese marketing practices may significantly differ from those of their larger counterparts (p. 280). Therefore, the need to develop specific marketing theory, which would be suitable for small and medium enterprises, has been recognized.
According to Hills (1996), in countries with developed economies it is considered that marketing sector should include all commercial operations and that it should possess the same rank in organizational structure and hierarchy of an enterprise as other sectors such as production or finances (p. 112).Sparling et al. (1994) discuss that, marketing sector, organized in this manner, should perform functions such as purchase, sales, market research, distribution and promotion (p. 199). According to company's needs and its specific circumstances, the number of employees for every business activity is defined.

Within enterprise marketing feature, sales represent one of the most important operational activities. Depending on the type of industry in which enterprise operates, its production capacity, sales range and other enterprise specifics, different organizational models of this enterprise feature exist. According to Vasiljev et al. (2002) two categories of sales organization and management models can be distinguished:

- Sales management as marketing function model and
- Management of sales processes model(p. 168).

Management of sales process refers to higher hierarchy level in organization which implies owners, board of directors and top management, who are making strategic sales decisions. Vasiljev et al. (2002) state that this system is considered to be developed along with marketing development through following development phases:

- Phases of line models of sales management, direct-line and line and staff model,
- Phases of cooperative functional models,
- Team model phases, i.e. project-team, market-team and innovation-team models, which represent more thorough implementation of marketing in enterprise management (p. 185).

Direct-line model represents the earliest form of sales management and its essential task is to provide management control. According to Lovreta et al., (1998) line and staff model represents certain breakthrough in terms of sales management, due to the fact that it includes advisory role of expert, even though members of management structure are still entirely responsible for decision making(p. 232).Cooperative functional model implies that it is necessary to establish cooperative relations between all enterprise functions, as well as sub-functions i.e. marketing services such as informing, analysis, forecasting and alternative consideration, with the aim of sales decision making.Siropolis (1995) discusses that main characteristic of numerous and various functional models of marketing organization is the existence of unique and direct chain for marketing organization management which includes one superior and one or few subordinate employees (p. 298).Team sales management models require competences and collaboration of larger number of different profile experts who create teams for resolving certain problems during the process of sales decision making. Kalinić (1993) states that this type of organization is flexible, due to the fact that teams are formed by available experts in enterprise, as well as external associates who are periodically engaged (p. 205).

Organizational structure of purchase service is very similar to organizational structure of sales function. According to Lovreta et al. (1998), the role of this service is very important for regular supply of production sector, which provides prerequisite for sustained production which is coordinated with sales needs (p. 232).Kalinić et al., (2002) discuss that, in case of trading enterprises, purchase service is directly connected with sales sector, because of the fact that sales needs to be provided with quality merchandise in time and in an amount which market requires (p. 177). Therefore, it is necessary to provide tight correlation between these two services. Organizational structure of purchase service may be created regarding areas of supply, supplied merchandise as well as combination of these two models.
Other marketing activities consider market research, promotional activities, informational marketing systems, marketing activities planning etc. Siropolis (1995) states that these activities may be organized in form of services, created for fulfilling marketing management sector needs (p. 310). For performing these work tasks, employees from these sectors collaborate with production and other operative sectors and are directly responsible to marketing management sector.

Gutić, Rudelj (2009) state that, in accordance with small and medium enterprises specifics, project-matrix organization model is suitable for this type of business ventures(p. 264). It is based on, at least, dual command system. Every employee in marketing sector of an enterprise is liable to at least two managers. Jaško and Kostić (1997) discuss that project-matrix structure is usually applied in order to achieve specific strategic marketing aim, such as new product placement, or modification of existing product in its maturity phase (p. 108). This structure can also be applied in enterprises where changes in technology are major, frequent and intense, and is, as well, suitable for medium-sized enterprises whit several product lines. This model of marketing organization is commonly used in states of significant uncertainty in enterprise environment.According to Jaško et al. (2013), project-matrix organization model is suitable in cases of enterprise adjustment to current market demands, such as product differentiation, new product placement, product modification, increase of loyalty and satisfaction of consumers etc.(p. 567-574).

