Foreword

We are very pleased to present the Proceedings of the XIII International Symposium of Organizational Sciences, traditionally organized by Faculty of Organizational Sciences, University of Belgrade, and held at the beautiful mountain resort Zlatibor, located at the heart of Serbia. We have selected the general theme «INNOVATIVE MANAGEMENT AND BUSINESS PERFORMANCE» for this year's Symposium and with great satisfaction report high interest and response that we received to the call for papers. More than 250 papers and about 500 authors and co-authors, scholars and practitioners, are represented with their contributions in the Proceedings.

The authors have contributed, from multitude of perspectives based on – or cutting across - many disciplines and specializations, to the ongoing and rapidly increasing discussions and research in the subjects of management and innovation leading to business performance improvement. Presenters and participants are discussing the latest research and applications in innovative management and its relations to business performance, wealth creation and improving the quality of life. The broad scope of the thematic issues covered in the contributions presented in the Proceedings confirm that Innovative management and business performance is a multifaceted phenomenon that cannot be easily squeezed into a particular branch of technical, social sciences or the humanities.

The purpose of the Symposium in providing a unique international forum to facilitate interdisciplinary discussion of current issues and exchange of cutting-edge information, ideas and innovative solutions is clearly achieved and represented by the papers that cross the boundaries between different fields and disciplines and report collaborative research. It also shows that the current turbulent and very often unpredictable environments in which firms operate create pressures on academics and practitioners to better understand and respond in creative and innovative ways by searching innovative solutions for continuous business performance success. Crucial responsibility and starting point for sustainable development, competitiveness and high business operations performance lies within the creative, open, innovative and collaborative management. Innovative management leads to exceptional business performance at the core of economic and social development. We are grateful to the many authors and co-authors that contributed their thoughts and talents to enrich the state of knowledge in this field.

The broad themes of the Symposium have allowed for exploration of different aspects of these areas:

- Innovative organization and management
- Performance Management
- Business Intelligence and Decision Making in Management
- Business Psychology
- Communication Management and Social Networking
- Corporate Social Responsibility
- Education Management
- Entrepreneurship and Management of Small and Medium Enterprises
- Financial Management
- Health Care Management
- Human Resource Management
- Information Technologies in Management
- International Management
- Knowledge Management
- Marketing Management
- Operational Research and Quantitative Methods in Management
- Operations Management
- Organization of Business Systems
- Project Management
- Public Administration Management
- Quality Management
- Strategic Management
- Sustainable Development and Environmental Management
- Technology and Innovation Management
- Case Studies

Proceedings contain full papers accepted for presentation at the Symposium. Also, it includes papers of invited keynote speakers, to whom we express appreciation for taking part in this year's SymOrg.

Belgrade, May 25th, 2012.

Abstract: *The paper reviews the literature and shows the main results of empirical studies about the relationship between human resource flexibility and innovation. This relationship is not linear and straightforward but depends of each specific dimension of human resource flexibility, and at the same time it is moderated by different variables.*

Keywords: *flexibility, human resources, innovation, moderator effects, industry.*

1. INTRODUCTION

In the past several years, the European Commission has opened up a dialogue and made recommendations concerning the requirements of flexibility in the labour markets of European countries with the aim of shaping new human resource management practices compatible with new forms of work organization (an initiative referred to as “flexicurity strategy”). The ultimate goals of this dialogue and the research tied to it are, by improving firms’ innovation capacities, both to promote their competitiveness in a globalized world and to maintain the European social model. At the centre of this drive is the “insider-outsider” model of the labour market, according to which the work force is divided between incumbent employees whose positions are protected by labour turnover costs (the insiders) and entrants (with low turnover cost) and unemployed workers. The flexicurity strategy is aimed at reducing the divide between insiders and outsiders in the labour market so as to improve firms’ use of human capital.

At the same time that European countries debate about the important changes in labour relations promoting flexibility, new challenges arise regarding the factors directly related to increase innovation capabilities. Innovation contributes to the firm’s competitive advantage, and therefore country’s competitiveness. Among the factors influencing innovation, the relationship between human resource flexibility and innovation has received little attention. Human resource flexibility focuses on adapting employee attributes (such as skills or behaviours) as well as on modifying the number of working hours to changing environmental conditions. These flexibility abilities are important not only because they contribute to cost reduction but also because they may influence innovation. For instance, skill polyvalence enables employees to respond better to stimuli which have appeared previously by thinking of new ideas and introducing more products, more quickly than competitors.

However, prior research has not established consistent relationships between human resource flexibility and innovation. Some theoretical perspectives and empirical research seem to view the model of flexibility provided by the institutional framework as neutral because its aim is simply to provide the flexibility firms need. However others argue that labour market institutions can affect the innovative activity of firms. To the extent that their argument is correct, the model of flexibility dictated by the institutional framework is not neutral. For instance, excessive resort to outsiders gives employers little incentive to invest in human capital initiatives such as training and, as a result, restrains the implementation of forms of work organization that lead to greater innovative activity. The aim of the strategy proposed by the European Commission, nevertheless, is not to eliminate the numerical flexibility provided by temporary workers (outsiders); rather, it is to look for a balance between this flexibility and the functional flexibility associated with new forms of work organization. Flexibility allows firms to match employment with output levels more closely.... However, flexibility may discourage long-term investment in transferable skills by the employer, since the worker may not stay with the firm. It also discourages investment in firm-specific skills by the worker, since there may not be an adequate return on that investment in the absence of job security.

The purpose of this paper is to contribute to the analysis of the relationship between human resource flexibility and innovation by discussing theoretical arguments and exploring some latest empirical evidences from studies that focus on different dimensions of human resource flexibility. We show specially data from Spanish manufacturing firms because with the highest proportion of fixed-term employees in the

European Union, the Spanish labour market is an exceptionally good test case for investigating whether and to what extent heavy reliance on temporary workers and other flexible dimensions constrains innovation. Adding interest to the case is that the predominant collective bargaining model in Spain has been –just until this same year- quite far from the coordinated bargaining models that characterize the most innovative EU countries.

2. THEORY

2.1. Measures of human resource flexibility and innovation

Flexibility options have the potential to broaden the range of capabilities necessary to innovate. Some scholars (e.g., Karuppan, 2004; Upton, 1995) argue that human resource flexibility constitutes a platform to build other levels of flexibility and explain the variations of innovativeness. Milliman et al. (1991) define human resource flexibility as “the capacity of human resource management to facilitate the organisation’s ability to adapt effectively and in a timely manner to changing or diverse demands from either its environment or from within the firm itself” (p. 325).

Human resource flexibility can be classified in internal and external. Internal human resource flexibility (functional and internal numerical) involves efforts to increase the firm’s ability to adjust to changing circumstances through modifications of the internal labour market or work organisation. External human resource flexibility uses changes in the external labour market through short-term hires, temporary help agencies, or consulting/contracting firms and R&D centres. Each human resource flexibility category may contribute differently to deploy employees’ embedded knowledge and to broaden the access to knowledge-based resources that support innovativeness.

Given the variety of human resource flexibility dimensions, many scholars recognise that firms rely upon different modes of employment. For instance, Matusik and Hill (1998) and Tsui et al. (1995) have studied differences in employment relationships that range from long-term relationships with core employees to short-term exchanges with external workers. In the core-periphery model of the flexible firm, Atkinson (1984) differentiates between: (a) the core employees who are most vital to the firm because they are involved in activities that generate core competences like innovation; and (b) the periphery of external employees who are less important because they perform activities that generate non-core competences. However, not all the external work arrangements have the same implications for innovativeness, and therefore this model has been criticised.

Lepak and Snell (2002) have overcome the limitations of the core-periphery model by examining human resource configurations in a two-by-two typology according to the dimensions of strategic value (contribution to the firm’s core competences) and uniqueness (extent to which they are rare in the external market) of employees. They argue that besides a core of knowledge employees and a periphery of short-term contractual employees, firms may establish partnerships or hire highly qualified individuals whose skills and knowledge-intensive services are more transferable than that of core employees. Other scholars also argue that a firm’s innovation increasingly relies on external knowledge sources (Quinn, 2000). Looser employment relationships may enable firms to gain access to an array of diverse specialists, filling identified knowledge gaps which firms may not afford to engage internally on a full-time, permanent basis (Matusik and Hill, 1998; Nesheim, 2003).

Internal human resource flexibility includes functional flexibility and internal numerical flexibility. First, functional flexibility means a process through which firms adjust to changes in the demand for their output by an internal reorganisation of workplaces based on multiskilling, multitasking, teamwork and the involvement of employees in job design and the organisation of work. Two causal links can explain the relationship between functional flexibility and innovation at the firm level.

On the one hand, functional flexibility practices like multiskilled teams may contribute to a wider dispersion of skills and knowledge that make the deployment of individual workers to particular tasks more adaptable and, as a consequence, may positively influence innovation (Arvanitis, 2005; Kelliher and Riley, 2003). The speed with which individuals learn to perform new tasks is becoming increasingly important in today’s environment of rapid technological change. Firms with larger percentages of employees involved in functional flexibility practices are more able to innovate activities because: (a) functional flexible practices require employees to be trained in order to enhance their individual skills; and (b) the process of

innovation in the firm needs the cooperation between different departments. Both inputs create opportunities for the adoption of multifunctional teams that need employees with skill polyvalence and a wider dispersion of knowledge which leads to greater innovation at the firm level.

On the other hand, functional flexibility can improve the quality of working life by reducing monotonous, repetitive work. Flexible practices are supported by human resource policies like on-the-job training that contribute to develop employees who generate core-competences like innovation (Kelliher and Riley, 2003). Ehrlich (1994) states that the new psychological contract that offers 'employability' through developmental experience creates more productive employer-employee relationships at the firm level. Improving labour relations facilitates the performance of multifunctional teams that develop new product and process innovations. As a consequence, the ability to be functionally flexible may enhance innovation through commitment and development of core employees.

Second, internal numerical flexibility is related to adjusting the employment volume to changes in demand through part-time contracts and the annual, monthly or weekly distribution of working-time. Flexible practices like flexitime contribute to job satisfaction (Konrad and Mangel, 2000), which in turn may enhance innovation at the firm level. The concepts of psychological contract, organisational commitment and psychological safety offer causal explanations. First, psychological contract and organisational commitment are two related concepts: psychological contract consists of employees' beliefs regarding what employers owe them and what they owe their employers in turn; organisational commitment is a stabilizing force that binds individuals to organisations (Ng and Feldman, 2008). Employees who perceive that they are valued by their organisations are likely to reciprocate with greater discretionary effort to ensure organisational goals are met (Wayne et al., 1997). For instance, employees covered by practices like flexitime and supported by their supervisors to balance work and family, feel more psychological contract and organisational commitment (Veiga et al., 2004). These employees which in turn may be more willing to increase efforts in innovation activities like extra time in new product development teams that enhance innovation at the firm level.

Second, psychological safety –the degree of support for interpersonal risk taking- reinforces the link between flexibility and innovation. The implementation of practices like flexitime requires the support of supervisors and top managers (Eaton, 2003). Without this support, employees are reluctant to adopt these practices because managers might perceive them as little compromised to their jobs. However, a supportive job environment created by internal numerical flexibility enhances the employee's psychological safety, and this may lead to greater innovation at the firm level. These learning processes contribute to the deployment of knowledge and the performance of multi-functional teams in activities like new product development which leads to greater innovation at the firm level.

Regarding external human resource numerical flexibility, it adjusts the firm's output by contracting and firing temporary employees: short-term hires, temporary help agencies and consulting/contracting firms. Firms use these non-standard work arrangements in their innovation activities for different reasons. On the one hand, firms may emphasize numerical flexibility: the use of 'more or less input of similar knowledge'. Training, recruitment, and hiring costs are lower for temporary than for permanent employees, and firms can manage capacity more efficiently (Kalleberg and Mardsen, 2005). On the other hand, firms may also develop flexibility capabilities by assessing, creating, and implementing 'new knowledge'. Both needs of knowledge should have different theoretical implications to use each type of external work arrangement.

First, short-term hires may contribute to reduce labour costs but they may also have negative outcomes. Innovation requires organisational commitment that it is less frequently found among short-term hires (Michie and Sheehan, 2003, 2005; Posthuma et al., 2005). For instance, the performance of new product development teams may be less productive whenever there are poor labour relations within the team and with supervisors.

Second, firms can lease employees from temporary help agencies for the same reasons than short-term hires. These employees may also represent a threat to job security, indicating firm can easily get someone else to do the same job which can affect the stigmatisation of temporary employees. External workers are more difficult to organise and often have different objectives from those of the permanent workers, making collective bargaining difficult which may negatively influence labour relations and discretionary efforts (Pfeffer and Baron, 1988). These employees are also normally excluded from in-house training programs

which make them less productive for new product development teams which negatively influences innovation at the firm level.

Third, firms may use consulting/contracting firms or universities/R&D centres to provide numerical flexibility and obtain knowledge. When properly planned and executed, firms that hire knowledge-intensive activities reduce innovation process obstacles (Gupta et al., 2009). Similarly, firms that conduct their own R&D and seek external knowledge related to their core competences can more effectively incorporate this external knowledge and use it to enhance innovation. Thus, firms concerned with developing innovations may acquire the services of consulting/contracting firms or universities/R&D centres. These external employees bring knowledge of occupational and industry best practices into the firm, and may stimulate exploration of ideas outside the firm's knowledge stock (Nesheim, 2003). This flexibility offers increased opportunities for much faster and lower-cost innovation to firms that develop their core competences and integrate outside knowledge properly.

Then the literature reveals disagreements about the association between human resource flexibility and innovativeness. Whereas some scholars suggest the need to build and sustain committed human resources with full-time and permanent contracts, others argue that different types of looser employment relationships may contribute to innovation. Serrano and Altuzarra (2010) even propose a two-part hypothesis to test that the relationship between flexibility and innovation is not a linear one: innovation is not incompatible with the numerical flexibility provided by the insider-outsider model; but excessive resort to temporary workers can hamper firms' innovative activity. The threshold at which innovation activity begins to decrease could be different for different countries, depending on their respective labour market institutional frameworks and productive structures.

The non-conclusive findings can be partly explained because the absence of moderators in these studies and because prior research is mostly focused on the influence of single flexible practices on limited measures of innovation output. We have carried out several empirical studies which include moderator effects in order to test the influence of some moderators on the relationship between flexibility and innovation. These moderators could contribute to reconcile the differences in theoretical discussions and empirical results found so far.

2.2. Moderator effects between human resource flexibility and innovation

There has been very little discussion in the literature about the moderator effects that could explain differences in results on the relationship between flexibility and innovation. Nevertheless there are at least three moderators that could be introduced to analyse this relationship: inter-organizational cooperation, environmental dynamism, and the level of flexible technology in operations.

First, the role of inter-organizational cooperation is important because as a firm increases interactions with other members in the supply chain, it may experience changes in its organizational flexibility. External cooperation may modify (increase or decrease) the need to be flexible internally and this could have implications for the firm's innovation performance. Firms that cooperate in new product development within the supply chain can broaden their knowledge base and contribute to diffuse innovative work practices along the supply chain. High-cooperation firms can access a broader knowledge base than low-cooperation firms, and therefore they may be more able to deploy a wider dispersion of knowledge through human resource flexibility that contributes to greater innovation performance.

Firms that combine resources can gain a competitive advantage over firms that are unable to do so, and this is viewed as one of the key benefits of inter-organizational cooperation. For instance, Gupta et al. (2000) found that involvement of suppliers and participation in joint-venture/strategic alliances in the R&D process is greater in high-R&D effective organizations than in low R&D-effective. Thus, previous experiences of inter-organizational cooperation in the supply chain forge close bonds over time and increase confidence that exchange partners will pursue mutually compatible interests thereby facilitating the exchange of knowledge crucial for innovation performance. Accordingly, cooperation experience may foster supports adaptability, and deters opportunism that can positively contribute to innovation performance. Besides, inter-organizational cooperation will require the use of inter-organizational systems which other studies have demonstrated that provide flexibility in relationships with connected trading partners, improving responsiveness and other flexibility dimensions relevant to innovation.

Thus, inter-organizational cooperation may positively moderate the relationship between external human resource flexibility and innovation, which enables high-cooperation firms to benefit from external flexibility. This moderator effect could reconcile competitive results from the literature about the relationship between external flexibility and innovation. Employing contingent workers in combination with internal employees might be advantageous to upgrade the firm's knowledge stock. External knowledge from inter-organizational cooperation activities may also bring knowledge of occupational and industry best practices into a firm, and stimulate exploration of new processes and ideas outside the firm's knowledge stock.

Second, environmental dynamism, which describes the rate and unpredictability of change in a firm's external environment, may also be very important. Dynamic environments are characterized by changes in technologies, and variations in customer preferences and product demand. In low-dynamic environments, firms might efficiently fit their human resources with the demands of the competitive environment, by developing a human capital pool with a narrow range of skills. However, when the firm's operating environment is highly dynamic, previously developed capabilities may not be able to keep up with the frequent changes in technological conditions. The misfit between a firm's existing capabilities and the firm's operational environment may be mitigated if the firm can explore new areas and build new capabilities. Firms engaging in continuous exploration of knowledge are likely to have technical groups with varied perspectives and are then better able to reframe problems and overcome competitive traps when the environment demands organizational change.

Firms in highly dynamic environments may also need more access to relevant external knowledge than firms in more stable environments. These externals may bring knowledge of occupational and industry best practices into the firm. External knowledge may leverage the internal stock of knowledge to develop innovations in order to overcome greater environmental uncertainty. At the same time, firms in highly dynamic environments may need to enhance the in-house dispersion of knowledge and the deployment of employees' skills through core innovation activities. Firms in highly dynamic environments may also need more adjustments than firms in low-dynamic environments. If environmental dynamism raises the rotation of temporary employees, then the negative influence of short-term hires and temporary help agencies would be enhanced in terms of lower organizational commitment which in turn would negatively affect innovativeness.

And third, the level of flexible technology has been almost ignored as moderator effect in the flexibility-innovation relationship. However, flexible production environments need more deployment and access to knowledge than traditional production environments in order to accommodate changes in the business environment and the increasingly demanding needs of well-informed customers. Flexible production technologies also require the use of flexible employment to accommodate changes in production and market demand enabled by increasing levels of flexibility in production technology. The development and implementation of flexible production technologies may need as well the access to external experts and consultants on the technological activities required to carry out such projects.

3. EMPIRICAL STUDIES

There are very few empirical studies that have analysed the relationship between innovation and flexibility. The following paragraphs briefly describe the results and conclusions from these studies.

Michie and Sheehan's (2003) study illustrates this complex relation between innovation and flexibility. They studied innovation and human resources flexibility in a survey of 242 UK manufacturing organisations. First, they found that the use of innovative work practices (functional flexibility) was significantly positively correlated with all categories of innovation, especially process innovation. On the contrary, the use of short-term and temporary contracts was negatively correlated with all categories of innovation combined, although not significantly so with product innovation taken alone. And thirdly, the use of part-time employees was negatively correlated with all categories of innovation, significantly so for process innovation. The authors concluded that the more innovative firms had been those that had passed up the use of numerical flexibility and external work practices, and instead have pursued the sort of functional flexibility associated not with short-term and temporary contracts but, on the contrary, with employment security. These results would support the Atkinson's model of the flexible firm since innovation activities are performed in core value-creation areas and require multi-skilled employees with employment security.

Storey et al. (2002) also found that employers were rarely using flexible working as a strategic lever to achieve innovation in a large-scale survey of 2,700 UK companies and more detailed case studies. On the contrary, not only was flexibility in the main pursued for other reasons (cost minimization or labour shortfalls), but the potential impact (negative or positive) on innovative capacity was usually not taken into account. The authors even suggest that flexible working was a consequence rather than a driver of innovation. For example, flexible support was required in some cases to release the time and resources of those core employees who became actively engaged in innovative projects. Likewise, flexible contracts may be needed to enable the firm to move into uncertain new business areas without contractual commitments to full-time employees. Thus, what the authors suggest is not that flexible employment per se contributes directly to innovation but that the rise in flexible employment practices reflects the degree of innovative activity. This result is quite interesting because indicates that firms in dynamic and high-technology environments might be in need of flexible arrangements (numerical flexibility or outsourcing) to keep up with technology development in non-core value-creation areas or access relevant capabilities with less risk.

This late empirical evidence would support the proposition that companies might use flexible practices to complement innovation activities in core value-creation areas, according to the theoretical framework developed under the relational view of the firm and the resource-based view of the firm. There are even some studies that challenge the assumption that the use of flexible employment (e.g., fixed term or temporary contracts) will have negative consequences for innovation. For example, Guest et al. (1999)'s report that, overall, contingent workers displayed no differences in levels of motivation, organizational commitment or innovative behaviour compared with permanent employees. Indeed, the authors suggest that those on fixed term and temporary contracts, especially where they have chosen this form of employment, sometimes actually report a more positive 'psychological contract' and a potential higher propensity for innovation¹. Furthermore, Nesheim (2003) found in a sample of 26 Norwegian firms in the information technologies industry that firms in dynamic environments often use external personnel deliberately in core value-creation areas; the use of external arrangements in the core value-creation areas was positively related to innovation strategy.

It is interesting the findings of Serrano and Altuzarra (2010) who investigated the relationship between manufacturing firms' innovation activity (measured by product innovation, process innovation, and R&D activities) and their numerical flexibility (proxied by the rate of fixed-term contracts). Estimates using data from Spain's Survey on Firms' Strategies for the years 2000–2002 revealed a non-monotonic relationship: a firm's probability of innovating and carrying out R&D increased as the rate of use of temporary and other non-core workers increased, but only up to a threshold, beyond which this probability decreased. This result means that external flexibility may not be incompatible per se with innovation at a firm level but empirical analysis should pay more attention to the type and level of external flexibility. Other studies only find linear negative relationships. For instance, Beugelsdijk (2008) finds a negative relationship between the use of short-term employment contracts and the firm's ability to generate product innovations.

This double-side impact on innovation can also be found between innovation and outsourcing. Thus, Mol (2005) found that R&D intensive industries in the Netherlands initially displayed a lower level of outsourcing, but that R&D intensity became a positive predictor for changes in outsourcing levels over the 1990s. These findings suggest that firms in R&D intensive industries have increasingly started to rely on partnership relations with outside suppliers, which corroborates the propositions outlined by the relational view of the firm that outsourcing levels of R&D intensive industries should have risen to access other firm's innovation resources.

Other studies have been carried out at a more strategic level. The purpose of these studies is to examine the effects flexibility has on firms' innovative capacity. According to the resource-based view of the firm, dynamic capabilities that enable firms to fit the environment become a source of sustainable competitive advantage. Following this line of research, Verdú-Jover et al. (2005) examined the impact of different flexibility levels –strategic, structural and operational- on a sample of 417 European firms' innovation capabilities. The results indicated that strategic flexibility was the only flexibility level impacting on the organisation's response capacity through innovation. Neither structural nor operational flexibility explained the company's innovative capacity or innovativeness. This type of studies highlights the importance of top management to develop capabilities to be flexible and help firms manage environmental uncertainty.

¹ The argument ultimately is that the type of employment contract (whether permanent or fixed term) matters to the individual rather less than other factors, such as job design or the existence of supportive and progressive human resource policies.

Firms that are strategically flexible are usually well situated to anticipate market demands and respond to them by developing innovative products and services.

We have carried out two more comprehensive empirical studies about flexibility and innovation. Our first study analysed the moderator effect of environmental dynamism in a sample of 123 Spanish automotive suppliers (Martinez et al., 2011). Following this analysis, we have explored in a recent study more moderator effects in a larger sample of Spanish manufacturing firms.

Our first study (figure 1 & table 1) indicated that internal (functional and numerical) flexibility and the external flexibility of R&D consulting/contracting firms are positively related to innovativeness². Regarding the other two dimensions of external flexibility, the percentage of short-term hires is negatively related to innovativeness whereas the percentage of employees from temporary help agencies is not significantly related to innovativeness. Environmental dynamism positively moderates the relationship between two human resource flexibility dimensions and innovativeness: functional flexibility and R&D consulting/contracting firms. Other human resource flexibility dimensions are not significantly moderated by environmental dynamism. Employees directly involved in innovation activities are far less subject to external flexibility. Although the use of flexible practices has increased over the analysed period, staff in general is approximately twice as likely to be the target of flexible contracts than the staff involved in innovation. Besides, consulting/contracting firms are more used to innovate, whereas short-term hires and temporary help agencies contribute less to innovation.

Our second study is more comprehensive in terms of sample size and moderator effects. We use the Survey of Business Strategies (SBS) questionnaire which contains a set of statements that permit the study of human resources and innovation for a great number of Spanish industrial firms. The SBS is an annual survey conducted by the SEPI Foundation³ in collaboration with the Spanish Ministry of Industry with the objective of knowing the evolution of the characteristics and strategies of Spanish industrial firms. This survey contains information about markets, customers, products, employment, technological activities and economic-financial data of the firms. The reference population comprises industrial firms operating in Spain and with more than 10 employees, with representativeness being one of its characteristics. We develop a database with panel data from 1,626 industrial firms in the period 2003-2006.

The dependent variable in the study is innovation performance at the firm level. We use three variables to run two logistic regressions and one linear regression: product innovation (dummy), process innovation (dummy), and number of patents granted. The independent variables are three measures of external flexibility: the percentage of temporary employees in the workforce, the use of R&D external employees from technology centers/contracting firms (dummy), and the outsourcing of R&D activities (dummy).

The three moderator variables are: inter-organizational cooperation in technological activities with customers, competitors, suppliers and R&D centers (categorical variable from 0 to 4), market dynamism (index of change in the marketplace), and flexible production technology (use of flexible production technologies – categorical variable from 0 to 6 that takes into account the number of flexible technologies implemented in the production process: robots, flexible manufacturing systems,...).

Table 2 shows the results from the three regressions. They indicate that we have to differentiate between the influence of external flexibility on the decision to innovate (dummy variables of product and process innovation), and on the intensity of innovation measured by a variable like the number of patents. Thus, firms with greater percentages of temporary employment have less probability to obtain product and process innovation. On the contrary, the access to external knowledge through R&D individual experts or outsourcing activities may positively contribute to a successful product or process innovation. However, the analysis of patenting indicates that external workplace flexibility is not beneficial to a higher intensity of innovation: firms with fewer patents have more access to R&D outsourcing and R&D external experts than firms that generate more patents as innovation output.

It is interesting to analyze and discuss the moderator effects found in the results. First, the influence of inter-organizational technological cooperation compensates the influence, either positive or negative, of external workplace flexibility on the three studied measures of innovation output. Thus, there is a less

² We measured innovativeness as a construct of different items that measure the newness of the product and process innovation developed by the firm, and the improvement in the innovation process of the firm (such as time, cost and quality).

³ The SEPI Foundation is responsible for the survey design and control through the Economic Research programme.

positive effect of R&D external experts and R&D outsourcing on innovation in highly cooperative firms than in less cooperative firms. Inter-organizational cooperation in technological activities can be interpreted as a substitute for contractual access to external technological knowledge through R&D outsourcing and consultants. At the same time, the negative impact on patenting of R&D consultants and outsourcing is less important in highly cooperative firms than in low-cooperative firms. Inter-organizational cooperation may leverage the use of external work arrangements and R&D outsourcing to facilitate the creation and dissemination of knowledge that contributes to patenting. To benefit from external relations, cooperative rather than adversarial relations in external transactions should be sought when the level of core-related change is high. As the cooperative relationship develops, the persons brought in may be given more vital tasks closer to the core of the firm. In combination with employees and internal competence, the firm's innovative capabilities may be strengthened. Thus, high-cooperation firms that use more external flexibility practices could develop more innovations faster and cheaper.

The second moderator effect of market dynamism positively moderates the relationship between R&D consultants/outsourcing and patenting. Firms in highly dynamic environments may benefit more from this external flexibility than firms in low-dynamic environments. Environmental dynamism may enhance the need to access relevant external knowledge, as well as the internal dispersion and deployment of knowledge through employees' skills and abilities. This external flexibility may contribute to the firm's patenting by enhancing the stock of knowledge and its flow through core employees towards innovation. However, the positive contribution of R&D outsourcing to a successful product or process innovation is less important in highly dynamic environments than in low-dynamic environments. This result indicates that low-dynamic environments are less uncertain to develop innovations with the support of external sources of technology, whereas firms in highly dynamic environments may be less reluctant to outsource R&D activities.

Finally, the third moderator effect is the level of flexible technology in the firm's production process. Flexible production technology moderates positively the relationship between temporary employment and product and process innovation. There is less probability to innovate in firms with larger percentages of temporary employment than in firms with lower temporary employment. However, when there is a greater use of flexible technologies in the production process, firms may benefit more from temporary employment than in more rigid production environments.

However, flexible production technology negatively moderates the relationship between outsourcing R&D activities and product and process innovation. This means that firms with less flexible production systems can benefit more from R&D outsourcing than firms with highly flexible production processes. This external workplace flexibility may help compensate the less dynamic internal environment that contributes to the deployment of knowledge through flexible processes. On the contrary, flexible production technology positively moderates the relationship between R&D consultants/outsourcing and patenting. Firms in highly flexible production environments may patent more intensively when outsource technological activities and have access to the best industrial practices through external experts. Flexible production technologies may enhance the need to access relevant external knowledge, as well as the internal dispersion and deployment of knowledge through employees' skills and abilities. This external flexibility may contribute to the firm's patenting by enhancing the stock of knowledge and its flow through core employees towards innovation.

4. CONCLUDING REMARKS

The results reported and commented so far indicate that it is important to differentiate even further the implications of moderator effects on the impact of external human resource flexibility dimensions on firm performance. Our latest research suggests that future studies should separately formulate hypotheses for each dimension of external flexibility. It should also be necessary to differentiate among several dimensions of innovation performance, at least for dimensions focused on the decision to innovate and for dimensions that measure quantitative outputs of innovation.

The association between external flexibility and innovation depends on the type of contingent employee. Whereas the use of short-term hires is negatively associated to innovation, the contracting of employees from consulting firms or R&D centres is positively associated to innovation; the influence of employees hired via temporary help agencies is not significant. This result contributes to clarify prior research on external flexibility and innovation. We have developed our arguments in terms of the contribution of

external flexibility to the process of knowledge access and deployment within the firm. Then, it is possible to reconcile prior research by using common arguments to analyse the influence of several flexibility dimensions. The potential of employment intermediaries to contribute to innovation will in most instances be larger when personnel from consulting/contracting firms are involved, as compared to personnel from short-term hires and temporary help agencies. The first group is more likely to possess competencies that are useful in assessing industry best practices and creating an innovation-stimulating competence mix with the employees of the focal firm.

We have demonstrated the importance of moderator effects to explain the influence of human resource flexibility on innovation. For instance, firms in highly dynamic environments may benefit more from functional flexibility and consulting firms/R&D centres than firms in low-dynamic environments. Environmental dynamism may enhance the need to access relevant external knowledge, as well as the internal dispersion and deployment of knowledge through employees' skills and abilities. Both flexibility dimensions may contribute to the firm's innovation by enhancing the stock of knowledge and its flow through core employees towards innovation.

Future studies could also extend the group of moderator effects that may influence the relationship between external human resource flexibility and firm performance. For instance, the level of product innovativeness may also be relevant. When an innovation is less familiar, a project team may require more face-to-face communication as opposed to that involved in more familiar tasks and smaller changes which would reinforce the positive impact of functional flexibility on innovation performance but it would reinforce the negative impact of external flexibility as well. Another extension could be to enlarge the moderator dimension of inter-organizational cooperation activities to include network measures like the intensity or formalization of the firm's relations with the other organizations in the supply chain.

THE CHANGING FACE OF AGILITY: THE CHALLENGE AND OPPORTUNITY OF SOCIAL MEDIA

Robert M. Mason

The Information School, University of Washington, Seattle, WA 98195-2840, rmmason@uw.edu

Organizations, especially organizations that are engaged in knowledge work—whose value added depends heavily on information—are facing 4 challenges. In this presentation, I want to illustrate why these challenges exist, what the consequences are of the trends that we see in today's economic and business environment, and how organizations can meet these challenges.

We are in a revolution, a period of profound change. Organizations and institutions must transform themselves if they are to survive and remain relevant; and we as researchers must critically examine our organizational models and assumptions.

The revolution is due to the confluence and interactions of 3 streams of change:

- Technology [Internet and connectivity, social media platforms]
- Demographics
- Values and social norms—societal and community behavior

The next few paragraphs review these three trends and describe how they affect how we work and live together, how they affect the process of innovation, and how we may need to revise our approaches to leadership and research on organizations. Whether we are practitioners or researchers, we have to take a critical approach to our past experiences and knowledge and our past assumptions about how we organize for knowledge work.

TECHNOLOGY AND INFORMATION FLOW

The first trend is the wave of social media platforms and services that have emerged and are attracting huge numbers of users (and investors: as I write this, Facebook's initial public offering valued the company at over \$100B, the largest ever IPO). The ubiquity of social media changes how people behave and changes societal norms. Some examples of what is "normal" with today's set of information and communications technologies

- Books delivered in seconds to hand-held tablets, which can hold trunk-loads of books
- Access to information is assumed; discussions of facts can be settled quickly; Wikipedia has consolidated the world of facts into a set of accessible resources—in multiple languages
- The old-fashioned 'sneaker-net' used to communicate by word of mouth among friends and colleagues is complemented by Internet platforms that enable information sharing with unprecedented speed and reach; an information event can go viral in days or even hours
- Personal information sharing continues to expand through an increasing number of social media platforms. While Facebook perhaps is the best known, with over 900 million active users (Anon, 2012a), there are dozens of other platforms: Youtube, Twitter, Pinterest, ..., and new ones are being offered every day. It's unclear how many blogs exist, but the Technorati directory list over 1.3 million (Anon, 2012b) The result is an information ecosystem in which different platforms evolve and change and become differentiated over time.
- Information sharing has become big business. With a price of \$38/share, Facebook's initial public offering (IPO), which valued the company at over \$100 billion, which was the largest ever initial valuation for a public company (Raice, 2012). Even with the recent fluctuations in share price, the high valuation of the firm shows how much business interest exists in social media companies.

DEMOGRAPHICS

If the technological changes taking place were not enough, we're seeing a major shift in the demographics of the world's population. The "Net Generation"—the generation that has grown up with the Internet—is entering the workplace as the "Baby Boomers" are entering retirement age. As shown in Table 1 (which shows U.S. figures, although the relative sizes of the generations for the world are comparable), the generation is the largest post World War II generation.

Table 1. Population Estimates of Three Generations of Workers

Generation	Birth Year	Age in 2000 Census	Current Age in 2012	Population Estimates *
Baby Boomers	1946-1964	36-54	48-66	82.8 million
Generation X	1965-1977	20-35	35-47	50.9 million
Digital Natives	1978-1994	6-22	18-34	69.1 million

* Population estimates based on 2000 U.S. Census

The demographic shift is not just about numbers, however. Members of this generation bring into the workplace an ease with the new technologies of information and communication. Members of this generation have never known a world that does not have the Internet, mobile phones, laptop computers, and ready access to information. This generation has a different attitude about information and work. They have different expectations about their relationship to organizations for which they work and what they expect their efforts to produce. They do not see employers as safe economic havens and thus do not exhibit firm loyalty. They may choose companies based on the values of the company and the opportunity to have an impact on society; they want their work to “change the world.” While not universal, there is a high percentage in this generation that has a heightened sense of social justice. They are concerned with the asymmetries in the world, both economic and information. Their sense of information differs from the older generation. As one NetGener expressed it in a symposium on innovation (as she was tweeting about what was being discussed), “An idea isn’t real until I’ve shared it.” Table 2 summarizes some of the distinctions between the Baby Boomers and Net Generation.

For the most part, members of the Net Generation have been told by their parents that anything is possible, resulting in self-confidence and optimism in their capability to make a difference. [It is too early to tell if a protracted recession and economic downturn will affect this confidence.] Many in this generation start businesses or anticipate starting businesses, and many of the new businesses are related to information technology, information sharing, and social networking. The NetGener see not only opportunities in the emergence of new technologies; they see opportunities with combining technologies (mashups).

Many NetGener, even if they become entrepreneurs later, first go into established companies. When they do, the combination of their confidence with new forms of communication with their comfort with technologies often creates tensions with workers used to more established routines. These younger workers—and others who have embraced the newer technologies and work practices—seem to stand apart with their approach to work. They exhibit behaviors that often are inconsistent with the practices and expectations of their colleagues who prefer a different approach to information and work. As a consequence, leaders of organizations with a mix of ages and experience in their workforce face challenges that go beyond the expected challenges of organizations that have a more homogeneous workforce (Barzilai-Nahon and Mason, 2010).

Table 2. Comparison of Working Styles of Digital Natives and Baby Boomers

Values, Attitudes, and Styles	Digital Natives	Baby Boomers
Work style	Multitasking	Time management
Learning style	Learn from experience	Learn from instruction
Collaboration	Collaborative	Independent
Motivations	Positive reinforcement; competition for fun	Competition typically is zero-sum game
View on authority	Respect for others is earned	Respect for authority
Structure	Decentralized, nonhierarchical, inclusive	Centralized, hierarchical, exclusive
Information access	Access for all	Access to those in power

[Adapted from (Barzilai-Nahon and Mason, 2010) ; See also(Tapscott, 2009a)]

VALUES AND SOCIAL NORMS

Technology, social norms of behavior, and enacted values coevolve (Barzilai-Nahon and Mason, 2010). Community and societal values are expressed in social norms; a community's behavioral norms reflect the underlying values of that community. Technology does not cause changes but does facilitate the exploration of behavioral options, which may lead to changes in how fundamental values are manifest.

Consider, as an example, the concept of privacy. As software platforms enable merchants to offer benefits to buyers who share more information, people may decide the benefits outweigh the "cost" of giving up what can be private information. Similarly, users typically find that Facebook and Google provide sufficient benefits that they are willing to tolerate the collection of personal information in return for the convenience of use. As a consequence, previously accepted norms of privacy have been, in many observers' eyes, eroded. The result is that the very notion of privacy in today's world is undergoing change.

Other changes in behavioral norms are observed to varying degrees in different communities and corporate cultures:

- The availability of smartphones means that one may always be available, changing the expectations of responsiveness to questions and issues arising from coworkers
- The availability of location-based services, leading to a sense of "persistent presence" for one's friends, family, and coworkers
- As a consequence of the affordances of the technologies, knowledge workers experience less separation of "home life" and "work life." Social life, personal life, and work life become intermingled more than ever before
- Telecommuting is more accepted. Working from home is the norm for many workers whose jobs are based on coding and systems work. Many people can (and do) work without "an office" at the firm. Others may share workplaces at a central location.
- In most cases, teamwork is the norm. Work is accomplished by communities of practice where individuals are working interdependently to produce output more often than working independently on a Taylor-like decomposition of separable tasks (Wenger, 1998).

CONSEQUENCES

The coevolution of information technology (particularly social media) with social norms and values as the demographics of knowledge workers are shifting provides the fuel for this revolutionary period. This results in significant shifts and disruptions, and consequential challenges for practitioners and researchers.

However, in any revolution, some things remain unchanged, and we should examine what is unchanged in this period. We should examine what continues to be foundational whenever we face what appears to be a dynamic and rapidly changing environment. In today's setting, I would posit that one principle remains constant. This principle is that primary driver of economic growth and development continues to be innovation, particularly technical innovation.

However, even as innovation remains a key to economic growth, the processes by which innovation occurs are changing. Innovation itself is affected by the confluence of technology, social norms, and demographics. A major shift in thinking has been the idea of crowdsourcing innovation.

The idea has been around for a decade (Quinn, 2000), and the experience of major firms such as Procter & Gamble (Rao and Sakkab, 2006) has shown the value of using networks of resources outside the firm to resolve issues associated with product and process innovation. What seems to be different is the rate of new venture formation by NetGeners (and others) based on the affordances of social media.

It should not be a surprise that Facebook was started by a NetGener, for example. Other examples may not be so obvious, but let's look at another entrepreneurial case, that of Quirky.

Quirky was formed in 2009 by Ben Kaufman when he was 23. Quirky illustrates the power of crowdsourcing, building on social media technologies, which provide the basis for many of the NetGeners' entrepreneurial efforts.

Quirky

Quirky is a company formed in 2009 that resulted from the vision of Ben Kaufman. As a self-identified poster child of young serial entrepreneurs, Kaufman (age 23) illustrates many of the characteristics we identify with NetGeners. His story demonstrates the creativity, desire, drive, and approach NetGeners take to having fun with innovation.

Quirky is Kaufman's third major launch. His first venture was mophie, began when he was in high school. Mophie was formed to manufacture and sell retractable lanyard ear buds for the iPod Shuffle. The product succeeded, and mophie followed the lanyard with more add-ons for the iPod and Apple products. In 2006, two years after its formation, mophie's "Relo" product was another hit at the MacWorld expo. The next year at MacWorld, having succeeded in raising venture capital that enabled him to have a professionally designed booth, Kaufman threw it out—noting that he did not want to be 'just another successful company'—and used 2x4s to build a framed-in, wall-less room that metaphorically stated the unfinished nature of his business. He handed out 30,000 pads to MacWorld attendees with the message, "help us decide on and design our next product line." He discovered tens of thousands of people were willing to offer ideas, and he took on the challenge of doing a complete design within 72 hours. By the end of the show, mophie had prototyped and introduced three new products (Anon, 2009). The extraordinary success of this process of "crowdsourcing" new product development got Kaufman thinking about the process, not just the products.

Despite, or perhaps because of, the success of mophie, Kaufman realized he was bored. Three months after MacWorld 2006, he sold mophie (which he described as "making iPod condoms"). As he put it, "I sold the product but kept the process." He then devoted time to refining the idea of kluster, a collaborative decision making platform that would streamline the "crowdsourcing" of innovation that was done at MacWorld 2007. Kluster tracks the contributions each person makes to the design (e.g., color, name, or other characteristic that contributes to the product's success) and uses collaborative decision making on major design decisions. Kluster soon spun off namethis, a crowd-based approach to selecting names for products and product lines.

With kluster as the platform and an appreciation of the power of the crowdsourcing process, Kaufman's begin assembling a team that would form Quirky (Rao and Sakkab, 2006). After two years of research, team-building, and testing, Quirky emerged in June 2009.

Quirky provides a combination of platform and process (based on kluster) that streamlines the collaborative (crowdsourcing) approach to innovation and new product development. Quirky enables anyone to suggest a product idea, which is then submitted to the Quirky community for comments and feedback (including the demographics on those providing feedback). Each idea is considered for the next Quirky product, which means that the Quirky community focuses on evaluating and polishing an idea and turning it into a product. The Quirky process and platform enables anyone in the extensive network (the Quirky community) to submit ideas, contribute at each stage of the innovation process, and be rewarded for their contribution.

Other Examples

The idea of crowdsourcing and open innovation has become so popular that there is a website devoted to sharing information about the opportunities—a list of "open innovators" (De Ridder). The list of almost 100 sites is wide-ranging—from early "peer production" represented by Linux, Yahoo Answers, Wikipedia—to 'freelance' platforms that match independent contractors with specific needs [e.g., Amazon Mechanical Turk; Human Grid]—to those more focused on creating new products [e.g., Quirky, Threadless and Spreadshirt (T-shirts and "hoodies"); Dream Heels (custom shoes)]. Not all are startups by NetGeners—established firms are represented in the list (e.g., Dell, Kraft, Sara Lee, Nokia, Starbucks, ...), showing that they are aware of the opportunities—but founders from the Net Generation are well represented in the list.

IMPLICATIONS FOR PRACTICE

The convergence of the above trends, and the crowdsourcing approaches to the innovation process, present organizational leaders with four challenges if their organizations are to remain agile.

Challenge 1: The Talent Life Cycle (or, the Five Forces Revisited)

In the past, competition and dynamism have been seen primarily as market and industry sector characteristics: competition for the customer and market share and defending against new entrants into the marketplace. In the 1990s, the competition was seen as the race ("war") to acquire and manage talent, and organizational agility was a key to attracting talent. In today's hypercompetitive economic environment, both dynamism in downstream (customer) and upstream (supplier) dimensions remain, but

the competition for attracting talent per se is only the beginning step in a competition to effectively utilize this talent in an expanded talent cycle that extends beyond employment.

Young knowledge workers entering the workplace bring with them a new dimension of dynamics: they demand personal development through challenging tasks, job flexibility that is higher than what baby boomers would have preferred (and have accepted), participation in development towards objectives that matter to them, and flexibility in connecting and developing their own networks. Such preferences pose challenges to organizations to which our respondents provide different responses.

In a study of firms in Switzerland, which has one of the highest innovation scores in Europe (Anon. 2011), we interviewed C-level executives and asked how their firms were handling the changes in demographics (younger knowledge workers) and the prevalence of social media (Katzy et al., 2012). The executives recognized that changes are needed in their approach to organizational structures and leadership. For example:

- *...young people who've grown up with games, these computer games, they don't do things the same way as we have done it...*
- *... young people take over more responsibility [for] themselves and give less to an employer, which is certainly having advantages and disadvantages ...*

These observations affirm that the resource-based view of the firm⁴ remains dominant. In the eyes of the executives, creative knowledge workers determine the competitive advantage of the firm and represent the capabilities for continued learning. The executives recognize that knowledge and learning are not simply an individual capability but one that is manifest through work teams and the organization as a whole.

New Motivations and Values

As implied in Table 2, NetGeners do not adapt easily to the industrial ways of working, hierarchical organizations, and bureaucratic decision making—organizational models that have been accepted by baby boomers. NetGeners seek to make a difference; they like challenges. They want to continue to improve their skills and capabilities. These motivators, more than job stability and routine, stimulate this generation of workers. Our respondents recognize these values:

- *... there are more people who are looking to do something they like. And what they like is not only the career, like having a lot of money and the title and all that, that they start a career. They also want to do something which they have a passion for. And people who are driven also by passion not only by titles and by salary ...*
- *... people have become more flexible because of the young people nowadays ... who, not all of them, but a lot of them, ... have [their] own ideas of what they want ...*

Our research and other studies of this generation (Tapscott 2009b) show that NetGeners have high expectations about their career development. They frequently assume personal responsibility to make the best out of every job. They expect to continue professional development and want to see themselves progressing; they are dissatisfied with remaining in the same position for long. As a consequence, “career paths” for the new generation of knowledge workers are more dynamic and less predictable than they once were. The job stability preferred by the baby boomers is slowly being replaced by a desire for vigorous professional development. Executives recognize this:

- *... those newcomers really take more responsibility for themselves and for their career...*
- *... these people are engaged and they do a job that want to do ...*

Solution: Re-think the Management of Knowledge Workers

NetGeners require different leadership approaches, and the pioneering organizations recognize this. Executives who had been successful in attracting the brightest new workers acknowledged and promoted work practices such as the following in their organizations.

Engage the workers early. Many of the leading firms have expanded their internship, part-time, and summer employment possibilities for college students. This enables them to establish a relationship with potential employees early and provides a low-risk and relatively low-cost opportunity for both employee

and firm to get acquainted. Each can learn from the other, and there is a greater likelihood of a good match in roles if the engagement turns into regular employment.

Search for challenging projects. For NetGeners, having fun while working and being a part of what 'changes the world' plays a crucial role in the work they do. Consulting and tourism firms have opened the social network sites for employees. Many said that an attitude of "work-life balance" is being replaced by an attitude of "work-life integration" for those who choose this approach. If employees work during their "non-working" hours, they can do private networking during their workday. The firms provided opportunities for flexible working environment (people can work from anywhere they want); home office opportunities (this is especially crucial for women with children); and interesting jobs that bring self-realization and self-satisfaction. Those firms emphasize that challenging projects in which employees can develop their own ideas and be creative provided more incentives to the digital natives than a higher salary.

Opportunities for development rather than promotion. People like to succeed, and the NetGeners are no exception. They demand more personal responsibility for what they do, but they want to be rewarded for their contributions and performance. Therefore, progressive companies encourage employees' learning and development as well as provide alternative reward paths. They organize seminars and conferences where employees can share their success stories and give advice to those who is still looking for new opportunities.

More personal responsibility. Telecommunication firms and attorneys long ago began building the relationships with their workers on results orientation and trust rather than on directing and controlling time spent in the office. These firms trust the workers to be capable and do the work needed in the time framework required. To accomplish this, they ensure a dense communication pattern: they discuss with the employees what they expect and communicate the realistic goals to which they have agreed. These firms have concluded that it is not about controlling what employees do, but rather about prospering from the good results they achieve.

Reverse mentor programs and supervision modes. For the advanced firms, hierarchical structures and top-down control and supervision modes for knowledge workers were judged to be outmoded and ineffective. Employees were an essential component and contributor to a dynamic corporate strategy. Dynamic governance and flexible roles are replacing static reporting structures, enabling an integration of strategy formulation and execution. For example, tourism firms base their governance and decision structures on knowledge authority, such as processes of peer reviews, revisions, and collaborative strategy rather than following a top-down strategy. They engage knowledge workers in the decision making processes. For these firms, fewer rules, mutual learning and continuing dialogues are effective practices. If we pictured these organizations as hierarchical, we would say that the top-down supervision has been replaced by vertical (up and down) collaboration and more intense horizontal communications.

Solution: Resolving the Issue of Short Tenure

Executives have recognized the mobility and increased dynamism of the human resource. As long-life employment becomes rare, fewer young employees stay at the same work place for several years. They become nomadic workers not only in terms of work space flexibility and work from anywhere, but they desire flexibility in where they choose to work.