3.2. Small and medium enterprises key marketing specifics

Hatten(2014) states that marketing involves all the points of contact between small or medium enterprise and its customers (p. 147). Small and medium enterprises marketing is fundamentally different, and usually much more successfully conducted, than marketing practice in large enterprises. According to Hills(1995), reason for such phenomena may be that within small and medium enterprises marketing development is observed as decisive success factor in comparison with, for example, planning or strategy development (p. 219). Unlike large enterprises that include large number of experts in process of decision making, small and medium enterprises marketing practice usually delegate all important decisions towards one person.

Accordingly, some enterprises make marketing decisions on their own, while others make marketing decisions in collaboration with very influential individuals in this field, i.e. marketing experts.

In the article about marketing myopia, Theodore Levitt indicates that enterprises which did not have their focus on customers' needs, but on their own needs instead, experienced failure. Most business ventures operate today with a customer-driven philosophy, which indicates that customer wants and needs are determined before goods and services are produced. This philosophy is called the marketing concept. Business concept that broadens marketing concept view is called relationship marketing. This concept indicates that business owner should recognize the value and profit potential of customer retention. Kotler and Keller(2006) state that therefore, main aim of this concept is to develop long-term, mutually satisfying relationship with stakeholders, primarily with customers and suppliers (p. 281). Due to the fact that one of basic characteristic of small and medium enterprises imply that owner / manager / entrepreneur has strong influence in decision making process, it can be stated that relationship marketing concept is convenient for small and medium enterprises. His management competence strongly influences enterprise business success, especially in the initial development phase when business operations are highly personalized and defined by knowledge and capability of the entrepreneur. Due to the fact that in small and medium enterprises owner is most commonly creator of the initial idea and organizational structure of the enterprise, it can be concluded that development of marketing activities is also conducted under owner's strong influence. This statement can be confirmed by McGrath (2008) who notes that enterprise venture owners customize marketing activities to personal needs, and usually do not have marketing specialist or sector which is engaged with development and implementation of marketing activities (p.21). In addition, Butigan and Mahnić (2011) claim that classic marketing mix theory is not applicable in case of small and medium enterprises. These authors elaborate that the owner's prominent role in enterprise structure is the key feature of small and medium enterprises when compared to large enterprises. The owner creates his own relationship network with business partners, with whom they will realize marketing activities, which enhances possibilities for successful marketing decision making (p. 96).

Butigan and Mahnić (2011) discuss that small and medium enterprises marketing activities were, for very long period, observed from the aspect of traditional models, which were based on large enterprises practice, and therefore were considered as non-traditional, informal, short-term and non-strategic (p. 92) In domestic market conditions, marketing is commonly perceived as certain luxury which only large enterprises can afford, while small and medium enterprises usually conduct marketing activities occasionally and with as less funds as possible. This attitude may, to certain extent, be justified by the fact that, in initial development phase, entrepreneurial venture does not possess significant financial means. Therefore, entrepreneur takes responsibilities of a marketing expert, even though most commonly is not competent for this kind of business activities. However, in following phases of their development, marketing concept implemented by small and medium enterprises does not respond to classic perception of marketing activities organization. Considering the fact that enterprise must react to very dynamic market fluctuations and create its business activities in accordance with it, it can be concluded that it also has to create its marketing activities as a reaction to market fluctuations.

4. SURVEY RESULTS AND DISCUSSION

For the purpose of this paper, author has researched structure and organization of marketing activities application in small and medium enterprises on the territory of Republic of Serbia. Research was conducted during the period from February to April 2016 with a sample of 54 small and medium enterprises. By using method of random sampling and paying attention on the representativeness of the sample, results were obtained by applying questionnaire method. Criteria for research enterprise selection was based on The European Commission recommendation on enterprises definition (Recommendation 2003/361/EC, The Annex, Article 1 - Enterprise) "An enterprise is considered to be any entity engaged in an economic activity, irrespective of its legal form. This includes, in particular, self-employed persons and family businesses engaged in craft or other activities, and partnerships or associations regularly engaged in an economic activity". In accordance with this specification and relevant legislation in Republic of Serbia (Accounting Act "Official Gazette of Republic of Serbia"No. 62/2013), this research included small and medium enterprises from the territory of Republic of Serbia, which were classified in accordance with number of employees criteria.

Majority of data was gathered through the questionnaires which were completed by interviewees on their own, whereas representatives of six enterprises were interviewed. Research results were gathered by sending 490 questionnaires via e-mail to directors, owners or employees responsible for marketing sector or public communication. E-mail addresses were obtained by using Serbian Chamber of Commerce and National agency for regional development database. Level of responsiveness was 63%, or 34 completely

answered questionnaires. The rest of the results were gathered directly, by phone calls directed to employees who are responsible for public contacts as well as by interviewing representatives of certain business entities. Through empirical research, results which refer to structure and organization of marketing activities with the aim of gaining insight in domestic entrepreneurs' attitudes towards this business feature were obtained. Structure of enterprises included in this research is dominated by companies for production, trade and services (27,8%), companies from the sector of wholesale and retail (14,8%), enterprises from the field of civil engineering (20,4%), enterprises from the manufacturing industry (25,9%) and other fields (11,1%).

Results of the research indicate that the highest percentage of small and medium enterprises in Serbia conducts certain form of marketing activities, because 79,6% out of 54 enterprises which were included in this research confirmed that they use or were using certain marketing activities in order to enhance their business results. Within enterprises which confirmed their engagement in this sphere of business activities, 14% uses marketing agency services, while rest of them individually creates and realizes marketing activities. Furthermore, within enterprises which individually realize some forms of marketing activities, 43,2% of them claim that the owner of the entrepreneurial venture is responsible for realization of this type of projects, while 32,4% of the interviewees claim that within the enterprise there is an employee which performs marketing activities, besides its main tasks. Research results also indicate that even when an enterprise possesses an established marketing sector, employees in this sector do not have precisely defined responsibilities, and perform simultaneously more tasks. Besides creating and conducting promotional activities, they directly communicate with clients and are expected to attract new clients and broaden enterprise's business activities.

Research results have also indicated that owners of entrepreneurial ventures in Serbia do not conduct classic marketing activities, such as market research, due to the fact that they are considered expensive and indicators of underperformance in business. In accordance with this, owners of entrepreneurial ventures engage marketing experts only when they realize that certain market segments do not prefer or have negative attitude towards their products or services. Thereby, entrepreneurs usually impose their opinion to engaged external associates, expecting to achieve maximum results with as minimal possible investments. Therefore, they usually conduct marketing activities through different types of compensations or joint ventures with, for example, mass media with whom they later share economic profit form conducted activities.

Within enterprises which plan conducting of marketing activities, 25,6% of them possess formal marketing plan for their business, while rest of them create marketing activities as well as financial expenditure, i.e. marketing budget, optionally, i.e. in specific situations and from time to time. This can be confirmed by the information that only 16,3% of the interviewed enterprises which conduct marketing activities have precisely defined marketing budget. However, those funds are not significant because of the fact that most of the interviewed enterprises in Serbia claim that only 1 to 5% of total income is invested in marketing activities. Results of the research indicate that in small and medium enterprises marketing activities are treated in an informal manner and with significant influence of enterprise owner who determines the manner in which contact with customers will be established. Owners create direct relationship with customers and suppliers and develop their own marketing network because they consider that this kind of marketing is the most suitable for small and medium enterprises.

5. CONCLUSION

Theoretical and empirical research presented in this paper indicates that small and medium enterprises have simpler organizational structure when compared with large enterprises which have complex organizational structure. Small enterprises strive to centralization of organizational structure and business decision making, unlike large enterprises which apply decentralization in management process. As the enterprise expands its capacities, management conception is shifted from individual to collective or team management. Due to greater financial resources, large enterprises possess within its organizational structure special sectors for key functions and business activities such as marketing, finances, planning etc., which is not a characteristic of small enterprises due to lack of funds. Milošević et al. (2014) state that survival, growth and development of small and medium enterprises are primarily determined by funding opportunities from favorable sources (p. 519). Limited access to the sources of finance is probably the most important feature and the biggest issue of these enterprises which, to a large extent, defines their organizational structure.
Krivokapić and Jaško(2014) state that, due to small and medium enterprises specificity and their dependence on the specific conditions and situations, each one of them should be considered separately in one particular context (p. 1338). Therefore, small and medium enterprises differ due to: 1) individual

production or small batches production, 2) regional business orientation, 3) flexible organizational structure, 4) simpler management structure, 5) centralized organizational structure and 6) significant entrepreneur's influence that is usually the owner of small or medium enterprise. Small and medium enterprises specifics significantly influence organization of one of its key functions – marketing feature.