Executives in our study acknowledged that NetGeners felt they easily could move from company to company; they observed that there seemed to be little stress associated with losing one's job. Typical comments were:

- ... when I started to work 25 years ago, it looked like a lot of people chose an employer and they were loyal to their employer. That has changed ... Now young people choose something they like to do. They do something and if it's not what they like, they just move on and go somewhere else. And I think that has also forced us to think differently...
- ... most of them, they do not think that this is a problem. If they lose their job, they will go for the next one...

Approach: Create and invest in alumni networks. Several of the firms acknowledged that they never try to keep employees as long as possible. It simply does not work for the firm or the employee. What these firms do is accept when employees choose to leave, recognize their valued service, but engage them in alumni networks so they remain connected. These firms keep track of what their former employees do and where they work. They invite them to the annual Christmas dinners and keep them in their network of knowledge assets. This not only widens the company's network but gives young people the chance to come back to the firm when the good opportunity arises. This approach serves as a powerful resource for identifying new talent and maintaining an engaged network as a source of new ideas and learning.

Challenge 2: Core Resources—they're not just inside the organization

Our executives acknowledge their firms are part of a broader network built around individuals' social networks:

- *...it goes in this direction; above all, we will also have to look at these social networking sites, like Facebook or even in such a business network like XING, what is being talked about there. I think, this cannot be prevented, or how can one prevent that anyhow?*
- *... the use of all of these new forms is important and I should say people establish their own networks out of the company, within the company, but this is not basically organized. That is done on individual ways. I mean people have this urge and this need to network and to stay on top of the development in their fields...*

While we have known about this effect for a long time, it now becomes increasingly clear that firms acknowledge the importance of the networks and develop ways of building trust in them. The networks are about interactions that maintain the ties between individuals, but they also are about getting access to new knowledge and information embedded in these networks.

- *... I think the way people need to interact with each other, the way people start to work in groups, the way people interact has a different work style. There is something in it, there is a call in it which I would say is relevant probably trained, it's a relevant development that I'm also seeing out there...*
- *... it depends on how you can link your private friends and working friends together. I think that one of the topic in the future that what the young people like to have. Then of course, the newest technology you should apply in your office. Social network for me is the topic, I think that's also for the working area important even it's now restricted. But we would like to motivate young people to use that...*

The use of social media has made it possible for professionals around the globe to get advice from their colleagues and share experiences with a mouse click. Utilizing the vast amount of resources that are available online available tends to make access more valued than *self-creation*. As the technology makes this easier, the focus shifts from simple factual knowledge exchanges to enabling tacit exchanges and collaboration among trusted members of the network:

- *...it is less about just having access to study results and getting numbers. It is more and more also having access to the people who have experienced something similar and so on and so forth and having these types of networks in this dimension where the human interaction earns a great value...*

Communities of practice (CoPs), as part of the knowledge management practices of the firm, are also undergoing significant changes due to the social media influence. The academic literature typically views CoPs as effective tools for tacit knowledge transfer within an organizations(Wenger 1998); the presumption is that they are contained within the corporate borders. Our studies show they increasingly bridge organizational boundaries and may be formalized as independent entities.

Professional communities have long taken this approach to formal independent associations. Journalists, doctors, teachers, and lawyers extend linkages beyond organizational boundaries to preserve their professional ethics and enhance their learning in collaboration with other professionals. Prior studies have shown that members of the professional communities often feel a stronger identity with their profession than with the companies that employ them.

FLOSS (Free/Libre Open Source Software) and other open source software communities are examples of successful open knowledge creation communities in a free knowledge ecosystem. Many of them are operated by independent knowledge workers, but many larger firms explicitly or tacitly encourage their employees to support these FLOSS developments, as IBM and Oracle have done for the Linux and the OpenOffice software package.

Question of Control

The cross-boundary nature of the individual networks raises the question of how an organization can control the flow of information in these networks and what should be the role of management in this more open information environment. If individuals' loyalties shift away from their employer toward their personal network, how should executives approach this new environment? Although many organizations express concern over the risk of potential loss of proprietary knowledge, some executives in our study express optimism that the benefits outweigh the risks:

- *... we have a strong development to the new communication channels like instant messaging, Facebook, and LinkedIn, and we are also offering these products certain services to our customers ...*
- *I am absolutely convinced that if companies make use of those features like Facebook or XING, they will gain a competitive advantage and if they don't do it at some point in time, they will actually lose people and they will lose the chance to realize on ideas that are in their company but they are not being found because they don't use these new tools ...*

The key seems to be an organizational agility to embrace openness and the opportunities for learning through the individual networks. Corporations have used similar approaches before to building strategic partnerships between and among firms with whom they could cooperate. The difference now is that the networks are individual and potentially more collaborative.

Challenge 3: A New Communication Network Ecology

The early emphasis on the use of social media for marketing and HR purposes is diminishing as firms recognized the limitations of treating social media like other marketing channels. Collaboration platforms and shared workspaces enable more community-based communication and collective actions. Some firms have made a shift from physical meetings to virtual working environments, enabling project and human resource management, technical support, training, and networking to be accomplished from anywhere. The so-called *Enterprise Microblogging* (Twitter-like messaging on a firm's intranet) improves employees' visibility and provides new opportunities for knowledge management.

The variety of communication channels (SMS, twitter, email, phone, video-conference, shared workspace etc.) also increases contact with those outside the firm and blurs boundaries between customers and employees. Not all channels are the same, however, our respondents recognized that they need to make careful choices among communication channels to avoid loss of productivity.

The capabilities for virtual collaboration are enhanced with the wider range of opportunities for shared storage and even processing capacity in "the cloud," enabling greater organizational agility for knowledge work across boundaries. GoogleDocs and shared storage platforms such as Dropbox are just the beginning, and firms can expect to see additional cloud service options.

Solution: Getting Engaged

The more possibilities the firms provide to the employees to stay connected, the greater access they will have for new knowledge and ideas. Collaboration platforms, shared data storage, wikis, blogs, and forums—both inside and outside the firm—enlarge the range of resources available to the firm and leverage existing investments. The emerging network environment does preclude the loss of control but does require executives to rethink the means by which risk is managed. Only by remaining engaged with the emerging information ecology can firms maintain an awareness of the expanded opportunities for learning and creating value. Managing risks through limited experimentation and bounded engagement with the wider networks will be a better choice than staying on the sidelines. Engagement is a better choice than the certain risk of being left behind by the competition.

Challenge 4: Still no Consensus on a Single Model for New Ways of Work

The executives in our studies, even those that recognize the opportunities of this still emerging environment, still have widely divergent views on the most effective management models for realizing these opportunities. The differences can be attributed largely to the business sector (dynamism of the sector, characteristics of the customers and competition) and management philosophy. There is no single “right” way to engage the technologies.

- *...we have different systems, like iChat, Skype ...and, as we try to work together very quickly we are using these. This is a development which we have made by ourselves. We look what is completed or whether it is stuck...we are organized very well at this point...*
- *...we don't even know how to competently decide whether we use iPhone, Smartphone, Blackberry or HTC. It's just a centralized competence which defines the standard. That's probably the reason why we are not proactive looking for different ways. We are quite limited in that...*

What we see is that some companies have no restrictions on employee use of the Internet during working hours, allowing them to surf the Internet in search of new ideas and customers as well as linking to other individuals on social networks. Others are absolutely convinced that there is no direct linkage between social media and the work their employees are doing and consequently close all the social websites in an attempt to force their employees to “think only about work” in the working hours.

While we judge that the pioneering companies that are experimenting with, or even embracing, the affordances of social media will ultimately come out ahead, our studies can't say that the companies that take a more reactive tactic are misguided. Our studies do suggest that trying to change employee behavior and establish norms through only technical or policy barriers is limiting. As noted earlier, employee behavior, technology, and social norms (within the firm and in the larger community) are linked and coevolve. An organization that attempts to change one without being aware of this coevolution process is likely to fail.

For most firms the experimentation will continue, with new work practices and organizational forms being tried, evaluated, and subsequently either adopted or discarded. These experiments are seen as part of the firms' overall adaptive and agile strategy.

- *... the evolution is still going on, so that the young generation entering the company has no trouble and we don't have trouble with them. So we try to evolve, be up-to-date with the technology, no need to make a special job for adaptation. It's an ongoing process...*

IMPLICATIONS FOR RESEARCH

The confluence of the three trends (demographics, social media technologies, and behavioral norms and values) provides a strong incentive for scholars to re-examine our models of organization and management. Perhaps what is in order is a critical review of the models that have become accepted as the norm, that are accepted as the bases for what we teach in management courses and what we accept as conventional wisdom. As noted above, it may be that some principles don't change, but how we articulate these principles in practice may need to be modified. Two examples of these include the following:

- Coase's concept of the nature of the firm (Coase, 1937), which argues that firms exist to reduce coordination costs, needs a close look in today's information ecosystem. Information exchange costs, necessary for coordination, have dropped to near zero with the Internet. The necessity to collocate work resources has been addressed with a flood of studies of “virtual organizations.” However, at some point, the cost of sorting through the options for coordination channels may itself constrain the ideal of a totally distributed organization, but as a minimum scholars should critically examine the underlying assumptions in our management courses to detect the hidden assumptions based on Coase's nature of the firm.
- The Resource-based/Knowledge-based views of firm (Barney, 1996; Barney, 2001; Kogut, 1996), which argue that firms are organized to take exploit specialized knowledge, may still be valid. In today's information ecosystem, what is the resource? For firms that consider knowledge as the key resource (and it's hard to identify exceptions), the information ecosystem means that knowledge is less sticky and more leaky. The firm has less control over the critical knowledge (whether that knowledge is in tangible form or more tacit). Early critical reviews of organizational

and knowledge management models appeared earlier this year (Katzy et al., 2012; Hemsley and Mason, 2012); more work is warranted.

CONCLUSION

It has always been the case that technology presents society with challenges for which there are no templates, no precedents, and no guidelines for making decisions. Today, this remains true, only the technological changes are happening more rapidly, coevolving with society changes and even changes in community values—and these trends in many ways have become mutually reinforcing. Organizations confront significant challenges as they seek strategies that will enable them to take advantage of the opportunities inherent in this dynamic and emerging information ecosystem.

There is some evidence that the Net Generation, having grown up surrounded by these coevolving forces, see the opportunities more clearly than their counterparts who have been successful in earlier times. Established organizations that pursue agility and innovation will do well to engage this new generation; such engagement is both a serious challenge and the critical opportunity.

DIGITAL CULTURE AND INNOVATION: IS THE INTERNET REVERSING THE RENAISSANCE?

Jonathan Sapsed¹, Feichin Ted Tschang²

Abstract: *Human creativity and its outcomes are partly stable over the ages, and partly influenced by their techno-historical contexts. In this paper we examine the features of creative effort in two historical periods separated by five hundred years: the early Italian Renaissance and the contemporary Internet age with the production of art for digital products such as video games and animation. We examine how human creative processes can be conceptualised as a general nature within a complex framework of evolving practices (techniques), technologies, and society; addressed to the development of an art form. Certain commonalities emerge by comparing these two ages. In particular, creativity can be thought of as being based on imagination, bounded by the set of possible motifs and their social acceptance. Second, creativity involves recombining, firstly of motifs, and secondly of techniques, expanding the frontier of creative output. Thirdly, creativity involves iteration in work - this may be constrained by the media and techniques or technologies, or facilitated by advances in them. Finally, at larger scales of complexity, creativity involves production processes and productivity - both enabled by technology. Finally, we outline contemporary trends in the digital age and the dramatic impact of these on culture, industry and creativity.*

Key words: *Creative process, artistic innovation, Renaissance, digital art, video games*

1. INTRODUCTION

Art and technology are generally considered two vital indicators of civilisation, yet their advances are typically considered separately. Technology and Innovation studies research has generally turned its attention away from culture and the arts. In spite of the recognised need for creativity in the initial stages, research has focused on the outcomes of innovation as observed in products, patents, and publications. Creativity itself has been mystified as a 'fuzzy front end' and has been left to the psychologists and organisational behaviour fields, which often adopt an experimental approach. Aesthetics, symbolism and cultural meanings have not been treated as part of the innovation system.

The indifference appears to be mutual. Warren Steinkraus in a 1982 article entitled 'Artistic Innovation' in the *British Journal of Aesthetics* concluded "...the idea of innovation is inadequate as a fundamental aesthetic category...It may be a demeaning term when applied to those regarded as artistic geniuses." (Steinkraus, 1982) (p.260). Artistic greatness was believed to transcend the observable patterns of introducing mere novelty, possessing more rare and mysterious qualities.

In more recent years however, this distance reduced as the relationship between innovation and aesthetic culture has attracted research interest. Scholars have begun to suggest definitions and measurement of 'artistic innovation' (Castaner and Campos., 2002), 'stylistic innovation' (Cappetta et al., 2006) and 'soft innovation' (Stoneman, 2010). All these are attempts to demystify the artistic creative process and reconcile it with knowledge largely derived from studies of science and technology. This growing interest is partly inspired by government agendas to stimulate and promote cultural industries (Lampel et al., 2006;

Hesmondhalgh, 2007) and 'creative industries' (DCMS, 1998; Caves, 2000), in which value is understood to reside fundamentally in symbolism (Jones et al., 2012).

This paper expresses the argument that through study of the artistic process, and the influence of technology on it in different periods of development, we may better understand the creative process: we may begin to differentiate its stable characteristics and those specific to techno-historical moments. We may better understand what propels creativity, and what constrains it, in particular, its social and cultural environment. To do this we investigate two quite different eras of artistic expressions, both widely perceived to be revolutions and periods of explosive creativity, separated by over 500 years. The first is the Italian Renaissance, in particular the early period where the practice of drawing became important. The second is the current digital age, in which art is practiced through digital tools and the Internet. We focus on digital art as practiced in a corporate professional context in entertainment industries like video games (and to a lesser degree, animation), contrasting with the patronage of the Renaissance (Williams, 1981).

Through comparison of these historical episodes in creativity we develop a framework with the following interrelated themes: (1) Imagination, Motifs and Content, as the envelope of creativity (2) Combination and Iteration, as the core forces of the creative process, and (3) Production and Organisation, as the means by which creativity is accomplished and diffused. We discuss these in relation to the two epochs and show how there are some quite fundamental shifts occurring in the creative process due to digital technology, even while the core categories and impulses of human creativity remain stable.

1.1. Approach

We sought to compare and contrast the practices in the recently emerged and burgeoning field of digital art production against those of the Italian Renaissance in Art (particularly that which was largely centred on Florence), itself located in a distinguished period of artistic and intellectual history. This paper pays especial attention to the Renaissance case, drawing out the necessary details needed to discuss the comparison. Both authors have conducted numerous studies of the video game production process in US and UK studios, involving observation, participation and over 150 interviews with developers and industry representatives.

Our view of how the practice of artistic creativity is shaped by the employment of practices is neatly summarized by Bambach: "it has become apparent that the issue of artistic practice is central to any discussion of the broad stylistic and theoretical developments of art in these periods." (Bambach, 1999). We have performed our assessment of the Renaissance's artistic practices in three ways. The first was to examine museum catalogues of special exhibitions, thereby treating paintings and other artefacts as the unit of analysis. Typically, along with the painting's background, the curators will supply a brief sketch of the artist's details and thought process. In particular, a major recent exhibition of Renaissance drawings provide a hitherto little seen perspective into the "minds" of artists, by interpolating between the drawings and what the eventual canvasses looked like (Chapman and Faietti, 2010).⁴ It should be noted that art historians have invested considerable time not only in learning about the life, times and work of the Renaissance artists, but increasingly, to learning about the techniques used. "To see revealed the intricate techniques and devices actuating the design processes of the great Italian Renaissance masters is not to deny their genius, but rather to understand how fundamental a tool drawing was to their vision." Bambach, 1999) (p.11).

Second, we have buttressed this reading on drawings (as well as the corresponding views of the artists' thinking where possible) with a variety of catalogues of other special exhibits and historical sources on

⁴ We recognize the biases placed by the available stock of drawings (sifted from the combined holdings of the British Museum and the Uffizi in Firenze or Florence (acknowledged to have two of the worlds' three largest collections of drawings - the third being the Louvre's), by the manner in which the drawings are selected to provide a narrative in time, and by the accumulated but particular knowledge of the curators of this exhibit (from the British Museum and the Uffizi).

Renaissance drawings, selected references from the art historian Vasari's work *Lives of Artists*, and sources on other individual painters and Italian Renaissance cities (in particular, the period surrounding Titian's life in Venetian art). This is in order to ensure that the relevant phenomena are appropriately captured and contextualized.

Third, we have examined historical works on additional major figures of the Italian Renaissance (in particular, Brunelleschi, Da Vinci, and those involved in major civil works). Through these, we have identified major trends that occurred in the Renaissance, where the major trend is identified from the literature, and further confirmation or disconfirmation is sought from other studies.

We identified four themes that occupied art historians' interests (also found to a lesser degree in other historians' studies of technology): (1) the sources of the artists' creativity (including the motifs they derive from the social period), (2) the artistic and design process (involving amongst other things, the placement of objects in designs), (3) the social situation that artists inhabit (which provides funding and social and political acceptance, and hence, acts as an envelope on creativity), and, (4) technological change, including tools and practices used in the production process (which involves apprenticeships and workshops, considered as hierarchical teams).

To validate and iterate with the analytical frames used in this paper, we performed a partial coding of themes arising from selected works, in particular, the BMU catalogue by Chapman and Faietti (2010), which contains about 100 drawings (and in cases, their corresponding finished works), and in other books such as one by Van Cleave (2007).

In the following sections, we introspect patterns within each of the two periods (the Renaissance and contemporary digital arts industry as represented by videogames) over various aspects of creativity, through the following themes: (1) sources of knowledge and creative landscape, in particular, the nature of imagination and the role of motifs (section 2), (2), the nature of the creative process (i.e., the combinative and iterative nature of creative work (section 3), and (3) the nature of technology and work practices in the production of art (section 4).

2. CULTURE AND CREATIVITY: THE IMAGINATION AND MOTIFS AS CONSTRAINING ENVELOPE FOR CREATIVITY

Our interest here is in determining what has infused artists' imaginations and what sources have fed their creativity. The primary elements that combinative creativity operates on are the motifs, or recurring cultural elements and symbols that seed and influence the creative arts. Motifs may be seen as 'the stuff of imagination'. Artists' creativity was slowly unlocked as new images made their way past religious and institutional barriers and were combined in new forms.

In the sphere of cultural products, artistic output can be said to be bounded by the artists' imagination, but this imagination itself is in large part bounded by the motifs that are generally used and socially permitted. These motifs are in turn shaped by the creative contributions of artists. The wider population of artists are limited by the sensibilities of societal norms and to a degree the willingness to pay of consumers of the art or other cultural goods. Motifs form an envelope or constraint on what is permissible. Motifs paradoxically provide heuristics and impulsion while also retarding artistic development.

The Renaissance: From Religion as Motif to the Imagined

Renaissance art made several turns over the vast, two to three hundred year period that Giorgio Vasari outlined in his monumental *Lives of the Artists*, mostly written as a contemporary biography of artists during the period of his own life. These consisted of a combination of technical achievements (such as the development of linear perspective), a movement to realism via the depiction of natural forms, and the

development of complex scenes and environments, including landscapes. The introduction of new measurement and display techniques such as perspective and foreshortening were key.

Selected Shifts in Artistic Styles

To highlight some of the phases that Italian Renaissance art went through, we will summarise three commonly identified shifts in the artistic styles of that period: the emergence of a naturalism undergirded by science, the emergence of new motifs, and the increasing complexity of the art.

First stylistic shift – Science and Naturalism (late 1300s/1400-): The first turn was an expansion in the “set” of permissible images, or manners of their depiction. First was the movement from the prior byzantine form of more “static” and iconic religious images to the more interpretive form of religious images. This allowed some artistic creativity to come in, e.g. in the portrayal of biblical scenes, as opposed to the typical Byzantine portrayal of figures in a diptych or triptych of panels. In particular, in his history of the period, Vasari singled out Giotto in the 1300s as the one who “revitalized” art and helped lead the beginnings of Renaissance art by breaking away from the Byzantine style (Vasari, 1998). Giotto was followed by others such as Masaccio di Bondone, who “In 1426... was hired by the monastery of Santa Maria del Carmine... one of the first to discover a new lifelike method of painting.” Masaccio discovered Fra Lippi, who came to the attention of the new force in patronage, Cosimo de’ Medici (Strathern, 2007) (p.138). This period saw a slow percolation of concepts and their eventual diffusion, both within artistic circles as well as across cities. Even within this limited repertoire of motifs, advances could be seen, ranging from the rediscovery of perspective drawing by Brunelleschi, to Da Vinci’s naturalistic forms, and even to the increasing depiction of the passage of time and narratives in works (Chapman and Fiaetti, 2010).

Secondly, science moved concurrently with Renaissance depiction, especially of the human form. The Renaissance artists became intensely interested in the naturalistic representation of life subjects through close observation. Artists believed that the emotional effect of a viewing a human figure in a painting depended on the truth and accuracy conveyed in the image. Da Vinci’s studies of human anatomy are famous examples, but many artists studied real models in order to capture the sense of life and presence, and extended this practice to animals, organic objects like plants and foodstuffs and artificial objects such as furniture. In fact, the normal practice became that of life observation for a commission, rather than relying on the tried and tested, but overly familiar model books.

This trend throughout the early Renaissance towards life observation was an important aspect of the new naturalism. Artists became obsessed with expressing lifelike figurative representations using models for reference, as well as still lives and later on, landscapes. Prior to the Renaissance and in its early phase model books were used for reference, containing images often by prior masters. The shift from simply copying these images in favour of life observation was a major stimulus of creative interpretation, and was a core component of the new design thinking. Drawing from life was a step introduced to the painting process, partly enabled by the greater availability of paper and drawing materials. Life observation became a core skill in the arts until contemporary times. For instance, the life drawing of nude or nearly nude models had been a core convention in art schools. In the late twentieth century until today however this practice has come to be seen as an anachronism with the rise of conceptual art and the postmodern.

The third innovation was the development of linear perspective (Kubovy, 1986). These techniques were formalized if not systematically developed by Brunelleschi. By setting out the composition of a picture through geometric principles the human artist was able to locate himself or herself in space, exerting control over it using tools of abstraction. Once developed, perspective increasingly appears in paintings as we march down the Renaissance period, and by Jacopo Bellini’s time, fully developed use of the

techniques could be seen (Chapman and Fiaetti, 2010) (p.53). We can classify perspective as a part of the move towards scientifically-based naturalism, in that the natural optical perspective was becoming the norm, rather than the former means of artificially placing objects in ways that did not capture the sense of distance within a painting.

The social setting and its expectations influenced painting. The vast majority if not entirety of the works produced during this period had religious motifs. They were largely commissioned by the churches and patrons (such as Florence's Medici family). This suggests how the cultural period "constrained" the creativity and channelled it towards certain forms and output. Given the shortage of space in this paper, we have elected to focus on the creative process, and are keeping patronage (for Renaissance art) and publishers (in videogames) as a background factor.

Second stylistic shift –Mythology and other new motifs (1450-): Beyond more accurate depiction, second shift was to expand the set of motifs. Towards the third centenary described by Vasari, that he dubbed the "High Renaissance", mythological motifs was increasingly evident in artistic tradition, particularly in the work of new artists, such as those who worked in Venice. A new sensuality became part of the tradition, brought on by Venice's notoriety: "prostitutes and courtesans were only one of many manifestations of....Renaissance Venice. It is, therefore, no surprise that highly sophisticated depictions of sensuality were developed in Venice." (Cole, 1999) (p.56). Breakthroughs followed as artists followed a new type of patron interested in these new themes. Giovanni Bellini helped found a more sensuous, coloured style of Venetian painting (with "excursions into the realm of mythological subjects, a type of painting that was then just gaining favor" (Cole, 1999) (p.54), but it was his students like Giorgione and Titian who matured this form by the weaving of Roman and Greek mythologies into their art, recapturing lost cultural aspect of Europe's (Roman) past. Moves such as this were to dramatically change the set of motifs available to other artists. It is this evolution in imagination, largely started during the Renaissance that created an ever expanding canvas for artistic rendering, to culminate in the ultimate forms of self-expression: the modern periods of art.

Another set of motifs came from the emphasis of landscapes as a form of painting in itself. While landscapes increasingly figured as backgrounds in the early Italian Renaissance, it took much longer for landscapes to become a genre in their own right. A window into this process is provided by a number of exhibitions and studies of the Renaissance, for instance, a recent major international exhibition titled "Nature and the Ideal: Landscape Painting in Rome, 1600-1650" at the Grand Palais and the Prado. In this, it was shown that by the 1600s, European landscape painting was well underway, and figures, even religious icons, had been reduced to the role of objects providing a human dimension to the much larger scale of the natural environment. Writing about the exhibition, an observer noted one "possible reason" for why landscapes only took off this late, despite having surfaced over a century before: "The 17th century is a period when religious meditation receded in the living culture of Europe." For instance, in Il Domenichino's "The Flight to Egypt" for instance, "A tiny Mary riding a donkey, followed by Joseph, appears in a corner... Religion is the excuse in this picture that really deals with the world." In addition to the demand and the natural tendencies of the painters, "(having been) practiced long before by painters when sketching," there was the external influence of Northern European painters over their Italian brethren.⁵ This corresponds with the Swiss historian Jacob Burckhardt's view of the Renaissance's main feature being that of a gradual embracement of artists' individuality (Burckhardt, 1990).

Third stylistic shift: Narrative and other complex meanings: A third shift occurred when, in addition to the more technical aspect of perspective and the naturalistic focus embodied in figure composition, more complex, layered meanings started to be incorporated into works of art. For example, narratives also started to figure strongly as a means to conveying the emotive elements of a scene. The use of narratives predated Florentine and Venetian painting – complexity figured in the work of early painters, such as those

⁵ S. Melikian, "The Landscape Comes of Age", New York Times, June 4-5, 2011.

of Altichiero of Padua (c. 1325-1395) (Cole, 1999) (p.8). This narrative aspect was displayed in the BMU's exhibition as well as in other studies of art history. For instance, in Giovanni Bellini's work *Agony in the Garden* (c. 1460): "by far the most important and prophetic one (modification) – is the introduction of time and atmosphere into the narrative" (Cole, 1999) (p.12). In fact, the elder Jacopo Bellini's model book is a prime example of the use of paper to experiment with compositional drawing, partly to convey narratives (Chapman and Fiaetti, 2010) (p.52). Reinforcing this, Leon Battista Alberti's 1435 treatise on painting *Della Pittura* (On Painting), (which is believed by experts to have been widely read and distributed), discussed the importance of conveying a complex narrative, amongst other things (Chapman and Fiaetti, 2010) (p.54).

Other Cultural Shifts: The Role of the "Market"

The ever expanding or cumulative stock of knowledge of possible (and once tested, "proven") motifs suggests that the capacity for combinative creativity will increase, and that the number of combination should increase at an even higher rate. Thus, the limited number of "combined" motifs during the Renaissance period can be seen to be directly limited by the total number of "meta" level motifs that were socially acceptable. A crucial limitation comes from the gatekeepers. In the case of the Renaissance, this consisted of two very narrow sets of patrons: the church, and wealthy individuals (often honouring god or thinking of the church). Not surprisingly, most of the art then tended to depict religious imagery, though eventually, portraiture became popular as individual patrons also turned to means of ennobling themselves.

2.2. The Comparison with Digital Art

We start this section by considering what we just learnt: that Renaissance Art began to incorporate not only more sophisticated religious motifs, but the notion of realism as well as imagined motifs; additionally, the Renaissance thematically and technically set the groundwork for other movements as landscape painting and Impressionism. All of this took on the order of 500 years (if we begin the period with Giotto in the 1300s and end it with the Impressionists in the late 1800s). This point is important when we contrast it with the period in which the video game industry and the other digital arts performs: a mere three or so decades.

Motifs in a Digital Age: Deconstructed and Ever Expanding: In videogames, the regular reuse of motifs from various other media and popular culture are common, either as sources of inspirations or as direct content (intellectual property) to create games around new themes, for instance, science fiction and fantasy books and movies, electronic toys, and historical events (Tschang and Szczypula, 2006). In this way, the combinations are based on far more varied sources. Given the number of game genres that have come out in the short three decades that electronic games have been in existence, these are even more accelerated than the Renaissance. While a controlled comparison between the two ages is impossible, the common understanding of industrialization points to some mixture of technological and organizational change as some of the main factors underlying accelerated development in the modern age. As the mix of technologies increases, so does the number of possible combinations, and the exercise of these combinations. Our comparison implies a similar mechanism for cultural production: it would stand to reason that the nature and prevalence of motifs and their possible combinations increases with increasing societal complexity (such as channels and means of consuming and producing media). Certainly, a similar phenomenon was seen during the Impressionist period, when artists turned to daily life and social themes as subjects.

Shifts in games have occurred that are analogous to the thematic shifts seen in the Renaissance period. The games industry saw the rise of many single player genres between the 1980s and late 1990s. In the last decade, this has been followed by social gaming (e.g. massively multiplayer games, largely based on role-playing games or RPGs), casual games (games that are simple and require short periods of play), and emergent game-like virtual worlds (which are more social and involving of non game-like activities like

“creating”, “transacting” and “socializing”). More recently, serious games and games have been introduced into other aspects of life like advertising (a process termed ‘gamification’). This new range of innovations has been enabled by technological changes, as well as changes in the way consumers play or want to play.

While game genres are typically said considered to be the epochal forms of new games (Tschang, 2007), more than what is encapsulated in genres (and the specific combinations of features they embody), it can also be said that “artistic complexity” involves shifts in how we relate to narratives, in our manner of gaming (e.g. the shift to casual games), and so on. As with Renaissance art, the advent of innovation in games suggested that external influences such as other media like film, TV, music and books, significantly shaped the field of games (Tschang and Szczypula, 2006). The imagination of game developers is only limited by the number of other media and cultural references tapped into by game designers, aided by the propensity of people to try or play almost anything. Genres that are familiar from fiction, comics, films and television can be found, such as science-fiction, horror, military combat, Wild Westerns, super heroes, music, and aspects of urban culture like skateboarding and street dance, in addition to the game-specific genres.

3. THE NATURE OF THE CREATIVE PROCESS

Our second construct in the ‘landscape’ of artistic creativity is that of the creative process itself. This describes the basic cognitive mechanism by which art evolves – the cognitive action of combining (and recombining) new and old knowledge. In this, we are adopting a classical approach to the study of creativity, by trying to understand it as an individualistic process (especially as it is seen in the eyes of observers of the Renaissance). Certainly, the social view of this process will be obscured to the extent that the unit of analysis is the painting (and the painter’s efforts). We say presumably since it is only possible to infer this in retrospect. It is however well known in artistic endeavours that much of what is described as artistic creativity involves experimentation as much as insight.

The nature of creativity can be said to involve the exercise of the imagination, with a willingness to experiment with new forms. This is accompanied by the vagaries of socially (or societal) permissible genres, e.g. in art, these are the human form, portraiture, landscape, etc. However, what we turn attention to here is the examination of how both renaissance and digital art have advanced through the continual combination of received content and culture, as well as through the iterative nature of combinatorial experimentation.

Note that we are emphasizing more the social sources of knowledge behind this creativity. In section 4, a fuller treatment of the social and organizational nature of creativity is given.

3.1. Creativity in the Renaissance

One formative view of Renaissance artists considers the distinction between the artists as being either experimentalists; partial to inductive methods, proceeding by trial and error, or conceptualists, who work deductively, make detailed preparatory drawings or studies, and tend towards step changes in their progress (and hence, are prone to making more radical leaps). While this distinction encompasses only a part of artistic activity, we will show that it also highlights the combinative nature of much of the artistic work. Galenson and Jensen in particular consider Masaccio and Raphael to be conceptual artists, and Michelangelo and Titian to be experimentalists (Galenson and Jensen, 2001). As we will point out, even the great experimentalists could be said to necessitate acts of combination, and experimenting can be considered a much broader term.

Combinative Creativity as Mechanism in Artistic Activity

A window into the act of thinking through combinations was depicted by the illustration of great and minor works of the Renaissance side by side with the drawings representing the artists' earliest envisioning of what became the final form (Chapman and Fiaetti, 2010). Time and time again, objects, backgrounds, figures and poses were altered by artists seeking an optimal view of the scene. In character, this predilection of artists to adjust their art is no different from the modern digital artists' need to conceptualize, prototype and otherwise iterate their creations towards their best "tuned" forms.

One question raised by our analysis is that of the particular nature of creativity driving the evolution of art over time. While it is certainly true that new art involves revolutionary creative insights, once a genre or period of art is established, much 'new' art will tend to encompass changes in content, or stylistic approaches, often mixed with more familiar motifs or techniques. For instance, it has been noted that that one of the first great artists in the Renaissance period, Masaccio, blended the shading and form techniques of his predecessor Giotto with that of his friend, Brunelleschi's, linear perspective, and his own great innovation of a single consistent source of light to bring depth to light in his work (Galenson and Jensen, 2001). His techniques spread to others who witnessed his work, as attested to by Vasari. Galenson and Jensen (Galenson and Jensen, 2001) point out that Vasari's description of a second conceptual Renaissance artist, Raphael, points out that his team of draftsmen provided Raphael with "good designs which he could use in his work", in effect, giving him access to material for combinative use. Even an artist acknowledged to be a great experimentalist like Titian also relied on the past, "combining what had previously been the two great independent stylistic tendencies of Renaissance painting" (Galenson and Jensen, 2001). Our reflections later on model books also highlight their role in a codified manner for imitation and reuse, even as the motifs themselves are adapted and evolved.

Combinative mechanisms are at the core of artistic practices such as composition. Innovation may result from the replacement of objects within a given painting as a result of iteration, and in the transfer of motif between works or art or even across categories of art (e.g. an image from a painting to a medallion). Many of the paintings made during the High Renaissance exhibit both an attention to the landscape as well as to the figures and foreground scenes. In this way and others, they betray an increasing complexity which is combinative of the themes already mentioned. For example, Giovanni Bellini's Pietà depicting Christ's sacrifice and his 1514 major mythological work Feast of the Gods both contain minute background details such as clouds and distant buildings (Cole, 1999) (p.34). This led to an increasing complexity of painting, so much so the opportunity for combinations helped masters to distinguish themselves and to push the boundaries.

While combination itself is a powerful mechanism, its deployment as an explanatory mechanism of change requires **motifs** – both original and old - and techniques. The sources of motifs (effectively social in nature) were discussed in section 2. While some motifs evolved over time through their invention and introduction by individual artists (Da Vinci for instance was a great experimenter, and other artists also adopted a scientific approach, as with Brunelleschi's 'invention' of perspective), other motifs came from religious themes and classical ones:

"A potent source of inspiration for figural ideas for all fifteenth century artists, was...ancient (Greek and Roman) cameos, coins...and sculptures" (Chapman and Fiaetti, 2010) (p.57)

It is because of this process of adapting and evolving motifs that the earliest Renaissance art like Giotto's could be considered as inspired "first of its kind" prototypes, while the artists immediately succeeding him primarily adopted his practices. It is only with the steady accumulation of new techniques that complex combinations and increased individual variation could occur, via learning and experimentation.

Iteration and Experimentation

Thus far, what we have highlighted is that combinative creativity in Renaissance art is based on the access to motifs, and the ability to recombine these motifs into different products or product categories. However, combination is only half of what goes on in the shaping of a piece of art. This raises the question of how combinative processes work in practice. Clues to an answer can be found in the actual practices observed in our Renaissance data. Recent scholarship in this line of thinking has focused on the analysis of the drawings of painters, which betray the artists' thoughts and trials. The evidence is quite clear that artists consistently iterate in their work. Analysis of Renaissance drawings suggests that the drawings were an integral part of experimental and diffusive processes of knowledge creation:

"By the close of the fifteenth century, the practice of drawing was established as a vital constituent of artistic education and the means by which painters developed compositions and figural ideas before beginning work." (Chapman and Fiaetti, 2010) (p. 72)

A range of practices and techniques were used in the Italian Renaissance as aids for iterating, including composition, ideation, and the general practice of drawing. There are for instance a host of drawing mediums that were experimented with (e.g. chalks, types of shading, like cross-hatching marks) and different artists use of these mediums gave the artists' and their work a distinctive reputation. Artistic practices like composition or ideation allow creative experimentation of object placement in drawings and are iteration at the design stage. While this is quite different to technical production practices like pouncing, which involves the transfer of images from one medium of paper to another (possibly the mural or painting itself).

The Need for Iteration

As we noted earlier, increasing complexity with sustained attention to detail was an ever more significant issue in the realm of Renaissance art. Not only did themes broaden through the 'shifts' in motif described earlier, canvasses also got bigger, as religious figures became embedded in scenes which became dioramas on which narratives were played out. In fact, it is not in the isolation of any one of the themes, but in their constantly roiling recombination and experimentation throughout the period, that we can comprehend the true nature of the advance that Renaissance art represented.

Drawings can be viewed as windows into practice. A central theme in the BMU exhibition and other studies of Renaissance drawings is that of how drawings occupied a central role in the artistic process:

"the refinements worked out in individual studies (i.e. drawings) of figure and costume might be distilled at the next stage into a finished design that could serve as a template for the painter's composition..." (Chapman and Fiaetti, 2010) (p.32)

This was necessary because the materials of the final product, such as canvas and plaster, were costly and unforgiving of errors - allowing little time for experimentation.

In the case of murals and reliefs, the finished drawing led further to a 1:1 scale under drawing, or to a drawing of greater precision, a cartone (or cartoon), whose contours were transferred to the wall by pricking with a sharp instrument (Chapman and Fiaetti, 2010) (p.33). Renaissance artists would work on these cartons or drawings on paper and other lighter materials for many months testing out concepts and form before committing the final product to canvas.

Representation of prototypical forms: The continual invention and adaptation of new drawing (or prototyping) media, the actual means of drawing, occurred alongside the techniques. Over the centuries, a bewildering array of materials were brought into use for not only production, but also pre-production – e.g. stylus, metal point, lead point, chalk, red chalk, and so on. Invention of technique followed this development of media, and artists would take painstaking care to experiment with representations and

styles with their drawings. The result was that the drawings, which were subordinate to the final work, were meticulous and lavish in detail. Today they are exhibited in the world's great museums as masterpieces in themselves. Yet in Renaissance times these drawings were considered a mere process step before embarking on the main work. With the new ways of displaying drawings, artists were able to further invent new ways of displaying perspectives, e.g. the use of cross-hatching to display the volumetric nature of figures, and hence, ultimately a form of realism (Chapman and Fiaetti, 2010). These various techniques for refining and shading contributions helped artists to manage complex works of art. These initially aided artists in differentiating their contributions from one another, but eventually became a part of standard practice.

Compositional drawings: Artists responded to the increasing complexity of canvasses by modifying their use of drawings and their connected practices. These can be analyzed in separation. **Composition** or the **placement (and substitution) of objects**, as well as the attention paid to their foregrounds or backgrounds, became important, in part addressed by drawings. Many of the drawings of the time show how early artists handled this. For instance, in *The Vision of St Augustine* (c. 1460-1526), Vittore Carpaccio makes several adjustments before his finished work, including the substitution of a dog for an ermine (in so doing, substituting an animal symbolizing fidelity for one representing purity) (Chapman and Fiaetti, 2010) (p.266). In Filippino Lippi's *Triumph of St Thomas Aquinas* (c. 1457-1504), a comparison of the artist's drawing with the eventual painting shows "*an alternative design of the foreground*", possibly to allow the artist to discuss the composition with the patron (Chapman and Fiaetti, 2010) (p.238).

This placement of objects or rearrangement of designs in particular paintings, suggests a desire to experiment and try out new designs. For instance, in Da Vinci's *Adoration of the Magi*, a "*sequence of around 15 studies for the altarpiece suggests that Leonardo may have had some flexibility in the subject, as some show the Adoration of the Shepherds rather than the Magi.*" (Chapman and Fiaetti, 2010) (p.210).

Sketching as rapid ideation: As paper became more and more affordable, certain artists started to employ **rapid sketching** as a means of experimenting with different poses and forms for objects. No one exhibited more of a stylized form of such iteration than Da Vinci: "*In the quest to keep pace with the flow of ideas, he adopted in such drawings a notational manner to capture the essentials of a pose of an expression*" (Chapman and Fiaetti, 2010) (p.206). Da Vinci's and del Verrocchio's sketches of relatively mundane topics such as babies and cats are widely recognized as one of the finest examples of early experimentation on paper.

In summary, these three examples of forms of drawing iteration are part of an evolving set of practices utilising new technologies in the form of materials and media, but all in the service of the fundamental creative impulse of revision and rework. In the transference of image from mind to paper and subsequently to plaster, artists are able to conceive of and iterate on larger-sized and more complex pictures, more complex themes and means of carrying the themes.

3.2. The Creative Process in the Digital Age

Our study illustrates that combinative mechanisms have been at work in the period of Renaissance art and the digital age alike. This suggests that the raw essence of human combinative creativity is as unchanged between the period of the Renaissance with its 'opening of eyes' and the current modern age of digital media. The creative process is ultimately composed of the processes of inventing new forms, combining them with one another (as well as with artists' personal expressions of views, painting styles and design approaches), and of experimenting with these via iterative means.

The impulse to combine to generate novelty is recognised not only in the artistic field, but forms the basis of creativity in social network views of entrepreneurship and innovation as well as representations of the creative process in scientific discovery (Simonton, 2004) and engineering and technology (Arthur, 2009). The realisation of 'new combinations' also forms the basis for Schumpeterian economics of innovation (Schumpeter, 1942; Freeman and Soete, 1997; Nelson and Winter, 1982; Fagerberg et al., 2004). Combination and recombination is broadly believed to be pivotal to creativity and innovation.

We have seen combination played a key role in the advances of Renaissance creativity enabled by the application of new techniques and materials. Similarly now in the digital age we can observe changes that are still more dramatic. If we consider the distinctive properties of digital technologies, as outlined by Castells (2004) (p.9), we can see that all these have ramifications for the possibilities for combination:

- (a) their self-expanding processing and communicating capacity in terms of volume, complexity, and speed;
- (b) their ability to recombine on the basis of digitization and recurrent communication;
- (c) their distributing flexibility through interactive, digitized networking.

The processing power of ICTs means that combination may be achieved faster and at greater scale, but this capacity is increased exponentially by the shared digital format of information, and its mobility. Digitally recorded ideas and cultural artefacts may be 'pinged' across continents in seconds, to be received and integrated in the creative outputs of large numbers of networked individuals. There is a recursive effect where further innovations are always generated because of the communicative ability of digital technologies and their global reach. Castells puts it succinctly, "One of the key contributions of the Internet is its potential ability to link up everything digital from everywhere and to recombine it." (Castells, 2004) (p.10). Jenkins notes how the Internet has only served to accelerate and otherwise further the mixing of media (Jenkins, 2006). All of this allows for easily manipulated experimentation involving scope, speed and scale.

Combinative Mechanisms in Videogames

Games are developed in part by their developers' exposure to other creative media such as film and books (Tschang and Szczypula, 2006). Combination is common because the product is considered to be 'plastic', i.e., easily reconfigurable, and admitting of new content into the existing product. One increasingly important component of games that came from prior arts is the narrative tradition. Top selling games (such as in the first person genre) have narrative qualities that are highly reflexive, involving professional script writers. In order to provide a playable user experience, games combine varied components, including logical components such as rules and mechanics, content such as the narratives, tokens and other onscreen objects (that represent "playable" content, i.e., content that the players can manipulate), as well as parts of the "system" that players interact with such as user interfaces, artificial intelligence, and so on. These combinations are possible because of the plastic nature of games and the code that drives them; that is, code can be used in many different ways to represent different outcomes. Consider the conceptualization of a classic video game, *Civilization*, by its designer Sid Meier, which illustrates how prior games by himself and others influenced its making:

"Civilization had many influences. SimCity in its turning the world away from destruction toward construction, the idea that it's just as much fun to build something as to destroy it. Empire, which had that "uncover the map" quality. Railroad Tycoon with the idea of economics and building and all it had." (DeMaria and Wilson, 2002) (p.190)

Another area of cross-media combination is games that tie-in with movies, comics, novels and toys. Characters, brands and other forms of motifs are taken from these other media in which they are more familiarly known and combined with the elements of interactivity and structured play mechanics of games. In some cases multiple combinations are created, such as the Lego series of video games featuring superhero comic content like Batman or sci-fi film content such as Star Wars. Developers of these games report that the complexities involved in such combinations are not technical, but concerned with co-ordinating and negotiating the brand management interests of the various parties. In the digital age the drive for combination is often more explicitly economic than in the pre-industrial Renaissance. The choice of elements to combine is as much a matter of financial risk reduction than artistic experimentation. Yet there is no doubt that the digital format enables rapid combination, as for example, importing a Batman character image into an animation software tool such as Maya or 3DS Max and setting this character in any number of pre-coded worlds. It is worth pointing out that combination in this new age is largely driven by a new (i.e. more extreme form of) capitalist commercialism at work, driven by the desire to acquire and reuse intellectual property (for profitability reasons) to the greatest extent possible (Tschang, 2007). While certain Renaissance painters (and indeed, select painters in all ages) were acknowledged to have business acumen as well, it is the existence of large, profit-making institutions that has driven the games industry to be the mega industry that it is today.

Ultimately however, games have to be playable and learnable, in order to become successes in the market. The latter dictates that new games have to possess some familiarity. While the visual content of

modern games is already commonly combinative (since like movies, games are based on popular culture), the combinative aspects that are most unique to games is that of the game mechanics (or means of user-interaction with the game) and the resulting game play. It is in the connecting of variants of core mechanics that combinative and even revolutionary types of game play can be created. Mechanics can be recombined with one another because of the modular manner in which they occur in different parts of a game, and how they fit together like logical components.

Ultimately, past games are seen in the new forms of gaming and other entertainment – that is, the historical predecessors are present. For example, massively multiplayer games like *Everquest* and more recently, *World of Warcraft*, rose out of single player role playing games. Developers of virtual worlds (like Linden Labs and its *Second Life*) were driven in part by visions of cyberspace laid out by science fiction writers, but were also enabled by real time and three dimensional graphics software from the MMO games tradition.

It is worth noting that complexity arises in technological innovations, as technologies are said to be “deepening” over time that is, getting more complex (Arthur, 2009). In video games, the product is already the embodiment of complexity. While early games were based more on reflex type action than anything else, the design of modern games, especially first person shooters, by now embodies an intricate mix of narrative, game play elements tied to motifs, systems within which objectives exist, and more intricate actions embodying analogies to real world or other worldly situations. A good example is the creation of the first person shooter, *Half-Life*, where the development of a compelling narrative closely tied to the game play and employment of game mechanics (means of interactivity) ensured that the design (and in fact, the second major iteration) of the game was successful. Further complexity comes about from technological change, since technology enables more complex and sophisticated functionality. For example, increasing complexity can be observed in the development of game controllers. Early controllers in the 1980s had one joystick and one button, while modern controllers have over 10 buttons and 2 joysticks, with combinations necessary for many commands.

Prototyping and Iteration Practices in Games

Taken together, all of the iterative and experimental practices we identified in the Renaissance suggest attempts to iterate on the form or to experiment prior to a full production. The many instances of artists trying out different types of objects and their placements, as noted earlier, can be said to be an iterative process. The drawing itself became a prototype as it were, subject to modification. To generalize what we are seeing in the different forms of iteration identified for the Renaissance: ideation is a vital part of the personal creative process in the Renaissance age; and the composition process involves the more rational rearrangement and placement of objects, which reflects a design type of process.

Game development is a series of ideation processes, starting from conceptualization, and running through to the development of systems, and even the debugging of code and “broken” bits of gameplay (e.g. parts of the game that are not playable or not effectively so). Iteration has a broader meaning in game development, since all aspects of a game’s development are iterative. Most games are iterated (i.e. tuned) at the conceptualization (design) phase, at the detailed design phase, and even at the full development phase (Tschang, 2005).

To some degree, much of the inefficiency in and obstacles to good game development comes from the interactive and experiential quality of games, and the inability to “play” the product till at least a partial system is done. Sometimes, developers are unable to play it till a complete system (through to the final stages of production) is defined. This requires games to be “tuned”, that is redesigned (and continually at that), for just about all of their development period: that is, from initial conceptualization, through full production. Sometimes, dramatic changes in the design are needed midway through the development cycle (essentially lengthening the total cycle by half or more) in order to perfect the design and its implementation. Consider the retrospective on *Half-Life*, a game that won over 50 game of the year awards:

“nearing the end of our original schedule, a whole lot of work had been done, but there was one major problem — the game wasn’t any fun...There were some really wonderful individual pieces, but as a whole the game just wasn’t working...At this point we had to make a very painful decision — we decided to start over and rework every stage of the game.” (Birdwell, 1999)

Production: A common feature of post-mortems on gaming suggests that prototyping has been vital to a given team's success. This prototyping is far more intense than what we saw in art. Prototyping is defined as the process of arriving at a playable version of a game, even a part of it. This is often in the form of a 'vertical slice' - a fully working and playable chunk of the game, representing only a portion of its whole narrative but demonstrating its look and feel. Vertical slices are an economic way for developers to test concepts and show these to commissioning publishers. They are aids to further iteration as feedback is elicited and technical difficulties are discovered.

Vertical slices and other forms of game prototyping are iteration aids that correspond to the drawings of the Renaissance. However there is an important sense in which they differ. Because the final medium of the work is the same as that of the prototype i.e. digital code, the work of iteration loses its sense of being a discrete preparatory step, as it was with drawings on paper as preparation before applying the images to plaster, wood or canvas. The implication is that with the high degree of manipulability of digital code the creative process is more continuous, and less stage-based as it was in Renaissance times. This means that the creative process is intensified and accelerated as well as open to the combinative capacity that the Internet offers. There are significant ramifications of this for the organisation of production, discussed in the next section.