In the process of organizational structure construction, small and medium enterprises develop their structure through different phases. In initial development phase, sales feature of the enterprise is dominant. Nevertheless, direct contact between the owner and stakeholders, as well as development of proper marketing network is characteristic of initial development phase. Reason for paying that much attention to relationship with other market participants is because they affect, directly or indirectly, the results of all entrepreneurial ventures in the market. Continuous growth of small and medium enterprises initiates multidimensional development of marketing feature, that is sales as an operative function is being separated from other marketing activities, such as market research, promotion, product design enhancement, after-sales activities, etc. The aim of this paper is to stimulate discussion and further research about marketing development in small and medium enterprises in Serbian market, as well as to change perspective of domestic entrepreneurs towards conducting marketing activities with the aim of achieving best possible business results.

APPENDIX

QUESTIONNAIRE

1. Does your enterprise conduct marketing activities within its business operations?
   - Yes
   - No
2. If the answer to previous question was affirmative, does your enterprise:
   - Independently creates and conducts marketing activities
   - Using the services of marketing agencies?
3. Who is responsible for conducting marketing activities in your organization?
   - Marketing expert
   - Employers who perform marketing activities besides their main occupation
   - Marketing sector
   - The owner
4. Does person who perform marketing activities has formal education or training in this area?
   - Yes
   - No
5. Who brings final decision about conducting marketing activities?
   - The owner
   - Marketing manager
   - Marketing sector
   - Other managers
6. Does your enterprise posess formal marketing plan with defined budget for marketing activities?
   - Yes, company has defined marketing plan and budget
   - Company has marketing plan, but budget is defined depending on the available funds
   - Company does not have marketing plan, activities are conducted depending on current needs
7. Which procent of total funds in invested in marketing activities?
   - 1-5%
   - 5-10%
   - 10-15%

WOMEN'S ENTREPRENEURSHIP - A GLOBAL PERSPECTIVE AND CURRENT STATE IN SERBIA

Maja Vrbanac*[1], Marina Milovanović[1], Jasmina Perišić[1]

Abstract: *This paper describes the current situation in the world and Serbia related to women's entrepreneurship. The goal of this work is to point out specific properties, development and challenges of women's entrepreneurship, The emergence of women entrepreneurs in the past twenty years in the developed world are closely linked to the democratization of society, namely, the equalization of men's and women's rights, particularly the right to education and access to economic and financial resources. Women's entrepreneurship is based on equal rights and inherent human dignity of women and men. Reducing the high unemployment rate of young women in the world and in Serbia can be achieved only by creating favorable conditions for the development of entrepreneurship. This will be achieved by improving the microeconomic business environment and ensuring the start-up capital. Primarily, it should create the conditions that would allow a safe and long-term development of their own business. Another important aspect of our study is women's education in formal and informal educational systems. Specific target skills and competencies precondition are necessary for any business enterprise, so it is important to arrange non-formal and continuing education directed to population of adult women.*

Keywords*: entrepreneurship, women's education, unemployment, the initial capital, gender equality*

1. THE EMERGENCE OF WOMEN ENTREPREUNEURSHIP

Affirmation of women entrepreneurship as a relevant objective of development of modern society, is supported by a number of international documents. The Beijing Declaration adopted in 1995 is the key document in which the integrated objectives and principles set out in the UN Charter, the Universal Declaration of Human Rights, in particular the Convention on the Elimination of All Forms of Discrimination against Women and, inter alia, the Declaration on the Right to Development. Women's entrepreneurship is recognized as an important mechanism for achieving equality, democratization and development of society, the preservation of peace and poverty reduction (Sarfaraz, Faghih, & Majd, 2014)(Duflo, 2012).

The phenomenon of female entrepreneurship includes all aspects, above all, that women want and need to reconcile family and professional obligations, bringing their personality and values into the business, and that their engagement in entrepreneurship is highly personalized (Rey-Marti, Tur Porcar, & Mas-Tur, 2015). Although there are more women in the population, employment of women is lower than male employment, women are the most present workforce at one of the lowest-paid sectors - services(Mitchelmore & Rowley, 2013), and there are very few women in leadership and management positions (Zlatkov Cvetković, 2015). Also, the average earnings achieved by women in relation to men are lower in almost all activities. From different studies we can find out that women who have entered the private business are generally well educated, their professional composition varies, most are married, with children, areas where they founded the private business mainly belong to traditional female occupations, thay rarely have their own start-up capital, and they form micro or small enterprises (Alam, Senik, & Jani, 2012)(Kalyani & Kumar, 2011). The reasons for starting a new business are the most common means of ensuring the existence of family and children and the desire to prove their own abilities (Gidarakou, 2015). The biggest obstacle they are facing are so called "Work on three fronts" (the household, the children/family care and work) (Vossenberg, 2013) and gender discrimination (Barsh & Yee, 2011).

In practice, women are often excluded from decision-making (Pines, Lerner, & Schwartz, 2010). Decision is reserved for small, informal, and as a rule, men's groups, which excludes women from institutional policy or diminishes their political power even when they are represented. Exclusion of women from institutional politics can slow down the democratic process generally and in the countries of ex-Yugoslavia. A particular problem to be solved is participation in public and political life of the multiple discrimination of women. There is more woman than men in the world, but in the economy, according to official information and indicators, they are minorities all over the world.

2. THE DEVELOPMENT OF WOMEN'S ENTREPREUNEURSHIP

Women's entrepreneurship, as a phenomenon of our time, bought very little attention until recently. The first important scientific paper on this subject appeared in 1976 (Schwartz, 1976) which drew attention to the upward trend of this kind of entrepreneurship. For example, according to statistics from 1972, about 4.6% of all US businesses are led by women. After investigations of the UN in 1995 two changes that have occurred in the last ten years have led to the establishment of a positive climate for the development of women's entrepreneurship

- Establishing legal and legislative equality for women;
- Ensuring equal access to vocational education and training for women.

Male resistance to women is stronger in Europe than in America. Polls in Italy and the UK have shown that nearly half of men reject the idea that women can perform manager tasks. Statistical analysis of the population of managers in the US and Western Europe has shown that women make up only 3% of CEOs of major companies and occupy about 12% of middle and lower management positions, even though they were in the labor force for more than 45%. In the literature, this phenomenon is explained by the existence of strong or impenetrable barrier, which is the result of a combination of all stereotypes (Huarng, Mas-Tur, & Yu, 2012). In the world there are three countries where women make up more than half of the employees (Ahl & Nelson, 2015).. This is Sweden (60% of employees are women), Canada and the US (52% of employees are women). The other extreme are countries of the Middle East in which the proportion of women in the labor force between 35% (Israel) and 4% (Iraq, Saudi Arabia). Unfortunately, one of the still strong reasons of meager representation of women in the management is their personal acceptance of "female roles" and from it emerged they are not interested in leading or managerial career.

In most cultures there is a strong division between male and female roles (Duflo, 2012). According to such cultural stereotypes that dominate, especially Arab countries, Latin America and the less developed regions of the world, managers can be only men. Women are expected to be subservient and dependent, not to stand out and to serve men. Even in developed democratic societies, where women enjoy formal equality, these cultural stereotypes are not completely eradicated. Different legal constraints that women are placed in a second-class status are only recently removed from the legislation of most developed countries, and in underdeveloped are still very much present (for example, Switzerland's did not have the right to vote until 1971, France had no regulation to protect women from harassment at work, and in the US women for the same job often receive lower wages than men).