Pre-production work or prototyping could fulfil the testing of the core mechanics (or core elements of the game play), but has is only one aspect of testing. Because games are getting complex and to some degree have to appeal to a diversity of players and player styles (of gaming or play), they have to be tested in multiple ways in order to optimize the enjoyment of play across the population of players. In the game development process, testing is continually undertaken by developers, by specialized testers, and finally and often, by consumers allowed to "try out" the game as "beta testers". This illustrates how the sequencing of stages in digital iteration is compressed, rather than strictly stage-based as in Renaissance artistic processes (see Castells, 1996; Castells, 1997; Castells, 2004).

In much the same way as we have seen with Renaissance art, digital content creation has a need for prototyping and iteration on the work's design and its production as a whole. Games are known for their pre-production and iterative processes, largely because designers simply cannot pre-visualize with any certainty whether the implementation of a mentally visualized concept "will work", i.e. be playable, let alone enjoyable (Sapsed et al., 2010). Typically, all stages of production, ranging from conceptualization to the preproduction stage and finally, the full production stage, involve iteration, with preproduction being the stage where prototyping is most actively done.

This raises one last important parallel between the practices of Renaissance art and videogames is that of the production process usually being a heavy and relatively irreversible commitment of resources, in part due to the product's heavy requirements for content and coding. This is in fact the first parallel, as it is because of this that iteration and prototyping are necessary to both artistic periods.

Iteration as Means of Dealing with Complexity or as 'Cognitive Support'

The question of *why all this iteration is necessary* is another related subject. An introspective look at what this comparison may actually be reveals is the fact that prototyping exists for these two forms of visual arts and visual-interactive entertainment – separated by 500 years – suggesting the idea that one need for iterating and prototyping is perhaps because the initial creativity that occurs in the mind's eye or imagination is lacking the full picture (literally), and one needs to craft the fuller experience visually and interactively in order to appreciate the experience of it. This suggests a thermostatic approach to creativity, where the imaginative output has to be "regulated" by impressions, which in turn feed back to our abilities to validate and iteratively improve.

Our proposition, partly based on these observations, but also informed by a growing intellectual sense that knowledge is complex, socially-located (in similar veneer to the idea of distributed cognition), is that iteration is necessary for the shaping of these incomplete forms – partially complete in individual visions. From this, we suggest a revisit of the of the classical notion of imagination by David Hume (1939). Rather than treat imagination as being incomplete and degraded in comparison with other faculties like memory, we suggest that it is not necessarily degraded, but rather, is an intermediate stage to a future state of "complete knowledge". As is well represented in organizational and philosophical thought on thinking, humans know more than they can articulate, but even more importantly, with iteration, learning and combinations (somewhat akin to constructivism, e.g. Bruner (1986)), we can eventually articulate more

than we currently know. This is what we termed at the beginning of this section the “implemented vision”. Certainly, in the digital age, we are no better off than early Renaissance artists –hence the need for cognitive supports as increased frequencies and differently sized cycles of iteration. In the next section, we will address another source of cognitive support: that of the social and organizational nature of knowledge creation.

4. ARTISTIC PRODUCTION AS SOCIAL AND ORGANIZATIONAL PROCESSES: FROM THE INDIVIDUAL TO THE ORGANIZATION

We ended the last section having developed an individualized notion of creativity based on the individuals combination of (largely existing) motifs. Now, we will look at what happened as a complexity in artefacts as well as a “social complexity” (containing embedded knowledge) occurred over time. We will argue that this complexity was directly associated with an increase in “organized production”. Even as the Renaissance progressed, as witnessed by Vasari’s history, painters were each influenced by other painters, and by patrons. It is clear that art has a collective feel not entirely captured by the individualized, combinative view of creativity we described earlier. We will now turn to a broader view of how the organization of effort and production took place in the Renaissance and the digital age alike, as well as the socially-located nature of the sources of knowledge. It is perhaps more evident nowadays that art, at least from the impressionist period onwards, is as much a social phenomenon as an individual one. Csikszentmihalyi et al’s studies of successful art students also being business minded ones (Csikszentmihalyi et al., 1984), Becker’s notion of “art worlds” and the notion of peers (Becker, 1982) and intermediaries as “selection systems” (Wijnberg and Gemser, 2000) are just three views in radically different literatures that have come to similar conclusions.

Yet, in addition to this notion of a production system being regulated by peers and intermediaries, our view of art innovation is informed by a more dramatic turn partly performed by the cognitive sciences (or a part of it) towards an understanding of cognition as culturally situated. This is represented by constructivists as Bruner (1986), and (socially and materially) distributed cognition scholars as Hutchins (1995).

4.1. Production Processes in the Renaissance

To begin our tour then, we start with the relatively more easily (and increasingly) recognized view that production by many masters in the Renaissance, especially in Venice, was not just about the feats of single individuals as it were also of entire teams or workshops that surrounded and enabled the individual artists’ feats (Bambach, 1999). Certainly, different types of artists were at work in these workshops – some as apprentices, some as more valued assistants and others as workmen.

Enhancing Productivity and Tackling Complexity

While the recesses of time make the techniques of the workshop elusive to scholars, observations such as those of Da Vinci’s are suggestive of a *“workshop tradition with its inheritance of cultivated design habits, technical short cuts, props, gadgets, and its view of drawing primarily as a functional tool rather than as an expressive masterpiece”* (Bambach, 1999). In a similar way, drawing became a fundamental tool to their vision. How the artist took initial visions and ideas to a fuller version involved not only the encapsulation of complexity, but also specific techniques that allowed for modularization and augmented the artist’s capabilities.

The iterative techniques examined earlier facilitate creativity (and eventually, individual creative expression). Renaissance artists employed a second category of drawing techniques as aids to production, particularly for complex projects (Bambach, 1999). These were also hard won by experimentation. Bambach specifically refers in her study to the use of techniques such as pouncing or *spolvero* as major steps in the artistic production process, especially for murals. Pouncing referred to the transfer of images from “cartoons” (outlined images on paper) or other drawings, to the final surface or media, via indelible marks made by sharp tools. *Spolvero* was imported into Italy around 1340, but around 1460 or 1470, artists begun to combine *Spolvero* with another technique, *calco*, another transfer technique. Artists later also used this as aideation technique or compositional tool. As noted earlier, artists also used

cartones or underdrawings as part of the pouncing process. These were eventually applied to different applications such as easel paintings and frescoes.

These techniques were used as much for iteration as they were for guiding labor. We want to focus attention on the former purpose now, as it is related to the increasing complexity in works of art, especially murals. As such, these methods were the natural extension of the iterative drawing processes seen with individual creativity.

Machines for Masterpieces

A different example of productivity enhancement was displayed by Brunelleschi, famed for the dome of the Santa Maria del Fiore Cathedral in Florence. Under the category of tools can also be placed the machines that Brunelleschi was famed for creating to help enact the Dome— at the time one of the largest vaulted domed structures in the world. These machines included machines for lifting masonry as well as for transporting stone down rivers. Interestingly enough, the actual dimensions, and thus, vision, for the “Duomo” was laid down years earlier, before a competition was raised in order to choose the Dome’s eventual builder. Brunelleschi also built scaled down prototype models of the dome (‘prototyping’), employed assistants (‘organized production’), and even tried to profit from side enterprises (e.g. the building of a water borne transportation ‘system’) (thus displaying all the trademark “commercial interests” associated with modern day productive organizations), all in order to further this enterprise and his agendas (Prager and Scaglia, 2004).

4.2. Knowledge as Being Socially-Located

We now turn to another perspective of creativity in the Renaissance: that of the conception that knowledge was located in the artefacts and minds of society, or what we term socially located knowledge. We note this primarily because of Vasari’s accounts of how artists knew of each others’ work, tutored star apprentices and the like. In addition, expert understanding since then confirms that artists also access the accumulated knowledge via a variety of knowledge transfer mechanisms, including apprenticeship with master teachers, and increasingly, books and model books. In the earlier part of the Renaissance, artists’ personal collections of drawings (known as model books) became a means of not only preserving representations of motifs for their use in further experimentation, but also allowing for compositions: “*(Jacobo Bellini’s) large drawings... seem to have been used by the artist and members of his shop as models for a myriad of painting types: religious subjects, mythological scenes, and architectural fantasies, among others*” (Cole, 1999) (p.8).

In sum, we can say that **the ‘model book culture’ facilitated copying and hence, substitution and combinations at a wider social level**, since students could copy out of other established artists models’ which were privately available (to students of those teachers). Eventually however, the increasing availability of the once-expensive paper led to the decline of model books, and a greater individuality and experimentalism (Chapman and Faietti, 2010) (p.49).

Thus, alongside the well understood apprenticeship format, model books formed the equivalent of a social means of knowledge transmission and diffusion. This could be seen as further forms of “cognitive supports”, that is, means to aid the mind in creating.

Perhaps as important as their role as preserver of knowledge are the idea of model books as the first instance of a technology modularizing for “productivity enhancement”. As with the “precision” techniques of pouncing (putting outlines on surfaces where the art is to be laid down) and drawing (for envisioning and dealing with the need to recombine), pre-Renaissance artists typically used model books and received images in their work that contained hundreds of ‘readymade’ sketches and images that were passed on from artist to artist – such as from master to students. These sources of ideas and images saved time and effort at the expense of originality.

The Implications for Innovation and Diffusion: Art as Distributed Cognition

Even as we acknowledged the sources of creativity as being the very artefacts themselves as well as the common forms of inter-personal knowledge transfer, we have also laid down the groundwork for an even more speculative proposition. Essentially, model books could be said to be acting as a common (and sometimes semi-private network) repository or storehouse for knowledge. In a way, these acted as **a form of distributed cognition** (or the pieces of the cognitive system embedded in artefacts).

To this degree, in an “innovation system” perspective of art, categories such as the sources of innovation, diffusion and evolutionary notions (of incremental and cumulative innovations) suggests a perspective to art that complements the ‘art as Taylorist production process’ that the art histories suggest, or that of the traditional view of creativity (being that of art being based on individual creativity, or on the creative individuals being contrarian to the field).

Something that is less obvious in productivity studies is the actual mechanism by which the stock of knowledge (including forms such as designs) accumulate. Model books and drawings more generally have been a part of this process. In general, *“An artist’s stock of drawings was a form of intellectual capital...useful in the production of future paintings.”* Drawings helped promulgate a masters’ influence in three important ways. Firstly, it reinforced the relationship between master and student: *“For the most part, drawing was related to workshop training and the preparation of finished work.”* Secondly, *“the dynastic nature of many Renaissance workshops meant that drawings constituted an important part of an artist’s legacy”*. As an example, the artist *“Squarcione promised to teach the boy his method of perspective ... and to provide drawings to copy”*. Third, drawings also served *“as a means of informal communication between artist and patron”*.

The following makes clear what the diffusion and innovation pattern looked like for drawing:

While individual styles naturally evolved over the centuries...the function and mode of drawing style broadly followed the pattern established during the swift development of the medium established ... (that) century” (Chapman and Faeti, 2010) (p.72).

The upshot of all this is that knowledge was circulated in both general form as a broad body of techniques as well as in forms specific to particular “circles” formed around leading artists. This in turn created the conditions for an ever increasing spread of knowledge radiating along particular lines and potential for their further combination with other new knowledge that minds would bring into play. While this point has been shown for the area of technical progress (Arora and Gambardella, 1994), it has been less evident for the cultural and artistic forms of innovation.

4.3. Production and Loci of Knowledge in the Digital Era: The New Renaissance?

Production Complexity Arising from the Complexity of Games

Like Renaissance art, the production of games has more or less evolved to involve a “workshop” environment of sorts. This is in part due to the complexity of the artefact, but is also in fact part of a general trend towards increasing complexity shared by both art forms.

The differences between the art forms are worth elaborating, as they have implications for their development. Unlike paintings, games have many intricate “working pieces”, and the modern craftsmen need to be as good in their own areas as the lead designer. Perhaps the key issue that differentiates games from art, especially Renaissance art is the complexity of games. This comes from their interactivity and sequentially experienced (e.g. visual narrative) nature. Rather than a single medium like art that embeds other layers of complexity, games are made up of multiple equally important layers, each of which interacts with the others. A simple narrative for instance helps to locate game play that should occur at each instance of time, and will branch in different ways depending on the decisions taken by the player. Through this complexity, games can be said to require additional practices and means of organizing in order to manage the complex flow of work. Individuals suffer more and more disadvantages in relation the big projects.

The need to weld together multiple non-related media such as visual media, text (and the narratives that run through them), as well as gameplay (e.g. reflexive gameplay or gameplay involving logical-deduction) together makes not only game design but game production (of all components involved) complicated as whole. Dependencies are caused when certain components are dependent on others (e.g. the design and some of the programming needs to occur before the art), and consequently, the “pipeline” or flow of these components in production becomes sensitive to one another. While there is no direct equivalent of this in the Renaissance, a degree of interdependence and division of labour between artists and carpenters was critical in the production of altarpieces (Northesole, 2011).

We cannot overemphasize how much software changes the productivity of not only development, but also the manner by which the products are engaged with (what we term “game operation”). This can be seen clearly in the translation of board or “pen and paper” games to digital versions. While rule making and application for a pen and paper game like Dungeons and Dragons used to be meticulously handled by human game coordinators (called dungeon masters), during game operation, the computer now effortlessly handles all rule application, as well as calculations and computation of “effects” on the players’ tokens. On the development side, mundane processes of keeping track of the “values” assigned to a given token in the context of play are now tracked (and allowed to be changed) via databases, in essence, treating content as virtual ‘objects’.

Game Production: From the Individual Developer to Being Team-Based

While in the early days, designers were all-in-one programmers and artists too, over time, games became increasingly complex, costly, and needing of team efforts. Modern video game production involves highly complex projects sometimes costing on the order of tens of millions of dollars and upwards of a hundred developers. In this sense, team management is an increasingly vital component. Most projects have multiple leads managing the creative divisions (be it programming, design or art) and producers handling scheduling and other resource coordinating tasks (other than the parts of the game that lead designers coordinate on). On the software side, a variety of advanced software process methodologies are increasingly employed in game development, such as Scrum, rapid prototyping, and Agile software development (all of which accelerated the iteration and rapid deployment of software). While there is no analogy in the Renaissance to many of the software practices, team management was apparently necessary for the larger Renaissance workshops, as with the larger game development project. As Vasari points out, Raphael had a extremely large team of draftsmen, and his practice largely involved his developing detailed designs and instructions that this “team” could then carry out under his supervision (Galenson and Jensen, 2001). Most attempts to characterize the team as being important also tries to incorporate the importance of a designer’s solitary vision, which is preserved in a complex counterbalance between the team and the individual.

Related to the prototyping seen in both periods is the idea of transference of imagery. Many Renaissance practices involved the transfer of images from one media (e.g. drawings) to the final media (painting). In a way, the Renaissance use of drawings to prototype the final art was a means of reducing the uncertainty of successfully carrying out complex art forms as envisioned. The equivalents of the painstaking transference techniques used in large-scale art production (e.g. pointing) are largely less evident in videogames as many processes has largely been automated, but prototyping of parts of a game clearly serve an equivalent purpose in addressing uncertainty. Content creation (e.g. definition of wire frames for 3D modelling or use of motion capture to capture human movement) is wholly automated by software. Also, content is created (e.g. drawn) in the manner of “what you do is what you will see”, that is, whatever is committed to screen is what players play. The digital age accelerates this trend through software. Life drawing has become a neglected elective course in many art schools as students prefer to learn digital tools such as Illustrator, Photoshop, Maya and 3DS Max.

In another way, the manner of art has become more expansive and subject to multiple interpretations. The imperative for naturalistic accuracy and vitality is not as critical in the digital age. Instead the preferences of the postmodern age are unusual or ironic combinations of images that may shock or amuse (Collings, 2000), comic forms and unusual visual styles may be adopted as much as realistic ones. The images need not be lifelike and produced by the artist, which would be seen as a waste of time, but increasingly, images and objects of art are drawn from the World Wide Web. The Internet is effectively a massive model book of the 21st century. Artists search using key words and visit sites known for images and simply download them. The search for new combinations has been extended to animations, video, photographs and audio, driving on the mash-up phenomenon.

User Creativity

One trend in modern game development has been the move towards user creativity. This in a sense started with the automation of game operation (e.g. computing the mindless calculations needed to assign outcomes after resolving players’ and their opponents’ moves). A natural outcome was the application of automation to enabling users to express themselves in more than strategic ways. Users were allowed to create user-defined objects (with unique properties), and developers found that games exhibited emergent properties. Certain designers found this to be particularly alluring, and created whole genres after this new

“paradigm” of empowering the users (e.g. Will Wright and his game *Spore*). This was in part due to the perceived need to personalize games, but is in fact a natural step in the evolution towards more user participation, at least in some games. More recently, user generated content has become a de facto manner of helping developers “create virtual worlds” (once developer created) by relying almost entirely on users’ creative efforts, virtual worlds such as *Second Life* displaying these hallmarks. Thus, in a way, games and the virtual worlds that have sprung from them have moved the media full circle from “developers (thinking as) as users” to “users as developers” (Au, 2008).

Game Development Tools as akin to Machines

Knowledge flowed less easily during the Renaissance, but the production technologies of the time meant that artistic work could be scaled-up to a degree, whether through the prototyping techniques like drawing or more complex machines for sculpture and other 3D products, or simply designs in the mind’s eye, as seen in Leonardo’s sketchbooks. The use of machines in the Renaissance has a more direct analogy in videogames, since the various tools (e.g. 3D Max, Maya, etc.) augment human potential in games as much as they did in architectural constructions like the Dome. In the production of digital art we see now methods that provide a dramatic improvement in the ability to implement what previously could only be conceptualized. Rem Koolhaas headquarters building for China’s CCTV is a good example of this, as without the advanced computers the architects used, it would not have been structurally possible to build. In games, the flexibility of digital tools allows artists and designers to create a ‘prototype’ image very quickly, and then iterate: playing with the parameters and proportions for the image, and adjusting colours and tone. These changes are effected in seconds with a few mouse clicks. Even with a more complex creation such as an animation or video game, the effort might include multiple designers and artists as well as programmers. The latter’s development processes are organised on principles of building an early prototype and then iterating. Software engineering methods such as Agile, Scrum, eXtreme Programming and Test-Driven Development consist of honest communication, regular monitoring and builds rather than sequential work packages aimed at achieving predetermined milestones. The production of the work has subsumed the design phase. Thus, in large part due to the nature of the product, but also due to tools, design is no longer a discrete and subservient preparatory activity (i.e. as in the pre-envisioning of art), but is integral and ongoing in the production of creative works.

Knowledge (for Combinations) as Socially-Located

We have now moved from a view of individual knowledge creation as being combinative, to one where we now suggest that we recognize the social complexity involved in knowledge production. In addition, we suggest that the complexity of art forms, especially in the digital age, reinforces the use of further “cognitive supports” – in this case, as embedded in production processes themselves.

5. Discussion: Constants and Change across the Ages

Our investigation of the relationships between creativity and technology (taken broadly to include practices and techniques) suggests several views of creativity – not all commonly discussed as such in the creativity literature, and certainly not all at once. We will now summarize these strands via a narrative of creative production that spans the two periods.

Creativity as Combinations and Constraints

We started with the question: What is creativity about and where does creativity stem from? While original knowledge, and hence, fundamental knowledge attained from scientific and other deeper inquests, as well as inspirations, are important forms of creativity, our argument has been about creativity as the combination of new as well as pre-existing forms. In the Renaissance, the various strands of technique and style were just taking shape, but it is really in the later works that the combinative nature of these trends, or to put it another way, the confluence of these trends in each artists’ work, took shape. This combining came through the convergence of concurrent stylistic trends, as well as in the artists’ usage of techniques to iterate on and vary their works from one another. The preponderance of techniques (and ways of using them) further contributed to the variation in stylistic output.

At the same time, in the Renaissance, the early stages of religious motifs and the limited (or early) state of technology constrained creativity considerably. That it may be the lack of technology that enhances creativity may complicate the original form of Burckhardt’s thesis – that the lack of creative output was simply due to early stage of the world and of artists’ intellectual development (Burckhardt, 1990).

Ironically, in games, it may be the opposite. While the early technology constrained creativity, the markets still bore the variety that early designers created. More recently, the more risk-averse and conservative nature of markets and publishers alike have constrained creativity – a changing “selection system” as it were.

Creativity as Complexity, and Iteration

As was seen in the Renaissance, over time, art forms and the motifs constituting them became more complex. The implication of course being that, the more complex the society and culture (as sources of knowledge for combination), the more complex the resulting art forms. Culture contributes in deep, expansive ways, especially in the modern day. At the same time, our economic machinery ensures that what is interesting is less important than what is saleable at scale economies. That complexity is ever increasing in digital products like video games is clear. This parallels the complexity seen in art, but great works of “digital art” have not always had critical success, as witnessed by the fate of “auteur led” games. This is in part due to the ability to envision and realize complex art forms, but is also due to a perceived need for the visual effects and video games industries to achieve what has come to be known as ‘photorealism’ (Sapsed et al., 2007). But the goal here is to make digital creations appear more sensory and impactful to view, for movement to be more fluid, for action to be more thrilling. In other words the goal is for digital creations to appear more video-like, rather than lifelike, framed within a screen and designed for consumption within that format. At the same time, the imagined settings may now come from anywhere in the “content universe”.

In art, even though detailed artistic methods help put form to idea (i.e. the implement), iteration was needed to help prove out these initial “forms”. In games, preproduction and conceptual art also help to put form to idea in “testing” processes. Thus, the complexity in artistic forms has led to the cognitive need to pre-envision and prototype. This much is common to both periods. What we argue however is that the character of this iteration and tuning process has also become dramatically greater in the modern age, partly due to technological change, but also due to the need to service the more complex art forms of the digital age. Whereas innovations in drawing media were simply innovations in how to depict the eventual form and style, innovations affecting game production, as with innovations in animation, *accelerate the process of production, including potentially, the iterative activities jointly determining (with the exercise of creativity) each stage of production.*

Creativity as Socially Distributed in ‘Artistic Innovation Systems’

We have advanced a socialized view of creativity that is generalized over these two periods, that is, of it being constituted from the broader society (as a repository of knowledge, and possible restraint). Along with the need for iteration, we illustrated how this suggests that creativity rests as much on the cognitive supports of practices like iteration as it does on the social support of knowledge as being distributed. We hope that this provides the components of a prospective view of artistic innovation as being a located within an artistic innovation system. While this seemingly weakens the individualized nature of creativity, it is important to recognize that we are still intent on keeping the value of the individual in bringing about “creativity”, even as that creativity is shown to be using (if not needing) supports and stimuli.

Creativity as Production

We have seen how early art was already subject to early forms of a division of labour. Again, this was partly due to the growing complexity of art forms. What we showed was how technology directly aids the production of work spawned by the initial conceptualization phase, as well as its diffusion (in the case of delivery). Increasingly complex combinations go along with an increasing complexity of forms and societal relationships. Artists and designers manage these forms by breaking down the work (e.g. by composition). A similar occurrence happened with videogames, and various means of game design (e.g. breaking games down into levels) occurs. However, it is in the means of team production that increasingly large game projects illustrated the true nature of organization that was emerging. More hierarchical or Taylorist forms of organizing production were common. The individual artist became the designer who was, in the early days of games, was a solitary developer, but who over time, again with increasing complexity of the art form, became an integral part of a team.

The new techniques of the Renaissance, such as perspective, were profound as forces of actualisation, giving human artists control over space and positioning in the scheme of things. Fundamentally they entailed a repositioning of humankind's relationship to God. The power of the tools and techniques

brought a new confidence and commitment to human progress (Welch, 1997). The beginnings of the superstar artist were seen with the likes of Michelangelo who likened the artist's work to divine creation (Johnson, 2005). Where the rules of perspective were inconvenient artists would simply bend the rules, as can be seen in Leonardo's *The Last Supper*, where proportions and vanishing points are inconsistent but the overall composition has a celebrated harmony and balance.

The superstar artist instilled a view of individual creativity in the Western mind in the Renaissance through to the digital age. Paradoxically the individual consumer has been afforded a greater creativity in the Internet age, even while innovations become ever more collective efforts. Even though the importance of the self is somewhat diminished by the Internet, the individual continues to assert him or herself in virtual communities, and the fact that the Internet amplifies combinative forces is undeniable. What was once creativity locked up in social structures and codified volumes (i.e., what we saw with model books) is now widely distributed, accessible throughout the planet. This is not to say that the Internet does not have a social or cultural structure – it is meta-social or meta-cultural in nature. Original creations are mashed-up and collectivised, and the protection of individual creations cannot be feasibly managed through the existing institutions of Intellectual Property law in the digital age. In this way, technological mediation – both as a part of the artefact as well as in its production - has been a far greater force in the modern age. This is perhaps the most dramatic difference between the ages.

6. Conclusions and Implications

The Renaissance and our own Internet age would appear to have some similarities in that they are both revolutions in the production of art and creative works. The Italian renaissance brought new paradigms in design thinking, and perspective, as well as the many associated tools, practices and forms of organisation that these entailed. Similarly, the digital age has brought new tools and methods of creative working that also appear to obliterate existing practice. However this surface similarity between the two ages actually hides a complex relationship, because it is precisely the paradigms inherited from the Renaissance that the digital age is overthrowing. These principles and practices, which have had a defining influence on Western culture for the last 500 years are on one hand being overturned by the digital age and the Internet, but on the other, are demonstrating fundamental properties of human creativity and the role of technology in mediating this. This paper has argued that two very different epochs, containing two crucibles for creativity, are in many ways only separated by the types of technologies, but not by the types of technological mediations, and needs of human creativity.

We have sought to highlight several distinct aspects of creativity across the two ages, as well as how technology and practices have generally mediated this creativity. The paper illustrated how the various technologies and practices related artistic creativity to larger scale social systems and over longer time scales. Through these, we can furnish a different perspective on creativity that is both evolutionary (in being knowledge-based) and more appropriately incorporative of the mechanisms of innovation and diffusion. Thus, comparing two very different epochs – joined by the fact that each was emergent in its own time – can help us to discern patterns, the generality of mechanisms, and the mediating role of technology and culture.

Acknowledgements

Jonathan Sapsed's work on this paper was partly funded by the Arts and Humanities Research Council (AHRC)'s 'Brighton Fuse' project. Both authors are grateful for comments from Nikiforos Panourgias, Marios Samdanis and the participants of the EGOS 2011 Subtheme 'Digital Technology and the Creative Industries', as well as at workshops at Brighton Business School and the Freeman Centre.

Abstract: Professional service SMEs in emerging markets are growing in importance. Prior research has provided limited insight into how SMEs from emerging markets internationalize at accelerated speeds with less resources than multinational firms. This empirical study of India's professional service SMEs found that an entrepreneurial orientation and relational capital are key contributors to SME internationalization. Specifically, the ability of human capital to build relationships with customers and channel partners determines the speed and degree of SME internationalization. The current research contributes to international entrepreneurship literature by confirming that entrepreneurial orientation, human capital, and relational capital resources contribute to professional service SME internationalization.

Keywords: Internationalization, Entrepreneurship, Human Capital, Relational Capital, Professional Services

1. INTRODUCTION

The tremendous growth of emerging markets has captured the attention of the world. Global trade in emerging economies continues to expand (UNCTAD, 2009a). For instance, when developed markets experienced negative GDP growth in 2009, India reported growth of 5% and China's GDP grew by 7.8%. Service trade, a dominant component of world trade (WTO, 2009), has increased on average 10% per year since 2000 with notable growth from the emerging market of India (UNCTAD, 2009a; WTO, 2009). India, where service contributions to GDP outpace manufacturing, has experienced service trade growth over the past decade exceeding the global average (UNCTAD, 2009a). In fact, India is said to possess a comparative advantage in services (UNCTAD, 2008c).

Emerging markets have become resilient players in world trade (UNCTAD, 2009a). The fastest growth among service sectors has been seen in professional services (e.g., financial, legal, management consulting, engineering, architectural, education, and information technology) (Styles, Patterson, and La, 2005). Information and communication technology (ICT) services, a sector where exports grew six times faster than total service exports, are increasingly delivered by developing countries where their share has grown from 4% to more than 28% (UNCTAD, 2008a).

With unequal growth evident across nations and service industries, research has yet to address the drivers of such disparate growth and success. Do some service sectors, such as professional services, possess characteristics that facilitate internationalization among small firms in emerging markets? Professional services, a services sector, use highly-skilled human assets which possess specialized knowledge (Hitt et al., 2006). Professional service firms that are intensive in technology and human capital inputs are known as knowledge-based firms (Javalgi et al., 2011; Styles et al., 2005). These knowledge-based firms derive value from intellectual capital, which is comprised of human capital, structural capital (internal organizational capital), and relational capital (Youndt et al., 2004). Since the professional service industry is uniquely characterized by expertise, human capital, relationships, and knowledge flow between the provider and customer, professional services warrant more research attention (Freeman et al., 2007; Lindsey et al., 2003). Given the considerable growth of professional service sectors in emerging markets, these remain important, under-researched markets (Javalgi et al., 2004). Consistent with this view, Freeman, et al., (2007) and Coviello and Martin (1999) highlighted the need to better understand the internationalization process of firms in the professional service sectors.

Entrepreneurial literature contends that an entrepreneurial orientation motivates SMEs to overcome deficiencies and leverage their intangible resources for internationalization in emerging markets (Yamakawa et al., 2008); yet, significant gaps remain in understanding the role of entrepreneurship and resources in the internationalization of firms from emerging markets (Luo and Tung, 2007; Yamakawa et al., 2008). A 2008 review of research on entrepreneurial firms in emerging markets revealed only 43 studies (Bruton et al., 2008). International entrepreneurship (IE) research, a relatively new and growing field positioned at the interface of international business and entrepreneurship research, includes examination of entrepreneurial internationalization (Oviatt and McDougall, 2005). In the IE field, research has largely focused on developed economies (McDougall and Oviatt, 2000; Oviatt and McDougall, 1994), small venture firms, and antecedents, with a focus on individual sociocognitive factors and their direct effects on outcomes (Keupp and Gassmann, 2009). In an effort to advance the field of IE, Keupp and Gassmann (2009) undertook an extensive literature review of 179 articles published over 14 years from the disciplines of strategic management, international business, entrepreneurship, and technology and innovation management. The review revealed knowledge gaps among the various approaches to understanding international entrepreneurship, the lack of a cohesive theoretical framework for SME internationalization, and the need for a strong theoretical foundation to align future studies with the international business or international entrepreneurship literature streams to integrate literature and advance the field of international entrepreneurship. The same investigators note that within entrepreneurship journals, research which addresses international entrepreneurship comprises only 4.6% of all articles. Even more striking is the significant research gap evident by the small amount of research which has utilized the entrepreneur orientation (EO) scale (Miller, 1983; Covin and Slevin, 1989) in an international context (Slevin and Terjesen, 2011).

In response to a growing interest among the research community for a clearer understanding of IE, several focused journal issues have recently provided reflections, constructive analysis of research to date, and recommendations to advance the field of IE research. A review of 323 articles on international entrepreneurship from 1989 to 2009 finds that human capital is a better predictor of internationalization than firm size or age (Jones et al., 2011; Westhead et al., 2001). These researchers also question the temporal effects of EO dimensions and suggest that an EO may be an outcome of internationalization for established firms. A need is evident for clarity of the effects of EO in international contexts (Jones et al., 2011). Recommended areas for research include the elements comprising an entrepreneurial orientation, access to resources, as well as knowledge and firm capabilities (Keupp and Gassmann, 2009). There has been limited empirical evidence that identifies the capabilities which help SMEs internationalize early (Knight and Cavusgil, 2004).

We contend that professional service firms possess knowledge resources that facilitate internationalization. We build upon the findings of Hitt et al (2006) and apply the resource-based view (RBV). The RBV is an appropriate approach when examining high-tech venturing, such as computer and communications technology SMEs, a sub-sector of professional services (Miller, 2011). We follow the approach of Keupp and Gassmann (2009) in extending the RBV by applying a knowledge-based perspective as the framework for examining knowledge-intensive services. As an extension of the RBV, the knowledge-based view (KBV) emphasizes intangible resources rather than physical assets, whereby knowledge is the most important resource. With regard to professional service SMEs, we contend that knowledge resources facilitate a SME's speed and scale of internationalization in that a complementary relationship exists between firm resources and decision-making processes (Miller, 2011). We concur with management research in that the primary asset base for professional service delivery is knowledge, and the development of human capital knowledge capabilities generates relationship capital and facilitates international expansion (Hitt et al., 2003). A focus on knowledge resources provides an appropriate lens to examine professional human capital as the key to developing relationship capital between professional service employees and their international market customers for global expansion (Hitt et al., 2003). Hence, research can provide insight into the effect of entrepreneurial activities and human capital on the internationalization efforts of SMEs (Todd and Javalgi, 2007).

To address the compelling need for international entrepreneurship research, we empirically test a model of the drivers of service SME internationalization by surveying professional service SMEs in India to examine how an entrepreneurial orientation, human capital, and relational capital resources contribute to the speed and scale of internationalization. In a focused journal article which reflects upon entrepreneurial orientation research to date, Miller (2011) notes the growing awareness of the importance of entrepreneurship in regions such as India and asserts that globalization is a form of "new entry." Areas of

great research promise include the study of entrepreneurship in planned economies that are transitioning to market economies (Dess et al., 2011), as well as research examining SMEs in an emerging market and their outward international expansion, a neglected research area (Bruton et al., 2008).

Given the pressing need for research, the intent of the current study is to integrate entrepreneurship and strategic management research, which examines an entrepreneurial orientation and human capital, with a subset of IE research that focuses on small firm internationalization. Extension of entrepreneurial orientation research into the field of international entrepreneurship is an area of meaningful research attention (Miller, 2011; Slevin and Terjesen, 2011). Findings of this study address a gap in international entrepreneurship research (Keupp and Gassmann, 2009; McDougall and Oviatt, 2000; Styles and Seymour, 2006) and answer the call for a multi-disciplinary approach to understanding small firm internationalization (Venkataramanaiah and Parashar, 2007). The study's unique contribution is the context of an emerging market where resources are thought to be constrained. Furthermore, entrepreneurship research has not fully addressed the gap in extending and linking entrepreneurship with internationalization in a variety of contexts, nor addressed accelerated speeds of growth from emerging markets, or even from an SME perspective. In summary, this study provides the following contributions:

1. An empirically tested multi-disciplinary framework that integrates and extends the fields of entrepreneurship, international entrepreneurship, strategic management, and management;
2. Empirical evidence that an entrepreneurial orientation, human capital, and relational capital contribute to professional service SME internationalization from an emerging market;
3. Empirical support for the resource-based view;
4. Firm-level empirical evidence of accelerated SME internationalization in a context where the process theory of internationalization (Johanson and Vahlne, 1977) does not fully reflect the SME internationalization process; and
5. Support for differences among service sector SME internationalization.

2. RESOURCES AS A BASIS FOR INTERNATIONALIZATION

Research on service internationalization indicates that service firms are typically first entrants into international markets as client followers (Calof and Beamish, 1995; Erramilli and Rao, 1993). Advances in technology, privatization, and opportunities in national markets resulted in tremendous growth of international business activity in the 1990s (Hitt et al., 2006). The interrelationship of national economies, international financial markets, and globalization of industries led to the need for global laws and the movement of professional law firms into international markets (Hitt et al., 2006). Foreign professionals often attended U.S. law schools then returned to their home countries. In this manner, knowledge, the basis of professional services, was acquired in a foreign market and transferred to the home country for global expansion. As a result, professional service firms that invest in human capital create highly valued, transferrable assets that facilitate international expansion. Resources, in part, explain internationalization of professional service SMEs.

While there are several theories that attempt to explain the internationalization process of the firm, traditional theories fail to consider entrepreneurial behavior or the resource needs of smaller firms (Knight and Cavusgil, 2004). As a result, the RBV (Barney, 1991) has emerged as a promising framework to explain SME internationalization. Moreover, the knowledge-based view (KBV), an extension of the RBV, is the dominant theory used to explain internationalization of knowledge-intensive firms in dynamic environments characterized by highly competitive knowledge-intensive industries (Saarenketo et al., 2004). The KBV asserts that knowledge is a key factor contributing to firm internationalization (Autio et al., 2000). The KBV agrees with traditional stage theory (Autio et al., 2000; Yli-Renko et al., 2001) in that knowledge and learning are key factors contributing to firm internationalization, and firms are repositories of knowledge (Saarenketo et al., 2004).

According to the RBV, firms possess unique resources and capabilities which explain rapid internationalization (Knight et al., 2004). The RBV explains differences among firms as being due to

varying tangible and intangible firm resources (e.g., physical, human, and organizational) or differing firm capabilities in leveraging resources. SMEs have resource deficiencies unlike large firms, such as limited financial capital and a smaller complement of human capital. However, SMEs have successfully internationalized at speeds faster than resource rich multi-national enterprises (Calof and Beamish, 1995). Observed accelerated internationalization among small computer software firms indicates that technology intensive firms have not followed a sequential progression through the stages of internationalization (Bell, 1995). Given accelerated patterns of internationalization, Bell et al. (2003) contend that early internationalizing firms are typically knowledge- or service-intensive, both of which rely upon a sophisticated knowledge base.

Researchers assert that one theoretical framework does not capture the complex SME internationalization process, and evidence of accelerated SME internationalization highlights the need for research into factors influencing the internationalization of small knowledge-intensive and service-intensive firms (Rialp et al., 2005). After a decade of inconsistent findings, researchers have concluded that additional research is needed (Hitt et al., 2006). Although prior studies suggest that internationalization varies across service categories (Javalgi et al., 2003; Styles et al., 2005), the lack of research on service internationalization is striking when considering the contribution of professional services to worldwide employment, production, and trade (UNCTAD, 2009a; WTO, 2009). Furthermore, findings from studies of large law firms (Brock et al., 2006; Hitt et al., 2003, 2006; Kor and Leblebici, 2005) cannot be generalized.

To advance this line of research, the current study focuses on professional services, a sub-sector within services encompassing law firms, accounting firms, engineering consulting firms, and management consulting firms (UNCTAD, 2005). Professional service firms rely heavily upon intellectual property, specialist expertise, and knowledge. Intellectual capital and knowledge-based assets are key resources of professional service firms. Research on intellectual capital and knowledge-based assets deconstructs intellectual capital into human capital, structural capital (internal organizational capital), and relational capital, also referred to as customer capital (Bontis, 1998; Youndt et al., 2004). This study examines human and relational capital, intangible resources of professional services. We now focus on the theoretical background and hypotheses development.

3. THEORY AND HYPOTHESES

3.1. *Entrepreneurial Orientation and the Degree of Internationalization*

A number of researchers contend that internationalization is an entrepreneurial strategic choice (Ibeh and Young, 2001; Sapienza et al., 2006; Autio et al., 2011). Firm level entrepreneurial orientation (EO) “is demonstrated by the extent to which the top managers are inclined to take business-related risks (risk-taking dimension), to favour change and innovation in order to obtain a competitive advantage for their firm (innovation dimension), and to compete aggressively with other firms (proactiveness dimension; Covin and Slevin, 1988, p. 218). An EO was originally conceived to describe entrepreneurial processes that manifest differently depending on the context. EO would be evident as risk taking in small firms, innovation in high-tech companies, and proactiveness in large firms (Miller, 2011). Lumpkin and Dess (1996) describe EO as “the processes, practices, and decision-making activities that lead to new entry” (p. 136). International entrepreneurship, “the discovery, enactment, evaluation, and exploitation of opportunities across national borders to create future goods and services” (Oviatt and McDougall, 2005, p. 540), extends entrepreneurial new entry to a global level. In short, an EO manifests in the firms' strategic decisions to enter new international markets (Miller, 2011).

In a case study of eight ventures, firms with an entrepreneurial orientation (EO) were more likely to internationalize early as a result of an innovativeness and openness to international opportunity (Chandra et al., 2009). A study which examined privatization by the Spanish government from 1985 to 2000 found that entrepreneurial corporate venturing activity increased after privatization and resulted in greater internationalization (Romero-Martinez et al., 2010). Similarly, privatization of businesses by India's government in the early 1990s spurred entrepreneurial private ownership of start-up firms. Moreover, an entrepreneurial orientation has been shown to increase the speed of internationalization (Zahra et al., 2000). Firms possessing an entrepreneurial orientation identify and respond to environmental cues faster than competitors (Wiklund and Shepherd, 2003) and leverage market knowledge resources into market entry capabilities that maximize the speed and efficiency of entry (George et al., 2004; Grewal et al., 2011). Researchers have noted the increased speed and scope of entrepreneurial firms into international markets (Knight, 1997) and the greater scale and scope of exporting among entrepreneurial firms in

Finland (Kuivalainen et al., 2007). Evidence exists to support the positive effects of entrepreneurial firm characteristics on the choice and speed of firm internationalization in both developed and lesser-developed regions of the world (Ibeh and Young, 2001; McAuley, 1999; Zucchella et al., 2007).

With regard to small firms, size is not a barrier to internationalization (Bonaccorsi, 1992; Calof and Beamish, 1995; Katsikeas et al., 1997) and at a certain sales level, there is no difference between small and large firm export intensity (Cavusgil, 1984; Wolff and Pett, 2007). The ability to export is not a function of firm size or age, but more importantly, entrepreneurial human capital and internal resources (Westhead et al., 2001). An entrepreneurial orientation aids in overcoming size barriers for international growth (Wolff and Pett, 2007) and increases both international sales growth and market share (Fillis, 2001).

In emerging markets, the challenges are even greater. Yet, an entrepreneurial orientation aids SMEs in overcoming deficiencies by leveraging intangible resources for internationalization (Yamakawa et al., 2008). In fact, entrepreneurial capabilities are known drivers of entrepreneurial economic activity and may even be more important than tangible firm resources in emerging markets (West et al., 2008). As a result of the growing research on SME internationalization, entrepreneurship has been confirmed as a driver of internationalization among manufacturing SMEs (O'Cass and Weerawardena, 2009), new venture internationalization in the emerging market of China (Yiu et al., 2007), and is expected to be a driver of internationalization among India's professional service SMEs.

Hypothesis 1: A professional service SME's entrepreneurial orientation is positively related to the firm's speed and scale of internationalization.

3.2. Human Capital and the Degree of Internationalization

Human capital is the intelligence, skills, tacit knowledge, and expertise of human actors in an organization (Bollen et al., 2005). Human capital resources include the "training, experience, judgment, intelligence, relationships, and insight of individual managers and workers in a firm" (Barney, 1991, p. 101). Unlike individual personality traits, which have a less certain impact on entrepreneurial outcomes, human capital can be developed over time and transferred between individuals (Wright et al., 2010). A recent meta-analysis differentiates human capital into two distinct conceptual categories: (1) human capital investments, which include education and work experience, and (2) outcomes of human capital investments, which encompass acquired knowledge and skills that are related to specific tasks, such as running a business venture (Unger et al., 2011). More importantly, it is the latter outcomes of human capital that have a significant relationship with firm profitability and growth. In entrepreneurship literature, human capital is known to enhance the discovery and exploitation of business opportunities (Shane and Venkatraman, 2000). Thus, human capital enables the recognition, exploitation, and successful growth of business ventures.

Professional service firms rely heavily upon intellectual property, specialist expertise, and knowledge, which are key intangible drivers of internationalization (Erramilli and Rao, 1993). Although professional service SMEs possess a liability of "foreignness" when entering new markets, knowledge barriers to internationalization can be overcome with experience (Lu and Beamish, 2001). Managers with international experience rely upon experiential knowledge to identify professional service opportunities, decide which markets to enter, and how to manage the internationalization process. Both international stage theory (Johanson and Vahlne, 1977) and the "born-global" view (Knight and Cavusgil, 2004) agree that knowledge contributes to firm internationalization. Furthermore, international experience has been identified as a driver of SME internationalization (Javalgi and Todd, 2011; Crick and Jones, 2000).

With regard to professional services, a study of U.S. professional law firm expansion confirmed that human resources facilitate greater international market scope (Kor and Leblebici, 2005). Research suggests that human capital compensates for the lack of resources in small firms (Westhead et al., 2001), and knowledge intensity is a known predictor of international sales and growth (Autio et al., 2000). Knowledge intensive new ventures that possess unique resources exhibit a greater tendency for internationalization (Bloodgood et al., 1996). The rapid internationalization of "born-global" firms (Knight and Cavusgil, 2004) also suggests that knowledge or prior experience accelerates internationalization (Calof and Beamish, 1995; Knight et al., 2004). "Born-global" firms in Denmark and the U.S. attribute their success to leveraging intangible resources comprised of skills and managerial experience (Knight et al.,

2004). A body of prior research also supports the positive effect of human capital on SME internationalization (Autio, et al., 2000; Bell, 1995; Calof and Beamish, 1995; Ruzzier et al., 2007). Given the resource constraints of smaller firms and the skills needed to deliver customized professional services in SMEs, human capital is a key strategic resource and the source of knowledge for SME internationalization.

Hypothesis 2: A professional service SME's human capital is positively related to the firm's speed and scale of internationalization.

3.3. Relational Capital and the Degree of Internationalization

A professional service SME's relational capital is the value of firm-specific professional service relationships created by human capital. Relational capital extends the concept of customer capital, defined as an organization's relationships, interactions, and intimacy with customers (Stewart, 1994). Relational capital also encompasses knowledge of marketing channels, suppliers, and customer relationships (Bontis, 1998). Marketing literature cites relational capital as a valuable resource (Srivastava et al., 1998). Social exchange literature further defines relational capital as the personal relationships parties develop through interactions over time (Nahapiet and Ghoshal, 1998). Similar to the marketing literature, the social exchange literature states that relational capital creates value through the exchange of information for knowledge creation.

Professional service client relationships are a source of foreign market knowledge which is used to create customized local service products. In this manner, relational capital enhances the success of international ventures (Thuy and Quang, 2005). Relationships aid global market penetration, accelerate cash flows, and reduce costs (Srivastava et al., 1998). In the case of professional services, studies of Australian knowledge-based service exporters cite high levels of customer relationship skills as key drivers of international success (Styles et al., 2005). Greater customer involvement enhances both knowledge intensity and international sales growth (Yli-Renko et al., 2002).

A study that compared relationships with distributors in the UK and Australia found that relationships enhance export sales growth (Styles and Ambler, 2000). Recent research which examined SME knowledge resources also confirmed that the development of relationships in foreign markets facilitates SME internationalization (Zahra et al., 2007). The inimitable and non-substitutable nature of relational resources enhances export expansion and success (Morgan et al., 2006). Additionally, international business research supports the view that relational capital resources contribute to the delivery of value to global customers (Leonidou and Kaleka, 1998). In the context of customized professional services where relationship capital is enhanced from knowledge and satisfaction of clients' needs, international expansion of professional service SMEs is more likely to be successful.

Hypothesis 3: A professional service SME's relational capital is positively related to the firm's speed and scale of internationalization.

3.4. Human Capital and Relational Capital

Human capital creates relationship capital and without human capital, relational capital does not exist. Human capital creates valuable professional service relationships by understanding and satisfying customers' unique needs. Relational capital is a consequence of knowledge dissemination between parties, and as such, knowledge sharing enhances value (Bapuji and Crossan, 2005); thus, relational capital is created and its value is enhanced by human capital. The greater the service and customer knowledge possessed by the firm's human capital, the greater the development of relationship capital (Bollen et al., 2005). Human capital nurtures and enhances relational capital by drawing upon the specific skills and knowledge of professional service employees to provide satisfied, long-term client relationships. As clients' professional service needs increase with greater complexity, wealth, and geographic expansion over time, highly-skilled professional service human capital strengthens relational capital by satisfying a greater variety of customers' needs, which in turn, facilitates SME growth and international expansion to new markets.

In the case of professional services, a study of the relationship between clients and consultancy firms in London substantiates that the competence of the individuals involved in the exchange is crucial to

determining the quality and development of the relationship (Karantinou and Hogg, 2007). Even in the emerging market cultural context of Taiwan, human capital and relationship capital facilitated goal achievement and enhanced value by establishing relationships with external stakeholders (Tseng and Goo, 2005). Human capital enhances relationship capital (Bontis et al., 2000). Furthermore, as a result of increased interest in human capital, recent research has examined various models containing human capital and relational capital to clarify the relationships among intellectual capital components (Cabrita and de Vaz, 2008). Results of this research indicate that human capital has a significant and substantial effect on relational capital.

Hypothesis 4: A professional service SME's human capital is positively related to the firm's relational capital resource.

4. METHODS

4.1. Sample and Data Collection Procedure

4.1.1. Database of SMEs in the Emerging Market of India

To test the four hypotheses, data was collected from professional service SMEs in the emerging market of India. We selected this country for this study because SMEs in emerging markets, such as India, face considerable challenges and governmental support programs are relatively recent. In the early 1990s, the Indian government began encouraging entrepreneurial activities among small businesses in recognition of the important role of SMEs in the global and national economy (Todd and Javalgi, 2007). Consequently, India is now the world's largest ICT exporter and is ranked among the top 10 nations in world exports of several service sectors (WTO, 2009) and small business sectors (Venkataramanaiah and Parashar, 2007). Growth of India's services has been fuelled by SMEs. Output of India's 12.34 million SMEs grew by more than 50% between the years 2002 to 2006 (Karmakar, 2007) and accounted for 40% of exports (UNCTAD, 2008b). Insight into factors contributing to the international growth of India's SMEs would be useful for identifying policies that encourage economic development in emerging markets. When examining entrepreneurship in emerging economies, India has been the focus of only one study from 1990 to 2006 (Bruton et al., 2008).