However, things started to change in the 21st century. Between one quarter and one third of all businesses in the world today run by women with a growth rate up to two times, compared to the national average in the USA. Women are owners of approximately 30% of all businesses in the world. Entrepreneurs in developing countries now represent a vital driving force in all sectors of the economy, whether measured by the number of new jobs, the number of employees or the volume of realizing profits as shown in the following tables (Vukmirović, 2005).

Table 1: Women-owned businesses in the world (in %)

Country	Year	women-owned (%) enterprises
Netherlands	1992	8
Mexico	1990	9
Japan	1991	13
Germany	1993	15
Canada	1995	17
Australia	1994	18
US	1996	20

Table 2: New jobs launched or owned by women, from 2000 to 2010

Country	Started businesses owned by women (%)
Japan	23
Russia	64
China	25
Germany	34
Hungary	40
Poland	38
Mexico	32
US	38
United Kingdom	25
EU	33

When it comes to female entrepreneurship, there are countries in the world where the number of women entrepreneurs is lagging behind compared to the number of men, but there are also countries where women entrepreneurs grow:

- In the United States the rate of growth of women's enterprises, 2010. was twice the national average, and nearly half of the company is majority owned by women.
- In the UK, where the situation of women's entrepreneurship, according to the majority of analysts is pretty bad, 6.5% of all women of working age were employed in their own businesses. The share of women entrepreneurs is 26%, and this is a figure which has not been changed since 1990.
- In the countries of the European Union women lead 70% entrepreneurs of micro and small businesses with five or fewer employees.
- In the transition countries of Central and Eastern Europe economic position of women is largely deteriorated due to the reduction of the public sector, increased unemployment, greater job insecurity and the poor state of social welfare systems.

Most countries in transition do not pay attention to women's entrepreneurship. Most often it is represented in the less developed countries, where culture does not allow for the development of entrepreneurship. In these countries, there is still gender discrimination. In transition countries in financial crisis situations is the most hit by the female population (Pines et al., 2010), because they were the ones who would most often become out of work.

The difficult situation of women in the labor market in the countries of Central and Eastern Europe as well as in countries in transition is affected by various factors. Employers prefer to hire men and women are viewed as a labor force that does not guarantee stability in the business due to the fact that women are traditionally burdened with family and household chores. In addition, average unemployed women have a higher level of education than unemployed men. Most of them have secondary education, which means that they are not specialized to any particular area or skill. Overall opinion which prevails in countries in transition is that in terms of unemployment, men have more right to a job than women. Research shows that such thinking has: 55% of respondents in the Czech Republic and Poland, 42% in Hungary, 40% in Russia and 29% in Slovenia. This opinion is shared by 8% of respondents in Sweden, 11% in Denmark, 15% in Finland, 16% in Norway, 24% in the USA.

3. THE SPECIFICITY OF WOMEN'S ENTREPREUNEURSHIP

In all developed and traditional, patriarchal environments It is evident that women are at worse position, especially when it comes to property ownership (Duflo, 2012)(Vossenberg, 2013). It is a common practice when the inheritance of immovable property (land, houses, buildings) is under the cosideration women are expected their share of an inheritance to give to a brother or a male family member. When entering into marriage, as a rule, the right of ownership is transferred to the man, even in cases of joint construction or purchase of a house or apartment. By this women remains deprived of the right to dispose of their own property, or the right to run their own business, if there is a need for it, since there is not enough material resources, and they are not able to raise mortgage loans as a favorable alternative provision of financial resources. If a woman is financially dependent on someone else or doesn't have her own sources of income, she is likely to be on the margins of social events and without the possibility of active socialization.

It turned out that women are realistically discern, versatile thinking, and respect the opinions of others. Women hear better than men and faster adopt modern solutions. Thirty years ago barely, five percent of women were among the Masters of Science, and today women make up to between forty and fifty percent of participants specialized postgraduate business programs. According to some statistics, it is believed that women in Europe triggered or have been triggered every fourth new job. Many women have the creativity, the necessary expertise and skills necessary to start a new business, but often, unlike male entrepreneurs do not have equal access to credit, education and information, without which no successful conduct of business is possible(Witbooi & Ukpere, 2011). Like their male entrepreneurs, women entrepreneurs are highly educated, prone to taking risks and have developed an entrepreneurial spirit. There are several various motives conditioned by various factors for women starting their own businesses (Inić, 2007):

- The economic situation in the country - political contacts, corruption, crime, access to credit.
- Legal regulations - whether women have adequate legal assistance and access to information on the legal aspects of business;
- Cultural and social factors - traditions and patriarchal attitudes in society about who should be entrepreneurial.