Although there is no generally accepted definition of a SME, entrepreneurship literature most commonly uses the definition provided by the Small Business Administration (Oviatt and McDougall, 1994), which defines SMEs as independent enterprises with less than 500 employees. Classification of firms with fewer than 500 employees is also congruent with SME characteristics deemed appropriate by researchers (Leonidou et al., 2004; Lu and Beamish, 2001) and in accordance with the North-American Industrial Classification System (NAICS). According to an in depth examination of SMEs, the established definition of a SME is a smaller firm employing 500 or less employees, and/or having sales turnover less than \$25 million U.S. dollars (Leonidou et al., 2004; all monetary units noted in this study are expressed in US dollars).

In contrast to large firms, SMEs have limited financial and managerial resources (Hoskisson et al., 1994) which may impede growth and foreign expansion. SMEs face not only the same challenges as larger firms, but also potential deficiencies in resources not present in larger firms (Bilkey and Tesar, 1977; Westhead et al., 2004). Small businesses and large businesses are different species (Shuman and Seeger, 1986).

A descriptive profile of the sampling frame requirements (e.g., firm size and ownership) was provided to a research firm located in Mumbai, India. The database was comprised of the following sources: business membership web sites, city-wide data of IT companies, service publications, service and business-related journals, professional service business associations and professional associations of architects, chartered accounts, medical professionals, and law practitioners. Survey respondents were randomly chosen from a SME database of 4,572 contacts which was reviewed for accuracy. The total database was reduced by 32% due to an SME being incorrectly classified or a lack of complete contact information. Among the sample frame of 3,127 data points, 1,112 SMEs or 36% were randomly sampled and initially contacted.

Prior to mailing the survey, respondents (one per firm) were pre-qualified by phone to verify: (1) professional service classification, (2) international business involvement, (3) employee size less than 500, and (4) the respondent as being the owner, CEO, or key international management executive.

Among the 1,112 firms contacted, 730 or 66% were confirmed as meeting sample requirements. Of the 448 surveys forwarded to willing respondents, 199 surveys were returned for a 28% response rate. An overall 6.4% rate of response was obtained from the original 3,127 sample frame.

4.1.2. Data Collection

Responses returned were from the following regions: West India 54%, South India 21%, North India 19%, Central India 3%, and East India 2%. The sample included the following service sector distribution: 54% computer and information technology, 24% management consulting, 5% architecture and engineering, 5% health services, 4% financial services, 2% real estate, 2% accounting or payroll, 2% legal, and 2% entertainment and tourism services. Some sectors and regions were more heavily represented due to: (1) the difficulty of obtaining responses from privately owned SMEs, and (2) strong growth in specific sectors supported by government privatization policies and liberalization of the Indian economy in the late 1980s.

5. VARIABLES AND MEASURES

5.1. Degree of Internationalization.

Degree of internationalization (DOI) was measured using two items to capture the *scale* and *speed* of internationalization. The two items are based upon research which differentiates between firm internationalization and financial performance (Contractor et al., 2007; Elango, 2006; Kumar and Singh, 2008; Lu and Beamish, 2001, 2004; McDougall and Oviatt, 1996; Pla-Barber and Escriba-Estevé, 2006). The first item measures the scale of internationalization as the percentage of foreign sales to total sales (Contractor et al., 2007; Kumar and Singh, 2008; Lu and Beamish, 2001; McDougall and Oviatt, 1996). This item asks respondents to "Estimate the percentage of your company's total sales which are attributable to foreign sales."¹ Respondents selected from a scale ranging from 1 to 6 to indicate the total percentage of sales attributable to foreign sales as follows: 1 (less than 5%), 2 (6 to 10%), 3 (11 to 24%), 4 (25 to 49%), 5 (50 to 74%), and 6 (over 75%). The second item, speed of internationalization, asks respondents to provide the firm's percent growth in foreign sales compared to competitors since the start of international activities (Autio et al., 2000; Oviatt and McDougall, 2005; Wagner, 2004; Zhou, 2007). Respondents indicated their foreign sales growth by selecting from a range of 1 (much worse) to 7 (much better). The growth rate of international sales captures how quickly foreign revenues increase, thereby addressing one aspect regarding the speed of internationalization deemed important to understanding accelerated internationalization (Oviatt and McDougall, 2005).

5.2. Entrepreneurial Orientation

We employed the most widely used measure of entrepreneurial orientation (EO) (Rauch et al., 2009; Slevin and Terjesen, 2011) based upon the work of Naman and Slevin (1993), Covin and Slevin (1989), and Hult et al. (2004). The 5 item scale is a measure of entrepreneurial orientation at the firm level. The response format requires that the respondent select a response on a scale ranging from 1 to 7, where 1 indicates that the respondent strongly disagrees with the statement, and 7 indicates that the respondent strongly agrees with the statement. The items capture the respondent's belief that wide-ranging acts are necessary to achieve objectives, the firm initiates actions to which other organizations respond, the firm is fast to introduce new products and services to the marketplace, the firm has a strong proclivity for high-risk projects, and whether the firm is bold in its efforts to maximize the probability of exploiting opportunities. Construct validity of the scale has been established using confirmatory factor analysis, and invariance across cultures has been confirmed (Knight, 1997). Reliability of the scale has been established in prior studies with Cronbach alphas ranging from .77 to .88 (Hult et al., 2004; Hult et al., 2003; Hult et al., 2002; Naman and Slevin, 1993; Covin and Slevin, 1989).

5.3. Human Capital

The human capital (HC) scale utilizes five items to measure the skill, knowledge, and abilities of employees (Subramaniam and Youndt, 2005). The scale was developed from human capital and strategic human resource management literature and has been tested in more than 100 industries including services (Subramaniam and Youndt, 2005; Snell and Dean, 1992; Youndt et al., 2004). A Cronbach alpha of greater than .80 has been reported across several studies. The scale response format ranges from 1 to 7, where 1 indicates the respondent strongly disagrees with the statement and 7

indicates strong agreement. The items ask respondents to indicate their degree of agreement that employees: (1) are highly skilled, (2) are widely considered the best in the industry, (3) are creative and bright, (4) are experts in their particular jobs and functions, and (5) develop new ideas and knowledge.

5.4. Relational Capital

Relational capital (RC) was measured with a scale developed to capture a firm's relational resources viewed as the number, strength, and quality of relationships with key customers and channel members (Morgan et al., 2006). The scale consists of 4 items with a response format ranging from 1 to 7, where 1 indicates that the firm's relational resources are much worse than their major competitors' relational resources and 7 indicates that the firm's relational resources are much better than competitors' relational resources. Specifically, respondents were asked four questions regarding the strength of existing customer relationships in the export market(s), the quality of channel relationships in the export market(s), the duration of relationships with current distributors, and the closeness of existing customer relationships. A Cronbach alpha of .79 was reported in a prior examination of export venture relational resources in the UK and Germany (Morgan et al., 2006).

5.5. Control Variables

The following control variables were included since prior research suggests that these factors may affect a firm's degree of internationalization (Calof and Beamish, 1995; Li and Atuahene-Gima, 2001; Litz, 1997): industry sector (representing the industries noted in section 4.1.2) which included firm size (number of employees), firm age (number of years in business), and international experience (years of international business experience).

6. METHOD OF ANALYSIS AND RESULTS

6.1. Analysis

Prior to factor analysis and review of the reliability and validity of measures, the correlation matrix was examined for multicollinearity and appropriate correlation magnitude (Tabachnick and Fidell, 2007). Next, a multiple step structural equation modeling (SEM) process was undertaken. Dimensionality, reliability, and validity of the measures were tested using a measurement model and confirmatory factor analysis (CFA). Upon satisfactory evidence of the scales' psychometric properties, the hypothesized model relationships were empirically tested. SEM involves causal analysis whereby a model is evaluated against patterns of relationships among the collected data.

SEM analysis involves up to three sages. First, the conceptual model is developed. Second, the conceptual model is converted into a measurement model which specifies the relationships between variables.² The measurement model is assessed for unidimensionality and reliability of measures. Although Cronbach's alpha is typically used to assess reliability, this measure does not ensure unidimensionality (Cronbach, 1951). Third, the structural model is created for testing the model fit to the data. Goodness-of-fit criteria are used to assess the structural model.

Review of the bi-variate correlations (see Table 1) for all means, standard deviations, and correlations indicated sufficient correlation between variable pairs for factor analysis and that multicollinearity was not a problem. High means for human capital and relational capital substantiate the highly-skilled nature of India's professional service SMEs and strong relationships. The Kaiser-Meyer-Olkin result of the partial correlations among variables was computed as a second test of factorability and sample adequacy. The Kaiser-Meyer-Olkin measure of 0.88 is above a 0.60 level, indicating appropriate correlation of variables to perform factor analysis and reliability tests (Tabachnick and Fidell, 2007). As expected, an entrepreneurial orientation ($r = .36$; $p < 0.01$), human capital ($r = .28$; $p < 0.01$), and relational capital ($r = .41$, $p < 0.01$) were significantly correlated with SME internationalization.

Table 1
Means, Standard Deviations, and Bi-variate Relationships

	Mean	s.d.	1	2	3	4	5	6	7
--	------	------	---	---	---	---	---	---	---

1. Age	10.04	12.13							
2. Industry Sector ¹	-	-	.09						
3. Number of Employees	37.00	25.00	.18 [*]	-.16 [*]					
4. International Experience (Years)	2.84	1.26	.32 ^{**}	.12	-.05				
5. Entrepreneurial Orientation	5.19	.88	-.02	-.14 [*]	.07	.06			
6. Human Capital	5.68	1.13	-.10	-.08	-.02	.01	.42 ^{**}		
7. Relational Capital	6.24	.84	-.00	-.13	.06	.05	.38 ^{**}	.44 ^{**}	
8. Degree of Internationalization	4.57	.98	.08	-.23 ^{**}	.30 ^{**}	.10	.36 ^{**}	.28 ^{**}	.41 [*]

*p < 0.05; ** p < 0.01

No means and standard deviations are provided as the service industry sector was measured as a categorical variable.

Inspection of the detrended normal plots indicated a slight data non-normality, which was confirmed by the Kolmogorov-Smirnov and Shapiro-Wilk normality tests. Examination of data found constructs and items negatively skewed and possessing a positive kurtosis. Strong kurtosis and skewness is often the cause of non-normality. In accordance with structural equation modeling of non-normal multivariate data, a bootstrap technique was employed (Byrne, 2001). To increase robustness, analysis of outliers was conducted by examining the Mahalanobis distance of data points. Next, measurement model results were compared to results with outliers removed. Fit indices and the chi square (χ^2) statistic with outliers removed indicated that the model fit did not significantly improve, and in fact, reduced the fit of the model. Therefore, inclusion of outliers does not negatively affect the hypothesized model's predictive ability. The next step undertaken was to assess the reliability and validity of the measures.

Prior to CFA using structural equation modelling, reliability and dimensionality were reviewed by examining Cronbach alpha magnitudes and item factor loadings. The scale items, average variances extracted, composite reliabilities, factor loadings, eigenvalues, and variance inflation factors for all scales are provided in Table 2. Composite reliabilities were above the recommended 0.70 level (Anderson and Gerbing, 1988; Fornell and Larcker, 1981), and average extracted variance exceeded the 0.50 threshold (Anderson and Gerbing, 1988; Hair et al., 1998). Reliability was established since all scale Cronbach alphas were above 0.70 (Nunnally, 1967). All scales exhibited convergent and discriminant validity as evidenced by correlations with an acceptable range, high reliabilities, no high factor cross-loadings, and unidimensionality (Tabachnick and Fidell, 2007). Furthermore, all scales possessed acceptable psychometric properties as exhibited by appropriate correlation of variables, reliability among variables, and distinctly separate constructs with no strong evidence of multicollinearity.

Table 2
Factor Analysis and Reliability Measures

Scale Items	Factor Loadings ¹			
Entrepreneurial Orientation (EO)	EO	HC	RC	DOI
1. We believe that wide-ranging acts are necessary to achieve our objectives.	.733	.180	.112	-.173
2. We initiate actions to which other organizations respond.	.741	.085	.044	.142
3. We are fast to introduce new products and services to the marketplace.	.719	.140	.178	.083
4. We have a strong proclivity or tendency for high-risk projects.	.731	.137	.233	-.026

6.1.1. Measurement Model Analysis

Next, the measurement model was estimated using the covariance matrix of the indicators for the exogenous and endogenous constructs as input. We assessed dimensionality of the scales and convergent and discriminant validity of the measurement model in accordance with Anderson and Gerbing (1988). We used confirmatory factor analysis to evaluate the measurement model fit employing the Delta2 index and the comparative fit index (CFI), the recommended indices since sample size and degrees of freedom are considered (Gerbing and Anderson, 1992; Hu and Bentler, 1999). The measurement model possessed an acceptable fit with a Delta2 index of 0.98 and a CFI of 0.98 with all model item path coefficients significant (Gerbing and Anderson, 1992; Hu and Bentler, 1999), indicating convergent validity. All correlations among factor constructs were significantly different from 1.0 and not significantly above 0.70, the maximum acceptable level before excessive multicollinearity exists (Tabachnick and Fidell, 2007). Thus, discriminant validity was established. Examination of standardized residuals also confirmed an appropriate fit with no statistically significant residuals. Given an acceptable fit, the measurement model was then converted to a structural equation model to depict the relationships between the manifest indicators and latent variables. With regard to controls, only firm size and industry sector had significant effects on the DOI.

6.1.2. Common Method Bias

Common method bias was examined using the techniques outlined in the literature (e.g., Podsakoff et al., 2003). First, wording of the items were tested in the sample market to ensure their clear meanings. Second, the measurement model was compared with another measurement model by adding a common method factor *ex post*. The two statistical models are similar in fit indices, showing no potential for common method bias (Williamset al., 1989; Podsakoff et al., 2003). Third, since cross-sectional data were collected, a Harman one-factor test (Gerbing and Anderson, 1992) was also undertaken if the results were inflated due to a common method variance test. Results of the one factor test indicated that the dependent variable was not subject to method bias.

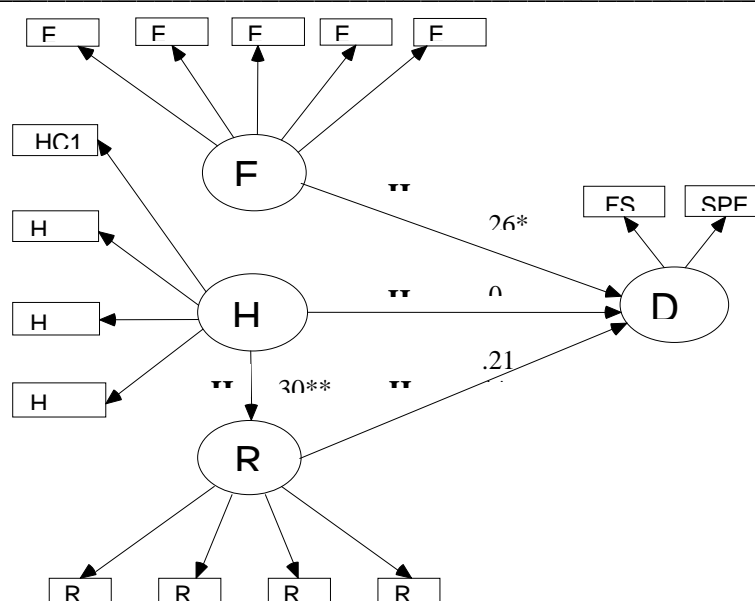

6.2. Hypothesis Tests

To test the hypothesized model relationships, AMOS structural equation modeling software (Arbuckle, 1999) was used with maximum likelihood estimation, the recommended method with sample sizes of 100 to 200 (Tabachnick and Fidell, 2007). Before assessing the individual parameters, the overall fit of the observed data to an *a priori* model was examined. Structural equation modeling relies upon non-significance of a difference between the covariance matrix derived using the hypothesized model and the covariance matrix derived from the sample. The χ^2 test is the most common fit measure recommended with samples of 100 to 200 (Tabachnick and Fidell, 2007). A rule of thumb states that the χ^2 divided by the degrees of freedom should be less than 2. However, since the χ^2 statistic is sensitive to sample size, additional measures of overall fit must be used. Research by Gerbing and Anderson (1992) finds the Delta2 index and CFI as the most stable and robust fit indices for model evaluation.

6.2.1. Robustness tests

Analysis involved estimation of three competing models, a full model with direct and indirect effects (M3), a mediation model (M2), and a direct effects only model (M1). The full model (M3) is the hypothesized model depicted in Figure 1 with direct links from EO, RC, and HC to DOI and an indirect link from HC to RC and then to DOI. The nested model M2 is similar to M3 except the direct link from HC to DOI is constrained to zero in order to examine the potential mediation effect of HC via RC to DOI. The last model estimated, M1, contains only direct effects of EO, RC, and HC on DOI.

Figure 1
Structural Equation Model with Standardized Parameter Estimates

RC = Relational capital
 HC = Human capital
 EO = Entrepreneurial orientation
 DOI = Degree of internationalization
 FSTS = Percentage of foreign sales to total sales
 SPEED = Foreign sales revenue growth

As Table 3 indicates, pathways of all latent constructs in all models are significant except for the relationship between human capital and a SME's degree of internationalization. Next, measures of fit provided in Table 4 were examined. Goodness of fit indices for M3 establish an acceptable model fit ($\chi^2 = 149.36$ and d.f. = 100; $\chi^2/\text{d.f.} = 1.49$; Delta2 = 0.98; CFI = 0.98; RMSEA = 0.05; RMR = 0.08; GFI = 0.92; AGFI = 0.88; TLI = 0.97; NFI = 0.94) and a parsimonious model PRATIO = 0.74; PNFI = 0.69; PCFI = 0.72; (Hu and Bentler, 1999; Hair et al., 1998). Given the non-significant relationship of human capital with a SME's degree of internationalization, a competing direct effects only model (M1) was considered. Fit measures of M3 were superior to M1 on virtually every fit index (see Table 4). To further support model M3, a mediation test was undertaken.

* $\Delta\chi^2$ - Difference test between M2 and M3 nested models = 1.22 and d.f. = 1, not significant at $p < 0.05$.

6.2.1.1. Tests of Mediation

Mediation was tested (see Table 4) by employing a chi-square difference test of two nested models (Anderson and Gerbing, 1988) and by comparing the fit of the full model (M3) to a mediation model (M2). Both M3 and M2 possess acceptable fit (Hu and Bentler, 1999; Hair et al., 1998); however, when comparing individual fit indices, M2 does not possess a superior fit over M3. Furthermore, the χ^2 difference test ($\Delta\chi^2 = 1.22$ and d.f. = 1) is not statistically significant, indicating that the mediation model does not provide an improved fit over the full model (Baron and Kenny, 1986).

Second, to provide further support for our hypothesized model, we employed the logic of mediation testing outlined by Baron and Kenny (1986) which establishes three conditions: (1) the independent variable is significantly related to the mediator variable, (2) the mediator variable is significantly related to the dependent variable, and (3) the relationship between the independent and the dependent variable is reduced when both the independent variable and mediator are considered.

The first requirement that a significant relationship exists between the independent variable and the mediating variable is met since the pathway between HC and the mediating variable RC is significant (see Table 3). The second requirement that a significant relationship exists between the mediating variable RC and the dependent variable DOI is also confirmed (see Table 3). Lastly, the third requirement stipulates that the relationship between the independent variable HC and dependent variable DOI be reduced with consideration of both the mediator RC and independent variable HC. When comparing the direct effects

model (M1) and the full model (M3), results indicate that the direct path from human capital to the degree of internationalization is not significantly reduced given inclusion of the variable relational capital (see Table 3); confirming that RC does not act as a mediator. Finally, as Table 5 indicates, pathways of all latent construct items are significant. Given the acceptable measure of fit, reliability and validity of the measures, the hypothesized model (M3) was accepted and hypothesis testing is now reviewed.

HC5 item dropped during Structural Equation Modeling.

The standardized parameter estimates of the relationships between latent constructs shown in Figure 1 revealed that an entrepreneurial orientation has a significant positive relationship with a SME's DOI ($\beta = 0.26$, $t = 2.31$, $p < 0.01$), supporting H1. However, the relationship between human capital and a SME's DOI was not significant ($\beta = 0.03$, $t = 1.01$); therefore, H2 was not supported. As expected, relational capital was found to have a positive significant relationship with a SME's DOI ($\beta = 0.21$, $t = 2.43$, $p < 0.01$) in support of H3. Consistent with the hypothesized relationship between human capital and relational capital, support was found for H4 ($\beta = 0.30$, $t = 5.98$, $p < 0.001$). Figure 1 shows the structural equation model with path coefficients and their significance levels.³

7. DISCUSSION

The purpose of this study was to investigate the key intangible resource drivers and speed of professional service SME internationalization in the emerging market of India. Empirical findings support the positive effect of an entrepreneurship orientation on internationalization as a force that aids in leveraging intangible resources for SME's internationalization in an emerging market (Yamakawa et al., 2008). Furthermore, the development of relational capital by service professionals was found to be a factor in determining the contribution of human capital to SME internationalization. As expected, human capital was found to have a significant positive relationship with a SME's relational capital (Bollen et al., 2005; Bontis, et al., 2000; Cabrita and de Vaz, 2008; Karantinou and Hogg, 2007; Tseng and Goo, 2005), which in turn, has a positive effect on a professional service SME internationalization. However, although relational capital was confirmed as facilitating international expansion (Leonidou and Kaleka, 1998; Morgan et al., 2006; Srivastava et al., 1998; Styles and Ambler, 2000; Thuy and Quang, 2005; Zahra et al., 2007), the effect of human capital on SME internationalization was not significant nor mediated by relational capital. Therefore, contrary to expectations, human capital of India's professional service SMEs did not have a significant direct effect on internationalization. These results indicate that human capital is a facilitator of professional services international expansion (Hitt et al., 2006) via development of relationships with foreign market customers and channel partners. International growth requires professional service human capital to possess strong relationship-building skills. The ability to build strong service relationships is critical for acquiring customers in new foreign markets or retaining customers when service firms follow clients into new international markets.

The findings of this study suggest that the effects of human capital are complex and require a fit between investments in human capital and service sophistication (Sirmon et al., 2007). Specifically, sophisticated services, which are tailored to customers' needs, use substantial information that is transferred between the client and the service provider and require sizeable investments in knowledgeable employees. In the case of professional services, employees must possess sophisticated service product knowledge and the ability to develop relationships that are both specific to the foreign market business sector and culture. Therefore, firms must invest in human capital to develop and leverage knowledge resources that are specific to the foreign market culture and service sector. In this case, India's accelerated SME expansion has been aided by the development of relationship capital, which provides knowledge of customer preferences, improves responsiveness to customer needs, lowers new customer acquisition costs, reduces service maintenance, creates premium-priced service value, develops barriers to entry, and permits brand category extensions (Srivastava et al., 1998).

Sample descriptives provide compelling evidence that the speed and scale of India's professional service SME internationalization is also accelerated. The average age of SMEs sampled was 10 years, of which 37% were international at inception and 82% having internationalized within 5 years. With regard to scale, the majority or 62% of SMEs offer services in 1 to 4 countries, 23% are involved with 5 to 8 countries, and 2% of the remaining SMEs offering services in more than 25 foreign countries. Annual revenues are also moderate to strong with 79% earning annual sales of up to \$999,999, 13% reporting \$1 million to just below \$5 million in annual sales, and 8% exceeding \$5 million in annual sales. Examination of foreign revenue reveals that more than 27% have experienced a foreign revenue growth rate of over 20% during the three years preceding the survey. The majority or 61.7% have established a wholly owned subsidiary, 15.4% are involved in joint ventures, 17.9% export professional services, 4% have licensing arrangements, and 1% have established international franchises. Thus, the majority of SMEs sampled have established a wholly-owned subsidiary abroad.

As is evident, this study dispels the notion that resource constraints of smaller firms limit successful international growth and confirms that size is not a barrier to internationalization (Calof and Beamish,

1995). More importantly, findings indicate that India's professional service SMEs experience strong foreign sales growth and accelerated international expansion early, which is contrary to the traditional stage theory of internationalization (Johanson and Wiedersheim-Paul, 1975; Johanson and Vahlne, 1977). When examining service sectors in this study, profitable accelerated SME international expansion is particularly evident in India's high technology service sectors, and as expected, internationalization was confirmed as varying across service categories (Javalgi, et al., 2003; Styles et al., 2005).

With regard to knowledge-based resources, entrepreneurial behavior of India's human capital propels emerging market SMEs to profitable positions in competitive global markets; hence, resources explain rapid internationalization (Knight et al., 2004). Clearly, the ability to leverage human capital resources in professional services is a key contributor to successful international expansion. Historically, leveraging human capital has involved increasing the ratio of support staff to professional employees, as in the case of U.S. law firms in an effort to generate more revenue per partner (Sherer and Lee, 2002). This leveraging of a scarce resource in law firms resulted in institutional change that was legitimized by firms and government institutions. Institutional acts, such as privatization and liberalization, may serve as mechanisms that enable leveraging of assets for economic growth. Examination of the productivity of India's private versus government-owned firms over 25 years suggests that the decline in state-owned firms has caused a significant increase in the productivity of human resources in India (Majumdar, 2007). Measures of employee input to economic output have risen dramatically over the period of liberalization, substantiating an increase in the creation of economic value per employee (Majumdar, 2007). As this study suggests, development of highly-skilled, entrepreneurial human capital that has been nurtured through government supported privatization and an educational emphasis on engineering and information technology, has positioned India to become a leader in global information technology trade. Therefore, the observed differences in the degree of internationalization of SMEs in this study may be due to sector or regional institutional economic policies in India.

8. LIMITATIONS AND FUTURE RESEARCH

Due to the cross-sectional industry sampling methodology, generalizability of findings is limited. Replication of this study in other emerging markets is needed to affirm cross-national invariance (Hansen et al., 2011) and to understand how culture affects entrepreneurial behavior (Hitt et al., 2006). For example, countries exhibiting higher levels of collectivism exhibit lower levels of venture activity even after consideration of institutional and economic factors (Li and Zahra, 2011). However, risk-taking new business initiatives are evidenced in the high uncertainty avoidance cultures in the emerging economies of Brazil, China, India and Thailand (Khanna, 2008). Thus, the collectivist nature of India's society (Hofstede, 1983) may pre-dispose India's human capital to relationship-building capabilities, which would represent a national advantage. More importantly, differing cultural propensities of human capital for developing relationships may exist and yield different service outcomes in various global contexts. Although cultural and institutional dispositions toward entrepreneurial activities have been documented in the emerging markets of Bulgaria, Hungary, and Latvia (Manolova et al., 2008), these factors may have varying effects in determining the propensity of human capital to seek international opportunities or create valuable relationships given each service sector's nuances.

What other factors may have contributed to India's service SME growth? An examination of institutional factors warrants attention since institutional theory may provide insight into emerging economies (Coviello et al., 2011; Hoskisson et al., 2000; Slevin and Terjesen, 2011). The strategic choices of entrepreneurial firms are a reflection of the institutional framework that entrepreneurs face. The model in this study should be tested in differing institutional contexts to examine potential effects of governmental and economic policies since country environments differ in promoting entrepreneurship (Manolova et al., 2008). Institutional frameworks may enable or constrain international entrepreneurship and offer a complementary view to the RBV and the results obtained in this study (Peng et al., 2008). However, institutional policies to stimulate venture capital activities may be less effective in collective societies (Li and Zahra, 2011). Lastly, prospect theory may also provide insight into why entrepreneurial behavior exists in emerging markets, since individuals may increase risky behavior when their future is bleak (Slevin and Terjesen, 2011).

9. CONCLUSION

Does privatization and liberalization motivate international entrepreneurship and economic growth in an emerging market? There are lessons to be learned from emerging markets. The findings from this study of professional service SMEs in India provide evidence of a changing global service landscape. India has emerged a leading contributor to global service trade and now possesses a comparative advantage in services (UNCTAD, 2008c). Privatization of state owned enterprises transforms industries, economies, and firms by encouraging entrepreneurship and gains access to resources (Aulakh and Kotabe, 2008) through increased foreign ownership of domestic firms for economic stimulus. Findings from this study suggest that greater institutional economic freedom encourages entrepreneurial new services in a market-based economy (Gohmann et al., 2008). As a result of profitable international expansion, outflows of foreign direct investment (FDI) from India are the largest from the South-East Asian Region (UNCTAD, 2008b) and India is ranked third among the most attractive locations for FDI (UNCTAD, 2009b). India's impressive growth has been nurtured by governmental trade policies and the establishment of the 2005 Special Economic Zone (SEZ) Act to promote exports. By 2009, SEZs created over 890,700 jobs and FDI resulted in robust growth in the electrical equipment, services, and telecommunications sectors (Jhamb and Kaushik, 2008).

Yet, questions remain. Do institutional policies alter the capabilities of human capital? Are certain cultures predisposed to entrepreneurship? Or does an entrepreneurial orientation inherently exist within human capital, since a firm is only a configuration of "the humanly devised constraints that structure human interactions" (North, 1990; p. 3). What triggers entrepreneurial behavior, and how does EO manifest in the capabilities of professional human capital? How is entrepreneurial behavior managed over time as the firm grows in size (Slevin and Terjesen, 2011)? Is EO a pervasive response found in all successful firms (Wales et al., 2011) and are there varying degrees of entrepreneurial behavior at multiple firm levels (Miller, 2011; Slevin and Terjesen, 2011; Wales et al., 2011). We believe that varying degrees of entrepreneurial attitudes and behaviors at various firm levels may be necessary for global success.

The current study's sample of SMEs indicates that firm level EO manifests in the pursuit of new international opportunities. Excessive EO at a top management level may result in extreme risk-taking and failure; whereas proactive EO at a mid-level may invoke the departure of professional service human capital to start their own business, such as when accountants and attorneys exit large firms to establish their own private practices. Alternatively, strong EO in functional areas, such as product development or customer service, may create innovative service solutions that are adapted to local market needs which in turn, build strong service relationships. An ideal EO vertical, horizontal, and temporal fit between the firm's strategy and the EO of the functional business units may provide the optimum configuration for global success (Wales et al., 2011). The effect of size in this study leads us to believe that a SME's entrepreneurial orientation may align with a wave model since India's SMEs face unstable emerging marketing conditions. We offer the perspective that SMEs cycle in and out of an entrepreneurial mode as management shifts limited resources between exploration and stabilization as the SME grows and adapts over time. We suspect that born global SMEs exhibit temporal effects and stronger levels of EO in earlier years.

In summary, smaller firms face challenges to internationalization; yet, firm size and an emerging market economy are not limiting factors. Assumptions about large versus small firms, developed as opposed to emerging economies, and the capabilities of human capital must not cloud our judgments of what drives global success. Institutional, industry, and sector specific conditions may alter resource capabilities. The dominance of industrialized nations has been challenged by the new service economy and SME positions of global dominance. Findings of this study and firms in the emerging markets of China, Turkey, and Taiwan (Khanna, 2008; Yiu et al., 2007) shed light on SME success and the reality that the current research agenda remains fertile.

An entrepreneurial orientation, highly-skilled human capital, and relational capital are key resources that enable professional service SME internationalization. These key resources have contributed to wealth creation and development in the emerging market of India. In the global marketplace, knowledge-intensive, entrepreneurial human capital is a formidable resource.

END NOTE

1. Congruent with recommendations based upon a review of EO research, the percentage of sales to new markets was used as an objective behavioral indicator of entrepreneurial new market initiatives (Miller, 2011).
2. In accordance with the recommendations to advance entrepreneurship research, entrepreneurial orientation (EO) was conceptualized as a reflective model (George and Marino, 2011).
3. The predictive power of a multiplicative EO measure was also compared to a summated EO scale (Slevin and Terjesen, 2011). To test the alternative measure, interaction effects were included in our model and found to be not significant; thus, a multiplicative EO measure does not explain a greater amount of variance.

Abstract: Although the “Ambidextrous Organization” is not a new concept and contemporary literature on prior research has described it from many angles, in Serbian literature it is not sufficiently represented. Our goal is to promote ambidexterity in domestic literature as well as to introduce it to a broader audience, especially among people who lead our organizations – Serbian managers, as a concept that has already shown good results. We argue that the Ambidextrous Organization is a beneficial concept in long term for organizations in an unstable context, and that it could be a potential solution for Serbian organizations in their efforts to get out of a locked-in behavior pattern in which Serbian companies are recognized as sellers of raw / developed ideas, buyers of technology / manufacturers with cheap labor. This paper describes organizational ambidexterity from two angles: structural - usage of dual structures and strategies to separate and integrate exploitation and exploration units; and contextual - adjustment of the organizational culture – routines and policies – in order to make ambidexterity possible. As a back-up for this paper beside the literature, we used examples of successful foreign ambidexterity practices. A predominantly theoretical nature of this paper is, however, its biggest limitation.

Keywords: innovation, Ambidextrous Organization, exploration, exploitation

1. BACKGROUND: NEED FOR AMBIDEXTERITY

More than twenty years ago March (1991) has argued that *maintaining an appropriate balance between exploitation and exploration is a primary factor in systems survival and prosperity. He emphasized those adaptive processes by improving exploitation more rapidly than exploration would probably become effective in the short run but self-destructive in the long run. “Both exploration and exploitation are essential for organizations, but they compete for scarce resources, and as a result, organizations make choices between the two what in the long run could look like organizational choices between investments in learning and in consumption of the fruits of current capabilities”* (March, 1991). That competition can be considered as the fundamental tension at the heart of an enterprise’s long-term survival. *The basic problem for an organization is to engage sufficiently in exploitation to ensure its current viability, and the same time, and to invest enough energy in exploration and exploitation to ensure its future viability* (March, 1991). While exploitation and exploration represent two fundamentally different approaches to organizational learning and processing, recent literature has increasingly indicated the need for firms to achieve a balance between the two (He, Wong, 2004). This balanced view is embedded in the concept of ambidextrous organizations. *There is growing evidence to support the view that ambidexterity promotes organizational growth and adaptation* (O’Reilly, Tushman, 2007).

There is, however, some confusion in the use of the term Ambidexterity. According to Tushman and O’Reilly (2007), *ambidexterity is a specific capability embodied in senior leadership’s learning and expressed through their ability to reconfigure existing organizational assets and competences in a repeatable way to adapt changing circumstances*. Organizational ambidexterity is generally understood as a firm’s ability to simultaneously exploit and explore with equal dexterity.

Why is it important for a company to simultaneously explore and exploit? Companies (don’t) survive because of their (dis)ability to adapt to changing surrounding. Many companies from the Fortune 500 list from 20 years ago today don’t exist so the answer to question why some firms survived and some haven’t is in the fact that *the system that is structured as a core capability suited to a relatively static business environment turns into barrier in a discontinuously rapidly changing business environment* (March, 1991). *“Despite the transient efficiency of best practices, the cycle of doing “more of the same” tends to result in locked-in behavior patterns that eventually sacrifice organizational performance at the altar of organizational <death spiral>”* (Yogesh Malhotra, 2000) or success trap. An organization should not limit its activities to best usage of current knowledge base, but also must learn and gain the skills that might/will be useful in the future: *the process of organizational learning manifests itself in economically relevant innovations, i.e. in new creations*

of economic significance or either a material or an intangible kind which may be brand new, but are more often new combinations of existing elements" (Mattes, 2010).

Past innovative activities are important for future innovation because they provide a firm with a knowledge base that allows it to absorb technological competence on external sources. "An organization that doesn't explore in one period may not be able to explore in the future because of the lack of relevant knowledge" (Cohen, Levinthal, 1990).

Even if we accept that every organization for long term success should exploit (best usage of its current resources) and explore (nurturing emerging business that could grow) at the same time, another question that arises here is how to allocate people and resources from something that is successful and profitable and engage people, invest those resources in something that one day might make some profit? How to make senior management teams spend half of their time on something that might realize 5% profit, might make nothing or even losses?

*In order to have successful ambidextrous organization some conditions should be satisfied: top management must realize that the ambidextrous model is necessary for future survival of an organization and consequently have a **clear strategic intent** to implement it. Although every sub-unit would probably have its own culture, existence of the **overarching vision and values** is indispensable. A **senior team** should be **aligned and flexible** to manage ambidexterity. A common reward system should be based on **results for the entire business** (not on individual sub-units because every business is vulnerable at the beginning so competing for the same resources as traditional units and comparing results of new and old sub-units would not be fair). Subunits should be **physically separated** with targeted integration to leverage assets and capabilities. (O'Reilly, Tushman, 2007).*

Former president of "USA Today" Tom Curley avoid falling into the success trap. When his newspapers were top ranked, he established a new unit for online business. Traditional and innovation units had different standards, demands for profits. Curley maintained discipline in traditional and encouraged experimentation in new online business. He created a tool for fundamentally contrasting units, kept them physically and culturally distinct, and each reported directly to him (Tushman, Smith, Binns, 2011).

In order to be more competitive on evolving markets, we suggest that Serbian companies, at the same time with incoming of foreign investments, should adopt a new practice to simultaneously innovate and implement innovations, actually to stop current bad policy of buying new technological solutions and innovations and complementary know-how, and instead create and implement innovations themselves. It happens very often that our companies are dependent on knowledge of their foreign partners/technology sellers and that they often import technology without complementary know-how to use it. On the other side, we do have innovators individuals and many innovative companies that give/sell raw or developed ideas to third parties abroad to develop/implement them.

Lately, we have seen couple of initiatives: tight cooperation between explorative and exploitative organizations (software for rational usage of electrical energy made by Serbian company "Telvent DMS" in cooperation with Technical Faculty in Novi Sad was declared to be the best new innovative product the world in 2012.¹ and it will be hopefully implemented in Serbia too), and systematic support of exploration (building a big technology park in Indjija), but they represent the exceptions that prove the rule. The goals of this paper are to explain how those dual organizations should be designed and how to achieve that those opposite units successfully function together. Because of those initiatives in Serbia, for us it is very important to present this model just now because we argue that simultaneous exploitation and exploration should be supported from the very beginning of such initiatives. Any interruption in innovative streams can lead to difficulty with completing future project, and insufficient exploitation causes immediate failure of an organization. The paper describes characteristics of ambidextrous organization, its good and bad points, mission, purpose, significance and potential benefit. Our goals were to promote a concept of ambidextrous organization to a broader audience, to suggest it as an appropriate model to be applied here in Serbian companies because, although strong exploitative units are presupposed in ambidexterity, it emphasizes simultaneous existence and strengthening of explorative units so organizations could avoid technological and knowledge dependency, and in time they can create solutions-innovations and exploit them here with locally gained know-how.

2. BUILDING AMBIDEXTERITY

Organizational ambidexterity is usually described from **structural** perspective- to explain use of dual construction and different strategies for exploitation and exploration and from **contextual** angle-to indicate *behavioral* and *social* means to integrate exploitation and exploration, even at the organizational unit level (Birkinshaw, Gibson, 2004).

Tushman, and O'Reilly (1996) gave another definition of ambidextrous organizations based on organizational structure, which emphasizes organizational ability to explore and exploit through structural differentiation – *the subdivision of tasks into distinct organizational units that developed appropriate context for exploitation and exploration. "The separation of the entities (exploitative and explorative) can in some situations lead to the isolation of the structures focused on exploration which failed to have their idea accepted and to draw on the resources of the firm's other structures"* (Mahmoud –Jouini, Charue-Duboc, Fourcade, 2007). *"Structural ambidexterity requires strategic integration to ensure leverage and cross fertilization between differentiated units"* (O'Reilly, Tushman, 2008).

In order to prosper over the long run, most companies need to explore and innovate in more than one field. *Beside, incremental innovations, companies also have to make structural innovations. Small improvements in existing products and operations are important for companies in order to operate more efficiently and deliver greater value to customers, and applying technological or process advances are inevitable to fundamentally change some component or element of business. Finally, businesses need to come up with discontinuous innovations-radical innovations that totally change the basis for competition in an industry, often rendering all products or ways of working obsolete* (O'Reilly, Tushman, 2004). Similar rule applies to organizational strategy: *most of the innovative business models didn't devolve from the best practices or benchmarks of the organizations of yesterday that they displaced, but from radical re-conceptualization of the nature of the business* (Malhotra, 2000).

Explorative activities are associated with less certainties and higher risk for failure - but also with the potential for higher success. Management of these activities needs more degrees of freedom for the individual and less-structured work processes (Mirow, Hoelzle, Gemuenden, 2008). *Exploitative business units concentrate more on formal coordination mechanism such as centralization and formalization. Innovative businesses units have a more open culture, following a rather unstructured work process* (Mirow, Hoelzle, Gemuenden 2008). Because they use the same resources, *experimenting with new alternatives reduces the speed that existing competences are improved and refined* (March 1991). According to He and Wong (2004), *"a failed explorative effort may disrupt successful routines in a firm's existing domains, without any significant success in the new field to compensate for the loss in existing business"*. Tushman and O'Reilly (1996) explain further that *"exploitative activities are usually associated with mechanistic structures and routinized activities that help to raise productivity in these business units"*. Processes are tightened and are optimized for activities that lead to a better performance in a known environment. Firms adjust their structures also by the phase of the innovation process: *organic structures are employed to explore and they are followed by mechanistic structures to exploit* (O'Reilly, Tushman, 2007).

Generally, **"exploitation"** is about efficiency, increasing productivity, control, certainty, and variance reduction", actually in becoming more efficient in what organizations already know. **"Exploration"** is about search, discovery, autonomy, innovation and increasing variation", more uncertain more distant in time and sometimes represents a threat to existing organizational units. **"Ambidexterity is about doing both"** (O'Reilly, Tushman, 2007).

From contextual ambidexterity to open innovation

Possible distinctive positions of the locus of innovation (exploration) are: together with exploitative section in the same business unit so-called contextual ambidexterity, then in separated business unit (ambidextrous organization integrated at the senior management level) and finally the locus is partly placed outside of an organization-consumer based innovation. *There are some arguments that it is possible to have exploitive and explorative behavior in a single unit, (contextual ambidexterity) but this procedure demands high intellectual capabilities of the individuals within the innovating units, who have to decide themselves when and how to perform exploitative or exploitive activities* (Mirow, Hoelzle, Gemuenden, 2008). Contextual ambidexterity is not a structure, it is more an assumed boundary inside the business unit and because of non-existence of separation line *it can experience many barriers as a competition for resources or lack of inter-departmental collaboration* (O'Reilly, Tushman, 2007).

Figure 1: Ambidextrous organization
(according to: O'Reilly, Tushman, 1997)

On the other side we have arguments that managers cannot simultaneously explore and exploit and they must spin out the exploratory sub-unit (O'Reilly, Tushman, 2007). Some argue that it is impossible to have exploitation and exploration even in the same firm. Established companies can develop radical innovations and protect their traditional businesses by creating new business units that are integrated at the senior executive level (O'Reilly, Tushman, 2004). "Ambidexterity entails not only separate structural subunits for exploration and exploitation but also different competencies, systems, incentives, processes and cultures" (O'Reilly, Tushman, 2007) what increases the chances for conflict, disagreement, and poor

coordination. The most important decision is not about organizational architecture by which the innovative and traditional subunits are separated, but about choice of processes (a common set of values and shared meanings that provide a common identity, even though these values may foster different operating norms across the businesses and clear consensus within the senior team about the strategy and the importance of ambidexterity) to integrate these units in value enhancing way (O'Reilly, Tushman, 2007). According to Mirow, Hoelzle, Gemuenden (2008) the bigger problem is to implement new structures in the mind of the innovators and top management than to install the adequate structure in organization. "Arranging ambidexterity is not a structure and design task, but a leadership one". It requires a leadership team with subtle competences and skills necessary to provide a clear vision and strategic intent, a consensus and commitment within the team, the skills to manage dissimilar sub-units (explore and exploit) with clearly defined interfaces to leverage existing assets, and the ability to resolve the inevitable conflicts that this design embodies (O'Reilly, Tushman, 2007). Top management must decide about the right balance between new and core business, and by no means that decision should be pushed down to middle management. Organizations progress when their senior managers accept the tension between old and new business and foster a state of constant creative conflict at the top (Tushman, Smith, Binns, 2011).

Open innovation roused interest when scholars had realized that knowledge creation for many products can be created outside the boundaries of the firm and that individual or groups of users and consumers can be important resource for innovation especially in time of digitalization (Lakhani, Tushman, 2012). Open innovation is not a new model; it can be understood as an ambidextrous organization with partly open outer boundaries. According to Lakhani and Tushman (2012) the dimensions that determine the degree of openness and permeability of boundaries are the degree to which critical tasks can be decomposed (because of the digitalization process most of ideas and even physical objects can be presented in binary language) and the extent to which problem solving knowledge for these tasks is distributed (Internet enabled organization to have access to distributed knowledge of thousands of external individuals- cheaply). "Such task decomposition and the fact that widely distributed actors have access to unique knowledge move the locus of innovation outside traditional firm boundaries". (Lakhani, Tushman, 2012).

The innovation boundaries will be fundamentally different in the case when all necessary pieces of information are narrowly held in the firm and in case when knowledge is more widely distributed amongst many external actors. The more knowledge is dispersed, the greater is use of open boundaries and the locus of innovation moves to communities outside a firm (Lakhani, Tushman, 2012). When problem solving knowledge is concentrated, then firms internalize R&D, build an innovative culture, improve capabilities, absorptive capacities, and processes that locate knowledge necessary for solutions within the firm and/or with the trusted partners (Lakhani, Tushman, 2012).

Ambidextrous eligibility

Operational
Leverage

As we can see, building an ambidextrous organization is very long, complicated, and probably expensive process, appropriate for big companies, but it can provide organizational survival because of creating surrounding that supports (beside other things) creation of new knowledge. Tushman and O'Reilly (2007) gave an answer that the ambidexterity should be considered when operational leverage and strategic importance are high. (See Figure 2).

Operational
Leverage

Low	Independent Business Unit	Spin-off
High	Ambidextrous Organization	Internalize and/or contracting
	High	Low

Strategic importance

Figure 2 Ambidextrous eligibility
(according to: Tushman and O'Reilly, 2007)

We must also emphasize that studies had shown that large firms are more likely to simultaneously explore and exploit. While innovation is turning into more crucial assets, despite the prediction of some scientists (Schumpeter for example) those actors who generate it are not dominantly small and medium enterprises and creative entrepreneurs, but huge multinational companies with profits that many governments can only dream of. *They are today the most powerful agents of innovation and control about three quarters of the commercial technological knowledge* (Dunning, 1992). Multinational companies have realized on time that scale economy at its best is not enough to achieve and maintain competitive advantage and that *only continuous learning could be a permanent source of organizational progress* (Mattes, 2010). Kogut and Zander (1993) explained that, *especially in MNC, two processes, seemingly opposite, occur simultaneously: organizational learning-spreading knowledge through an organization and internalization of knowledge transfer market* sometimes by changing organizational boundaries (like in open innovation). *The results of researches suggest that small firms that pursue either efficiency or flexibility strategies are able to achieve optimal performance, but firms that attempt to mix efficiency and flexibility strategies significantly underperform* (Ebben and Johnson, 2005). If we take Tushman's and Benner's definition that *exploration is related to flexibility, decentralization, and loose cultures, exploitation is associated with efficiency, centralization, and tight cultures* (Benner, Tushman, 2003) then we can equalize efficiency strategy with exploitation, and flexibility with exploration.

Lakhani and Tushman (2012) argue that an *ambidextrous design with intra-firm structural inconsistency and structural linkages, is an appropriate designed choice when there is a strategic interdependence after tasks have been decomposed and when knowledge is heterogeneous distributed (within a firm or firm and external actors). Boundaries and structural heterogeneity in an ambidextrous organization enable the firm to operate simultaneously in different innovation modes.*

Dynamic capabilities - a condition for ambidexterity

Dynamic capabilities can be observed from the perspectives of strategy and organizational design. The first perspective suggests that dynamic capabilities are the ability of a firm to reconfigure assets and existing capabilities and explains long-term competitive advantage. The second describes ambidexterity as the ability of a firm to simultaneously explore and exploit and enables a firm to adapt over time (O'Reilly, Tushman, 2007)

Organizational capabilities are essential part of existing organizational routines, structures and processes and they show the firm's ability to adapt to/ compete in the environment. Senior leaders should nurture and refine these capabilities and, at the same time, to be prepared to reconfigure these assets as environment changes. In order to be able to do so, senior leaders must develop ambidextrous capabilities - set of paradoxical capabilities because competences and routines of senior leaders to reconfigure assets to compete in emerging and mature businesses are different than those required only for exploration or exploitation (O'Reilly, Tushman, 2007). With regards to ambidexterity, a dynamic capability can be seen as a set of actions (or routines) taken by

When a vice-president of IBM came up with an idea to set up a separate division, he was given permission to do so and promptly lost ten million dollars. He came in the office of Tom Watson, the founder of IBM and told him "I suppose you want my resignation." Watson looked at him and said in disbelief: "Are you kidding? We have just spent ten million dollars on your education." *

senior management that permitted the enterprise to identify opportunities and threats and reconfigure assets (people, organizational architectures, and resources) to adapt to these. (O' Reilly, Tushman, 2007).

Dynamic capabilities result from actions of senior managers who have key role to ensure learning, integration, reconfiguration and transformation (alliances, joint ventures) new product development, cross line of business innovation, generally to enable organization to maintain ecological fitness, to reconfigure existing assets and developed the new skills needed to address the emerging threats and opportunities (O' Reilly., Tushman, 2007). "To be useful, a dynamic capability must be a repeatable: that is, the underlying processes are explicitly learned and managed by senior leaders". These skills can be developed and they are difficult for competitors to imitate. However, this capabilities can be lost" if senior management is not explicit in protecting them (O' Reilly, Tushman, 2007).