Table 3: Women's and men's managerial qualities

"Women managerial qualities"	"Men's managerial qualities"
- Preference particular	- Abstractly
- The tendency of power-sharing and information	- Leadership through comparison and control
- Encouraging participation and cooperation	- Relying on the power situation
- Avoiding the risk	- Risk appetite
- Little tendency to superficial effects	- Little resistance to superficial impressions
- Orientation on mutual relations	- Orientation to action
- Network "family" structure	- Hierarchical, "military" organization structure
- Understanding of other people's behavior and problems	- Ignoring other people's personal problems and concerns
- Willingness recognition of personal mistakes	- Striving for hiding personal fouls
- The tendency harmonious relationship with the environment	- Willingness to conflicts and conflicts
- Emotional durability and resistance to frustrate	- The tendency of the explosion or "cracking" in crisis
- Greater self-control	- Smaller self-control
- Less hastiness	- Larger hastiness
- Stability in attitudes	- The tendency of changing attitudes
	- The exchange of services as a source of motivation
	- Analytical and rational problem solving

4. FEMALE ENTREPREUNEURSHIP IN SERBIA

On the labor market, statistics do not anticipate an unfavorable position of women in relation to men: from around 900,000 unemployed, 56 percent are women, but it is similar to their percentage share in the 1.9 million employees. (Zlatkov Cvetković, 2015) gives a qualitative review study of the perceived enabling factors for the female entrepreneurship in Serbia.

On the other hand, in Serbia, women are owners or co-owners of 16 thousand companies. This is the fifth of the total number of domestic companies. When these figures are compared with other countries, it is possible to conclude that Serbia already has a European average because even in Sweden, for example, there is no more than 22 percent of women entrepreneurs.

Unfortunately, a large number of companies in Serbia are only registered in the woman's name. More precise information is obtained when take into a consideration in how many companies woman is the wife of the owner and the manager of the same time, because then the more likely that they are present there only by name. By this criterion, according to data from the Agency for Business Registers, the women are manager in 6,700 small and medium-sized and 16 large companies in Serbia.

"Women's entrepreneurship in Serbia was mentioned ten years ago, when international aid programs were directed at women-refugees, as the most vulnerable category".Research suggests that as many as two-thirds of women who have a job, consider the woman in Serbia difficult to start a business because of the "Balkan syndrome". In one group of courageous women who have begun to engage in business, this percentage was reduced to a quarter. The principle is proverbial - who wants to do something - finds a way, who does not want - he finds an excuse.

So whether women themselves may give rise to men's frivolous understand the business? Often, they themselves are the victims of prejudice that could be "subject to" discrimination by males, women often do not have enough confidence to say, there is no authority to impose their views, and they fear that the reason for the loss of value in the eyes of men.

The fact is that in Serbia there are still traces of patriarchy, but it is not only a male (Zlatkov Cvetković, 2015). Do women begin to act more decisively, men will certainly not reject a good business proposition, just because it is sent by a woman. And that is the future of women's entrepreneurship, the future we must create and carve women. Any other approach would mean further loss of half of the intellectual capital, as a company and a country.

However the Statistical Office of the Republic of Serbia in its annual report of 2012 stated that the total number of employees (1.73 million), 1.34 million were employed in the companies, of which 626,000 were women. When it comes to entrepreneurs, they were 385.93410 or together with the employees, of which 171,000 were women.

When it comes to farming, women have been registered 28% of all farms. However, they make up only 23% of all individual farmers and 71% of unpaid family members in agriculture. In 2012, he was an almost equal number of those who would and who would not have started their own businesses, while men showed a greater willingness than women. It also has been shown that women with higher education show the greatest interest in the opening of a private business, where the youngest 47% of women do so if they have some features which confirms that entrepreneurial orientation with the younger generation to grow.