According to O' Reilly and Tushman (2007) to be successful at ambidexterity firms must possess the capabilities of sensing, seizing and reconfiguring: "ambidexterity requires a coherent alignment of competences, structures and cultures to engage in exploration, a contrasting congruent alignment focused on exploitation and a senior leadership team with the cognitive and behavioral flexibility to establish and nurture both."

Capability of **Sensing** requires culture of openness that encourages debate, the commitment of resources by senior leaders (financial and time) to encourage a long-term thinking, and a senior management team that fosters a long-term mindset and promotes exploration. A certain balance in centralization and decentralization of control must be to encourage feedback from market-facing units because they are first to sense opportunities and threats, particularly in rapidly shifting markets (O' Reilly, Tushman, 2007).

Seizing opportunities is about making the right decisions and executing them, what need skilled, determined and strong leadership. **Reconfiguring**: Operational capabilities may provide competitive advantage at a given point in time, but for long-term success resources must be reallocated from the mature and declining businesses toward emerging growth opportunities. (O'Reilly, Tushman, 2007).

Two barrier types are linked to individual characteristics: capabilities and time resources of innovators and the motivation of individuals and can be considered to be the main reasons for barriers to innovation. (O'Reilly, Tushman, 2007). Ambidexterity is not instilled in an individual's ability to explore and exploit, nor is it simply a matter of organizational structure, although it is theoretically possible to conceive it in these ways. Ambidexterity is not a dynamic capability equivalent to ad hoc problem solving in which a business may <solve> a problem on a one-time basis by setting up successful exploratory venture. Rather, "as a dynamic capability ambidexterity embodies a complex set of routines including decentralization, differentiation, targeted integration, and the ability of senior leadership to orchestrate the complex trade-offs that ambidexterity requires". These are founded in a part of tacit knowledge and require long-term commitments to specialized resources (O' Reilly, Tushman, 2007).

Organizing to innovate

There is a sharp contrast between traditional, internal organization-centered models of innovation and recent ambidextrous or even open innovation model. "These fundamentally different and inconsistent innovation logics are associated with contrasting organizational boundaries and organizational designs" what occupies scholars of innovation, R&D, strategy, and organization theory as a central theme (Lakhani, Tushman, 2012).

According to OECD methodology there are y four types of innovation identified in the Oslo Manual for measuring innovation: product innovation, process innovation, marketing innovation and organizational innovation. O'Reilly and Tushman, (2007) argue that innovation occurs in three distinct ways. First is incremental innovation in which an existing product or service is made better, faster and cheaper. The second way of innovation occurs through major or discontinuous changes in which major improvements are made typically through a competence-destroying advance in technology and creates new product class or substitutes for an existing product. Innovation also occurs through seemingly minor improvements in which existing technologies components are integrated to dramatically enhance the performance of existing products or services.

The studies in wide range of management research areas have shown that exploration and exploitation require substantially different structures, processes, strategies, capabilities and cultures (He, Wong, 2004). We have already explained that exploration is generally associated with organic structures, loosely coupled

systems, path breaking, improvisation, autonomy, and chaos, and emerging market and technologies; and exploitation is associated with mechanistic architecture, tightly coupled systems, path dependence, reutilization, control and bureaucracy, and stable market and technologies (Lewin, Long, Carrol, 1999).

Scientists mostly agree how individual unit should be organized, but *they disagree about how and to what extent the differentiated units should be integrated* (Raisch, Tushman, 2011). *“It is important for organization to find a balance because a focus on exploitation may enhance short-term performance, and a form can lose its ability to respond to change. On the other hand, exploration may enhance firms’ ability to renew their knowledge base, what can trap them in an endless cycle of search and unrewarding change,”* (Raisch, Tushman, 2011). We have already explained that structural mechanisms enable an organization to cope with competing organizational demands that arise from the simultaneous pursuit of exploitation and exploration, but they are not sufficient for successful ambidextrous organization.

In order to manage differentiation-integration tensions, an organization constantly shapes its boundaries: it uses boundaries to differentiate business units with distinctive knowledge bases, while managing interactions across these boundaries, to integrate knowledge (Raisch, Tushman, 2011). Boundaries should be flexible, they should strengthen business unit’s identity, but they should be permeable at the same time to enable transfer of knowledge from other business units.

Raisch, S., Tushman (2011) *identified four categories of boundary activities that are integral for structurally differentiated units in an ambidextrous organization: reinforcing boundaries, nurturing across boundaries, buffering boundaries, and sharing across boundaries.*

Reinforcing boundaries category reflects the explorative unit’s efforts to separate- to strengthen its boundaries with mainstream units. This category includes three dimensions: to shape a distinct identity, to support different behavior, and to make specific skill set by acquiring new knowledge. **Nurturing across boundaries**-category describes the activities of organizational team over boundaries to provide the differentiated unit with resources. This category has two dimensions: to highlight the corporate team’s role in injecting functional know-how and to transfer of managerial expertise. Category **buffering boundaries** emphasizes the need and effort to isolate the explorative unit from exposure to external demands, pressures, and interferences of traditional units. It also include two dimensions: it highlights how the differentiated unit buffers its boundaries to defend its decision-making autonomy and it concerns the differentiated unit’s activities to retain a strategic control of operations despite the corporate team’s integrative efforts. **Sharing across boundaries** category explains the differentiated unit’s boundary activities to share resources with a mainstream units. The first of three dimensions concerns the sharing of operational assets between the differentiated units and the mainstream units. The second is engaging in joint market activities. The third dimension concerns the transfer of best practices and skills from the differentiated unit to the mainstream units. The transfer can be executed by transfer of managers, and the establishment of cross unit networks, and the informal exchange of knowledge across units (Raisch, Tushman, 2011).

Exploratory and exploitative units use different boundaries activity over time because different stages of projects demand different relation between those two: bigger autonomy or even isolation, exchange, leverage so they adjust boundaries according to demands. “All those changes and phases indicate that ambidexterity is a dynamic process” (Raisch, Tushman, 2011).

6. CONCLUSION

Twenty years ago March had emphasized the importance of simultaneous exploration and exploitation. In order to survive companies must improve every sequence of their business no matter how big or small they are, because they all compete at the same global market. If organizations want to compete in the short and long run, they don’t have luxury of choice: They have to meet current customer demands and new customer requirements. Our review suggest that ambidexterity (in structural, strategic, behavioral terms) could be a solution for organizing company in order to be successful in multitasking. *Ambidexterity is possible only if a firm develop certain set of abilities-dynamic capabilities- to learn and adapt to shifting environmental context. In a firm, organizational learning must take place in two levels: business units (exploration and exploitation) have to learn to cohabit, and senior management level itself has to learn how to maintain, protect and support ambidexterity, challenges the status quo, accepts failure, and provides the integration and transfer of knowledge* (O’ Reilly, Tushman, 2007)

Introducing an explorative unit might *help organizations sense and seize new opportunities. Introducing new business that is not profitable from the very beginning is not a way to tolerate inefficiency but a way to create a deliberate tension that uses existing firm assets and capabilities and reconfigures them to address the new opportunities. When done explicitly, this involves deliberate investments and promotes organization learning - what will result in a dynamic capability –a firm’s ability “to learn how to learn.”* (Raisch, Tushman, 2011).

Our goals were to promote concept of ambidextrous organization to a broader audience, to present its characteristic in order to explain why we think that is appropriate model for Serbian organizations. We think that our companies will stay dependent on high technology and refined know-how for some more time, but we argue that there are fields where it is possible to create in-house solutions-innovations and exploit them here with locally gained know-how.

This paper provides a starting point for future research on how ambidexterity creates a balance between current and future needs of organization and its convenience for implementation in Serbian organizations. We explained most important characteristics of ambidexterity mission, purpose, significance and potential benefit, how, and why it should be implemented. Ambidexterity, like every other organizational design, is not a silver bullet for all organizational problems, but if it is led explicitly and consistently enables short and long term progress of an organization.

Abstract: *The paper presents an important aspect of innovation performance measurement, concerning the role of indicators of patent protection in innovation process evaluation. Being one of the key intellectual property rights, patents have been widely recognized as an innovation management supporting tool which can also be used for strategic planning purposes. For this purpose, patent analysis is applied as an activity of analysing patent documents contained in patent databases. In addition, based on patent indicators as patent data of a certain type derived from patent databases, the evaluation of innovative activities can be conducted. The review of three approaches to the assessment of patent indicators is presented in the paper, followed by a comment on their relevance to innovative performance.*

Keywords: *innovation, patent indicators, innovative performance*

1. INTRODUCTION

Innovation is a well-developed and extensively examined area of management, since it is widely identified as the basic development and competitiveness factor, with increasing importance in the age of knowledge-driven economy directly based on the production, distribution and use of knowledge and information. Rising importance of knowledge as an economic driver implies intensifying influence of innovation management. It is broadly recognized that successful innovation management includes defining innovation strategy and coordinating with other relevant strategies in organization, such as intellectual property strategy. In that sense, with the increasing amount of revenue generated from intellectual property rights (especially patents), intellectual property management is becoming a strategic component of corporate business operation (CSU, 2004).

The question of using intellectual property rights in the domain of innovation management is important for two main reasons (Stošić, 2007):

- radical innovations during the last decade of the 20th century - emerging technologies with domination of ICT, telecommunications etc;
- globalization processes have direct influence on increasing needs for legal protection in innovation projects, especially in the beginning phases - generating new ideas.

Since patents are intellectual property rights aiming at legal protection of innovation processes outcomes that have technical nature, they can serve as indicators of innovative performance. The performance can be measured directly for technical product or technical process as for specific invention, or on a larger scale for R&D activities of organizations and industry branches. As a basis for measuring innovative performance through patents, patent databases are used which is one of the main patent analysis tasks.

The paper addresses one of frequently asked questions on measuring firm's innovative performance, concerning patents as one of inevitable indicators, both on micro and macro level. In that sense, a review has been given of three approaches, the first two (Ernst, 2003, Germeraad, 2010) discussing patent indicators applied to patent portfolio analysis and the third one (Littmann-Hilmer & Kuckartz, 2009), applicable to evaluation of patent documents as single innovative projects, as well as patent portfolio analysis.

2. INNOVATION AND INNOVATIVE PERFORMANCE

Lots of innovation definitions can be found, having in mind that this concept has evolved significantly over the last decades. In its wider context, it is the process of turning the possibilities into new ideas and putting them into practical use. Observed as a specific form of change, innovation can be defined in various fields, since J. Schumpeter has defined it, thus establishing the theory of innovation, formed as a distinctive academic discipline from the 1980s (Filippov & Mooi, 2010). In a remarkably short time, economic globalization has changed the world's economic order (European Commission, 2012) bringing new challenges and opportunities and putting innovation in the central place as the key driver of knowledge-based economy. The significance of the innovation strategic dimension also must be stressed, since it creates the possibility for enterprise to gain competitive advantage based capability to realize successful innovation projects.

As European Commission's *Green Paper on Innovation* has indicated, innovation is the renewal and enlargement of the range of products and services and the associated markets; the establishment of new methods of production, supply and distribution; the introduction of changes in management, work organization, and the working conditions and skills of the workforce. In the OECD and Euro stat's 3rd edition of *Oslo Manual* - guidelines for collecting and interpreting innovation data, basic definition of innovation covers realization of a new or significantly improved product/service, process, marketing and organizational method, thus recognizing four types of innovation (Oslo Manual, 2005). According to criterion of novelty degree, innovation can be incremental (small improvements) and radical (completely new product/services etc.) while some authors also identify semi-radical type of innovation, based on the interaction between technology and business model changes (Davila, 2005).

When it comes to measuring innovative performance, literature on innovation and related topics has a long history of trying to identify common set of indicators. However, the results of many studies have not yet led to a generally accepted indicator of innovative performance or a prevalent set of indicators (Hagedoorn & Cloudt, 2003). Measuring innovation performance can be carried out both on macro and micro level. Macro level implies assessment innovation performance on the national level, while micro level implies measuring on the company level. Different kinds of innovation surveys have been implemented in extremely large number of countries - EU, OECD, non-OECD countries in the different regions and continents. For example, in Europe, methodology and research known as Community Innovation Survey (CIS), was conducted in various European countries, aiming at collecting data to recognize range of *innovation activities* as wide as possible (such as R&D expenditures, product design, trial production, market analysis), *innovation input/output factors* and indicators (like patents, introduction of new products, processes and organizational changes) and variety of different factors that influence *innovation process* (hampering and stimulating innovation, like sources of knowledge, reasons for innovating, strength of various appropriability mechanisms (Stošić, 2006).

It should be fundamental to mention IUS (Innovation Union Scoreboard) of PRO INNO Europe® initiative which aims to become the focal point for EU innovation policy analysis. IUS is a tool which gives comparative assessment of the innovation performance of the EU27 Member State including Croatia, Iceland, the Former Yugoslav Republic of Macedonia, Norway, Serbia, Switzerland and Turkey. The IUS 2011 distinguishes between 3 main types of indicators and 8 innovation dimensions, capturing in total 25 different indicators (Innovation Union Scoreboard, 2012).

Table1. IUS by types of indicators, dimensions and number of indicators per dimension

	Main type of indicator	Innovation dimension	Indicators (Number)
1	Enablers	Human resources	3
		Open, excellent and attractive research systems	3
		Finance and support	2
2	Firm activities	Firm investments	2
		Linkages and relationship	3
		Intellectual assets	4
3	Outputs	Innovators	3
		Economic effects	5

Patent indicators can be found among Firm activities set of indicators, more precisely Intellectual assets, identified as:

- PCT patents applications per billion GDP;
- PCT patent applications in societal challenges per billion GDP.

Measuring innovation performance on micro (corporate) level is a relatively new area and many corporations have no experience in determining suitable metrics. It depends on how each company defines innovation and requires careful review in order to discover the usefulness of chosen innovation metrics. Some of diagnostic tools and innovative performance merits which help organizations to evaluate, benchmark and improve their innovations are illustrated in the following two tables. Table 2 includes patent indicators related to Developmental perspective in Balance scorecard (BSC) as a strategic management and measurement system.

Table 2. Innovation Measurement Tools (Tin, 2005)

Tools	Indicators	How it works	Devised by
Index of Corporate innovation (ICI)	Corporate culture Leadership Workforce Capacity Organizational processes and structure Collaboration and partnership Investment in innovation Innovative performance	Employees will be asked to complete on-line surveys. The consultant will then analyze the surveys and provide the ICI report card to the organization. From the results, action plans will be devised and integrated into the organization's operations and strategy.	Conference Board of Canada
Balance scorecard	Indicators relevant for measuring innovation Customer perspective The satisfied customer index (%) Customer-loyalty index (%) Developmental perspective R&D expenses (\$) R&D expenses/total expenses. (%) Investment in training/customers (No.) Patents pending (No.) Average age of company patents (No.) Ratio of new products (less than X years old) to full company catalogue (%).	The balanced scorecard methodology builds on some key concepts of previous management ideas such as Total Quality Management (TQM). It involves developing outcome metrics based on the priorities of the strategic plan.	Developed by Robert Kaplan and David Norton. Applied by both public and private organizations worldwide

Especially, the Return on innovation investment (ROI2) should be taken into account, as a comprehensive measure of innovative performance, allowing companies to compare innovation returns with returns from other types of investments (Table 3).

Table3. Performance Metrics(Tin, 2005)

Metric	Components	Potential Implications
Return on innovation investment (ROI2)	Cumulative net profits generated from new products launched Research costs + development costs + incremental production costs + initial commercialization pre-launch costs	Single, standard measure for comparing performance between divisions, over time, and within industry.
Cumulative profits	Cumulative (3-5 years) profits from new products	Impact on income statement
Cumulative revenues	Cumulative (3-5 years) revenues from new products	Impact on income statement
Growth impact	Revenues from new products over 3-5 years 3 year revenue growth	Contribution to firm growth
Success rate	Number of new products exceeding 3-year original forecasts Total number of new products commercialized in last 3 years	Indicates quality of planning
New product survival rate	Number of new products remaining in the market (time period X) Total number of new products launched (time period X)	Provides insight about the demand of new product introductions relative to total new product efforts

3. PATENT INDICATORS AS A MEASURE OF INNOVATIVE ACTIVITIES

Patent is an intellectual property right which protects inventions as technical solutions. Patents are granted in administrative procedures conducted by official authorities – normally patent and intellectual property offices. During the administrative procedure the invention that can be related to product process, or use is being classified using standardized classification system. The most commonly used classification system is the IPC (International Patent Classification) dividing all technology fields into over 70 000 hierarchically structured categories. Within the patenting process, the invention is disclosed to the public by official publishing done by the patenting authority. Published invention is entered into patent databases, and subsequently examined for patentability. If patentability criteria - novelty, inventive step and industrial application are met, the patent is granted.

Patent as a preventive intellectual property right gives right to patent holder to control patented invention on one country's territory for a certain period of time in terms of exclusive right to commercially exploit the invention and to prevent others from such exploitation. The exploitation comprises production, sale, marketing, import etc. In addition, patent protection provides the owner with exclusive right to hold, transfer and licence the production and sale of the patented product or process.

In appropriating the benefits of innovation, patents are considered as a sustainable factor of influence, in the sense of inventor's protection from imitation coming from competitors. Different analysis of using patent protection can be found, with potential benefits, but, also, limitations, due to eventual patent protection strength. Whatever the reasons for or against patent protection might be, there is no doubt about the fact that patents motivate inventors and certainly represent a sign of achievement. In this way patents are strategic tools highly significant for any technology oriented organization and if effectively used can constitute substantial competitive advantage of any innovative company.

Another characteristic of the patent system is its informatics function, derived from legal condition of publishing of the invention subject to patenting in order to provide public with the patent information. Patent information enables further R&D activities which are normally excluded from patent protection. Besides using patent information as source of ideas that can be used in R&D processes, patents are objective measure of R&D activities (Ernst, 2003) and can be used as technological progress indicators which are the main task of patent analysis. Patent information can be accessed through free and commercial patent databases, e.g. through Espacenet free database accessible online (EIC, 2012).

However, the experience of European countries shows that this strategic function of patents is usually neglected or not fully exploited by the companies. One of the reasons, beside the lack of awareness of the importance of patent as a strategic tool, can also be difficulty in using patent information (Nielsen, 2004). The insufficient knowledge in handling patent information can be overcome by trainings, provided in Serbia by the Education Information Centre established at the Intellectual Property Office (EIC, 2012).

Innovation management requires defining patent strategy in the way that corresponds to business strategy and different functional strategies of the enterprise. A patent strategy can be defined as a framework of decision making processes and procedures that should ensure that a company's patent activities support the company's business (Wijk, 2005). Patent strategy should be especially coordinated with innovation strategy, which can be found in innovation literature as broadening 4P of innovation with the new one: Product, Place, Price, Promotion and Patents. Also, when it comes to the new product development (NPD as product innovation), there is a strong connection between this intellectual property right and competitiveness that can be achieved through innovation (Stošić, 2002). This is one of the reasons for the innovation project team to take the key role in making the right decisions about planning and providing legal protection during the whole innovation project from idea to commercialization.

4. REVIEW OF SEVERAL APPROACHES TO PATENT INDICATORS

In order to use patent information to measure and evaluate innovative activities or to analyze company's patent strategies patenting indicators can be deployed (Ernst, 2003). In this section, the three approaches of establishing patent indicators are being reviewed. The main aim of the section is to point out to possible patenting indicators that could be used for evaluation of company's innovative activities.

Ernst (Ernst, 2003) introduces several patenting indicators (Table 4). Patent activity is a fundamental patent indicator related directly to R&D activity of the company. It is defined as number of patent applications of

company in certain technological field. The paper further introduces technology share as a measure of firms competitive position in a technological field as patent activity per number of all competitors' patent applications in a technological field and R&D emphasis as ratio of patent activity and company's total patent applications (patent portfolio).

Table 4. Patent indicators (Ernst, 2003)

Important patenting indicators for competitor monitoring		
Patent indicator	Definition	Meaning
Patent activity (PA_{iF})	Patent applications (PA) of firm i in technological field (TF) F	Extent of R&D expenditures of firm i in TF F (interest of firm i in TF F)
Technology share (based on patent applications)	PA_{iF} / PA of all competitors in TF F	Competitive technological position of firm i in TF F (quantitative)
R&D emphasis	$PA_{iF} /$ Number of firm s (i) total patent applications	Importance of technological field F for firm i (R&D emphasis)
Co-operation intensity	Number of joint patent applications with partners in TF F / PA_{iF}	Access of firm i to external knowledge (and identification of partners)
Share of granted patents (Q_1)	Granted patents of firm i in TF F / PA_{iF}	Technological quality of firm i 's patent applications
Technological scope (Q_2)	Diversity and number of IPC classes in firm i 's patent applications (PA_{iF})	Technological quality of firm i 's patent applications
International scope (Q_3)	Size of patent family and share of triad (US, JP and EPO) patents of PA_{iF}	Economic quality of firm i 's patent applications
Citation frequency (Q_4)	Average citation frequency of PA_{iF}	Economic quality of firm i 's patent applications
Average patent quality (PQ_{iF})	Sum of all indicators of patent quality (Q_1 – Q_4)	Average total quality of all patent applications of firm i in TF F
Patent strength (PS_{iF})	Product of average patent quality (PQ_{iF}) and patent activity (PA_{iF})	Technological strength of firm i in TF F
Technology share (based on patent strength)	PS_{iF} / PS of all competitors in TF F	Competitive technological position of firm i in TF F (qualitative)
Relative technology share	$PS_{iF} /$ Max. patent strength of a firm in TF F	Distance of firm i to the technological leader in TF F

The patent activity and technology share and R&D emphasis derived from it can be regarded as quantitative indicators which are not taking into account the quality of company's activities. Hence, the following set of patenting indicators - patent quality indicators related to certain technological field are further introduced using the patent activity definition (Ernst, 2003):

- share of company's granted patents in a technological field per patent activity,
- technological scope as diversity and number of patent classes (IPC classes) relating to a patent activity,
- international scope as size of patent family and share of US, Japanese and EP patent documents relating to a patent activity and
- citation frequency as average citation frequency of patent activity.

A patent family is a set of related patent documents (including applications and granted patents) published in various countries protecting the same invention (OuYang & Weng, 2011). Finally, average patent quality as sum of all indicators of patent quality is given, which constitutes a quality indicator from a commercial perspective, and not a legal value indicator (Ernst, 2003).

In addition to the patent quality there are following patent strength indicators, representing technological strength of a company defined:

- patent strength as product of average patent quality and patent activity,
- technology strength as patent strength of a company per patent strength of all competitors in technological field representing competitive technological position of a company and

- relative technology share as a ratio of patent strength and maximal patent strength of a firm in technological field, expressing the distance of a company to the technological leader in a field.

On the basis of empirical data an example is given showing impact of patent quality on the assessment of the competitive position of the three companies in a specific technological field with a conclusion that neglecting the quality aspects of the patents would have led to a substantial devaluation of company's technological strength and therefore its competitive position in a technological field.

Another paper (Germeraad, 2010) discussed the study of Intellectual Assets Inc. which identified following key portfolio attributes (Table 5), referring to patenting indicators, related to the innovation strategies defined in the Games of innovation by Miller and Floricel. The paper explains how the indicators can be used to consider the patent's potential role in the company's overall innovation strategy.

Table 5. Key patent portfolio attributes (Germeraad, 2010)

Portfolio Size	Patent Fences	Patent Velocity	Portfolio Momentum	Claim Quality	Claim Scope	Geographic Coverage
Sole Holder 	Multi-Generation 	Faster Than Competition 	Building 	High 	Broad 	Broad 
Largest 	Single Generation 	Equal To Competition 	Holding 	Moderate 	Moderate 	
Upper 20% 	Focused 	Episodic 	Pruning 			
Average 	None 	Slower Than Competition 	Pruned 	Low 	Narrow 	Specific 

- Portfolio size is looked at as a key element in IP strategy. This indicator could be treated as analogue to the previously described patent activity, technology share and R&D emphasis;
- Patent fences are created by generation of self-citations around company's core technology patents. A patent citation which can be done by the applicant or by the patent examiner links a patent for core technology to the follow-on patents which are based on the core patent. A self-citation is a patent citation where both the cited and the citing patents are held by the same company. When the percentage of self-citations for a given patent rises to over 20%, indicating that the company that originated the technology holds 20% or more of the follow-on patents, a patent fence begins to form, making it difficult for other entities to create products and services in that area. The patent fence essentially extends patent protection on the core technology by protecting products incorporating the most commercially important aspects of it, creating longer-term and more solid protection for the company's most valuable and commercially important technologies. Building patent fences constitutes typical patent strategy contributing to overall business strategy of a technology oriented company;
- Patent velocity refers to the time between the granting of initial patents and the patenting of follow-on technology. If kept high can lead to creating patent fences ensuring the advantaged position of the company;
- Portfolio momentum growth trend of patent portfolio, eg +, -, = 10% per year;
- Claim quality as enforceability of a patent claim in a litigation proceeding - chance of being upheld as valid an enforceable in litigation. However, the assessment of claim quality was not further discussed, except that it can be done by IP attorneys or specialized IP software. Uncertainty, but probability of successful enforceability could be increased by having more patents and more patent claims in a portfolio;

- Claim scope refers to the breadth and uses covered by a single patent. Typically, for new and evolving technologies the claim scope will be broad since the breadth and scope of the art may not yet be known. New possibilities of invention realization;
- Geographic coverage is relating to the number of countries where the invention is protected. This indicator could be equivalent to the previously described international scope.

The attributes of patent portfolios described here can also be used as IP metrics (assessing the business value of an invention) for the performance of R&D organizations and for defining particular innovation strategies (Germeraad, 2010).

Previous approaches to assess R&D activities of a company are designed for patent portfolio analysis. The following one proposed by Littmann-Hilmer and Kuckartz (Littmann-Hilmer & Kuckartz, 2009) is claimed to be suitable for evaluating single patents as well. For these purposes the following patenting indicators, named market value indicators, were introduced:

- Patent market coverage expressed by patent family size, contributes to the market value of a patent.
- The technological scope of protection is shown by the range of patent classes assigned to the patent application in the official examination procedure carried out by the patent office. The number of classes is proportional to the patent market value.
- Legal scale of protection is defined by the scope of patent claims, taking into account the number and structure of patent claims - independent and dependent claims.
- In terms of citations, there are forward citations - frequency of document citation by others, and backward citations in the official examination reports made by patent offices.

The paper is further discussing the methodology of applying most appropriate innovation strategy regarding the previously calculated patent indicators.

5. CONCLUSION

The main goal of this paper is to contribute better understanding of the role of different patent indicators in measuring the innovative performance of companies, having in mind that a number of various indicators can be found. The three approaches reviewed are showing the possibilities of using patent indicators for assessing innovative activities. The aim of the review was to show the complexity of links between patents as intellectual property rights and innovation activities quantified by patent indicators. All the three studies stressed the importance of patent family size (geographic coverage, market coverage) corresponding to the territory covered by patent protection contributing significantly to the market value. Another highly relevant patent indicator is frequency of citations where further differentiation to self-citations, forward citations and backward citations is made. Both indicators are highly relevant in different patent analysis activities (OuYang & Weng, 2011).

All the indicators reviewed express commercial (market, economic value) of patents except claim quality and claim scope (Germeraad, 2010) and legal scale of protection (Littmann-Hilmer & Kuckartz, 2009) indicating legal value of a patent. Because of the fact that they fall in the domain of patent right, they are especially worth considering.

Claim enforceability is difficult to calculate, and can only be roughly estimated, since the final decision is made by the court in litigation procedure. It is further stated that it could also be brought in correlation with the total number of patents and number of claims (Germeraad, 2010). Although, the number of claims could serve as a measure of legal scope of protection (Littmann-Hilmer & Kuckartz, 2009), it is difficult to determine how the number of claims is influencing enforceability of patent without conducting deeper analysis. Generally, the number of independent claims increases patent scope, unlike the number of dependent claims which, being narrower in scope than independents claim, have no further effect on the claim scope.

On the other hand, the relationship between technical scope and scope of the claims can be determined with more certainty. Technical scope, expressed by number of patent classes assigned to the patent is indicating the subject matter of the invention, i.e. implying possible application field, as purely commercial indicator. Hence, it is in correlation with scope of the claim, starting from the function of the claim which is to define the subject of the invention, although patent claims can have much broader interpretation requiring expertise in patent law.

Patent strategy is part of innovation/business strategy and by evaluating patents, the R&D activities as a measure of success of an innovative technology oriented company can be assessed. For this purpose patent analysis has to be conducted using proposed patenting indicators. The prerequisite for the analysis is the knowledge about basic patenting principles and about patent search which can be obtained in Serbia at seminars provided by Intellectual Property Office. The technology assessment can be made on various levels - for a single invention, R&D project, patent portfolio, industry clusters etc.

Abstract: *In this paper authors attempt to emphasize the need for change in the management of Serbian higher educational institutions of social sciences. Managers, as deans, need to reorganize the institutions into innovative organizations. The authors offer three arguments to confirm the thesis of the necessity of changing higher educational institutions of social sciences in innovative organizations.*

Keywords: *higher educational institutions of social science, innovation of educational process, innovation of management higher educational institutions, new technologies, Serbian higher educational institutions of social science*

1. INTRODUCTION

The economy is in the fifth stage of the of economic development activities (Fitzsimmons & Fitzsimmons, 2006. p. 5). It is dominated by services that enhance quality of life. The most important are the services in the fields of education, health, research, entertainment and recreation.

Education has always played an important role in the development of society, but now it has an outstanding role. First, educational institutions are important players in the modern services market. Second, education creates knowledge through multiple connections with science and technology, while knowledge is the dominant economic resource. Modern economy is called *knowledge economy*. The term knowledge economy means the economy is being developed on the basis of production, distribution and use of knowledge (European Commission, 2004, p. 22.) The economy based on knowledge is characterized by a high degree of correlation of those who create and those who use knowledge in all economic activities. The knowledge embedded in innovation and technology is fast expanding economic structure, creating new dynamics. Now it is period of transition from knowledge-based to knowledge-driven economy. The main features that cover the knowledge-driven economy are: knowledge is increasingly considered a commodity - it is packaged, bought and sold in the manner and at levels never seen before; advances in ICT as well as significantly reducing the cost of collection, and knowledge transfer; and degree of correlation factors of knowledge has increased dramatically. In addition to knowledge, time as resource is very important in the new economy. Business goes in the direction of real time enterprise. The role of time in creating companies competitive advantage, lays new requirements in front of education. Education cannot be developed under the influence of the economy demands, but in conjunction with science and technology, it creates directly the economic structure. Therefore it is not surprising that the U.S. universities in 2009 had invested mostly in research of education, as non-scientific fields - \$ 921 million (Britt, 2009)

This work studies change in the higher educational level and engaged in social sciences.

2. LITERATURE REVIEW AND HYPOTHESIS

Approximately half of the 20th century philosophers gave great attention to the social sciences, while in recent years, particularly, focused attention has been on the economy. The basic question posed by philosophers of science was fundamental difference between social sciences and natural sciences. Until now there was no single response. Johann Droysen was probably the first philosopher who has made

² the paper is a part of a research within a project financed by Ministry of Education and Science of the Republic of Serbia, which is called 'National strategy for inflow of the foreign capital so as to reintegrate Serbia into the world's economic flows', grant number:179032

terminological distinction between the concept of explanation and understanding. Natural science gives an explanation, but social science gives an understanding. Wilhelm Dilthey argued that the difference stems primarily from the structural relationships that scholars of natural and social sciences have on their subjects. Subject-object relationship is considered to be characteristic of natural sciences. Social sciences are based on the subject-subject relations. The aim of the study of human or social sciences is the understanding of social phenomena, which involves different categories: meaning, purpose, value, growth and ideal. It emphasizes that the nature of the social world is absence of causal order. Every social fact has a historical dimension. These views have opened the question of relativism of social sciences. Many authors adopt the position of individualism. However, the society goes beyond the individual, both in space and in time and as a whole, which is more than the sum of its parts. Human behavior is guided by reason-action relation. The main thesis is about what gives rise to human behavior: the reasons, not causes. Weber tried to find a compromise solution to the naturalistic and hermeneutic model of social sciences. He offered the *ideal type* methodology. These are hypothetical, *as-if* models. The present socio-economic reality in a way consists only of the parameters in the model. Thus, human beings are reduced to a few parameters - *homo economicus*, *homo sociologicus*, and *homo psychologicus* in accordance with the topic that describes and explains the purpose of economists, sociologists or psychologists. When the ideal type is empirically confirmed, it suggests social regularities, which serve as an explanation of social action. Further work on getting to know the essence of social science was influenced by Darwin's theory of evolution and Freud's psychoanalysis. Evolutionary biology is of utmost importance for the study of human behavior and thought. At 1975th appeared the book named *Sociobiology*, by EO Wilson. This book had sparked anger because it asserted that the social behavior of animals and humans have biological roots. Sociobiology is the systematic study of the biological basis of all forms of social behavior - all kinds of organisms, including humans (Weinert, 2009, p. 264-265). The great part of human behavior follows the norms and conventions, and is inspired by social values. These conventions, norms and values tend to vary from society to society. Sociobiology shows that these differences are the result of genetics. Genes are the ones who have allowed the development of the capacity for culture that is the basis for the tendency to develop a culture or another. But a man should his innate aggressiveness, propensity to warfare and the like under control and to rationally manage conflicts. We need to find a compromise between nature and nurture. The evolution of society is more a result of culture rather than genetics. Scientists from the social sciences cannot guarantee this approach at this point. On the basis of sociobiology has developed evolutionary psychology. Evolutionary psychology seeks to establish a firm link between evolution and social sciences. If the social sciences become a specialized branch of biology, the traditional autonomy of the social sciences will disappear. Proponents of evolutionary psychology point out the need for a new model of social sciences - Integrated Causal Model which is based on the human capacity: the symbolic language of learning, understanding and reasoning, perceiving the material world, the predictions of the future, the organization of social life, mating and food preferences; to recognize young people that they allowed a routine to solve complex tasks. They find that the traditional social sciences have failed due to disregard the biological dimension of human existence. However, at the present time there is an alternative evolutionary psychology research program, which has yet to determine their status. In addition to evolutionary psychologists, Freud had led to a revolution in the history of thought. Perspective is included. He argued that one should look at people from the standpoint of their unconscious motivations, rather than rationality, because of the unconscious dynamics. Freud created *homo psychologicus*.

These philosophical dilemmas suggest that social sciences are expecting dynamic period of development. This raises the question of education in the field of social sciences. The problem of modern education is that there is no logical or conceptual connection between belief, teaching and learning on one hand, and critical inquiry on the other hand. That given belief is not necessarily associated with a critical examination and can last without it, while that critical inquiry is the essence of knowledge and cannot survive without it (Nola & Irzik, 2005, p 19). It is necessary to change the present form of education. Education should not give only beliefs. It should include a belief and/or opinions of why they should or should not be holding a belief. Education should give a product of critical inquiry - knowledge and understanding. Without the rules of critical inquiry, learning in education is nothing more than obtaining the information, beliefs or income adjustments opinions. Linking learning and education provides a working definition of minimum education (Nola & Irzik, 2005, p. 51): *Education is the coordinated process, typically but not always involving teachers, in which the goal is to bring about pupil learning (including learning that, learning how to, learning why, etc.) and the process has a successful outcome*. Education is connected with science and technology, and can be presented as to the Figure 1 (Komazec, 2012).

Figure 1: Relationship between science, new technology and education

Today, there is no doubt about the fact that competitive advantage is achieved with new technologies that usually stem from scientific findings. Because science and technologies are largely implemented in enterprises, the third key element of knowledge - education, moved to companies. New types of educational institutions - corporate universities are developing. According to Annick Renaud-Coulon, president of the *Global Council of Corporate Universities* there are about 4,000 such institutions in the world, with more than 4 million students (Theil, Overdorf & McNicoll, 2011.)

Based on quotes upward of the scientific findings, authors support these hypotheses:

H_0 - Education became one of the key drivers of economic development.

H_1 -The educational institutions apply new emerging technologies and change the educational processes.

H_2 - Changes in the educational process requires innovation of management

H_3 - Serbia is not sufficiently technologically developed, and it has to pay particular attention to management of educational institutions, because education can help Serbia in achieving necessary level of technological development

H_4 - The higher educational institutions of social science have to become innovative organizations.

3. FINDINGS

X_0 : Big changes are happening in science and technology. Information on investment in science, technology and innovation suggests that the global picture of the scientific technological power of certain countries is rapidly changing (Silbergliett et al., 2006). Superior, former rulers receive strong competition. It is expected that the U.S. will continue to be a world leader in S & T capabilities and capacity, and innovation, but not the only one. It will not dominate in all technical areas. Some countries specialize in certain scientific fields, or invest in specific development programs. Globalization promotes the diffusion of technological solutions, but does not bring uniformity of science and technology. Speed of technology development will continue to accelerate, as the fields of science will become more integrated. The pace of these developments shows no signs of abating in the next 10 years, and it appears that their effect will be almost unbelievable. Many technology trends and applications will have a huge effect in changing the society, and will require further research and development, and consideration of consequences, the development of market forces and public debate. Knowledge and skills of people to implement, maintain, adapt and use new technologies gains great importance. From this perspective, human capital and technology are tails and heads on a coin or two indivisible aspects of the accumulation of knowledge. Innovation is seen as a gradual and cumulative process, and the development of future technology depends on the prior attainment level of development. Deep relationship between education, science and technology is confirmed by the exact indicators of two eminent institutions. Ericsson has developed *Ericsson's Networking Society City Index*, which allows states to compare with the best and to find opportunity through benchmarking for faster learning (Regardh, 2011). (Compare the cities, because they are less complex and measurement criteria are consistent.) Indices have proven that there is a strong link between the maturity of the application of information and communication technologies and socio-economic development of society and individual development. According to the last measured data (2011) Singapore has the highest rank, followed by Stockholm, Seoul, etc... Another organization, *The Information Technology and Innovation Foundation*, calculated based on six criteria (human capital, innovation capacity, entrepreneurship, IT infrastructure, economic policy and economic performance) that Singapore is the most developed country in terms of competitiveness. In Singapore, 38% of the population has higher education, on the 1000 workers they have 9.7 researchers and 1.4% of GDP invested in R&D of companies, 0.9% for public institutes, venture capital is 0.25% and 6.96 % is earmarked for information technology (Bennett, 2010, p. 43). It is followed by Sweden, then Luxembourg, Denmark,

South Korea, USA etc... There is no development of science, and technology without a good educational system.

X₁: In knowledge-driven economy, and with the rise of the Networked Society, schools are changing. Shape of future school is based on an individualization that is deeply embedded in new technology, and new way of living, characterized by an assimilation of work and play. New technologies, particular ICT, make possible achieving two fundamental human needs – communication and curiosity. A project named *The Future School* gives good picture of changing. A project is co-financed by Ericsson Consumer Lab, an organization that provides consumer insight to influence strategy, marketing and product management within the Ericsson Group, and Riksbankens Jubileumsfond, an independent Swedish foundation designed to promote and support scientific research. The ethnographic field work in Chicago and Hong Kong was done in cooperation with Conifer Research (Persson, 2012) It is identified the following six key areas of change: Work tools, Workspace, Infrastructure requirements, Ways of working, New roles for teachers and Skills, knowledge – and games. New working tools means 1:1 programs, in which every student and every teacher has a computer, and have become the model for progressive schools that focus on integrating ICT into education. Ericsson find interesting that several schools are making great use of interactive whiteboards. Like an analog whiteboard, an interactive whiteboard is a fixed device, but it can support interaction with each student' computer. Some experts view these devices only as a stepping-stone on the road to a classroom that has no fixed devices at all, while others recognize the potential of interactive whiteboards for supporting both individual and collaborative work. Workspace is changing, not only physical but also virtual space. Several of the schools studied in the project have broken down walls to make large rooms with plenty of lightweight movable desks and chairs that can be rearranged to suit the needs of each class or group of students. Students can work in "islands of learning in large rooms, creating flexible classrooms that enhance collaboration. Virtual space enables schools to interact and learn from each another. Classes in different countries are using Skype to communicate with each other and take virtual tours of each other's schools. Teachers are using blogs and social media to exchange ideas and lecture materials, driving forth new pedagogical ideals. In a society with omnipresent connectivity, the focus should not be on whether to work online or offline, but rather on using the best work tool and space for the specific task and situation at hand. Infrastructure requirements are related to connectivity. Teachers will use ICT to manage, observe, coach, protect and evaluate students. Without stable, high-speed connectivity, many of these tasks will fail. The school of the future will require hybrid forms of connectivity, including wireless, fixed and mobile broadband, to meet the need for flexible but reliable high-speed internet access. And that connectivity will be required not only in schools, but also when students are on the way to and from school, in locations such as the library and even at home etc. The Future School use different ways of working. Textbooks (both analog and digital) are still being used, but only represent one collected interpretation and presentation of a subject. Project-based learning seems to be the way of the future. Students are learning how to divide and take responsibility for different parts of their projects. Promoting leadership skills through project-based learning is meant to prepare students for future work at the management level. Teachers will continue to play a main role in students' learning process, but with new tools and changed ways of working, a new role for teachers is emerging. The teacher is more important than ever, but not as an all-knowing deity, but rather as an instructor or coach whose wisdom goes beyond mere textbook facts, expanding into the realm of everyday life and including the use of Facebook and Skype. Technology is making schools more transparent, offering new ways for parents to keep track of their children's performance at school and to establish direct contact with teachers and school administrators. Schools are facing new challenges in their mission to prepare students for their working lives. With the rise of the Networked Society integrated technology is creating the need for new, century skills, such as information and ICT literacy; communication; collaboration; and critical and analytical thinking. The focus in education is shifting from rote memorization and worksheets to collaboration and content creation. New technology has also brought gaming into schools. The gaming part includes lectures, and extensive physical and intellectual work. Science, global issues and strategic thinking are natural focus areas during the game challenge.

H₂: Gary Hamel in his book *The Future of Management* insists on innovation on management. He gives many arguments for that. In new circumstance, with rapid changing of business enviromental, companies practice management similar as scinetifical management from time of Frederick Taylor. Challenges faced by business leaders of the 21st century are numerous and unprecedented, and can be compared with those with whom they are experiencing the world industry pioneers a hundred years ago. Most companies are aware that there has been a radical change in the business. Spent tens of millions of dollars in efforts to achieve the desired changes, but do not achieve the goal - the return on investment. One reason is that using methods that were used in a different, simpler, the previous environment. This has caused huge resistance and firing people, the loss of staff morale and turmoil in organizacijonim cultures (Anderson &

Ackerman Anderson, 2001, p. 35). Over the last fifteen, twenty years the changes are more open, complex, continuous, and require changes not only the organization but also the employees, especially leaders. This type of change can be called a transformational change. In Figure 2 is shown that types of organizational change.

Figure 2: Transformational change

It is time for managers and employees to expand the awareness, skills and access to, and requires a broader approach that could be compared with mastery. Mastery implies a multidimensional approach, focusing on all aspects of the effort and the striving to achieve excellence in all these areas. Specialization in one area and neglect others, does not lead to excellence. The more you improve skills in one area, it is more a call for further development of others. Whatever you ignore becomes a weak link. Or, as Vladislav Bajac beautifully written in *The Book of Bamboo: The opportunity was missed when he made a mistake. Because the Masters are perfect; it is easier to perfect that you never make a mistake, but they will not be able to fix it*) Competitiveness is based on speed. The basic rule of competitive games is that *the fast eat the slow*. On the other side, demands side, it seems that the world is slowly marching in the type of self-replication. The concept of self-replication can be interpreted as a copy of a work of art by the artist who created the original. It has long been known that people's basic needs by seeking to meet new ones, and eventually sought their own development. The period of self-replication is based on new technologies, especial on ICT which enable individual delivery. Already today there is self-replication in the field of music and video projections. Clients express their identity, choosing from a variety, diversity and abundance of what they like best. New management lays change of knowledge. It need for so-called *just-in-time* knowledge. This type of knowledge comes from a new way of doing business - *Real time enterprise* (RTE). RTE is based on a different conception of time. Modern understanding of time means to transfer the so-called *causal time* to *flow-time* (Purser, Bluedorn & Petranker, 2005, p.1.) The concept of flow-time regarded the future as creative dynamic that is not limited to past knowledge. The future comes from what is happening at present. Such a future requires knowledge that comes from creative action in real time, i.e. *just-in-time knowledge*. In a rapidly evolving environment, decisions are not based on calculations, negotiation or adjudication, but the inspiration. Knowledge is results from the deep improvisation, allowing the vision to become a factor of change.

H₃ – Serbians economic system is weak. Main reason for that is circumstance she has been found herself during last twenty years. Serbia has been faced with sanctions, bombing and quite a bit unsuccessful transition of economy. Economic structure performs mostly low-tech companies. In Serbia, according to statistics, 3.4% of the population is illiterate, 21.8% have completed primary school, and 23.9% of the population has only primary education, 41.1% medium, 4.5 % increase and 6.5% higher education. Almost 50% of the adult population is at an elementary level of education or less. This means that about two million people over the age of 15 years without adequate working and living skills and competencies, and that many of them have serious problems to find and keep jobs. This corresponds to the current educational profile of the unfavorable economic structure and competitiveness of the state, dominated by low technology. Structure of employees in 2008 year, by level of education was: 7.6% of unskilled, semiskilled 5.5%, 17.7% of eligible, 5.3% of highly-skilled, 4.6% with primary education, 31.6% with high school diploma, 8.1% to 19.6% of college and university education. Output from such adverse economic structure can only be found by increasing the quality of education. Because of that, education have to change. It must follow the way of working presenting in *The future school*. EU gives Serbia a chance and open all doors for cooperation in educational fields.

H₄ According to the foregoing and reasoned opinions, it seems that the higher educational institutions of social sciences in Serbia are in a period of transformational change. To successfully manage these changes it is necessary to be reorganized into an innovative organization. This process will be extremely difficult. This

opinion is based on the knowledge of the results of transition higher educational institutions of social sciences in recent years. In accordance with the *Law on Higher Education* higher education institutions should be accredited under the new law and to work on new principles and standards. Analysis of 45 accredited or in process of accreditation higher education institutions in the field of social sciences can be concluded that were number of problems. One of the biggest problems is the insufficient knowledge of the changes of students, and teachers. Students do not understand the changes resulting from the Bologna, and therefore quality of evaluation teachers and educational process is low. In this way, they do not get quality information to improve the process. Teachers tend to work under the old principle and resist change. In addition there are serious problems in the technical and technological equipment. Facilities are far from the 1:1 program. Thus, for example, one of the most prominent state institutions, with 50 years of tradition, has one computer to 37 students. Besides it is rarely to find organizations that have fewer than 40 students per teacher, so the interactivity education is not enforceable. One of the new problems will arise from the Strategy of development of higher education in Serbia. Although the document is in the process of public hearings, is likely to be part of the strategy relating to the social sciences to adopt. It is anticipated cuts in funding social sciences students, or reduction in the institutions in this field. Under such circumstances high-education institutions have to become more innovative organization, which shall at all times be open to change and able to be changed as soon as possible. It is necessary to provide adequate technology to offer various educational programs and thus gain a significant advantage over the competition. To become an innovative organization, it is necessary to update the management, or the dean has to learn new skills and abilities. Dean addition to expertise in his/her scientific area should have knowledge in management and the computer-literate, particular knowledge of ICT. These requirements are too high, so many teachers do not want to perform this function. In addition, the high duties on the management take time for scientific work, which is essential for further progress. Some find solutions that correspond to their friends on their scientific work. It is a dishonorable solution. Therefore, the authors of this paper are considered to be functions of the dean and vice dean needed more professional. *The Future school* implement high-tech and high tech organizations can not operate without the knowledge of management and knowledge of technology, it is necessary to further knowledge of the dean as managers of higher education institutions. It is therefore necessary to find a new solution that would induce ablest scientists, who are very competent in their field, to further education in the field of management and technology. Encouragement should definitely include some way of evaluating its performance. It is not sufficient the position of dean of honor only to the individual. It is necessary to receive a certain category of scientific competence, because they would have multidisciplinary education and to show creativity in solving complex tasks, similar as new software.

4. CONCLUSION

The conditions in which higher education institutions perform seem to be radically changed. First, the social sciences are in a dynamic period which arises from different views on the nature of social science, the emerging network society and the need for better knowledge of man and his nature. Second, new technologies are changing the educational institution. The six key areas of change are: work tools, workspace, infrastructure requirements, ways of working, new roles for teachers and skills, knowledge – and games. Also technologies, in particular ICT, translate educational institutions into high-tech organizations. Third, on the services market, which dominates in the modern economy, education has a significant share, and increases the competitive struggle. On the educational market there are more and more corporative universities. In Serbia there are additional reasons. If higher educational institutions should be changed in accordance with *The future school*, they would create a realistic assumption for the development of the economy. In addition, it is anticipated by Strategy of higher education to cut a budget for higher education institutions in social sciences. All listed changes take the shape of transformational change. For managing these changes it is necessary to adopt innovations of management and reorganize institutions into innovative organizations. Because of that deans, as managers, have to have new knowledges, skills and abilities. They need to know management and new technologies.

EFFECTIVENESS OF THE NATIONAL MEASURES TO INNOVATION SUPPORT INFRASTRUCTURE AND PROMOTION OF INNOVATION

Sanja Popovic-Pantic¹, Djuro Kutlaca²

University of Belgrade, Mihajlo Pupin Institute, sanjap.pantic@pupin.rs,

University of Belgrade Mihajlo Pupin Institute, djuro.kutlaca@pupin.rs

Abstract: *A total of nine SME innovation and competitiveness support programmes are evaluated, implemented by the Government of Serbia and managed by the Ministry of Economy and Regional Development (MoERD), Ministry of Science and Technological Development (MoSTD) – since March 2011 integrated within the Ministry of Education and Science (MoES) – and the National Agency for Regional Development (NARD)³. For several years Serbia has gained access to and is integrated into the main EU support programmes for research, innovation and competitiveness. Meanwhile, Serbia has successfully set up the infrastructure to manage EU-based programmes and to promote innovation. In this paper we will present the so-far Serbian experience in the promotion of innovation through unique national competition in innovation and innovation fairs as well as the results of the effectiveness of the established business incubator network.*

Keywords: *innovation infrastructure; best technology innovation competition; innovation fairs; business and technology incubators; Serbia*

1. INTRODUCTION

Main goal of the transition of the economy and society in Serbia is creation of knowledge based economy, based on adequate national system of innovation (NSI) (Lundvall, 1992). Innovation infrastructure is driver of business sector restructuring and link between different components of NSI. Building of innovation infrastructure in Serbia is a painful process due to long period of economic and social struggles, political instability and still not finished transition toward market economy (Kutlaca, 2008; Kutlača and Semenčenko, 2004).

Ministry of Education and Science and the Ministry of Economy and Regional Development with National Agency for Regional Development are national institutions which provide support to promotion of innovation activities through project Competition for Best Technology Innovation (MoES) and to establishing of business incubator network as a part of the innovation infrastructure (MoERD and NARD). Also, there is a form of innovation fairs which is organized as a part of the business fair, rather than separate event, which contributes to the overall promotion of the innovation in Serbia. It is famous as Business Base, fair organized by MoERD and NARD. The aim of the Competition for the best technology innovation is to promote the entrepreneurial climate in Serbia and assistance to potential and existing high-tech entrepreneurs, who are willing and able to own ideas and inventions spill over into a market valuation of innovation. Target groups are potential and existing high-tech entrepreneurs, so the scaling of the objectives is adjusted to them.

Innovation fairs in Serbia are most frequently considered as a meeting place for inventors and exhibition of their creative ideas, prototypes or projects. Therefore, the prevailed perception of the innovation fairs is referring to the activities of the plenty of the associations of the inventors, which have been established in ex-Yugoslavia. It seems that the concept of innovation fairs with the purpose to be exhibition of the achievements in innovative industries, start-ups and research labs is not launched yet. The nature of the available innovation fairs is exhibitions of the achievements of the mostly conservatively organized associations of the inventors rather than the brokerage event where the inventors and investors can meet and create the innovation partnerships.

³ The assessment of the innovation and competitiveness support programmes is done against the government strategy for development of competitive and innovative small and medium-sized enterprises and the related policy aims and expected intermediate results. Detailed reports are produced for each assessment result by a team of experts in ICIP project, SE Prof. Dr Djuro Kutlaca and JE Sanja Popovic-Pantic, M.Sc, as well as team members, Dusica Semencenko Ph.D, as MPI expert and technical support of Marija Mosurovic M.Sc. and Zorica Mitrovic (ICIP, 2011).

The network of business incubators in Serbia has been established with the aim to provide support to SMEs mostly those which are technology based/oriented. The analysis of both programs to promote innovation and the last one which is actually part of the innovation infrastructure has been done in the framework of the comprehensive Assessment of Innovation and Competitiveness Support Programmes, realized within the ICIP project in 2011.

2. EFFECTIVENESS OF THE NATIONAL PROGRAMS TO PROMOTE INNOVATION

2.1 Competition for Best Technology Innovation

The project Competition for Best Technology Innovation is initiated in 2005 by the Ministry of Science and Environmental Protection of Serbia. The idea for this project came from Faculty of Technical Science Novi Sad based on successful pilot competition for its students conducted in 2003. The success of this competition initiated proposal for a national competition to the Ministry of Science and Environmental Protection. Proposal was that Ministry provides technical services for project and it was so since 2005. All costs for the technical realization of the competition are paid from the budget. In addition to the role of funder, the Ministry has taken the job of promoting and organizing various subjects in the organization of competition. They are, in addition to the above mentioned, the Faculty of Technical Sciences in Novi Sad, the Serbian Chamber of Commerce and the system of regional chambers of commerce, local governments and companies.

The aim of the project Competition for Best Technology Innovation is to promote entrepreneurship in Serbia and assistance to potential and existing entrepreneurs, who are willing and able to own ideas and inventions spill over into the market valuable innovations. Besides receiving awards all participants who pass first round get access to some expertise through training and consultation to create an innovative strategy out of its new or substantially altered the product / service / process / software on the market.

The basic idea of the Competition is that the combination of innovation and entrepreneurship are recipe for competitiveness for all individuals, companies, universities and state. This is why there is wish to promote entrepreneurial spirit among researchers, students, innovators, creative individuals, teams and companies, especially those who will contribute through its activities to the economic life of Serbia be quickly transformed to a knowledge-based economy. The overall result achieved during the competition for the best technological innovation since 2005 by 2010 year are as follows:

- The cooperation between Ministry of Science and Technological Development of Serbia and the Ministry of Science and Technology of Republic Srpska started in 2007 -so the competition for the best technological innovation was also organized on the territory of the Republic Srpska;
- The number of reported innovations by the end of 2010 is 1615, the total number of innovations that pass the first round of review is 970. But it should be noted that in 2008 due to the simplified procedure of competition there was no second round of review. So with the exception of the 2008 in the second round of reviews was included 68.07% of innovation after the first reviews;
- Total prize money so far was 53.18 million dinars, of which 46,335,000 dinars was funded by MSTD;
- In the final total for all six years were 68 contestants, the total prize fund for them amounted to 41.88 million dinars. In addition to finalists, awards were given to semi-finalists and also there were prizes for special categories. Total award for special category was 7,385,000 dinars;
- So far in this competition a total of 5360 competitors participated, it was held 234 trainings, 476 teams have written a business plan for setting up a business based on their inventions and 115 teams have drafted marketing plan;
- Over 350 reviewers from home and abroad, has participated in this contest;
- For the first round of review there were two forms, one for category implemented innovations and one for innovative ideas;
- The form for innovative idea consists of seven parts:
 - business idea – this section evaluates how much research area is up-to-date and in what extant presented ideas are clear,
 - product/service/process/software – this part evaluates readiness of product/service/process /software to be presented on market, protection of idea and if the idea, potentially, presents in some aspects environmental hazard,
 - possibility of application – self evaluation about possibility of application,
 - market assessment – in sense of market target and market absorption,
 - competition – assessment of competition,

- general assessment – this part consists of assessment if the idea is based on accurate technical assumptions, degree of novelty and valuation of idea,
- competency assessment of reviewers by contestants,
- the last part consists of assessment of competence in the field of ideas and assessment abilities of analyzing the business;
- The form for application of implemented innovations consists of following parts:
 - business concept – which evaluates if benefit to the customer is well explained, in which way it is explained and if idea is explained in professional way,
 - product/service/process/software – this section examines if the idea reflects the new thinking and innovative content regarding the product/service/process/software or a new approach to market; if concept is ready for the market; if imitation of the product is possible and if protection of innovation is adequate,
 - market assessment – consists of assessment of market size and potential participation of competitors, identification of target groups and competition,
 - business model – evaluates the level of the awareness of the team about the market opportunities for their innovation and their commitment to the implementation of innovation at the market. Also, in this part evaluation is considering if “plan B” is created and if there is potential for growth,
 - conclusion –should summarize key arguments of the importance of that particular innovation in terms of markets, production, team skills, etc.
 - competency assessment of reviewers by contestants - is the last part and it examines opinion of contestants about competency of reviewers in area of idea and business part.

2.1.1. Policy recommendations

The project Best Technology Competition is one of the most attractive approaches of government to promotion of innovation.

Main obstacle for sustainable continuation of the Best Technology Competition in Serbia is status of the competition within MSTD's annual programme of activities and budgeting. The recommendation is to define appropriate managerial as well as financial scheme which could allow sustainability and continuation joined with adequate monitoring and assessment of effectiveness and performance of the competition.

Partially limit of this competition is that only access to contest is online, competitor must be very well IT educated to get participate in the contest.

One of the recommendations also could be that at least in some part of contest it should be in English. For example the awarded finalists should have presentations of their innovations in English and also the website of the whole contest should have its translation in English.

During the competition phase and specifically the presentation of innovations the awarding committee might consist as well of competent researchers and of business people contributing with additional expertise in the final stage of competition. With additional competency both technically and commercially, the inventors and innovators might be brought closer to the market with their new ideas and pilot products.

The competition and specifically the award event might need more targeted promotion also the final event is broadcasted on TV programmes at attractive hours. The award event should be held with the presence of the business society. At one point of the competition phase measures or events might be organized to enable a closer presence of innovations and inventors to potential investors or users/buyers of inventions. A special presentation to this group of investors is recommended.

It is also recommended to establish robust monitoring, evaluation and impact assessment Monitoring and Evaluation (M&E) system for this Programme support.

2.2. Innovation fairs - situation analysis

Key actors in this activity are Associations of the inventors of Serbia, Vojvodina and Belgrade. They are organizing both exhibitions as individual events of the achievements of their members as national and international events, and exhibitions as a part of the sector's fairs usually of Technical Fair, held in May in

Belgrade, Agriculture Fair in Vojvodina or Business Base, which is organized for 9 years at the Belgrade Fair. Although established in socialism, associations of investors try to catch up with the new trends in terms of regional and international networking with the similar associations worldwide, still remaining non-connected enough to the market. Therefore, there is a rather weak level of the commercialization of the inventions and innovative ideas, which are promoted in the scope of the either sector's fairs or entrepreneurship fairs.

Apart from them, there are numerous local associations which indicate that the innovation culture in society is spread but in spite of the scope of its expansion, it is not highly profiled but rather amateurish.

One of the most active local associations of inventors is Belgrade Association of Inventors which is famous for organization of the largest Serbian Exhibition of inventions and new technologies, which has been taking place in Belgrade for 30 years in continuity. Association of inventors and authors of technical improvement is active in promoting their members through organization of different fairs, exhibitions, conferences (BAI, 2012). They also have active web site and there is also available web database of their inventions and patents which can be searched according to the sectors. For their members, association is organizing the "open door" consulting when they can learn more on the legal aspects of the protection of their invention. This association provides to their members services in protection of their intellectual property rights as well. According to the data available in the Association of the inventors in Serbia, majority of the inventions come up in healthcare sector, agriculture, food processing, energy efficiency and mechanical engineering.

Serbian Chamber of Commerce as well as National Agency for Regional Development is providing the continuous support to the associations of inventors through non-financial support. Business Base as a fair where mostly business support organizations are promoted, is offering free of charge the stand to the Association of Inventors. NARD and MOERD have a grant schemes to support innovation activities of SMEs but not to the inventors. Also, SIEPA in their program to support export of the competitive SMEs supports the protection of IPR for innovation.

The infrastructure to support inventors and innovators to protect their inventions is also equipped with the special unit within the Serbian Chamber of Commerce, as there is a Board for Technological Innovations (CC, 2012).

The accession of Serbia to the European Patent Organization in the October 2010 facilitated to the Serbian citizens the acquiring of protection in all the member countries of the EPO. The membership in this organization, which covers 38 states including Montenegro and Bosnia and Herzegovina as extension states, enjoys great reputation with regard to the quality of registered patents and provides transfer of knowledge and technologies. However, the awareness of the importance of the protection of IPR is still at the low level which can be documented by the small number of patent applications submitted to the national IPO in last 10 years: 350-400.

2.3 Key findings and policy recommendations

Innovation fairs in Serbian economy are still connected to the exhibition of the inventions, organized mostly by the national and local associations of inventors. Accordingly, these exhibitions are organized individually or as an integral part of Business Base or other relevant fairs in sectors such as: healthcare sector, agriculture, food processing, energy efficiency and mechanical engineering. It is obvious that the activity of this associations, which usually have in their title "invention" or "innovation", is promoted and exhibited separately from the innovations of the SME's at the sector's fairs, which indicates that the inventors and innovators are not only "physically" but also practically, excluded from the core innovation activity of the SME sector.

On the other hand, innovations created by SMEs are usually promoted as a part of company-innovator's campaign, but not as a market innovation itself. This facts show that there is not appropriate innovation fair which would bring together innovative industries, start-ups, research labs and investors.

It is pretty clear that there is not developed methodology and procedure to evaluate the potential of invention to be developed into innovation and to become "marketable". Also, there is not such kind of authorized body, which would be able to implement such a procedure. It seems that there is also lack of the mechanism to inter-link inventions with the potential to be developed into innovation with the investors, as inventors and innovators usually have a lack of the financial resources.

Regarding the support to the inventors which is still perceived as separate from the innovative activities in SME sector, there are some services in place. Business support organizations are mostly providing the service of protection of the IPR while some of them as NARD has signed the memo of understanding with the Serbian Intellectual Property Rights Office (IPRO) which in practical terms means, that they signpost the inventors to IPRO. Some of the inventors complain that this is not valuable for them, as the taxes are too expensive and should be paid periodically, all the time.

NARD, MoERD, SIEPA, City Council MoSTD has launched in two recent years grant schemes to support the innovativeness of SME sector. If that practice become regular, it will be good to relate innovation fairs to the promotion of the examples of the “best practices” that will come out from that financial support. Also, the achievements reached in the project Competition for Best Technology Innovation should be promoted as well at the innovation fairs, since they usually stay short of the resources to commercialize, even awarded, innovative solutions in the product/process/technology development. That approach will bring multifunctional benefits:

- encouragement of the SMEs to continue the innovative activities;
- rising the competitiveness of the Serbian SME sector;
- rising the awareness on the importance of the innovativeness among the SMEs;
- attraction of the investors to Serbian SME sector;
- better visibility and transparency of the achievements of the grant schemes.

The main recommendations and proposed corresponding actions in the field of effectiveness and efficiency of programme are:

- Repositioning of the concept of the innovation fairs from the old-fashioned perception refer to the mostly non profitable projects of the inventors into the promotion of the cutting-edge technologies and achievements in profitable sectors;
- As a part of the new concept of the innovation fairs, online-matchmaking and networking should be organized through the web portal developed for the purpose of the continual activity which will be performing in the period between two annual innovation fairs;
- Relate the innovation fairs to the promotion of the examples of the “best practices” that will come out from the either direct innovation support provided by the relevant governmental unit in charge for Science Policy, or regular innovation support grant schemes organized by MoERD and NARD;
- Integration of the “Competition for Best Technology Innovation” into the new concept of the innovation fairs.

3. EFFECTIVENESS OF THE ESTABLISHED BUSINESS INCUBATOR NETWORK

3.1. Key findings of analysis

The study analysis on business incubators identified existence of 22 incubators in the network. The sources for research were three databases: databases of the Ministry of Economy and Regional Development, database created by Business Technology Incubator of Technical Faculties) and database of incubators registered in the Agency for Business Registers. Out of 22 incubators, 11 responded and the findings are based on their responses. All of these incubators have been established with, at least, one of the key listed goals: support to the development of entrepreneurship; promotion of entrepreneurship ;improvement of competitiveness; reducing unemployment; keeping young educated people from economic migration; making the link between science and economy ;technological development and increased innovation; training, education and retraining; Sustainability, economic and regional development.

Most of analyzed incubators operate in service sector mostly, with an exemption of a few incubators with prevailed manufacturing industries. By the Law on innovation, incubators could be registered as this sort of entity since 2005. Therefore, most of the respondent incubators (8 incubators, 72.73%) operates between 2 and 5 years, while three incubators (27.27%) exist up to 2 years.

Number of employees in these incubators is ranking from one to five employees (this is the case in 10 incubators, 90.9%), while the only one incubator has 19 employees.

In 90.9% of cases (10 incubators) the founders are cities and municipalities in which incubators operate (Kragujevac, Uzice, Nis, Subotica, Zajecar, Zrenjanin, Raca, Palilula, Prokuplje). Apart from them co-

founders are: Vojvodina Investment Promotion, regional agencies, centers, associations and chambers of commerce, universities, private companies and in some cases they are result of NGO initiatives.

When it comes to the number of companies operating within the incubator, 45.45% (5 incubators) currently have 10 tenants; while in 54.55% (6 incubators) operate over 10 tenants. The largest number of companies operating within one incubator is 16 (Business Incubator Krusevac), while the smallest number is two tenants (Innovation Centre for Entrepreneurship Development Raca). Total number of tenants analyzed in the 11 incubators is 108.

Number of employees in companies varies from 3 to 65 employees, while the total number of employees in these incubators is 352. Tenants can be divided into two groups: the first group which consists of four incubators (36.36%) with up to 11 employees, the second group consists of the remaining seven incubators (63.64%) with over 30 employees. Business Incubator Subotica is an incubator which enterprises have the greatest number of employees- 65 in total.

The incubation period for tenants for five (45.45%) incubators is three, for other five (45.45%) incubators is four years, only one incubator stipulated that enterprises incubation period is six months (IHIS).

Only three incubators (27.27%) had completed the first period of incubation. The total number of unsuccessful incubations in these incubators was seven, because of the unsuccessful incubation in two cases only one tenant left the incubator, while the one of the incubators have left even five tenants. On the other hand the number of tenants in these incubators which has successfully developed a business and left incubator for this reason was 22. It can be concluded that tenants who left incubators in 75.86% cases were case of successful incubation.

The total score in all incubators so far is: the number of tenants who have left the incubators is 17, while 36 of tenants have developed a successful business and therefore left the incubator. Of all tenants that have so far left the incubators 67.92% of companies have left after the successful incubation.

The largest number of unsuccessful incubation in an incubator is seven, while the largest number of successful incubation is 12, which means that 12 companies have successfully developed their businesses within the incubator and after incubation period left it. This incubator is in Nis.

The total income that these incubators made is 250,948,550.00 dinars, while net profit 15,616,160.00 dinars. In 2010 three incubators (27.27%) had a net profit of 0.00 dinars out of which two have been recently established. The most profitable in the past years has been Business Incubator Subotica, with 477,000 dinars, while the highest income generated the Business Technology Incubator of Technical Faculties Belgrade, with the revenues of 24,731,000.00 dinars in 2010. Business Incubator Subotica also achieved high profit rate of 13.07%, Business Incubator Zrenjanin of 9.66%, while the remaining 9 incubator (81.82%) realized profit rate of less than 4.00%.

Findings on the services provided to the tenants, show that all 11 incubators (100%) provide to its residents service of networking with other companies, then 90.91% (10 incubators) provide business improvement activities and trainings; 81.82% (nine incubators) provides marketing promotions, training, writing business plans, organization of fairs and exhibitions for the tenants and their representation and handling of photocopiers and other office equipment, while 72.73% (8 per incubator) provide services of public relations, then 54.55% (6 incubators) provide planning, access to financial resources, handling information and communication equipment, 45.45% (5 incubators) provide accounting services, 36.36% (4 incubators) negotiation and legal assistance and at the end 27.27% incubators provide communication services for multiple users.

Incubators also offer the services to non tenants, which are usually networking, consulting, training, writing of the business plans for clients etc. Incubators are usually associated with governmental bodies and agencies - even 10 incubators (90.91%). The rest of them are operating within the universities or faculties while only three out of 11 incubators (27.27%) is associated with consulting companies.

3.2. Policy recommendations

Analysis and conclusions of this report provide basis for the following recommendations and proposed corresponding actions to policy and decision makers responsible for innovation infrastructure in Serbia:

- National Programme for incubators with tenants – companies which are technology based/oriented, should be governed by the Ministry responsible for Science and Technological Development (at the moment MoES – Ministry of Education and Science). This Programme should provide support to incubators, stable source of funding and liability of reporting, monitoring and evaluation of them. In addition MoSTD should propose adequate instruments for cooperation between Universities and other R&D organizations and Incubators in order to improve innovation capacities of the tenant companies;
- National Programme for incubators with tenants – companies which are business oriented, should be governed by the Ministry of Economy and Regional Development. This Programme should provide support to incubators, stable source of funding and liability of reporting, monitoring and evaluation of them. MoERD should propose adequate instruments for improvement of business performance, visibility in business community as well as networking in business clusters of tenant companies;
- Incubators that are even partially state-owned must be accountable and cooperative with their founders, considering monitoring and evaluation of activities and social responsibility within local and national economy;
- Incubator's administration should established functional cooperation with national partners responsible for functioning of European Enterprise Network in Serbia;
- It is necessary to create mechanisms for better cooperation between management of Incubators with institutions that can help them to improve performance and operations of incubators and tenants, providing training programmes, certification and accreditation procedures, access to international funding schemes, etc.

Policy recommendations in the field of effectiveness and efficiency of programme are:

- Consultative meetings of MoERD and MoES (Ministry of Education and Science) should be organized at the regular bases with the aim to ensure compatibility of the strategic development of the incubators in Serbia;
- Registers of the technology based and business based incubators should make as corresponsive;
- Set up the criteria for establishing of the business incubators based on the "best practices" from EU and launch the accreditation procedure, which will distinct business incubators from the associations and clusters;
- Establish the effective selection mechanism of tenants which will promote the best applicants for start-up credits. This action implies good communication between banks, awarding institutions (NARD, MOERD, MoES, Fund for development etc). Launching this practice will contribute to avoid developed business to exist within the incubators.

4. CONCLUSION

Best Technology Competition contributed to the rise of awareness on innovation among entrepreneurs and to the outspread of entrepreneurial spirit among innovators. This national measure to promote innovation achieves the goals and in order to make this project sustainable, stable financial and managerial scheme should be set up.

As to innovation fairs, repositioning of the current concept of innovation fairs is needed which will bring also new approach to the commercialization of inventions. This concept should enable online-matchmaking and networking through the web portal developed for the purpose of the continual activity which will be performing in the period between two annual innovation fairs.

Although rather new part of innovation infrastructure, incubators in Serbia has achieved number of successful outcomes, such as development of new products and services, successful incubation, increase of employment and profitable performance. Most of the incubators in Serbia support service oriented tenants, although there are a small number of incubators in which operate manufacturing companies. Considering types of tenant companies, some of incubators could be classified as technology based, and others which are business based incubators. Therefore, different types of incubators ask for the more tailor-made set of services and it is expecting that their offers of services will be more specialized in the future.

³ Politecnico di Milan, uros_sikimic@hotmail.com

Abstract: *The problem the paper focuses on is how to avoid economical misbalance that non EU transition countries cause when entering the EU. They enter their bad economies which disrupt the harmony of the EU economy. This approach leads to solving their problems only when they enter the society of generally highly developed EU countries. The problem should be resolved much earlier. In fact, the authors explore what could be the best way to introduce innovation as a philosophy and methodology into processes and activities in these countries long before their accession to the EU. Authors' hypothesis is that a cross-border innovation centre could be a platform of innovation activities between EU members and non EU member states. They have done a cross-border survey of random samples of about 100+100 SMEs, big companies and NGOs in cross-border regions: Vojvodina in Serbia and South Great Plain in Hungary. The survey which was performed gives data about basic innovation knowledge and cross-border possibilities of innovation process. The analysis of survey results has shown a lack of real understanding of the term of innovation, innovation development and cross-border innovation. Many suggestions the authors got were related to multinational spread of innovation. The contribution of this paper is a new model of a cross-border innovation centre which would bring more developed and innovative countries upon their entering the EU. This would reduce investment into their innovation activities and help in generating new products, processes and services, as such creating a unique innovation platform which would be of help to harmonize the EU economy by helping non EU countries before becoming EU members.*

Keywords: *innovation, cross-border, platform, model, transition countries, EU harmonization*

1. INTRODUCTION

The twenty-first century brought big changes into the capitalism world, especially in Europe and the USA. The usual flow of products, capital and working force starts to be misbalanced. The primer request of capitalism is to produce more and more and to increase profit with always growing profit rate shows impossible to follow. Mass production of products, even customized to consumer's demands, was not sufficient. For the first time a new phenomena appeared: mankind doesn't need increasing production, but strives towards new ideas, innovative products, services, processes. This all came in the worst moment for the European Union. The EU has just incorporated new members which makes this Union weaker and in position to be obliged to economically harmonize the EU area. This caused EU to involve experts in solving new increasing problems. Also, this made EU create some documents which would put a new base of EU strategic management highlighting the value of innovation as a new way of thinking and working. Open innovation and continuous innovation are two parallel branches of innovation process, both having a significant role in the European way towards the future.

The subject of the paper is the innovation process in non EU transition countries from which some are candidate countries (Croatia, Montenegro, Serbia) and others are potential candidate countries (like Former Republic of Macedonia, Albania, B&H, Kosovo).

The problem in focus is how to avoid economical misbalance which these countries make upon entering the EU. They bring their bad economies which disrupt the continuity of the EU economy. This causes solving of their problems only when they become members within the society of developed EU countries. The problem should have been solved much earlier. One of the solutions, an important one, is to start innovative activities before their entrance into the EU.

Actually, authors research what could be the best way to introduce innovation as a philosophy and methodology into the processes and activities of those countries before their entrance into the EU, having in mind the lack of knowledge about innovation in non EU countries.

This paper has the objective to present analysis of results about innovation issues and cross-border innovation aspects between non EU countries and EU members from the view point of innovation consumers and suppliers. The basic issues of this paper are:

The research object: Innovation as a tool of the EU economy harmonization

Hypothesis: A Cross border innovation centre could be a platform of innovation activities between EU members and non EU member states.

Research task: To set up a new model of a Cross border innovation centre by using survey of innovation subjects

Methodology: Survey made by using online questionnaires involving 100 respondents from Vojvodina and 100 respondents from south Hungary that answered the questionnaires. Data collecting, analysis and benchmarking are used to make a conclusion.

The paper proceeds as follows. The next section deals with literature review. The methodology is presented in the third section. The forth section explains the way the authors conducted the research and empirical results of the analysis. The last section is a conclusion with suggestions for the future research.

2. LITERATURE REVIEW

Global economy is turbulent. This is surrounding in which organizations function. (Eisenhardt et al., 2010). Changing environment is always unstable. Lack of stability is consequence of technical innovations, competition and knowledgeable human resources (Schreyog, Sydow, 2010). Organizations are forced in such conditions to be innovative. This makes them capable to face with new requests like: new market segments, demanding costumer requests... (Levinthal, 1993; Floy, Lane, 2000). Innovative processes which are permanent define Continuous Innovation (CI). CI consists of permanent improvement combined with radical operations, both resulting from knowledge gathering and using. These issues create flexible organization which is able to shape by changes (Boer, 2001).

Many articles and books are dealing with innovation, most of them focusing on corporate innovation. Some discuss why most business firms in advanced economies use only a fraction of their innovation potential. They suggest a new organizational form which is "collaborative multiform network". This form incorporates certain futures of innovative organizations along with some new necessary strategies, structures, capabilities and managerial philosophy (Miles, Miles & Snow, 2005).

Continuous innovation is not a natural process which occurs automatically within an organization. It is result of an active management and engagement with workers in an effort to initiate and sustain momentum (Cole, 2001). Some authors, like Zander and Solvell find cross-border innovation as an important process, but they analyze only cross-border innovation within multinational companies and they don't use wider access to regional concept. They find emergence of cross-border innovation in multinational corporations to avoid duplication. Such an international process would identify diversification of capabilities and ensure faster development of companies based on innovation. This increases importance of international innovation network (Zander, Solvell, 2000).

The Oslo Manual in its third edition published in 2005 discusses regional innovation and gives some rules how to create regional innovative strategies having in mind necessity to have consensus of policy makers and those involved in issue of regional innovation. This Manual defines basic terms connected with innovation and describes possible indicators valuable for the measuring of results of innovative process (Oslo Manual, 2005).

Cross-border regional innovation model is analyzed in Vang, Asheim, and Coenen's (2008) paper presented at the Conference: "New patterns and paradigms in global innovation networks". It presents regional innovation system RIS which uses knowledge exchange system which consists of two subsystems: knowledge exploration subsystem and knowledge exploitation subsystem (Vang, Asheim, Coenen, 2008).

Important issue of European future is to harmonize its area focusing on economy. Sufficient economic development should be base of common social and cultural activities and should ensure joint future of this new alliance. Problem addressed by the paper is a big difference in the level of development between old

EU members, countries which entered the EU during last decade and countries which will become EU members soon. Most of “Newcomers” are transition countries coming from the socialist regime which have been transformed into new capitalism states during the worst period of the big economic crisis, which is especially felt within capitalistic world. The European strategic goal is to overcome difference between old and new members and to gather new members as much developed as possible. Many European documents have aim to reach these requirements. The development which is requested must be result of new approach where innovations are core of all human activities.

What does continuous innovation mean for them, for the least developed? Do they start from zero point or they do re-start when enter the EU? Are there in position to improve, to innovate or to learn about those processes from more developed countries? How to assist them to enter the EU, as equal members, and not as states whose entry will likely require additional efforts in the protection of the EU economy.

This paper uses European directives for increasing innovation level by supporting cross-border innovation regional concept (Regional Innovation Strategies under the European Regional Development Fund, 2002) and directives for regional innovation strategies (Innovating regions in European network, 2005).

3. METHODOLOGY

The research which was performed by authors of the paper was financed through IPA (Instrument of Pre-accession Assistance) cross-border program Hungary-Serbia, second call for proposals. The proposal was made by two partners: Information centre for business standardization and certification of Novi Sad (Serbia) and Dél-alföldi Regionális Innovációs Ügynökség Közhasznú Egyesület of Szeged (Hungary).

Concerning the project it is very important that the accession of Serbia to the EU is in preparation. It is justified that the innovation strategic planning should be done in both regions by realising the cooperation with the neighbouring region and by the harmonization and optimal exploitation of resources. The first innovation strategy in the South-Great Plain region was made in 2004, and it has been constantly revised since 2008. There has not been a regional innovation strategy in Vojvodina yet. However, the South-Great Plain strategy also stops at clarifying relationships linked to national and communal innovation and it does not pay attention to cross-border innovation relations that are also important. The aim of this project was to fill these gaps by creating:

- a) Supplement of the South-Great Plain innovation strategy in relation to the Vojvodina regional innovation system, possibilities of cooperation, common cross-border innovation planning and the mutual interest from advantages of the new R&D major investments;
- b) Transmission of the South-Great Plain regional innovation strategy as a benchmark planning methodology and
- c) Commencement of strategic planning in Vojvodina by elaborating the Vojvodina regional innovation strategic concept based on pilot sampling and the dissemination of this among concerned economic participants.

The target groups of the project are primarily the stakeholders who participate in the link of innovation (SMEs, universities, research institutions, industrial enterprises) and those who have unquestionable role in the aspect of competitiveness of the region.

Benefits of the performed project will be:

- Strategic preparation for the accession of Serbia to the EU (as model for other non EU countries);
- Defining the possibilities of breakout to reach economic growth;
- Discovering cross-border cooperation in the field of research and development;
- Exploring possible cooperation;
- Enlarging the range of innovation services and counselling of bridging organizations;
- Increasing commitment of stakeholders towards innovation;
- Defining operational priorities in national resource planning;
- Defining possible big projects and their cross-border characteristics;
- Realizing innovation in the society.

The regional innovation strategic planning has many diversified but well-tried and applied methodology throughout the EU. In general each planning method starts with the elaboration of a questionnaire and a

primary survey. Since the South-Great Plain regional innovation strategy has a well defined and implementable methodology, it is applied for:

1. Processing of planning methodology of the South-Great Plain Innovation Strategy as a curriculum, elaborating and making available the related educational/training material related;
2. Organizing training(s) to Vojvodina participants according to the training material in the first point;
3. Elaborating common (on-line) questionnaire;
4. Sampling based on 100-100 questionnaires:

Serbia: intends to measure the 3 groups of examines: innovation companies, public funding research institutions, bridging institutions (they link those who need innovations and those who utilize innovation);

Hungary: concerns specifically cross-border innovation relations by analysing: public funding research institutions and universities, industrial participants and bridging institutions;

5. Creating a common database for innovative participants;
6. Statistical analysis of questionnaires and drawing appropriate conclusions;
7. Secondary data collection: going into deeper analyses where it shows as necessary;
8. Preparation of the strategy:

Hungary: completion of the South-Great Plain Innovation Strategy with relations, cooperation, and common planning points of innovation system of Vojvodina as a region;

Serbia: creating the Vojvodina Regional Innovation Strategy;

Common: defining the main points of the innovation strategy concerning to the two regions, defining synergies, differences and common possibilities of development.

The current project aims at the common strategic development, which concurs with the strategic target of the programme, that is to develop the two regions in a harmonic, cooperative and sustainable way, while also taking the business, educational and research-development targets into consideration. The project intends to reach the followings: reducing isolation of border areas by improving cross-border accessibility; synergies and co-operation in the economy; and to intense cultural, educational and research interaction.

The project directly supports economic development and reducing economic differences along the border region, and by opening up possible links, it creates an opportunity for long-term cooperation. The project also provides opportunity to increase the level of employment and balanced progress of the concerned regions. The activities serve the economic and social development of the border regions with respect to environment. The project is structured by setting long-term sustainability as an aim, and to ensure it, we integrated in the project activities. In the implementation of the project, enforcing the principle of sustainable development in the border region is a specific aspect, since the cooperation of local enterprises is an aim which must be achieved, with special attention to the cooperation of innovative companies on both sides of the border, which promotes the economic development of the companies, thus contributing to the positive advancement of the social status.

Concerning the long-term goals the following objectives have to be mentioned:

Increasing the cooperation between border regions: the objective comprises the increase in business connections, joint investments, and strengthening of cooperation with organizations and institutions.

It was very important to choose the right group of organizations which answers would make the real picture of cross-border innovation potential.

The sample was made from:

- a) organisations which need innovations: SMEs, big companies, public institutions, local authorities, government of Vojvodina and its departments,
- b) organisations which offer innovation services:
 - universities, faculties, R&D institutions, consulting agencies,
- c) organisations which transfer innovations
 - innovation centres, scientific parks, industrial networks, regional innovation agencies, chambers of commerce, business centres, technological parks, clusters, banks and financial institutions.

The research was done through following steps:

1. Creating of data base of respondents with general data and contact data
2. Creating of bilingual questionnaire
3. Primary data collection
4. Creating of data base
5. Statistical analysis of primary data

6. Statistical analysis of secondary data
7. Conclusions

Questionnaires were created during two workshops, first when partner from Hungary transferred its best practice to Serbian partner and the second one, when many stakeholders were involved in creating questions by including their innovation interests, services and troubles. In cover letter was explained that research was a subject of an IPA CBC project and definitions of some basic terms from the field of innovation were included, like:

What is innovation?

Who are innovation suppliers, innovation users and innovation transfers?

What is regional innovation strategic planning?

All questionnaires were sent by email. Respondents were called sometimes to remind them of giving answers. Big companies were visited and interviewed about the innovation subject.

4. EMPIRICAL RESULTS WITH ANALYSIS

Questionnaire in Serbia consists of two groups of questions:

1. Questions related to design of regional innovation strategy of Vojvodina

2. Questions related to design cross-border innovation strategy for an unique region of: Vojvodina in Serbia and South Great Plain in Hungary

There were sent:

-550 questionnaires in Hungary (answered 110, what is 20%) and

-620 questionnaires in Serbia (answered 106, what is 16%)

Figure 1. Percent of answered questionnaires in both regions
Source: Authors

4.1. Analysis of questions related to design of regional innovation strategy of Vojvodina

Analysis of answers on some questions which build a picture about level of innovation knowledge in Serbia will be presented.

- ✓ What does your firm consider „an innovation“ to be?

Figure 2. Structure of answers to the question: What does your firm consider „an innovation“ to be?
Source: Authors

Analysis of answers presented in Figure 2 shows missing knowledge about core substance of innovation. Most respondents, 80%, include only new products into term of innovation. Only 14% point that more efficient management could be possible innovation platform. Some of them, only a little percent of 10% consider all (management, organisation, services, products...) as potential source of innovativeness.

✓ What are the sources of innovation ideas in your company?

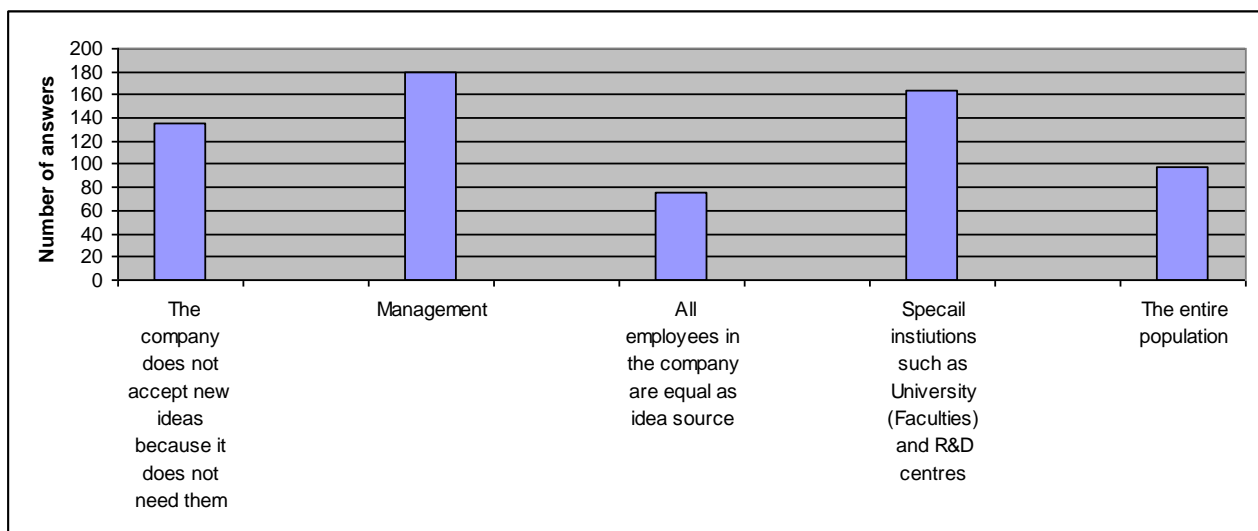

Figure 3. Structure of answers to the question:
What are the sources of innovation ideas in your company?
Source: Authors

Most responses referred directly to the management as an important issue of innovation. This shows that employees wait for management to generate progress and to solve problems of companies' sustainable

development. They regard themselves, employees, as not enough, or better to say, the least responsible for innovation as the base of the company's future. The reasons for this could be discussed having in mind significant number of answers which show that companies' management doesn't accept suggestions of working force as a pool of information, inventiveness, initiatives. Workers are not stimulated to be part of innovation process, they regard their ideas as needless for management. They wait for special institutions regarded as "innovation suppliers" to input innovations into the company's life.

4.2. Analysis of questions related to design of regional innovation strategy of Vojvodina

A separate group of questions is related to cross-border aspects of innovation. Namely, how innovation process doesn't recognize borders as limits. It should be analysed within wider territory. As Vojvodina and south Hungary have many similarities, innovation should be considered within cross border context. Some issues as: demography, culture, history, working habits, resources are similar between two regions. The big difference is Hungarian belonging to the EU and better economical perspective.

Such consideration brings to the point that two regions must have joint and complementary innovation strategic actions. These will brought to better competitiveness and future prospective of the cross-border region. Practically, first cross-border projects were initiated by the EU funds through Cards program, in 1990. The following part presents vision of cross-border innovation activities of examinees.

- ✓ Are you participating/or have been participated in a cross-border innovation project?

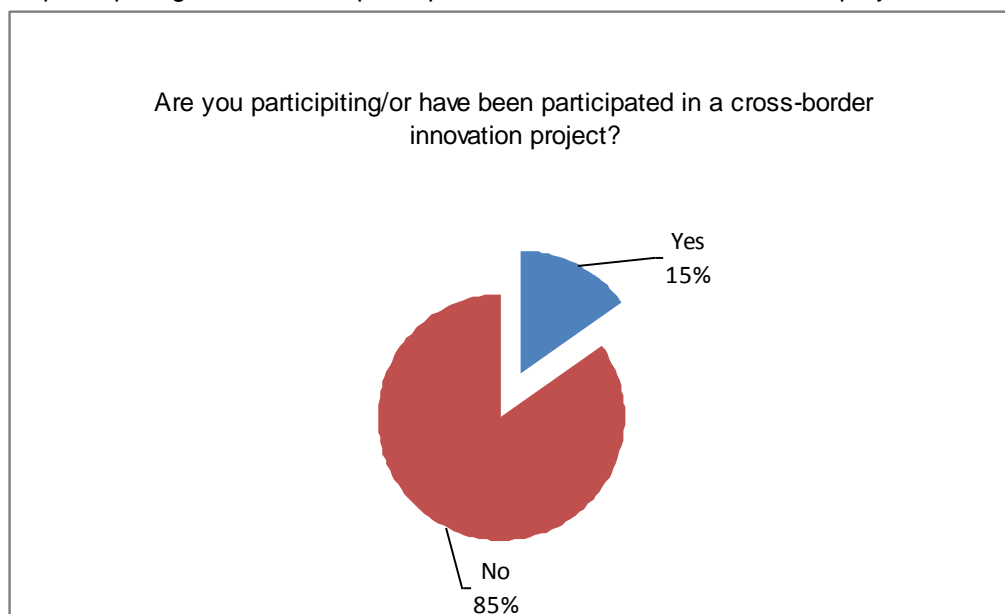

Figure 4. Structure of answers to the question: Are you participating/or have been participated in a cross-border innovation project?

Source: Authors

Experience with cross-border projects is very, very low. Only 15% have it. This shows that is necessary to increase awareness of possibilities of such cooperation for the whole region.

- ✓ Do you support cross-border study programmes?

Figure 5. Structure of answers to the question: Do you support cross-border study programmes?
Source: Authors

The majority supports cross-border innovation study programmes. This leads to the suggestion to create joint study programmes in the area of innovation which would help to initiate and to push innovation activities strongly. These programmes could be for young students but also for adults, in the form of long-life learning.

- ✓ Have you ever thought about cross-border innovation activity?

Figure 6. Structure of answers to the question:
Have you ever thought about cross-border innovation activity?
Source: Authors

This question supports our explanation about need to improve knowledge in the field of innovation and necessity of building awareness and institutions for innovation capacity building. The graph shows that only 23% examinees have ever thought about cross-border innovation activities.

- ✓ Do you support a creation of joint database of innovation potential resources (innovative firms, experts, suppliers, tools...)?

Figure 7. Structure of answers to the question: Do you support a creation of joint database of innovation potential resources (innovative firms, experts, suppliers, tools...)?

Source: Authors

Almost all (92%) who answered to the questions support idea of having joint innovation database. Database would offer pool of innovation experts, trainings, resources available to all stakeholders.

✓ Do you support cross-border SME associations (clusters)?

Results analysis show that 90% organisations support establishing and functioning of cross-border clusters which could join interests of all subjects from both countries such creating new value. Exchanging of problems and ideas will result with a new quality that will increase competitiveness of the region.

5. CONCLUSION

The project which is in progress and should give as a result Regional innovation strategy of Vojvodina has aim to influence policy makers to support area of innovation and all innovation subjects, but specially to stress potential and importance of cross-border innovation activities. Results analysis show lack of knowledge, activities, innovation results. Solution made according to received answers is a collaborative multiform network which would have function of a distributed cross border innovation centre. It confirms hypothesis that cross border innovation centre could be a platform of innovation activities between EU members and non EU member states. Such a centre would reduce costs of innovation activities and help in generating new products, processes and services, as such creating an unique innovation platform which would help to harmonize the EU economy by helping non EU countries before becoming EU members. Described model would be a core of innovation activities of cross-border networks of SMEs, like the cross-border clusters. It should incorporate following functions:

- a) education centre: Centre for start up and long-life education
- b) financial centre: Corn for financial institutions which want to support innovation based on different tools.
- c) development and research centre: SW and tools for innovation activities
- d) products laboratory centre for testing, pilot projects support, standardization and certification.

These functions must be managed by highly educated knowledgeable experts who have theoretical knowledge, social skills, but also realized real projects, that means practical experience in the economy. The supposed model is the result of Cross-border innovation strategy with cross-regional interest between two cross-border regions of Serbia and Hungary which was created within an EU funded IPA (Instrument of precession assistance) project. It is result of needs expressed in survey of random sample of about 100 SMEs, big companies and NGOs in cross-border regions: Vojvodina in Serbia and South Great Plain Hungary. The survey which was performed gives data about knowledge of basic issues like: invention, improvement, innovation, continuous and open innovation and comments on suggested new cross-border innovation model.

Contribution of the research is creation of a new model of distributed cross-border innovation centre which is not only multinational companies oriented. It encompasses all innovation activities of cross-border area in the field of products, processes and services. Such a model could be financed through instrument of pre-accession financial aid of the EU. Presented paper has contribution to the theoretical and practical issue of continuous innovation which would pull the future members of the EU into innovation life cycle before their entering the EU. Further research should analyse achievement of the suggested centre and diversify its functions.

Abstract: *Services play a key role in developed economies. Industries that deliver help, utility, experience, information, or other intellectual contents have expanded rapidly in recent decades and now account for more than 70% of a total value added in the OECD countries. Market-based services (that is, excluding those typically provided by the public sector, such as education, health care, and government) account for 50% of the total and have become a major drive of productivity and economic growth, especially as the use of IT services has grown. Services have also emerged as the main source of job creation, often compensating for job losses in the manufacturing area. Business services, such as computing, information services and R&D services, have generated more than half of the overall employment growth in many countries in recent years. Moreover, they encourage the improvement of competitive firms' performance in all sectors of modern economies. Since we now live in a services-based economy, it is disconcerting that universities are not more focused on the vital services sector in their research activity. At a time when concerns about outsourcing and off-shoring white collar jobs are raising alarms, a field that could assist in understanding how to add value to those jobs goes unexplored. Our ability to achieve further rise in our standard of living requires a deep understanding of how to innovate in services.*

Keywords: *service sector, characteristics, innovations, challenges, future*

1. INTRODUCTION

Globalization, increasing automation, the growth of the Internet, and the dynamic componentization of business are driving the reconfiguration of service sector at a scale and pace never before seen in history. The opportunity to innovate in services, to realize business and societal value from knowledge about service, to research, develop, and deliver new information services and business services, has never been greater. The challenges are both the multidisciplinary nature of service sector, which combines business, technology, social and organizational environment, and demand innovation as well as the lack of formal representations of service systems (Spohrer & Riecken, 2006)

More importantly, services play a key role in developed economies. They have expanded rapidly over recent decades and accounted for 70% of total OECD value added in 2000; on the other hand, market services (*i.e.* excluding government services) accounted for 50% of the total. Market services have become the main driver of the economy and the major contributor to productivity growth, especially as the use of information and communications technology (ICT) services has grown. Services are also the main source of job creation across the OECD area. While the service sector accounts for a lower share of total employment than of total output, market services was the only sector to make a positive contribution to job creation over the past decade in all OECD member countries. Job creation in services was often compensated with job losses in the manufacturing sector. Although service-sector jobs are frequently viewed as labour-intensive and characterized by low productivity, skills in this sector have undergone a rapid process of upgrading. As a result, the service sector attracts increasing attention from policy makers and other stakeholders interested in increasing economic growth and job creation (OECD, 2005a)

Several factors contribute to the expansion of the service economy. At the macroeconomic level, increasing manufacturing productivity and growing competition from developing countries limit employment growth in manufacturing and motivate efforts to focus on higher value-added activities. At the firm level, rising investment in intangibles, growing emphasis on knowledge management, a renewed focus on core competencies, and outsourcing play major roles. Within the manufacturing sector, services previously

produced in-house are now obtained via outsourcing. By the mid-1990s, services accounted for nearly 25% of the value added embodied in final demand for manufactured goods, compared to 15% or less in the early 1970s (Sheehan, 2006).

2. CONCEPTUAL FRAME

Where did the term “services” come from? The modern usage arose out of the U.S. Department of Commerce’s Standard Industrial Classification (SIC) codes in 1930s. In these codes, the major economic sectors were agriculture, manufacturing, and services. At that time, services was a residual category for other activities that didn’t fit into agriculture or manufacturing. Today, stretched beyond the point of being meaningful, that residual is the bulk of economic activity, and by far the fastest growing part of economic activity in the world.

How is the term “services” defined today? Some authors, as stated in Chesbrough & Spohrer (2006), suggest that: “A service is a change in the condition of a person, or a good belonging to some economic entity, brought about as the result of the activity of some other economic entity, with the approval of the first person or economic entity.” Services mean jobs and growth, but the companies who have been leading the charge lack a strong conceptual foundation for their work and are now reaching out to academics. To be sure, these firms have accumulated substantial knowledge bases from their engagements in each industry vertical market. But the knowledge bases are often company confidential and have not been studied by outside academics. Any larger patterns that might clarify and illuminate their functions have avoided detection to date.

The nature of services activity is broad (government, health care, education, finance, transportation, communication, business, and so forth). Services exchange is qualitatively different from both the earlier agricultural and manufacturing epochs. It involves a negotiated exchange between a provider and an adopter (supplier and customer) for the provision of (predominately) intangible assets. This frequent lack of a central artifact raises an important and interesting corollary: *Each party in the exchange needs the other’s knowledge in negotiating the exchange*. The provider lacks the contextual knowledge of the customer’s business, and how the customer is going to leverage the offering to compete more effectively in the market. On the other hand, the customer lacks the knowledge of the full capabilities of the provider’s technologies, and the experience of the provider from other transactions in assessing what will work best. While information asymmetries have always existed in economic exchange, the intangibility of services and the scale of modern B2B IT result in new levels of coordination complexity.