Based on information available from multiple sources, it is clear that the economic potential of women in Serbia is not used enough, either as a business owner or as a workforce. Comparative studies show that in 2007, among women aged 18-64 years, there were only 7.9% entrepreneurs. Recent studies from 2009 indicate that there were 14.9% of self-employed among women aged 15-64 years who are registered as employees.

5. SUPPORT MEHANISMS FOR GENDER EQUALITY AND WOMEN'S ENTREPRENEURSHIP IN REPUBLIC OF SERBIA

The National Strategy for Gender Equality (Republic of Serbia, 2016) is a basic strategic document of the Republic of Serbia, which shall be adopted with the aim of eliminating discrimination against women and achieving gender equality through the conduct of the equal opportunities policy for the period from 2016. to 2020. The strategy shall be adopted under the constitutional obligation of the State to guarantee the human rights provided by international treaties ratified, accepted rules of international law and the law of equality between women and men. It shall develop equal opportunities policy and it prohibits discrimination on any grounds, including that based on gender. Gender equality is a fundamental constitutional principle.

Gender Equality Law (Republic of Serbia, 2009) requires all public authorities to conduct an active policy of equal opportunities and to monitor the implementation of the principle of equality based on gender in all areas of public life and the implementation of international standards and the Constitution guaranteed law in this area. The strategy represents system of measures and policy instruments that the Republic of Serbia needs to implement in order to promote gender equality, fulfillment, respect and protection of women's human rights and the prevention of gender-based discrimination, especially against by certain persons or groups of persons belonging to vulnerable and multiply discriminated groups.

By creating, adopting and implementing the future national strategy for gender equality, the Government of the Republic of Serbia confirms their determination to persevere on the path of reforms that will ensure the full range of human rights of all citizens and complies with its obligations arising from the documents signed on the path of joining the European Union. Adoption of this Strategy is one of the priorities of the Republic of Serbia defined for the period from 2015. to 2018. in the National Program for the Adoption of the Acquis EU in 2014. - 2018 (European Integration Office, 2014).

In the period from 2016. to 2020, the state will focus on achieving the following general objectives in the policy of gender equality:

- Efficient use of sets of complementary gender-sensitive policies to promote exercise, respect and protect of the human rights of women.
- Gender equality is incorporated in all policies at all levels.
- Institutional mechanisms for gender equality is established and works effectively at all levels. The strategic objectives are aligned with the current policy documents, international standards of gender equality, the existing legal framework and the government's priorities defined in the National Program for the Adoption of the Acquis (2014 - 2018).

5.1. Motivations for women entrepreneurs

In our environment, it is known that the main motive of entrepreneurial business has a financial nature. There are still other factors of motivation of female entrepreneurship (Anuja, 2016) (DeMartino, Richard and Barbato, 2015):

- Dissatisfaction in large companies occurs due to various conflicts in the family, then layoffs, job responsibilities.
- The balance of family and work - for this reason more women are opting for smaller companies, because children cannot look after themselves.
- The desire to challenge - 44% of women entrepreneurs shows that when they began work, they realized that all they can do for the employer can do for yourself.
- Motivational differences.

Many analysts believe that women do not start big companies in order to satisfy their ego. They support each other. Researches have shown that men and women see success differently. While men see their success as achieving the objectives, women experienced success as a work that fills them, as well as control over their lives.

6. CONCLUSION

Female entrepreneurship is a reality and one of the main factors contributing to economic development in many countries. Political and economic changes in the past have created the possibility for women to set up companies and manage them. One possibility that is increasingly used today in countries with developed market economy, women control more than 25% of the total number of companies. Women represent more than one third of the total involved in entrepreneurial activity, while their participation in the informal sector of the economy is much larger. Generations of women in the world diverse heritage and education contribute to their environment and express very encouraging signs of entrepreneurial spirit. Women entrepreneurs have complex and keen sense of their management skills. They are better than men in giving new ideas, better in negotiating and convincing the interlocutor. Women are creative and responsible, self-confident, aggressive, goal-oriented, eager to be the first and only.