Before going any further, we should be clear as to what we mean by services since the term has so many varied and broad uses. When we use the term “service” or “services,” we are referring to service offerings provided for and/or co-created with customers such as professional services, retail, financial, telecommunication, healthcare, and many others. We also include services that are offered in conjunction with goods such as training and network support services in a technology company and even service that is derived from a tangible product such as the service embedded within an onboard GPS system in a car. What all of these services have in common is an interface with an actual customer whether through technology or interpersonal interactions.

3. DISTINCTIVE CHARACTERISTICS

3.1 Services as Processes

One of the most distinctive characteristics of services is their *process* nature. Unlike physical goods, services are dynamic, unfolding over a period of time through a sequence or constellation of events and steps. The service process can be viewed as a chain or constellation of activities that allow the service to function effectively. For example, a professional consulting service is represented by events occurring between business partners, beginning with learning about each other, developing a service agreement, a series of meetings, project deadlines, and deliverables. This service could take place over a short time frame or it could take place over several years. To function effectively for the client, the entire sequence of consulting activities should be coordinated and managed as a whole, over time, with emphasis on including the resources and steps that produce value for the customer. An analysis of the client’s consumption and co-creation process, interactions with the provider firm, and the underlying support systems is essential to managing this chain of service activities. While many of the essential activities that support the consulting

service are invisible to the client, understanding that fact and how these activities link to the client is essential to ensuring the value proposition.

Understanding how customers evaluate the service process, and how those judgments evolve, is also critical. Some research suggests that it is the summation of all the steps, or service encounters, within a service process that is evaluated by the customer and not just individual interactions with service providers. Other research examines the distinct events (i.e., service encounters) associated with a service process that are evaluated along unique attribute dimensions. Still others propose that the character of the process itself may play a greater role than the actual outcome in determining overall evaluations.

3.2 Services as Customer Experiences

In recent years the business world and trade press have become enamored of the notion of the “customer experience.” Some people advanced the idea that we are in an “experience economy,” in which the orchestration of memorable, even “transformational” events for customers is the key to differentiating one’s offering from those of competitors and escaping commoditization in an increasingly crowded competitive marketplace. Although the terms “customer experience” and “service experience” are frequently mentioned in the business press without explicit definitions, one article defines a customer experience as “the internal and subjective response customers have to any direct or indirect contact with a company.” Others have conceptualized a service experience as “the cognitive, affective, and behavioral reactions associated with a specific service event.” This definition implies a time-bounded progression of related interactions involving the customer and other people and/or technology in the production and consumption of a service. Customers have experiences, and all services create experiences. A main issue for managers is whether the company has the capability to systematically manage that experience, or whether it is simply left to chance. Effectively designing and managing the customer experience requires presenting a series of clues that function holistically to meet or exceed customer expectations.

3.3 Service Development and Design

Organizations that are more successful in providing new services keep their service development processes from being ad hoc. In other words, they prepare and move systematically (and often iteratively) through a set of planned stages from the establishment of clear objectives, to idea generation, to concept development, service design, prototyping, service launch, and customer feedback.

Service design requires an understanding of the customer outcome and customer process, the way the customer experience unfolds over time through interactions at many different touch points. A well-designed service that is pleasing to experience can provide the firm with a key point of differentiation from competitors. A smoothly delivered service with a positive outcome is more likely to result in favorable service quality and brand image evaluations, which both have influence on customer loyalty. Recurrent service quality problems are often the result of poor design (Bitner, Ostrom & Morgan, 2008).

4. SERVICE INNOVATION CHALLENGES

Companies, governments, and universities worldwide have recently awakened to the realization that services dominate global economies and economic growth. Yet, in practice, innovation in services is less disciplined and less creative than in the manufacturing and technology sectors. There are many reasons for this historic lack of rigorous attention to the unique aspects of service innovation. Some of these reasons are rooted in the remnants of the industrial revolution and the habitual fascination with tangible products and hard technologies as a source of product innovation, as well as an underlying belief that services have no tangible value.

Beyond these historic reasons, however, the lack of widespread and disciplined innovation in services derives at least partially from the nature of services themselves. Services are based on - and in many cases dependent on - human, interpersonal delivery systems, suggesting a need to focus on process and experience innovation. Traditional product innovation tools emphasize the design of tangible, relatively static products with physical properties. Services are fluid, dynamic, and frequently co-produced in real time by customers, employees, and technology, often with few static physical properties. Thus, many of the invention protocols and prototype design techniques used for physical goods, hard technologies, and software do not work well for human and interactive services, or at least they demand significant adaptation to address service innovation challenges (Bitner, Ostrom & Morgan, 2008)..

In recent years, a number of surveys have made it increasingly clear that service-sector firms are innovative, but with patterns of innovation that differ from those in the manufacturing sector. In general, innovation in the service sector relies less on in-house R&D than in the manufacturing sector. Whereas countries with high levels of R&D in their manufacturing sectors (measured as a share of value added) also have high shares of innovative manufacturing firms, this relationship does not hold for the service sector. Germany, for example, reports very high rates of innovation in the service sector, but low levels of R&D spending as a share of value added in services. Conversely, reported rates of innovation in Denmark and Norway are below the European average despite high relative levels of spending on services R&D (Sheehan, 2006).

5. THE CENTRAL ROLE OF COMPUTING

Rust & Miu (2006) pointed out that computing plays a central role in the service revolution by facilitating the communication, storage, and processing of information. Using IT, businesses have improved communications both internally and with customers. Different departments within the same company can easily share information electronically, and businesses and customers can now contact each other via email. Firms now have the ability to collect and analyze information on customers' entire purchase and contact histories. Since IT has drastically decreased the cost of customization, marketing to smaller segments has become economically feasible. As technology continues to decrease the cost of customization, the logical end is one-to-one marketing, with businesses targeting each customer separately and providing individually customized marketing.

Over time, firms can build relationships with customers by inferring their needs and providing service to meet those needs. Information also gives consumer the power. Consumers can receive information about a broader range of businesses, as well as perform their own searches to find the product that best suits their needs. Consequently, businesses are faced with greater competition and greater need to differentiate. Firms must provide the best value for better-informed consumers or fail to attract them.

6. THE FUTURE OF SERVICE SECTOR

Computing and IT provide a particularly strong support for a shift toward service by supplying information and tools to facilitate communication and build customer relationships. As the capacity to gather and process information grows, companies can use their new knowledge to offer customized service. Thus, with more information available to improve service, information-driven service becomes necessary for customer satisfaction and profitability. Many businesses have focused on cost reductions made possible by technology, but concentrating only on cost savings is an outmoded vestige of the production mind-set, from which companies must escape to succeed.

Academic research indicates that tunnel vision on productivity and efficiency can drive unintended service quality erosion, which may hurt revenues and profits despite cost savings. Instead, companies should utilize IT to expand revenues through better service as well as to cut costs via automation. Real-time communication with customers is becoming easier and more affordable. Companies can quickly identify customers' desires, guide them to products that meet their needs, and provide the necessary level of service. Additionally, firms can promptly detect and fix customer problems, again increasing customer satisfaction and building long-term relationships.

Companies are learning from relationships with their customers. Using computer databases in conjunction with information collected through surveys, businesses can better understand customer attitudes, perceptions, and behavior. Armed with this new knowledge, businesses can design and improve service to ensure long-term profitability. Finally, service gives firms a new tool for financial accountability. Customer equity is a measure of future cash flows that is useful in business valuation, and facilitates the calculation of return on investment for service improvements or any other business improvement. In addition, customer equity enables companies to compare prospective returns on investment from competing service strategies (Rust & Miu, 2006).

On the other hand, if policy makers wish to strengthen economic growth and improve the foundations for the future performance of economies, the services sector will need to do better. But strengthening growth performance is not the only challenge facing policy makers; countries are also confronted with the growing globalization of services and manufacturing and with rapid technological change. This has raised doubts about the capacity of economies to create new jobs, while at the same time offering new opportunities for

international trade and investment. Addressing these challenges and strengthening the potential of services to foster employment, productivity and innovation will need to build on sound macroeconomic fundamentals and involve a combination of structural policies. The OECD (2005b) report on services encourages policy makers to take action in the following areas:

- *Open domestic services markets to create new job opportunities and foster innovation and productivity*
Further regulatory reform of services markets will create fresh opportunities for firms to develop new services, meet emerging global demands and increase employment. It will also increase the incentives for companies to innovate and improve productivity growth. While much progress has been made in opening services markets, further steps are needed, e.g. in reducing the degree of public ownership in competitive industries such as air transport, in addressing anti-competitive practices in professional services, and in reducing barriers to entrepreneurship.
- *Take unilateral and multilateral steps to open international markets to trade and investment in services*
OECD work shows that the benefits of international trade and investment in services are highly significant, for both OECD economies and developing countries. Policy makers can take unilateral steps to open markets to international competition, for instance by reducing barriers to foreign direct investment. At the same time, multilateral action is needed to ensure a broad opening of markets and a wide distribution of the benefits. OECD members should therefore seize the opportunities offered by the ongoing WTO Doha negotiations to open their services markets.
- *Reform labour markets to enable employment creation and adjustment to a growing services economy*
Effective labour and social policies are essential to help OECD economies adjust to globalization, structural change and the shift to services. To strengthen employment creation in services, policy makers should address high labour taxes that affect the job prospects for low-skilled workers and the development of personal services in OECD economies. Employment protection legislation should be reformed in countries where it is overly strict, to help improve the capacity of these economies to create employment and enhance productivity growth in services.
- *Adapt education and training policies to rapidly changing requirements for new skills*
Since most services involve direct contact with customers, human resources are key to services sector performance. Education policies are important to help workers adjust to globalization and structural change and should help provide the qualifications that are needed in services. However, they need to be supplemented with actions, partnerships and co-financing by firms, workers and governments to foster life-long learning. This will require improved incentives for private financing of life-long learning and actions to ensure equitable access to formal and on-the-job learning.
- *Adapt innovation policies to the growing importance of services innovation*
Innovation policies remain ill adapted to the growing importance of innovation in services, and to the new potential for product and process innovation that is due to information and communications technology (ICT). Policy makers should consider how existing public R&D can better address the needs of the services sector and improve the links between services sector firms and public research. In modifying policies related to intellectual property in services, governments will need to strike a careful balance between innovation and the diffusion of service innovations to other industries.
- *Remove impediments that prevent services firms from seizing the benefits of ICT*
To seize the benefits of ICT for services, governments should continue to encourage effective competition in ICT infrastructure, network services and applications, notably for broadband. They will also need to increase the trust in electronic business, e.g. by developing effective regulatory frameworks. Regulatory barriers, e.g. to digital delivery and digital content, also require reform, as they are not adapted to the new potential offered by electronic business. Moreover, governments can take action themselves, by developing public services and digital content.
- *Provide a fiscal environment which is conducive to the growth of services*
Governments will need to avoid that the interaction between the application of EU and non-EU value added taxes, as well as sales taxes, leads to new tax barriers to cross border services. Tax treaties should be reviewed to avoid such activities being subject to double taxation. Tax dispute settlement procedures should be accelerated and reinforced, notably for cross border services and intangibles.

Reform of services sector policies provides an important opportunity for policy makers to strengthen employment, productivity and innovation. It will also help in strengthening the capacity of OECD economies to adjust to economic globalization in services and to the growing importance of services to future growth in OECD economies. The policies advocated in this report are mutually reinforcing. This is important since seizing the new growth opportunities in the services sector and adjusting to globalization will be possible only through a comprehensive strategy based on a policy mix that is suited to each country or circumstance.

7. CONCLUSION

One may reasonably ask, why is this the time for considering a field in services science? To be sure, the role of services has been growing in the economy, but this has been a long-term trend over many decades. What has prevented the emergence of a field earlier, and equally, what enables such a field to emerge now? The critical enabler today is ICT. As these technologies have advanced according to Moore's Law, the ability to codify and transmit knowledge, and to reuse and recombine that knowledge, has grown exponentially as well. More subtly, advances have enabled knowledge to be separated from artifacts in the form of high velocity information. Stripped of the artifacts in which they were previously embodied, this information can move at much higher velocity in specialized businesses, professions, and tools. In addition, the information is not consumed in the exchange, but remains available for additional use or reuse by others. This was not true in the earlier epochs, where the consumption of a product meant that others could not consume it. It is this liberation of knowledge into information, and embedding that information in systems augmented and accelerated by Moore's Law, that explains why the services science field may now be able to emerge. Similarly, the knowledge embedded in business organizations is being codified, modeled, and separated from the businesses, again accelerating the velocity at which this new kind of information - formal representations of business - can be reused and customized.

The future of the service economy depends on worldwide appreciation, dedication, and encouragement of innovation as a key component. The growing importance of services in the economy implies that efforts to improve standards of living, boost productivity, and create jobs must focus increasingly on the service sector. Whereas the service sector has often been characterized as a locus of low wage, unproductive, and un-innovative jobs, recent evidence gained through innovation surveys and better statistical data discredits this view, confirming that services are indeed innovative and, in some areas, more innovative than manufacturing.

In fact, knowledge-intensive services, whose value added is intangible rather than incorporated in physical products, play an increasingly dynamic and pivotal role in today's knowledge-based economy, contributing to innovation in all economic sectors. Firms in the telecommunications, finance, and business services have among the largest investments in R&D in the service sector and a strong reliance on highly skilled workers. Policymakers will need to determine how best to stimulate the growth of these sectors and to enhance the development and exploitation of knowledge in other service-sector industries. In other words, they will need to determine how best to promote innovation in services.

8. ACKNOWLEDGEMENT

This paper is written with the support of the Ministry of Education and Science of the Republic of Serbia, within the projects:

1. *National Strategy for Inflow of the Foreign Capital so as to Reintegrate Serbia Into the World's Economic Flows*, grant number: 179032;
2. *Improvement of Public Policies in Serbia in Order to Improve Citizens' Social Security and Sustainable Economic Growth*, grant number: III47004.

INNOVATIONS OF INSURANCE COMPANIES AND INVESTMENT FUNDS

Vladimir Njegomir¹, Jelena Demko Rihter²

¹Faculty of Legal and Business Studies, Novi Sad, vnjegomir@eunet.rs

²Faculty of Technical Sciences, Novi Sad, jciric@uns.ac.rs

Abstract: *The aim of this paper is to review recent progress in innovation activities of investment funds and insurance companies. The paper reviews main innovation trends globally, their causes and consequences. The research has identified that innovations of insurance companies and investment funds are predominantly incremental and focused on products although they usually refer to processes, marketing and overall organisation as well. In investment fund industry main innovations recently have included credit swap defaults (CDS), Exchange Traded Funds (ETF), hedge funds, social impact bonds and other innovative products. In insurance industry, in addition to incremental innovations such as amendments to contracts' terms and conditions, recent innovations encompass microinsurance, enterprise risk management, e-business applications, bancassurance, index insurance and alternative risk transfer. By summarizing the current state of knowledge of innovation activities among insurance companies and investment funds, the paper could be useful for domestic investment funds and insurance companies in their efforts to identify possible areas for innovation, as well as for the government bodies to understand why fostering the creation of an innovation-friendly environment will bring benefits not only to financial services industry but to society as a whole. Finally, the results presented in the paper are a good starting point for future research.*

Keywords: *innovation, insurance companies, investment funds*

1. INTRODUCTION

Etymologically innovation means to renew, to restore and the word stems from Latin word *innovare*. It essentially means the introduction of something new or different. Innovations are usually classified into product and process innovation (e.g. Oslo Manual, 2005; Greenhalgh & Rogers, 2010; Allen & Yago, 2010; and Pain, 2011). Product innovation is the introduction of a new or significantly improved product or service that improves the range and quality of those currently offered. Process innovation is the introduction of a new or significantly improved process of production or delivery of goods and services. In addition to product and process innovations, classifications can also encompass organisational innovations (e.g. Oslo Manual, 2005; Allen & Yago, 2010 and Pain, 2011) as well as marketing innovations (e.g. Oslo Manual, 2005 and Pain, 2011). According to Oslo Manual (2005) "an organizational innovation is the implementation of a new organizational method in the firm's business practices, workplace organization or external relations" (p.51). Also, according to Oslo Manual (2005) "a marketing innovation is the implementation of a new marketing method involving significant changes in product design or packaging, product placement, product promotion or pricing" (p. 49).

Furthermore, innovations can be classified by the degree of novelty. It is well known (e.g., Schumpeter, 1934 and Abernathy & Utterback, 1978; Oslo Manual, 2005; Greenhalgh & Rogers, 2010; Allen & Yago, 2010; and Pain, 2011) that innovation not necessarily means the introduction of radically new products and processes. In financial services, especially in insurance industry, innovations are more often incremental in their nature (Pain, 2011). In this regard, depending on the degree of radicalism innovations can be divided into incremental, evolutionary and transformational (Pain, 2011).

Innovations have had a paramount importance throughout the human history. Innovations such as fire, wheel, agriculture, pottery, irrigation systems, use of metals, writing and so on, actually directed the history. Without innovations humans would never calculate, write, sail, drive, trade and improve their overall well-being. The success of the Japan and Japanese companies after the Second World War is the obvious example of the importance of innovations. Namely, the success of Japanese companies in global markets is mainly attributed to continuous innovations by Nonaka & Takeuchi (1995) who pointed out that their success originates in their „capability to create new knowledge, disseminate it throughout the organisation, and embody it in products, services, and systems“.

Nowadays, innovation is the key driver of competitiveness, economic growth and prosperity (Chandra, et al, 2009). Marklund, Vonortas & Wessner (2009) point out that “innovation is essential to economic life, as it is the main determinant of economic productivity and productivity growth in firms, sectors, regions and nations and thus it is strategic issue for business of firms and public policy” (p.3). Innovation activities are especially important for companies doing business globally as confirmed by Knight & Cavusgil (2004). By investigating companies that expand into foreign markets and exhibit international business from or near their founding they highlight the critical role of innovative culture as well as knowledge and capabilities. Investments in research and development are common nowadays in order to foster innovations. However, it became obvious that new knowledge can generate economic growth and jobs only by its transformation through entrepreneurship in innovations (Audretsch, 2009).

Since the ancient societies of China, Mesopotamia, Egypt, Greece and Rome, financial innovations have always underpinned other innovations and made possible agriculture, especially the production of olive oil, wine and sugar and production of precious goods (Allen & Yago, 2010). The roots of insurance can be traced back to 5000 B.C. when in China traders divided their cargo into several ships in order to diversify risks of carrying out the goods over the Jangce river. The development of modern insurance started with first insurance company established in the U.K. in 1667 (Njegomir, 2011a). Finally, first mutual fund has been invented in 1774 in the Netherlands (Allen & Yago, 2010). More recent studies (e.g., Ćirić & Njegomir, 2011) indicate that the development of financial services is indispensable for entrepreneurship and innovation. Insurance companies and investment funds facilitate innovations in other industries. By accumulating capital and providing risk diversification on one hand and by fostering technological progress on the other, financial innovations facilitate economic growth and improve social welfare (Chou & Chin, 2004). The question that we are trying to answer in this paper refers to types of innovations that are present in the insurance and investment fund industry.

2. INSURANCE INDUSTRY INNOVATIONS

Historically, insurance companies have been conservative regarding innovations, especially those of radical character. Although innovations in insurance as well as in other industries present the foundation of the success there are many studies that indicate to conservativity. Pearson (1997) on the basis of the analysis of insurance industry in Great Britain during the period between 1700 and 1914 points out that innovations in insurance are important ingredient of success but have mainly counter-cyclical character and they are relatively undynamic. Garth (2011) indicates that insurance companies had been innovative during the sixties and seventies of the twentieth century while after that they became less innovative.

Innovation is recognized to be especially important for market oriented insurers. Lado and Maydeu-Olivares (2001) investigated the influence of competitive environments on the uses of market orientation in insurance companies in the EU and the USA and the effects of market orientation on innovations. They found that EU and US insurance firms analyze and react to their environment differently and that is reflected in a differential impact on their degree of innovation. However, there are no identified overall market orientation differences nor between market orientation and innovation degree and performance. They also found a positive impact of overall market orientation on insurance firms' innovation degree and performance in both the US and EU markets.

The thesis of the relationship between innovation and long term success in insurance has been confirmed by many studies. Lehmann & Zweifel (2004) have confirmed the thesis for health insurance. By ascertaining that important motive for deregulating social health insurance were to encourage product innovation and analysing risk selection in deregulated social health insurance, they found that cost savings achieved by non-US managed care plans are attributable to product innovation. Garth (2011) indicates that while insurers were innovative they achieved growth, expanded customer access and became more efficient. Lee, Wang & Chang (2011) have found that marketing innovation cast a significantly positive impact upon the performance in the case of life insurance companies listed in Taiwan. By analyzing a panel data set of 12 private life insurance companies over the financial period 2006-2009 in India Dutta & Sengupta (2010) found that increasing investment on IT-infrastructure which is resulting with technological innovation in business operation has a favourable impact on efficiency. Innovations in insurance also have positive impact on financial intermediation, capital accumulation, risk diversification and increased economic efficiency (Pain, 2011).

Despite the traditional conservative approach to changes in products, processes, marketing and organisation, the pace of innovation activities in insurance industry has been identified recently. New regulations such as Solvency II in Europe, changing competitive environment not only among insurance companies but also with other industries such as an investment or pension fund industry, changing nature of existing and emergence of new risks, such as environmental liability risks, increasing probability and intensity of loss events because of external influences such as terrorism or climate changes, the need for constant influence on public confidence in insurance, changing in customer preferences, economy, politics and technology are all forcing insurance companies to innovate. Aforementioned and similar changes are happening all the time and are pushing insurers to constantly respond to them by innovations. In the continuation we explain the most important recent innovations in the global insurance industry with no particular order.

Insurance is a type of financial service that potentially can provide evasion of high costs of other risk management approaches. Also, insurance can provide preservation of financial position in the event of a loss but also protect from the poverty. However, insurance is usually seen as a luxury by poor or at least there is their distrust in the security of coverage as it cannot be felt, smelt or touched. As a result of expressed needs microinsurance has been developed as a model for organisation of insurance activities for the poor. Microinsurance provides financial indemnification in the case of a loss event, provides avoidance of other cost ineffective mechanisms of loss protection, which as a final result has reduced poverty (Njegomir, 2011b). The term „microinsurance“ appeared at the beginning of nineties and since the middle of nineties it has been in use by International Labour Organisation and UNCTAD. Motives of microinsurers creation are various. Microinsurance is essentially intended for the poor, unemployed or employed in informal sector, or in other words, for persons that do not have access to traditional insurance and are excluded from social insurance programs. According to Brown (2009) the motives are: the loss protection of poor clients, reduction of own exposure to credit risk that stems from approved loans and the possibility for the achievement of additional profit (p. 171). From the point of view of insurance companies micro insurance is essentially business model innovation that provide them with access to people that previously have not been served. The tremendous potential of this market segment is evident and that is particularly important for insurance companies that operate in mature markets.

One of the business model innovations that appeared during the previous decade was enterprise risk management (ERM). The idea of ERM is that companies, especially insurance companies, manage aggregate level of risk. Basically, ERM menas to holistically manage all risks that insurance company is faced with. Insurers have traditionally managed insurance risks and that is their core business activity. However, insurance companies are not exposed only to insurance risks, or risks that they accept from insureds. They are exposed to many other risks such as market, credit and operational risks. Insurance companies firstly started to apply the ALM concept that meant simultaneous management of assets and liabilities. The main problem, however, was the fact that risks were managed individually in „silos“, that is, in isolation from one another. Then the concept of ERM appeared. The key intention is that the solvency position of insurance companies is better protected if risks are managed integrally, with all their interdependences. This concept provides adequate information for management decision making that seeks to optimise business operations through minimisation of expenses and thus profit maximisation at the given level of agregate risk, or in other words, to minimise agregate risk at the given level of capital (Njegomir, 2007a). The concept or ERM is now preferred by rating agencies and Solvency II, new solvency regulation within the EU.

Marketing is the basic preposition for the development of insurance and reinsurance. One of the most famous management gurus of the twentieth century, Peter Drucker (1973) emphasised that enterprises basically have only two functions, marketing and innovation, and he concluded that only „marketing and innovation produce results all the rest are costs.“ (p. 61). Marketing consists of individual and organisational activities that facilitate trade in dynamic environment through creation, distribution, promotion and valuation of goods, services and ideas (Njegomir, 2006). Although product, price and promotion are important, the most creative applications and the most of the innovations in insurance has been done in the distribution of insurance services. It is because the distribution channels are instrument that create value of the place, ie. they facilitate the availability of insurance services at the time and place where customers want them (Njegomir, 2007b).

Insurers usually use a mix of distribution channels. Traditionally they have used their own representative offices as well as agents and brokers. They have also developed bancassurance and e-business. The basic idea of bancassurance is to provide access to greater number of potential customers through established network of bank branches. The idea of bancassurance has emerged in 1965 and has been utilised

successfully mainly in continental Europe, particularly in France, Italy, Portugal and Spain. In these countries bancassurance facilitated insurance penetration and density and improved the structure of insurance giving the impetus for the increased share of life insurance. Although the idea is relatively old it is new in Serbia and it represents a striking example of how old idea can represent innovation when it is not previously applied in a specific company or market. Insurance companies in Serbia only recently, in the last decade, have started to utilise bancassurance and insurance companies has signed long-term contracts with banks, such as insurance company DDOR Novi Sad with Razvojna banka Vojvodine (Development bank of Vojvodian), Delta Generali with Intesa bank, Basler with OTP bank, etc.

Although bancassurance has been innovation for the Serbian insurance market, the most influential has been the utilisation of internet in insurance. Insurance companies presence on internet at first has been based on their static web site presentations. Later e-commerce has developed. It represents revolutionary accomplishment in the area of insurance sales and it provided insurance companies with ever greater access to potential customers, the improvement of sales services by providing insurance protection when and where customers want it, multimediality and interactivity. Later, the concept of e-business in insurance emerged. It is sophisticated concept that understand not only sale of insurance but full transition to the virtual business. Most recently insurers has been developing mobile internet access and social media presence. Mobile internet access provides potential customers and insureds with online services that are available through mobile phones. Now insureds, potential and existing, can quote, pay bills and report claims through their mobile phones. Also, social media presence of insurers, especially in the US is increasing. Social networks such as Facebook or Twitter have increasing impact for the marketing of insurance companies as they serve as special kind of „word of mouth“ promotion.

Product innovations are also very important for insurers but also for insureds and society as they provide coverage for risks that was not covered before, offer more affordable coverage through innovative uses of bonuses, maluses and deductibles and improve the customer satisfaction through services such as guaranties, assistance and property replacements. One of the most prominent product innovations recently has been index insurance, the alternative mechanism to traditional indemnity based insurance. Hellmuth et al (2009) indicate that index insurance offers significant opportunities as a climate-risk management tool in developing countries. According to Skees (2008) index insurance provide payments that are based upon „an objective and independent *index* that serves as a *proxy* for significant losses to crops, livestock, or other property“ (p. 1). In order to determine payouts that may be due to drought or flood, index insurance uses index such as rainfall instead of possible weather consequences such as crop failure. In contrast to traditional indemnity based insurance where in the case of loss insurance company loss adjusters need to visit individual insureds in the case of index insurance for the loss payment insurance company only needs to know if index has reached earlier agreed threshold. Because used indices are usually publicly available the process of payment of losses is simplified and thus more cost effective.

3. INVESTMENT FUNDS INNOVATIONS

The one and the only thing that is certain is innovation, but it is hard to predict their form and the intensity of changes. Investor's demands are changing, regulation are passed, new technology has become available and in such investment environment investment funds are seeking for new profit opportunities and adjust themselves to market changes. Innovations can also emerge without considerable changes in external market. Particular innovations happen as a response to the impact of non-market factors, such as changes in tax policy. Unlike innovative products and services in the real economic sectors, output of innovations in the business of institutional investors depends on timing and market environment.

Since 1980, investment innovations have realised in five distinct clusters: new asset classes, new asset allocation techniques, new risk and returns enhancing tools, new theme funds and new business models. Considering the value delivered by some kind of innovation, the most valuable innovations are: emerging market equities, emerging market bonds, high yield bonds, liability-driven investing and exchange traded funds (ETFs). At the same time, innovations that deliver the least value are: leverage, structured products, portable alpha, currency funds (Rajan, 2011, p. 6).

In the past period the most popular innovations in investment funds industry were index funds and lifecycle funds which have similarity in terms of automatic portfolio allocation, then socially responsible funds, funds of funds and one of the largest and most successful innovation are ETFs (exchange traded funds), as a new type of investment company.

ETFs are similar to index funds, because they are also passively managed with main purpose to achieve return above the stock market index (Tkac, 2007, p. 6). But the main difference is that ETF units can be purchased only through the stock market, like shares. ETFs provide individual investors access to diversified portfolios of assets that was previously been reserved for institutional investors. ETFs reduce transaction costs and increase efficiency. Disadvantage of investing in ETFs is realized when their investors become unintentionally more exposed to risk because of increasing participation of particular stock in index, based on rising stock prices and market capitalization.

Additional type of innovation in mutual funds industry is improvement in providing financial information needed by current and potential investors in order to help them in decision making. There are lot of companies indirectly connected to investment funds industry in terms of preparing, processing and presentation of financial information about performances of investment funds (Tkac, 2007, p. 8). Individual and institutional investors, but financial advisors and portfolio managers too, are seeking for basic as well as for more complex and sophisticated information for planning, decision making and analysis. Investors need objective, relevant and easy understandable information about fund performances. Acquiring needed financial information should also be time and money efficient. Companies that support investment funds industry by providing needed financial information innovate their own business too, by implementing new types of rating, new funds' types, new methodologies, computer modelling and automated tools for decision making of their clients.

By investing in funds of funds investors acquire investment units in other mutual funds, not just in one fund and through this type of investment they diversify more their portfolio and reduce risk. The worlds most famous fund families such as Vanguard and Fidelity offer „fund supermarkets“ to their investors. In the term „fund supermarket“ investors are „consumers“, mutual funds are „producers“ and brokerage firm provides location for this special type of „supermarket“ and also access to different mutual funds from various fund families. The main advantage of fund supermarket is possibility for investors to buy units of different funds in „families“ and get common financial report for all funds together.

Accelerated development of information technology, internet and modern web tools cause innovation and changes in traditional investment fund portfolio management. Investment fund families, financial advisors, information intermediaries, insurance companies and other related companies increasingly compete to satisfy changing demands of current and potential investors. Through continued education of financial advisers, portfolio managers and investors should be found the way of adjustment of non-traditional investment strategies to traditional fund portfolios.

Investment funds strategies and core portfolio are also exposed to changes and innovation in terms of choosing developed or emerging markets, taking long or short position, dollar vs. non-dollar investments. Considering new assets classes and asset allocation techniques, it is obvious that in the last decade has been more popular investing in emerging markets, in bonds, as well as in real assets and infrastructure. One of new asset allocation technique is GTAA (global tactical asset allocation), as a top-down investment strategy based on utilization of short-term mispricing among global set of assets. For example until the global financial crisis, many of the innovations included greater leverage, which has proved itself as a dangerous in terms of crisis. Beside the leverage and using of hedging and derivatives new enhancing tools that are also applied are shorting and portable alpha. Global trend of achieving sustainable economic development has influence on increasing interest of capital owners for investing in companies and projects in the fields of renewable energy, water, and environment. It can be noticed that all innovations, regarding new business models, enhancing tools, fields of investments and asset allocation techniques are represented in the financial market of USA, as the world's most developed financial market. Financial markets of Asian countries as huge emerging markets are also interested for implementing innovation in mutual funds industry.

In the modern financial era very popular innovations are credit-default swaps (CDS), interest-rate swaps (IRS), high frequency trading (HFT) and social-impact bonds. Financial innovation is the creation of new capital structures that align the interests of lots of different parties. By creating CDS as a securitisation instrument risk is transferred to the underwriting institution, most frequently insurance company. The borrower pays a premium to transfer risk. CDS protection may similarly blunt the incentives for creditors to be careful when they approve or extend credit. Securitization that has been used for decades allows banks to free up capital, enabling them to approve more credit, and helps portfolio diversification. If everything was on banks' balance-sheets and capital there would not be enough credits for needed purposes. For example, India has recently allowed using CDS, as an instrument that will attract new creditors and support developing

of India's bond market. Also, when CDS are used inappropriately or greedily, by taking on exposures that it should not, or without transferring risks, or by adding complexity in order to increase profit margins rather than to solve problems, they show their negative aspects. Unlike CDS, interest-rate swaps are useful and big innovation based on betting and hedging against future changes and trends in interest rates.

Social-impact bonds are based on the concept of risk transfer from the government to financial investors who will get paid only if the social scheme is successful. By using social impact bonds cash flows are created according to the needs of the sponsor, the provider and the investor. The main difference between the social-impact bonds and other financial instruments is that this type of bond has been created explicitly for the social purposes (Palmer, 2012).

High-frequency trading (HFT) means using of sophisticated technological tools in trading securities. It is characteristic that an investment position is hold very shortly (an average holding period is about 11 seconds). HFTs now account for over 60% of equity trading. Average investment periods for shares have shortened from around 7 years to 7 months since 1940. HFT may damage the process of long term capital accumulation and allocation and cause problems of potential market manipulation.

In the terms of global financial crisis and in the years after that, mutual funds have faced challenge to be as efficient as possible, because of decreased amounts of assets under management and tighter profit margins. At the same time was noticed that risk management systems of mutual funds had to be more flexible and to adjust to the terms of crisis.

4. INNOVATION RELATIONSHIPS BETWEEN INSURANCE COMPANIES AND INVESTMENT FUNDS

The number of natural and man-made catastrophe events (Enz et al, 2008) and their financial impact (NatCatSERVICE, 2007) is constantly rising on a global level. This rise is influenced by the impact of the trend of climate change and concentration of people and material values (Njegomir, 2011c). As (re)insurers have been traditionally regarded as being in a stronger financial position to pay the losses than the insureds (Rejda, 2005), they are at the forefront of the catastrophe trends impact.

Insurers and reinsurers have traditionally managed their exposures to insurance-related risks on the basis of the application of central limit theorem and the law of large numbers. Anything above their retention levels, determined on the basis of their available capital, was transferred to reinsurance or, in the case of reinsurers, to retrocession market. However, due to increased frequency and severity of catastrophe events it became obvious that the underwriting capacity of global insurance and reinsurance market is limited, especially for risks with catastrophe potential. The solution for additional capacity has been found in transfer of insurance risks to capital markets (see Figure 2).

Figure 1: Insurance risk transfer to capital market

Source: Njegomir (2008).

For the development of alternative risk transfer solutions that provide insurance risk transfer to capital market in addition to insurance and reinsurance companies' demand the interest from institutional capital market investors, above all insurance and reinsurance companies and investment funds, especially hedge funds, was critical. The interest from investment management community for investments in insurance risk stemmed from the fact that these investments are uncorrelated with other risks in investor's portfolio, offered relatively high returns and absence of exposure to other risks of insurance companies (Njegomir & Maksimović, 2009). Although alternative risk transfer solutions emerged under conditions of the hard reinsurance/retrocession market the continuation of (re)insurers interest for their application during the soft reinsurance/retrocession market and investors interest despite the financial crisis lead us to the conclusion that they are sustainable solution for managing exposures to catastrophes. Additionally, having factored in the continuation of the trend of increased frequency and severity of catastrophic events and ever increasing

demand for additional underwriting capacity, it is reasonable to expect the increased future usage of alternative risk transfer as a complementary solution to traditional risk transfer.

Another innovation that links insurance companies and investment funds is unit linked insurance. This is special type of life insurance that provide insureds with the option to have risk protection together with the opportunity for investment in investment units, similarly as is the case with the investments in investment funds. There is usually a guaranteed sum assured but returns beyond are determined by cyclical movements of the unit values. Basically, the actual returns are determined by the investment managers' abilities. These investments are considered riskier than ordinary life insurance but less risky than investments in investment funds. Developed countries have developed this type of life insurance during sixties. In the region this type of insurance is applied relatively recently in the region, only in Slovenia and Croatia. This innovation is still undeployed in Serbia.

5. CONCLUSION

Innovations have always been of paramount importance in human history, in all human activities but especially in business. They are also recognised as crucial for the success of insurance companies and investment funds, which on the other hand have great influence in facilitation of innovations in other industries.

Although innovations are crucial not only for the success but for the long-term survival of insurance companies, especially those that are market oriented, traditionally they were reluctant to drastic innovations. However, the increased pace of changes in the external environment has changed insurers behavior towards the recognition of more importance of innovations. The most intensified innovation in insurance industry regards processes, marketing and products while organizational changes are slower and less represented. Incremental innovation has been the specific of insurance industry but this will have to change if insurance companies want to successfully cope with growing pressures such as increased competitions from other industries and changing customer preferences.

Insurers are not absolutely free in innovation as they always need to consider limits of insurability and other basic premises of insurance business as well as regulatory constraints. Solvency, price and product regulation in insurance can hamper innovation. This is especially the case in countries with product regulation where innovation regarding product can be allowed only if all insurance companies have adopted that particular product, which in turn hamper individual insurers' innovation efforts as they cannot gain competitive advantage.

In the aftermath of the financial crisis of 2008 investors faced to negative aspects of some financial innovations. Asymmetry of information and knowledge between users of financial services and producers is obvious and increasing. Although some financial innovations have no general economic benefit, individuals and institutions which innovate can earn the large returns. Most financial innovation is deliberately designed to conceal risk and reduce transparency. Efficiency and transparency is not consistent with the high profit margins on the stock markets. Financial products usually need to be blurred and priced inefficiently to produce excessive profits.

The innovations by investment funds and insurance companies presented in the paper are present globally but not sufficiently and in many cases not used at all. Additionally, despite the scientific research results and economic development evidence, the innovation benefits are still not fully recognized by many countries, especially in developing world (e.g., Juma, C. & Yee-Cheong, L., 2005 and Bolay, et al, 2012). Thus the aim of the paper was to review recent progress in innovation activities of investment funds and insurance companies and their relationship with long-term success in order to foster innovation activities among domestic insurance companies and investment funds and facilitate the recognition of innovation importance by governments that will result with the creation of innovation friendly environment. The results presented in the paper suggest that with greater innovation of insurance companies and investment funds there is possibility for cheaper financing, more efficient risk management, greater availability of insurance coverage and thus economic growth. Additionally, research results could provide insurance companies and investment funds a useful comparison of globally available innovations and provokes them to try to implement already available solutions that are not developed within domestic markets but also to start to develop their own innovation approaches.

The limitation of our study is that it is focused on review of main globally available innovations in insurance and investment fund industry. It does not, however, precisely determine the influences of the innovation applications on specific national markets and individual companies. Thus, it gives the basis for a number of future research studies as all mentioned innovations can be a basis for separate quantitative studies for micro as well as macro economic impact.

INNOVATIVE VALUES OF MANAGERS WITHIN THEIR ENVIRONMENTS WITH BUSINESS PERFORMANCE

Emilija Stevanovska¹, Emanuela Esmerova²

¹Faculty of Economics, European University RM, Skopje; emilija.stevanovska@eurm.edu.mk

²SUGS Arseni Jovkov, Skopje; emaesmerova@yahoo.com

Abstract: *Values are the base for understanding attitudes, perception, personality and motivation of individuals affecting their behavior. The system of values determines individual's priority in accordance with their relative importance.*

We should consider that the individual tends through his/her life to keep and preserve the values acquired at his/her early age. It is about attitudes to values of what is right and what isn't, what is moral and what isn't. The attitudes of values are tightly related to the age, or to the period of individual's growing up and his/her creation as a person.

This could be a kind of explanation why older generations of employees have different attitude to proper work than the younger generations. All of this could be of help for managers to predict the attitudes of values according to the age, and these attitudes should be mainly focused on the way the work is done. They should also be able to direct these attitudes to more general issues related to the company's operations acquiring support from their employees. Unless the managers fail to implement this in their daily work, the undertaken activities will not be favourable. The system of values for managers is comprised of their personal values, some of which acquired and some of which could be by birth with the tendency to follow them. Personal values determine the person himself, his/her capacity, characteristics, moral and authority. The values, throughout the system of values, could describe anything that the managers are trying to achieve through their work and their attitude of behavior at work.

Key words: *environment, managers and values, instrumental and terminal values, interviewed employees and managers, success, professional activities and tasks*

1. TERMINAL AND INSTRUMENTAL VALUES WITH BUSINESS PERFORMANCES

One of the most famous social scientist researching values is Milton Rokeach. He defined a value as "an enduring belief that a specific mode of conduct or end-state of existence is personally or socially preferable to an opposite or converse mode of conduct or end-state of existence" and a values system as "an enduring organization of beliefs concerning preferable modes of conduct or end-state of existence along a continuum of relative importance" (Rokeach, 1973, p.5). Milton Rokeach made a classification value system based on the results of survey that proposed a list including two sets of values, the terminal and instrumental ones. Terminal values refer to desirable end-states of existence; the goals that a person would like to achieve during their lifetime and may vary among different groups of people in different cultures. Instrumental values refer to preferable modes of behavior. These are preferable modes of behavior, or means of achieving the terminal values. Sorting the terminal values from 1 (the most important guiding principle) to 18 (at least important guiding principle), then sorting the instrumental values on the same basis, from the persons that are interviewed can be made a clear picture of their systems of values trying to achieve in lifetime and need to be addressed. Everyone can well understand their own values grading first the terminal values, then instrumental ones.

Several of the terminal values listed in Table 1 are particularly important for managers - such as a sense of achievement (lasting contribution), equality (brotherhood, equal opportunity for all) and self esteem. Also, the instrumental values are expected by all managers.

Table 1. Terminal and instrumental values

Terminal values	Instrumental values
A world at peace (free of war and conflict)	Ambitious (hard-working, aspiring)
Family security (taking care of loved ones)	Broadminded (open-minded)
Freedom (independence, free choice)	Capable (competent, effective)
Equality (brotherhood, equal opportunities for all)	Cheerful (lighthearted, joyful)
Self-respect (self esteem)	Clean (neat, tidy)
Happiness (contentedness)	Courageous (standing up for your beliefs)
Wisdom (a mature understanding of life)	Forgiving (willing to pardon others)
National security (protection from attack)	Helpful (working for the welfare of others)
Salvation (saved, eternal life)	Honest (sincere, truthful)
True friendship (close companionship)	Imaginative (daring, creative)
A sense of accomplishment (a lasting contribution)	Independent (self-reliant, self sufficient)
Inner harmony (freedom from inner conflict)	Intellectual (intelligent, reflective)
A comfortable life (a prosperous life)	Logical (consistent, rational)
Mature love (sexual and spiritual intimacy)	Loving (affectionate, tender)
A world of beauty (beauty of nature and the arts)	Obedient (dutiful, respectful)
Pleasure (an enjoyable leisurely life)	Polite (courteous, well-mannered)
Social recognition (respect, admiration)	Responsible (dependable, reliable)
An exciting life (a stimulating active life)	Self-controlled (restrained, self discipline)

Source: Milton Rokeach, "The Nature of Human Values", New York, Free Press, 1973, p.112

Managers who believe that the feeling of achievement is important, can focus on achieving a lasting contribution for the enterprise such as creating a new product line that reflects the innovative management or opening new foreign subsidiary that will be the bearer of innovation management (Noe, Hollenbeck, Gerhart, & Wright, 2006, p.255). Manager who thinks that equality is the most important value could be a leader and will put the efforts of the company in providing equal opportunities for all employees, as well as finding innovative modified work force.

Some managers believe that values such as a comfortable life (a prosperous life), an exciting life (stimulating, active life), freedom (independence, freedom of choice) and social recognition (respect, admiration) are the most important for the company (Mathis & Jackson, 2007, p.235). The relative importance that managers give to each terminal value helps to explain what actually managers are trying to achieve within their company and on to focus their efforts. Some of the instrumental values listed in Table 1 are important components of the behavior of managers: being ambitious (hard work, aspiration), broadminded (open-minded), capable (skilled, effective), responsible (reliable) and self-controlled (self-discipline, restraint).

In addition, the relative importance of human resource managers put before these and other instrumental values may be an important commitment to their behavior in the workplace. For example, the manager who considers that value to a fantasy (creative, dare) is the most important tool to be innovative can take more risks than the manager who thinks it is not as important. Managers who believe that honesty is the most important value will put in the foreground task the required steps so that all members of the department or company to behave ethically. Managers who believe that the feeling of achievement is important, can focus on achieving a lasting contribution for the company such as creating a new production line or opening new foreign subsidiary (Gibson, Ivancevic, Donelly, 1999, p. 73). That is the new link that leads up to an innovative management. Manager who thinks that equality is the most important value could be leader and will put the efforts of the company in providing equal opportunities for all employees and will find modified work force according to the new business performance.

Considering the merits of over 55 million Chinese working outside China, managing trade and investment throughout East Asia are now expanding beyond Asia to Europe and USA. Often called "Chinese people by the sea", they are prominent in business and real estate investments in countries such as Singapore and Malaysia (Dessler, 2008, p. 118). They are successful in what they do, so successful that some of them now run multi-billion dollar companies. U.C. Njang is founder and chairman of Formosa Plastics Group, based in Taiwan, which built a factory of 2.1 billion dollars for the production of plastics and petrochemicals in Point Comfort Texas in 1994. Tzu-Cheng Tong, manager of real estate in Hong Kong, owns a chain of hotels and Stouffer Renaissance in the U.S., and has control over some real estate properties of Donald Trump in New

York City President Enterprises. A typical feature of “Chinese people by the sea”, whether managing a bank in Hong Kong or truly global organization, is their values such as: hard work, ambition, strong family ties, family safety, responsibility, self control and expertise. Billionaire U.C. Njang had never taken a day off, and Kao Chin-Dzen, Vice President of Enterprises, said he will be sick if there is no work. Many businesses that are operated and owned by Chinese families, work to provide as much needed education and experience in order to preserve the important positions in their companies. Many Chinese are disciplined and very responsible and their professional management success can be seen worldwide. They also consider that the most important principles are to dare to take many things and be creative, and that can be seen from their billions investments activities. In Taiwan, U.C. Njang built one of the largest production facilities in the world with a value of more than 9 billion \$.

For these managers and entrepreneurs important values are: respect, admiration and social recognition, the features of an innovative management. Many business deals between companies that are owned and are run by “Chinese people by the sea” stretch through a network of managers who have close ties of mutual trust and respect for decades. The true relationships built on respect and admiration is called “guandzhi” and is an operation mode for many “Chinese people by the sea”. Similarly “dzhinidzong” means having a good reputation and good credit rating, and that is the most important asset for many Chinese managers. It can be seen through (Dessler, 2008, p. 118):

- The manner that affect interpersonal relationships in which the manager is seen by the other individuals and groups;
- Decisions and solutions of the problems that are occurring;
- Perception of the situation and problems;
- Limits for determining what is or what is not an ethical behavior;
- The size of what individuals accept or oppose in achieving the goals and taking the pressures in companies;
- The perception of the individual organizational success or achieved results.

Individuals can be categorized according to personal values and attitudes within the business performance in several levels:

- First level - Reaction. Individuals who are not unaware of themselves or others as human beings and react based on physiological needs. This is characteristic of newborns.
- Second level - Tribal. Individuals who are characterized by high dependence on tradition and the power of authority.
- Third level - Self-centered. Individuals who believe the harsh individualism and are aggressive, selfish and do not react to power.
- Fourth level - Conformist. Individuals with low tolerance and hard-accepted views of the people whose values are different from their own and want others to accept their values and attitudes.
- Fifth level - Manipulative. Individuals who seek to achieve their goals by manipulating people through the work. They are materialists who aspire for higher status and recognition.
- Sixth level – Socio-centered. Individuals who have that attitude want to be loved and they agree with others rather to go on forward. They are taking a negative approach to materialism, manipulation and conformity.
- Seventh level - Existentialist. Individuals with a high degree of tolerance for people with different value judgments and diversity in general. They directly and openly oppose the inflexibility of the restrictive status policy and the arbitrary implementation of power.

When making categorization of the employees according to value positions can help managers to perceive the values of individuals in relation to those values that are dominant and popular in enterprises. For example, an individual who is characterized as egocentric is hard to fit in enterprises in which employees require conformity.

2. ANALYSIS OF THE EMPLOYEES AND MANAGERS VALUES IN R. MACEDONIA

The research was conducted in various towns of the R. Macedonia in the beginning of 2012. The aim of the research was to explore small and medium-size company managers and owner’s perception and attitudes towards ethical values and their importance in business decision-making process and actions. The research

was used as a exploratory study to explore how managers and owners of small and medium-size enterprises manage to bring their personal moral values into harmony with the company's interests.

Small and medium-size companies were defined by the number of employees. For the purpose of the research, respondents were companies with fewer than 50 employees selected from the following business sectors: industry, trade, service sector, public and state authorities, non-profit organizations, counsellor and education organizations. Respondents were selected by stratified random sampling to make sure that the companies operating in all sectors would be involved in the research. From the list of about 150 selected and contacted companies, 63 filled questionnaires were obtained, of which 12 questionnaires were obtained from companies that had more than 50 employees and thus were not included into the analysis.

The data was collected by personal interviews using a standardized structured questionnaire. The interviews were hold only with persons from the top management responsible for business decisions and actions, i.e. with the company's owner, director or manager (exceptionally with manager assistant). The questionnaire was designed in the way to cover various areas of business ethics, such as perception and evaluation of the business ethics in the R. Macedonia, ethical values, ethical/unethical behavior, and attitudes towards unethical behavior, its perception and the role of success. In questions focusing on personal and company's ethical values, pre-defined categories of values were used to measure their importance in the process of decision-making. As a starting point for the analysis of categorical variables, percentage frequency tables were used to describe the importance of personal and company ethical values. Results were considered to be statistically significant at significance level equal or lower than 0.05.

Owners and managers of SMEs are not just business people. They are also human being. They have their personal values that are deeply rooted and that are unlikely to change in a short period of time. To explore the owners' and managers' personal values importance, 20 so called target values (values focused on the objective that one would like to achieve) were selected from different areas of value system. Respondents were asked to choose and tick five the most important and five the least important values. The frequency of selected values in descending order from the most important to the least important value is shown in Table 2.

Table 2. The most important personal values

Values	Percentage of all the answers
Health	85,7
Family	76,2
Reliability	51
Integrity, honesty	41,9
Trust, reliance	40
Responsibility	34,3
Money, financial success (prosperity)	30,5
Education	28,6
Security, assurance	23,8
Relationships, team work, co-operation	22,4
Success	19
Work (job)	18,6
Tolerance	15,7
Respect, acknowledgement	13,3
Flexibility	12,9
Credibility, trustworthiness	9,5
Openness, frankness	8,6
Discipline	6,2
Individualism	3,3
Commitment	1,9

Similar to the personal value system, the importance of values in term of corporate management and culture was examined by the research. Respondents were asked to mark five values that they consider to be the most important values in their business decision-making process and business activities. At the same time, they were asked to tick five the least important values in managing their business. Table 3. presents the frequency of stated answers.

Table 3. The most important values in company's management

Values	Percentage of all the answers	
	most important	least important
Professionalism	65,2	4,3
Quality	65,2	2,9
Reliability	52,9	2,9
Relationships, co-operation, team work	51,4	5,2
Integrity, honesty	36,2	7,1
Responsibility	35,2	6,2
Focus on success, profit, prosperity	31,9	20,5
Flexibility	30	18,1
Image, reputation	27,6	24,3
Education, professional development	26,2	15,7
Trust, reliance	25,2	4,3
Credibility, trustworthiness	18,6	16,7
Commitment, assertive power	13,3	41,9
Friendliness, willingness	13,3	25,2
Creativity	10,5	41,4
Respect, acknowledgement, justice, fairness	7,1	19,5
Discipline	5,7	40,5
Openness, frankness	5,2	45,7
Tolerance	2,9	33,3
Individualism	2,4	77,6

Findings of the research on ethical values in small and medium-size enterprises show that the most important personal values are health, family, reliability, integrity and honesty, trust and reliance, responsibility, and money and financial success. As far as business values are concerned, the most important values are professionalism, quality, reliability, relationships, co-operation and team work, integrity and honesty, responsibility and focus on success, profit and prosperity. Out of the top seven values both, personal and business ones, four values - reliability, integrity and honesty, responsibility and focus on money, profit, financial success were common for both categories. This can be considered as a relatively good concurrence of the personal and business values importance.

However, the agreement among personal and business value importance does not necessarily mean that ethical values are implemented in practice. More than half of all respondents agreed that it is difficult to act according to their personal values because it is not possible to fulfill expectations of many people in the company, conditions in the market does not support ethical actions, company would lose its competitive advantage or position in the market or generally, there are no ethical principles and regulations especially in smaller companies (up to 20 employees) that would improve ethical actions and outcomes.

As far as the willingness of respondents to break their personal values was concerned, about one third would break their personal values if they could increase profit and economic success of their company. However, almost three quarters of respondents would break their personal values in order to save their companies from bankruptcy. The proportion of respondents that would break their personal values to save the company was significantly higher (about 84 percent) in case of companies' owners.

CONCLUSION

The relative importance that managers give to each terminal value helps to explain what actually managers are trying to achieve within their company and on to focus their efforts. Some of the instrumental values listed in Table 1 are important components of the behavior of managers, such as being ambitious (hard work, aspiration), wide-view (open), capable (skilled, effective), responsible (on whom you can rely) and has self-control (self-discipline, restraint).

When making categorization of the employees according to their present values positions can help managers to perceive the values of individuals in relation to those values that are dominant and popular in enterprises.

The survey held in Macedonian market shows that the most important personal values are health, family, reliability, integrity and honesty, trust and reliance, responsibility, and money and financial success. As far as business values are concerned, the most important values are professionalism, quality, reliability, relationships, co-operation and team work, integrity and honesty, responsibility and focus on success, profit and prosperity. Out of the top seven values both, personal and business ones, four values - reliability, integrity and honesty, responsibility and focus on money, profit, financial success were common for both categories.

Abstract: *For several years Serbia has gained access to and is integrated into the main EU support programmes for research, innovation and competitiveness such as the Competitiveness and Innovation Programme (CIP), Enterprise Europe Network (EEN) and Seventh Framework Programme (FP7). Meantime, Serbia has successfully set up the infrastructure to manage EU-based programmes. In this paper we are discussing the effectiveness of these programmes on improving technology transfer and linkages between the R&D sector and SMEs, as crucial components of a national innovation system in Serbia.*

Keywords: *national innovation system, EU programme, FP7, EEN, evaluation*

1. INTRODUCTION

Technological development is a result of a complex interaction between business organizations, R&D institutes, universities, professional associations, educational and information infrastructure, financial institutions and public agencies. This network represents the National Innovation System (NIS) (Lundvall, B. A. (ed.) 1992). According to Porter, Furman and Stern, National Innovativeness Capacity (NIC) is capability of nation to produce and commercialize new technologies in long term. NIC includes developed innovativeness infrastructure, developed innovativeness environment in industrial clusters, and relationship between those two. According to that, one of the most important strategic goals of economic development in Serbia should be creating positive environment for encouraging and developing stronger interaction between organizations' development and scientific-research development (SRD).

In economies in transition, the creation of these complex networks is more complicated than in developed, because a lot of the aforementioned elements of the network are undeveloped or do not exist. Therefore, scientific and technological policies for developing countries must be different from those for developed countries (Kutlača D. 2008). The main tasks and objectives of national innovation system of Serbia are technology development as a main condition for overall economic and social development and creation of framework for building of knowledge based economy and society (Kutlača Đ. and Semenčenko D. 2004).

2. PROGRAMMES SUPPORTING TECHNOLOGICAL DEVELOPMENT IN SERBIA

In recent years there is considerable breakthrough in promotion of innovation as a main driven factor of the economy and society with intention to Serbia become a knowledge based society. The policy frame is set by the Serbian Law on Innovation Activity, last amended in March 2010¹ and implemented by MoES/MoSTD. The Law on Innovation Activity regulates basic principles, goals and organization of application of scientific knowledge and inventiveness, for the purpose of creation and realization of new and improved products, processes and services to serve as a driving force for the development of the Republic of Serbia. Based on the legal frame, the government has developed the Strategy for Scientific and Technological Development of the Republic of Serbia for the period 2010-2015.

The Strategy for the Development of Competitive and Innovative Enterprises was adopted in 2008 and implemented by the MoERD; it is a strategic policy document for development of small and medium-sized enterprises and entrepreneurship, which defines key priorities and the way they will be implemented. The Strategy is based on five pillars, further developed in modules and measures, corresponding to the priorities in SME development and aimed to contribute to improving the performance of the entrepreneurs through all stages of start-up, growth and development of SMEs.

Specific support to technological development and innovation through national programmes is provided both, by the Ministry of Education and Science and the Ministry of Economy and Regional Development, as well as government of Autonomous Province Vojvodina. Currently are in progress the following programs:

1. "Programme supporting Basic Research for the Research Cycle 2011-2014" ("BR Programme")
2. Programme supporting Research in the Field of Technological Development for the Research Cycle 2011-2014 (TD Programme)
3. Programme of Co-Funding of Integrated and Interdisciplinary Research for the Research Cycle 2011-2014" ("IIR Programme")
4. "Programme of Providing and Maintaining Scientific Research Equipment and Scientific Research Facilities for the Research Cycle 2011-2014" ("SREF Programme")
5. Mini Grants financing Program
6. Matching Grants Program
7. Financing Of Short-Term Projects With A Special Interest For Sustainable Development in Vojvodina
8. "RIGHT" at the first chance
9. Plants for application of new technologies in AP Vojvodina
10. SMEE Competitiveness Support Programme
11. Programme for Innovative Cluster Development
12. SME Innovation Support Program.

For several years Serbia has gained access to and is integrated into the main EU support programmes for research, innovation and competitiveness such as the Competitiveness and Innovation Programme (CIP), the Enterprise Europe Network (EEN) and the Seventh Framework Programme (FP7). Meantime, Serbia has successfully set the infrastructure up to manage EU-based programmes.

The Serbian government's strategy for development of SME Sector was defined as a short-term priority within the National Programme for the Integration of the Republic of Serbia in EU with reference to the "Small Business Act". The EU framework, guiding entrepreneurship support and promotion, has been taken into account in developing the Serbian SME strategy. In total nine innovation support programmes and measures, targeting for improved competitiveness of the SME sector, were assessed to measure the programmes' impacts.

3. EFFECTIVENESS OF THE EU PROGRAMESS SUPPORTING INNOVATIVENESS IN SERBIA

Between the other, the Improved SME Competitiveness and Innovation Project (ICIP), financed by the EU aims at improving the competitiveness of Serbian SMEs and increasing levels of innovation in SMEs. The project also envisages related needs to strengthen the institutional capacity and support framework for increased level of innovation in enterprises, upgrade of innovation support services, build of capacities of innovation stakeholders and strengthen links between education, research institutes and business.

To support these aims ICIP has undertaken an in-depth analysis of the innovation and competitiveness support programmes in Serbia to raise awareness for strong policy coordination among main stakeholders to further adapt the support tools in accordance with needs of enterprises and innovation service providers (ICIP, 2011). In total nine SME innovation and competitiveness support programmes have been evaluated that are implemented by the Government of Serbia and managed by the Ministry of Economy and Regional Development (MoERD), Ministry of Science and Technological Development (MoSTD) – since March 2011 integrated within the Ministry of Education and Science (MoES) – and the National Agency for Regional Development (NARD). The assessment of the innovation and competitiveness support programmes is done against the government strategy for development of competitive and innovative small and medium-sized enterprises and the related policy aims and expected intermediate results. Detailed reports are produced by a team of experts for each assessment result.

The following programmes were assessed by ICIP under the activity 2.1 "Assessment of Innovation Support Programmes": Project for Supporting SMEs to Invest in Innovation, Project for Supporting the Development of Competitiveness of SMEs and Innovation, Project EEN - Enterprise Europe Network - in Serbia 2009-2010, CIP/EIP Programme in Serbia 2009-2010, Competition for Best Technology Innovation, EU FP7 Programme, Business Incubator Network, Innovation Fairs, Innovation Projects.

Reports were produced on each of the assessed programme and support activity, including main findings and recommendations. The assessment of the programmes consists of two approaches: firstly, sample groups of enterprises, which have participated in innovation support programmes and received grants for the purpose of the improvement or development of new products/ services/ processes were given questionnaires; secondly qualified interviews were held with persons from the MoERD, MoES, NARD and other government organizations responsible for managing the programmes.

In further discussion will be analyzed in detail effectiveness of programmes EEN - Enterprise Europe Network and FP 7 EU programme in Serbia. The main findings are results of research that was conducted within Improved SME Competiveness and Innovation project (ICIP), in which the experts from Mihajlo Pupin Institute were included⁴.

4. ENTERPRISE EUROPE NETWORK (EEN)

EEN project have started in Serbia in 2009. Within EU, national EENs were heritage of the former Innovation Relay Centers (IRC) and Euro Information Centers (EIC), and resulted from their merge, inside the frame of EEN project in the beginning of 2008 (2011, Semencenko, Mosurovic). The main purpose of the project in Serbia is internationalization of Serbian businesses and R&D results, and increase of the competitiveness of SME sector through greater access to information and business and technology connection at the EU level. Enterprise Europe Network became one of the basic tools for encouraging innovativeness of small and medium enterprises in Serbia. The staff of the EEN consortium in Serbia is highly professional, with previous background partly in academia sector involved in different kind of NIS research, and the other from public institutions who are dealing with administrative, technical and other kind of service support to SMEs. Being in that way trained and skilled, they can come out to meet demand of clients at all times. One significant advantage of EEN services is that they are free of charge to all interested companies. By establishing EEN in Serbia, it would be possible to motivate companies to think about improving innovation through new forms of business and technological cooperation as well as advisory services, not only through financial support from government and other funds.

More than 40 experts within EEN project in Serbia are engaged in order to help Serbian SMEs to identify their needs and potential. The main task of EEN project is to improve competitiveness of Serbian SMEs :

- To develop their business in new markets
- Source or license new technologies
- Access EU finance and EU funding.

According to the survey that Mihajlo Pupin Institute conducted in 2010, the services of EEN are recognized among Serbian SMEs (Semenčenko D. and Mosurović M. 2011). The main purpose of survey was to see how clients who received services from EEN in Serbia evaluate it. The statistical analysis of the survey was reflecting awareness of SMEs in Serbia about Enterprise Europe Network services and their satisfaction with those services. More than half respondents (51.43%) couldn't find other service providers offering the same or similar services as EEN in Serbia; 40.00% could, while 8.57% did not express any opinion on this issue (picture 1).

Picture 1. EEN and other service providers offering the same or similar services

Source: Semenčenko D. and Mosurović M. (2011).

⁴ Detailed reports are produced for each assessment result by a team of experts in ICIP project, SE Prof. Dr Djuro Kutlaca and JE Sanja Popovic-Pantic, M.Sc, as well as team members, Dusica Semencenko Ph.D, as MPI expert and technical support of Marija Mosurovic M.Sc. and Zorica Mitrovic (ICIP, 2011).

Respondents preferred the Enterprise Europe Network's services more than services of other providers who were offering the same or similar services, primarily because of the possibility of access to European Network (29.27%), as well as the acknowledged professionalism of staff (25.7%) (picture 2.).

Picture 2. The reasons companies preferred the Enterprise Europe Network's Services

Source: Semenčenko D. and Mosurović M. (2011).

Only (4.88%) respondents listed other reasons besides those mentioned in the question:

All respondents (100%) were aware that the Enterprise Europe Network was an initiative of the European Commission and is supported by European Union budget. Almost 90% of enterprises reported that the Programmes met their expectations. 25% of enterprises have applied an innovation strategy for the first time with the support of the Programmes. The survey found strong evidence of increased technical and non-technical innovations in enterprises; 68% claimed that the participation in the Programmes provided the basis for contribution to organizational changes and development of their business model and 65% reported that the Programmes allowed them to focus on their innovation capacities based on their own resources and supported by innovation collaboration with external partners.

The Programmes contributed significantly to the cooperation between research and economic entities. Almost 70% of enterprises have established innovative partnership through the Programmes, although only 12% organized it with R&D institutions or universities (28%) while the majority (43%) cooperated with consulting firms. The majority of them (65%) evaluated the cooperation as very good or excellent; consequently, 75% of enterprises will develop in the future new innovative activities in cooperation with external partners. Regarding future plans, 90% of enterprises reported to plan investments in innovation also for the coming years.

The technical and non-technical innovation effects are likely to increase based on the positive evaluation of enterprises, but could be positively influenced by availability of a central database with all eligible R&D institutions, university departments, consulting firms and laboratories acting as Business and Innovation Support Organizations (BISOs) for SMEs, which is under development.

By establishing EEN in Serbia, the direct and indirect users are in position to gain information about the requirements for entering and conducting business operations in EU (relevant legislation, directives, etc.), export opportunities, public procurement possibilities, innovative technologies, potential innovative partners, EU RTD possibilities and programs, and gain access to the innovative technologies in one place (one-stop-shop). Right information and right innovative solutions to the problems of SMEs contribute to the business development of Serbian SMEs and their survivability on today's dynamic and open markets. Also, the EEN can provide evaluations of company's financial situation and help in order to find the best possible source for funding support.

The main recommendations and proposed corresponding actions are:

1. EEN consortium and policy makers should promote the activities of EEN in Serbia with higher intensity among enterprises in Serbia in order to improve their innovation capacity.
2. It is clear that Enterprise Europe Network must continue its work with more joint efforts and must create an even larger client base in order to reach its goal and become a stronger support to SMEs and Serbian economy.
3. It is recommended to establish robust monitoring, evaluation and impact assessment Monitoring and Evaluation (M&E) system for this Programme support
4. In order to make SMEs motivated to be more responsive on the EEN activities, it is important to organize meetings where the achieved results will be promoted. Presentation of "Best practice in EEN Serbia: How to use access to EU market at your doorstep" might be appropriate form to get
5. SMEs together and keep them informed on the regular basis on the benefits EEN can provide to them.

5. THE SEVENTH FRAMEWORK PROGRAMME FOR RESEARCH AND TECHNOLOGICAL DEVELOPMENT - FP7

The Seventh Framework Programme for Research and Technological Development (FP7) has the main aim to improve scientific and technological basis at EU level. There is intension to encourage SMEs, research centers and universities in their research and technological development activities.

The integration of Serbia's R&D system into the European Research Area (ERA) system is a need, desire and the destiny of the vast majority of researchers in Serbia. The results of survey present the facts why it is good that the creative sector of Serbia becomes part of the European Research Area and thus contribute to the development of national economy and society as a whole. This good spirit and motivation of national science can, and should be used as a motivational factor for the faster integration into European Union and all other sectors and countries as a whole.

Process of integration of National innovation and research system (NIRS) of Serbia in the ERA is primarily a process of people, working together - local researchers with their counterparts from the EU. Serbian participation in EU projects should be improved. The number of FP7 projects where Serbia was included as a coordinator is too low, but in general number of projects is in increase (table 1), comparing with other countries the number is similar with the new EU member countries.

Table 1. The success rate of Serbian projects in FP7

		Number of Applicants (main listed)	Number of Proposals (main listed)	Sum of Number of Applicants:	Sum of Number of Proposals:	Success rate (based in main listed proposals)
Capacities	Activities of International Cooperation	8	4	33	20	24.24 %
	Regions of Knowledge	1	1	21	6	4.76 %
	Research for the benefit of SMEs	4	3	66	39	6.06 %
	Research Infrastructures	11	10	29	26	37.93 %

	Sum:	2	2	4	3	
TOTAL FP7 (20. 12.2010)		147	118	1,132	912	12.99 %

Source: Kutlača Đ., Semenčenko D., Nedović V., Kolić J. (2011).

The best evidence of Serbian soaring involvement in EU support programmes is the opinion of managers of teams from Serbia in FP6 and FP7 projects, collected in the survey conducted during the Jun of 2009. (Kutlača Đ., Semenčenko D., Nedović V., Kolić J. 2011).

The project effects have fulfilled the expectations of their project managers. Almost three quarters of respondent were evaluated project effect as excellent. But, some of them 37.5% didn't want to be involved again in FP7 as coordinator. The main reasons for negative attitude are:

- Complexity of administrative procedures, too much time is spent on management (especially at faculties which structure are not sufficiently organized)
- As a first I need experience as a work package leader in one or two projects, and then I will be able to take over coordination of the project. Beside that there are a lot of practical obstacles in money transfer from Serbia to partners in EU.
- Insufficient resources (human and material resources),
- Adminstrating projects is too much demanding,
- Too much obligations, especially administrative, currently I'm a project coordinator and next time I'll gladly give it to someone else.

But, there is still missing one important link in the chain of technology transfer processes – SMEs. Facts about low participation of SMEs from Serbia in FP projects urged on action. The problem is recognized within Ministry for Science and Technology Development, Department for international cooperation and European integration and National Contact Point (NCP) system, but still stays unsolved.

By the end of 2009, in total, 107 Serbian organizations and enterprises participated in the FP6/7 programme, which is evaluated as a good result. The number of SMEs benefiting from FP7 is given by the CORDIS database as 8 (5 from the thematic field of ICT and 3 from Knowledge Based BIO-Economy). None of those companies is project leader.

The main recommendations and proposed corresponding actions are:

1. Interaction with other stakeholders within national innovation infrastructure is recommended
2. Promotion of building partnerships between R&D institutions and SMEs is desirable. In this context, dissemination of the information about FP7 among SMEs should be intensified.
3. Linkages between NCPs and Enterprise Europe Network Serbia should be more developed and encouraged.
4. It is recommended to establish robust monitoring, evaluation and impact assessment (Monitoring and Evaluation - M&E) system for this Programme support.
5. To inter-connect all relevant EU funded projects to support innovation of
6. SMEs in Serbia with the aim to make final beneficiaries (SMEs) familiar with them. As a first step, set up of the links toward the relevant web sites of the mentioned programs are recommended. Link toward the FP7 should be set up on i.e. the website of the MoERD.

5. CONCLUSIONS

The initial aim of this paper was to examine importance of EU programs as a support for SMEs innovativeness in Serbia. Our survey indicates that participation in all supporting Programmes is evident for developing innovation culture and innovation management capabilities in enterprises for both SME owners and innovation project managers.

Also, our intention for analysis of the innovation and competitiveness support programmes in Serbia was in order to raise awareness for strong policy coordination among main stakeholders.

The evaluation of innovation support programmes is done irregularly and does not follow a harmonised approach. It is proposed to undertake an impact assessment of programmes supporting innovation and competitiveness in Serbia.

The approach should make a distinction between:

- Evaluation of the programme performance against programme objectives on the basis of clearly defined, measurable key performance indicators (e.g. quantified jobs ensured or created);
- Assessment of the cost effectiveness of the programmes in terms of policy aims, expenditure which results in the engagement of business, and the take-up of programmes.
- Strengths and logic of programme linkages, though causal chains that show the relationships and pathways between different implementation measures and programmes, in order to identify both strengths and weaknesses, as well as unanticipated consequences of the measures
- Direct impact on business activities and practices and business performance (e.g. new products initiated, profitability of business or penetration of new markets), as well as indirect wider spill-over effects (including Strategic Added Value) through the involvement of research partners and stakeholders; and
- Socio-economic impact assessment, measuring the gross and net economic impacts (e.g. employment, business creation, local multiplier effects, and Gross Value Added) at national and regional levels.

It is further proposed that an impact assessment system and methodology should be established allowing the respective authorities to undertake regular evaluation of socio-economic impacts of such programmes on a comparative basis, which will also ensure that both national and regional disparities in access, take-up and impact can be clearly monitored and assessed.

USING CROSS-INDUSTRY LEARNING FOR ORGANIZATIONAL TRANSFORMATION

Milutin Delic¹, Marija Vuksan Delic²

¹GlaxoSmithKline Ltd. Serbia, milutin.delic@sbb.rs

²M-Fly consulting, marija.vuksan@mfly.rs

Abstract: *Organisational management is in crisis and increasing competitiveness forces for new innovation paradigm and vision – focus on self and own industry has exhausted growth and change drivers and doesn't derivate vital success ideas and transformational levers. At the times when environment transformation is highly unpredictable and quick, self paced reinvention is lagging behind needs, so companies have to look for other sources of development. This paper provides an analysis of cross-industry and cross-sectors learning and knowledge transfers as an instrument of gaining competitive advantage through internal improvements aimed to embed practices and knowhow of external champions – what Formula 1 can bring to team work and learning agility in pharmaceutical industry, or how far social trends in IT shape brand development in automotive industry.*

Through methodological research of worlds' leading organizations best practice examples, literature and case studies review, we have discovered that an industry specific framework cannot always generate the most effective solutions and that answers lie somewhere else. Internal improvements based on own models are reaching the ceiling and tangible gains are largely exhausted; additional investments in existing models simply do not result in required revenue (efficiency, effectiveness, savings, etc.) Finding and transferring right model from other industry or sector is becoming the key factor in the organisational transformation – learning from champions in their narrow sphere of expertise and adapting such knowhow to own infrastructure.

Keywords: *cross-industry learning, best practices, HR role, innovation, creative solutions*

1. INTRODUCTION

We have witness historical trends of industrial revolutions. From industrial revolution in 18th century, through 19th century of automatisisation and mass production until increased pace of IT developments throughout 20th century, each of phases was driven by a different set of levers which led towards strong improvements and challenged existing practices. Development of new technologies has marked number of evolutionary steps that different industries have made. Examples of such transformation are well known and documented – we are clear on development pathways, driving forces and enablers which helped change. Once competitors have reached similar level of technological advancement, exploration of new drivers of differentiation and competitiveness entered a “soft orbit”. Companies started paying additional attention to innovation and talents over the last 20 years – these were recognised as the “War for talent”.

Although successful companies focus were in developing human capital and innovation strategies, return of such investments was not always coming quickly enough to keep the competitiveness in a comfort zone and new explorations were launched to look beyond existing transformational arsenal. Companies have to remain mobile and agile in search for its future structure (Survivors are the most adaptive, not the most advanced – C. Darwin). This invites for continuous transformations against and beyond known and predictable trends. However capable thinkers we can have in our organisations, pace and speed of developments and increasing number of variables which could place an impact to the organisation, require additional stretch and organisation learning in no-traditional manner.

2. NEW CHAPTER IN THE ORGANIZATIONAL DEVELOPMENT PRACTICE

New chapter in the book of organisational development goes into direction of cross-industry sharing of best practices, which are driving the need to remain competitive and demonstrate organisational ability to convert and develop own future. Getting a licence for existence and stakeholders support simply means remaining agile, flexible and driven at the path of constant improvement. Phase of self-reinvention can not generate

required level of change and competitiveness, and small, gradual self-paced improvements in own business models within an industry should be replaced by cross-industry learning and clever transfer of successful business models. Such companies are open to listen and watch others and are actively exploring beyond the industry fence. Richard Branson of Virgin has a simple look over such process - "I have no regrets trying to break the mould and taking a different approach. That has resulted in Virgin being one of the best known brands in the world".

2.1. "Smart copying"

Regardless of the industry in focus, if an organisation would look at range of other industries there are perhaps dozens of examples and ideas which could be copied. Yet, simple copying would bring the risk of inapplicability. Therefore "smart copying" is actually relaying on extrapolation of successful examples under your organisation operational circumstances and framework. Having said that, the pathway could look too easy, and too simple. We could say that many businesses across different industries face similar issues and similar business functions. Common roles which should be interchangeable are in finance, planning, human resources and sales. But in each of those functions there is something in other industries which could be beneficial and add value to your practices, processes, standards and business model.

Car manufacturers have an excellent history of developing and implementing business-improvement methodologies such as "lean manufacturing" or "just in time", but they have not always got the people bit right. Other industry sectors also have much to offer in this area and if an industry can capture this best practice and apply it within sectors such as the E&P industry, it can stand on the shoulders of those who have already done the hard work for us.

In a period when there is an on-going war for talent, selecting and attracting right people for the business can be extremely challenging. Beside regular human resources elements (salary, compensation packages, managing professional success, awarding and relations with employees, etc.), talents of today are very sensitive on industry perception – would I like to work in such business, is a typical question raised. This poses strong challenge to the industry and calls for an immediate investment – why would someone considered a talent work as salesmen in car industry, for example. Looking at benefits, the industry should be able to provide parity to other sector which is traditionally considered as better off. The evolution which automotive industry has passed through offers something potentially attractive and this change of viewpoint is starting to manifest itself in improved recruitment levels and staff retention. Driving force for introduction of new technologies and IT which have transformed an industry perceived as old fashioned and mechanical into state of the art IT based sector. And while promoting such transformation the industry attracted fresh brains, which in return provided new ideas and innovation.

This scenario is, clearly, not unique to the automotive industry. A number of sectors might be perceived as undesirable to potential employees – it's a mandatory in transformation to educate those who might be potential employees and, importantly, provide them with sound management and clear direction to retain them. Some industries have been more successful in throwing off past perceptions and are now perceived as attractive. "Fast-moving consumer goods" companies, selling items such as foodstuffs and general consumables in a retail environment or supermarket chains are now recognised to provide good prospects and world-class training and development for their staff. Some organisations may not been in position to transform far in that direction due to internal limitations (NPR limited investment capacity, small operating margin, etc.) but have recognised that something else should be offered to employees, like a fulfilling working environment and prospects for future development and progression. It is so easy to take for granted the existing workforce and lose skilled and very valuable people to other organizations and industries through neglect, a lack of clear direction, poor management, or a combination of factors. Still, while carefully browsing successful human resources strategies in other sectors, leaders can recognise pieces of mosaic which could be transferred and extrapolated into their own organisation – having right instinct and sound judgement about transferability are impact full skills of capable leaders.

In a typical retail scenario, a customer has various options ranging from the regular store format to the web based sales. Retailers try hard to ensure that they map and track the customer through targeting and segmentation, as a single entity no matter the kind of format customer uses. This has been at large copied by banks, which have many offerings in their portfolio and might require extensive modification in their customer relationship services to map and track a customer. They can benchmark the retail industry to understand the process to provide an improved service to a customer.

3. THE BEST PRACTICE MODELS

In a search for best practice models and champions in other industries, organisations are *de facto* focusing on own competitiveness. This imposes a capacity to benchmark and judge transferability – while in previous decades product benchmarking was a cornerstone of strategy developments, present era has required evolution of comparison models in a new field - benchmarking of functions, processes, strategies and performance. Understanding forces and value behind, ability to follow right variables and create systems which are prone to errors in comparisons, are becoming key assets for organisational transformation based on cross-industry transfers.

An IT manufacturer in US had a practice that orders received by 1pm are processed within the same day, while orders after 1pm are processed during the next day (Day, 1993.) In a highly competitive industry this can be a factor leading to company default, as any competitors with good customer insight and ability to look over the fence into practices of FMCG company or service call centre in air transport or courier industry would quickly can massive advantage and overtake customer pool.

One of the globalisation effects is that customers are better informed and have very high expectations, whatever is the industry in scope. Such increasing customer expectations are forcing organisations to be highly competitive and innovative when improving their services and operations. Consequently benchmarking of today requires an agile and flexible learning process, close monitoring of competitors' activities or best-in-the class organisation in the industry. Cross industry benchmarking increases opportunities to acquire innovative but transferable ideas from players across wide range of industries.

In the early 1990's, HP was studying best practices as well as doing the analytical legwork around what the best push/pull boundary would be. The first decision to deploy a postponement model was based on financial modelling to assess what the right model for HP would be. Benetton served as a good case study for HP in arriving at the Postponement Strategy. Each season, Benetton dyed yarn, knit sweaters, and then shipped the sweaters to retail stores. It was never clear until well into each season which colours would sell best. By reversing the process and getting rapid online feedback from retail outlets, they realized a huge return. Instead of dying the yarn first, Benetton knit the plain wool into sweaters and postponed colouring the entire inventory. This is the cornerstone of supply chain management practice that Hewlett-Packard is using today to improve their operations. HP manufactured printers in the U.S. and distributed finished products globally through three distribution centres in Europe, the U.S. and the Far East with each region having different requirements. HP began to investigate the benefits of a product and process redesign where a generic printer would be produced at the factory and shipped to the DC's for final customization with the power supply and the manual. The printer itself had to be redesigned for these requirements and the results from the DC localization at HP were positive inventory costs reduced while customer service measure such as fill rate improved (Feitzinger, 2006.).

Above examples are informing our thinking on the importance of knowledge transfer across the organisations – being more precise, we focus on tacit (implicit) knowledge. Rationale lays in transferability – while explicit knowledge is based on sound structure and learning process, it requires systematic and usually gradual learning process. Starts with basics and then develops in depth and breadths, through specialisations. On the other side, implicit knowledge is personal, based on individual's perception, is informal and easily communicates across peers and colleagues within the organisation. As such it's more difficult to capture and formalise. But at the same time we see value for the organisation if decisions are based on judgement, expertise, set of values and perceptions, which are all components of tacit knowledge. This in return speaks how important it is for organisations to nurture people developments and assure cultural framework based on agreed set of values and behaviours. Once this is established, organisational learning gets the momentum and derivates innovation and learning – out of which an important part is coming from other industries in cross-learning process. Successful organisational learning is critically dependent on collaborative environment, trust and openness, which is properly articulated and promoted; such environment would encourage organizational development based on learning. As the business conditions become more complex, so do human capital requirements.

4. HR REQUIRES NEW COMPETENCIES

Advances in formal organizational design and global human resource practices are essential. Future challenge for global organizations will be to develop and enhance their capacity to informally but tangibly link the elements of their employees and talents to the key elements of their global strategies. As organizations

rely more on informal and shared philosophies and understanding about strategic goals and resources, the bond that holds them together stretch around *decisions* about talent, rather than in rules, hierarchies, human resource practices or job descriptions. Yet, the dominant models of global HRM continue to focus on improving HRM *practices* applied to the global workforce, though with increasing attention to the distinctions of country, culture and local market variations (Bloom, Milkovich & Mitra, 2002).

Inevitably, organisational agenda based on learning for development requires investment in human resources and introduction of new standards for workers in 21st century. These skills cut across industries, functions and actual job titles, presenting a new golden standard. As this implies new thresholds for self-development, it equally well informs students or aspirants in career development on areas for improvement, either through education, on-job learning or exposure in circumstance which enable required development. We consider that critical set includes:

- Adaptability skills – critical thinking and problem solving, time management, flexibility and lifelong learning. Worker which are fixed to their job description, rigid and slow in adapting would face serious difficulties in remaining competitive in ever-changing labour market;
- Information management and communication – ability to quickly and selectively collect data, analyse, understand, and select information of critical importance and impact for transfer into forms appropriate for range of potential audiences. Cultural sensitivity and effective negotiation are of additional importance;
- Business skills – finance and project management, matrix and network management, as well as product marketing and management;
- Science, technology, engineering and math (STEM) – advance knowledge of STEM and quick adaptability to new requirements followed with capacity to immediately apply;
- Interdisciplinary skills – combining technical skills with business acumen.

In order to maximize advantage from cross-industry learning, organization has to have capacity to absorb new knowledge and flexibility to quickly adapt to the new procedures/practices. This is where the power of HR lays. The HR function creates tangible value in organizations by focusing primarily on delivery of HR practices (staffing, development, compensation, labor relations, etc.), based on professional and often research-based principles. These practices are important, and research indicates that when they are done well they add tangible value to the organization. However, professional practices alone do not systematically address the increasing sophistication and importance of talent markets and decisions to today's competitive challenges. HR department should develop own competencies required for molding and shaping talents. The new HR role is to know how to create the innovative profile of an organization; how to stimulate creative experience and actions; how to increase employee satisfaction rate (because this is in close relationship with the attraction and retention of employees); how to control the workforce stability (this represents the biggest threat to intellectual capital drain, since unwanted departure of best performing employees and talents significantly influence competitiveness of the organization), how to attract and retain experienced employees that create new approaches, services, products or processes based on their experience, etc.

A key supplier of global markets, New Jersey has a vibrant TLD industry. The industry is critical for the state's economy, providing thousands of well-paying jobs. In 2009, TLD supported over 390,000 jobs in the state, and over 30,000 workers were hired each quarter to fill new and replacement jobs at wages significantly higher than wages in other industries. Key workforce challenges facing TLD in New Jersey are a high level of turnover among new hires who fail to meet performance expectations or job requirements and current workers who fail to upgrade their skills and obtain the training they need to move into higher positions (New Jersey state job portal, 2012).

5. THE VALUE OF TALENT SELECTION

In addition of investment in in-house talents and promoting vertical development, organisations can opt for double win – recruiting talents from other industries. If properly targeted and carefully deployed within the organisations, talents could provide many benefits for new employer – strategic mindset, unique skills, fresh perspective, innovation, new visions and then invigorate present management structures and decision making. At the same time they need to learn new industry intricacies, business complexity and driving forces in order to properly utilise their previous experience, expertise and skills. Again, if done just in too bluntly manner, staff takeover can harm organisational performance – for example, by HBR review, more than 40% of CEO taken from different industries remained just 12-18 months at the post (Harvard Business Review, February Edition, 2012). So the mastery is not just in making a copy-paste, but doing this in a way that adds

value to the operational and organisational context – well thought on benefits, systematically planned, culturally and value-sensitive, and with clear transformational objectives.

In order to succeed, cross-industry talents must possess a number of specific characteristics, like:

- Ability to interact at all levels, including back-of-the house employees;
- Excellent relationship builder;
- Superb communication skills and a great active listener;
- Passion for new industry, customer service and the team;
- Ability to drive change while respecting the past.

IT executives frequently migrate to restaurant companies from other industries. While they certainly have a learning curve with respect to the management and development of point-of-sale systems and the need for tools that can provide timely information, a smooth transition is actually quite achievable, especially for executives with retail backgrounds who are comfortable with multi-unit operations. "Multi-location experience is both beneficial and transferable," says Panda Restaurant Group's Liu. More than a quarter of new vice presidents of HR (26 percent) are from outside the industry, according to Korn/Ferry research. One outstanding example is Wendy's Cava, who previously worked at Nike. The restaurant industry can benefit greatly from cross-industry HR talent, particularly if they recruit from organizations where HR is a true business partner, such as Pepsi-Cola and Kraft (Damon, Hansen & Von Der Ahe, 2005.)

The new function of HR requires more than knowing the business; it requires extending the traditional service paradigm to become accountable for great decisions about talent, wherever they are made, and where they matter most. This requires building decision frameworks that logically connect decisions about talent to strategic success, and provide the language that HR leaders use to collaborate with, have deeper conversations with, and teach their colleagues to find new answers to strategic questions - answers that reflect a unique perspective based on human behavior and the principles of talent markets.

6. CONCLUSION

Developing of sustainable organisation in 21st century requires moves beyond traditional business boundaries. Relying on single strategy, slow implementation of changes, lack of transformational discipline or slow organisational learning are among typical factors of failure – dynamics of market evolution and increasing number of variables impacting operational ambience are requesting different approach than what has been historical answer to transformation. Today and tomorrow, organisations need to nimbly introduce transformation within its core business processes – improved business operations, constant innovation and supreme talent management have to go hand-in-hand. A cross-cutting element, aligning actions across such transformational pillars is organisational learning – part of which needs to be seriously based on out of industry learning. In our research we have been exploring attempts and models of cross-organisational and cross-industry learning as a factor of sustainable organisational development and have presented number of successful cases which have been dismantled to the level of success factors and elements. These strongly point that solutions for sustainable transformation and development largely lay out of industry – its becoming critically important to look for best practice models and positive experience in range of non-traditional partners across variety of industries, academia and NGOs, and explore transferability of practices which create added value for sustainable growth.

Upstream collaboration with suppliers can involve formal collaborative practices, such as formal supplier requirements and audits, and informal practices, such as sponsoring meetings and working groups to share best practices. Downstream collaboration with customers and consumers organizations may entail activities such as involving customers in the product design process, educating users on appropriate practices. And working with non-governmental organizations as well as the academic, scientific, and regulatory communities can encourage the development of sustainable solutions that are advantageous to both the business and the broader society. There are unlimited opportunities and pathways in exploring cross-industry learning and exchange and it's about organisation transformational capacity and human resources potential if these are going to be recognised and utilised. Prerequisites are among company strategy which places innovation and human capital management highly at development agenda, as these are levers to support tacit knowledge development, acquisition of best-in-class models and generation of transformational potential. Organizations which have recognised importance of these sustainability components have higher chances to survive operational environment changes and reach new operational models.

Abstract: *Innovations in the field of management have been given too little attention so far. The attention has been directed towards product innovations, that is technology innovations. However, no less important field of innovations is the one in the area of managing and organization, i.e. in the field of management. Innovation in management is any decision that allows the introduction and application of changes in the existing ways of managing and organization, thereby bringing the system into a better position compared to that in the previous period. Dealing with innovative work in an organization is a must-do if we want to maintain or improve competitive advantage, or to put it in other words - if we want to survive at the market. Innovative management means a complete mental revolution and that is why certain managerial levels do not want to mention it, more precisely they make obstacles for those who want to deal with innovative work. The key of innovative activity, i.e. innovative climate, is in the role of the leader in the first place, and only then in the role of the system.*

Key words: *innovations, management, leader, creativity, motivation, growth, development*

1. INTRODUCTION

The aim of the work is to point out to the importance of dealing with innovations on all levels, especially in the field of management. All, without doubt, share the opinion that the management is perhaps one of the most revolutionary inventions of the modern age. It can be put in the same level with inventions of the wheel, fire or something similar to this. If we start from the point that the management is a process which combines available resources of the organization in the most optimal way, all in order to reach established aims, it is clear what it is all about. The aims we are setting forth are more and more demanding, considering the quality of products as well as services, price, scope, and also considering the social responsibility of those who deal with production. Let us take the example of Henry Ford, who having introduced the specialization and division of labor advanced the level of productivity to such a level that he could have produced a car which was of good quality, relatively cheap and which could have provided an adequate level of profit as well as level of income which enabled massive purchase of cars even by the workers themselves.

It is an indisputable fact that from the end of the nineteenth century till the beginning of the twentieth century, a great progress was made considering the quality of way of living. Also, no one can dispute the fact a new way of organization and managing had a leading role in that. Nevertheless, many people set the question: whether the management as a conglomerate of skills, knowledge, tools and methods which we use in order to achieve established aims through optimization of results and investments, has come to a critical phase when further improvements are not possible, or we at least do not know about them. Are innovations possible even in this field?

More and more people who deal with the issue of managing set this as a very important question. Why do a lot of them claim that the management stayed "capsuled" in the past and that innovations in this field are not possible?

Generally accepted point of view is that the human factor is the most important factor of innovating and that the lack of necessary knowledge, skills and passion is the most serious obstacle to innovations. Does existing, bureaucratic organization and on its foundations established system of managing also based on hierarchy allow enough place to people for dealing with innovations in the field of management? Does too much regulated system give enough place for people's creativity or on the other side does organizationally "dissipated" system motivate people for innovations? Does ever-lasting fight for profit leave a little place for dealing with innovations, and is a little money from profit invested into researching something new that does

not have to mean success a priori? Is dealing with innovations a privilege of a few chosen in the company or it has to be everyday task of all employees?

Those are just some of the questions that have to be answered if we want find out about the importance of innovations in the field of management. Without constant innovating there is neither growth nor development of the company, nor mere survival in very severe conditions of competitions governing the market?

2. DEFINING THE TERM INNOVATIVE MANAGEMENT

When we talk about innovativity, most frequently we think about technology innovations, that is innovations in the field of product and service production. It is rarely thought of innovations in the field of management that is social innovations. Social innovations beside technology innovations refer to those ones in fields which treat relations with stakeholders, development of new markets, development of existing and finding out new organizational forms, novelties in designing etc. That is basically a new philosophy of thinking and a new philosophy of acting. Modern, innovative management comprises a complete mental revolution. There is no inventiveness in management without a completely new approach to the process of organization and managing. The way it used to be done so far should be changed, but in a way that a new approach improves efficiency of the system. Innovations are very rarely the result of coincidence and individual thinking. They are before all carefully considered changes resulting from serious, professional and team work.

Before we start defining innovative management, it is necessary to make a clear difference between the creativity and innovations. Creativity does not have to mean innovations, whereas innovativity has to comprise creativity.

Creativity basically represents ability of constant "production" of new ideas without any obligation to apply them through a new product or service or some other new managing form. On the other hand, innovation is nothing but transformation of new ideas into new usable values. These new products and services should do nothing but provide competitive advantage resulting in prize in means of increased profit. Japanese management has gone furthest considering this. Their attitude is that the product makes profit only when it is new at the market, whereas the rest of time it "produces" costs. That is exactly why their business philosophy is a little bit different than this one we know. That is why the curve of their product life cycle has the shape of pyramid with very sharp angle, with difference to classic life cycle of product which we from this part of the world recognize and advocate.

Innovation of management is everything that in great value changes the way we do business in managing or that in great value modifies common organizational forms and that way improves organizational structure.⁵ Innovation in management is each decision by which bringing and application so-far way of organization and managing is changed and the system is put into a better position compared to the previous period. It is a very dynamic process not subject to individual, mutually not connected activities, but is a process that has to be considered in all its integrity. All the elements on which the system functioning depends have to be included in it. Innovations are changes that exceed the previous practice.

3. CHANGES AND MANAGEMENT

Where does the reason for quick changes in management lie? Are we already late with these changes? Is existing management system not enough efficient, so it demands only slight changes or adaptations or we have inevitability of revolutionary changes which basically change so-far way of working? Are we ready to go into those changes that look for many sacrifices and which final outcome is a complete mystery? There are so many more questions that make dilemmas and that can discourage us from those changes. Changes are inevitability, and the reasons we should look for in the following:

1. Competitive advantage of the company never disappeared faster before if we did not pay enough attention to necessity of following changes that were happening in the surrounding, as well as in the very company. Before all, that is a consequence of quick changes connected to the market and the necessity of constant adjustment to customers' needs. Enough is only a moment of self-satisfaction that can result in delay to market reactions to make your competitive advantage erode and that you can hardly bring it back.

⁵ Innovations. (2011). Magazine No. 3. Zagreb

2. How to motivate people to deal with innovations?⁶ How to persuade the staff that their obligation is dealing with innovations? We can do that only if we are “persuasive” enough through the system of evaluation, either material or non-material, that each employee feels satisfaction and benefit from dealing with innovative activity.

3. Globalization had as a consequence an accelerated, almost non-controlled growth of competition. In order to ensure a position at the market which will suit your interests you have to be more successful than the competition. It can be provided only by innovative activity and especially that one connected to management. In terms of constant changes of business environment, innovation management has become the essential prerequisite for maintaining competitive advantages.⁷

4. With the development of information technology access to customers is much more simplified, but the same way the access of customers to companies which are subject of their interests are also simplified, and almost unlimited. That has a consequence that the reasons for competitive advantage are constantly subject to risk that dissatisfaction of customers’ results in purchasing the same products from competitive companies. Nothing can be hidden from the customer any more.

5. Costs of communication between producer and customer, between producer and producer and costs of communication between customers are drastically decreased. It brought about the appearance of new competition which before all has a cheap product or service, whereas all other preconditions connected to the product remain the same.

6. We have already mentioned in the previous part of the work that producers themselves work on it to shorten the product life cycle. We should go even one step further. We should be working on how to shorten life cycle of adopted strategy. Strategy has to be subject to constant check-outs and should be changed when necessity comes and adjust to new conditions. Operative efficiency considering strategic determination of the company should be checked all the time.

7. People’s consciousness about the need to push the level of social responsibility higher is growing all the time. Organization International Business Leaders Forum (IBLF) thinks that social responsibility is “promoting responsible practical work which is useful for economy and society, and facilitates achieving social, economic, ecologic sustainable development maximizing positive influence of economy on the society, at the same time decreasing negative consequences to minimum.” Generally speaking, for profit they make, companies are not only responsible to shareholders, but to all other groups and individuals which are in some way influenced by that profit. Customers recognize it more and more, so you have to direct considerable sums of money for those purposes, and from the other side you have to be careful not to jeopardize profit level by which you accomplish your business objectives. According to Kerle K., when estimating the success of an organizational innovation, four parameters should be taken into consideration: culture and corporate responsibility, practice innovation, managers’ approach to innovativity and creativity as well as the approach to the strategy changes.

All those challenges, problems and changes which we have mentioned inevitably bring to the conclusion that we have to do reassessment of long-existing theory and practical application of management which is in practice nowadays. Do present skills, knowledge, present tools and techniques, people with existing knowledge and skills can meet the challenges that new time needs? If the answer is negative, then what is that that can give an adequate answer?

What is that that presents obstacles for development of innovative management in organization? We can hear most frequently that the obstacle is existing system of organization, which is inadequate, not suitable, rigid, etc. On the contrary, we are of the opinion that the problem is not in the system, but in the people, more precisely leaders. The most frequent problem is that the majority of managers think that innovating is not too important for positioning of an average manager. Unfortunately, most managers want exactly that role of mediocrity, due to the fact that it carries least risk for their career and enables continuation in career development ladder. It is slow, but it is certain. Most managers do not see themselves in the role of innovators. Maybe we could correct this statement that they want mediocrity. It is sure that they want success and benefits which this success brings. But it is also a fact that they do not want the risk of career

building. They prefer seeing themselves as pragmatic workers whose task is not innovating but maintaining and servicing the existing system.

The questions pops out what should be done to make innovativity the way of thinking and acting of all the employees in the company, so we can search for answers in the following:

1. Primary role in providing this way of behaviour is the role of the leader that is manager running the company. The difference between the leader and the manager must be pointed out. Manager is a person destined to run the system which is in a stable state whereas leader is a person in charge of changes.⁸
2. The thing that must be known about innovation is that that innovation is before all work, talent, creativity and imagination. It is necessary but not at all sufficient condition to become a successful innovator.
3. Innovation has to be self-obligation of all employees, every day. It is up to leader to motivate people to deal with innovations. They have to provide means as well as time for dealing with innovative work.
4. Field of innovative activity must not be a narrow one. It has to be considered from all points of view in order that each employee could find themselves in some of the fields.
5. Innovations should result in changes, either changes of people or process itself. If one of both happens is a good thing, but the best one is when both of them happen.
6. We have to provide equal possibilities for each new idea. Only that way we will create the attitude among employees that their dealing with innovative work has equal possibilities to succeed as ideas of other people.
7. Provide adequate system of giving prizes. Apply the principle" bigger the contribution, bigger the reward". Stimulate people to contribute more even through system of non-material rewarding.
8. Each innovation is full of unpredictability. However, it is wrongly formed the opinion that innovators are risk-takers. Exactly due to this high dose of unpredictability , success is not granted. More precisely, innovators are people who try to decrease level of risk to the lowest level possible in the conditions when level of unpredictability is very expressed.
9. Persuade people that even failure is an integral part of business and that failure should not disappoint and discourage you from taking part in dealing with innovations in your organization. Create trust, suppress fear! Bigger number of attempts, bigger possibility of mistakes, but also bigger chances for success.
10. Enable people to use part of their work time for experiments. Those experiments must be frequent and must be sufficiently financially supported and justified. It is better to enable, especially in the beginning, more frequent but cheaper experiments.
11. Encourage differences because only competition of ideas can result in ideas. Leader must never ever be scared of different ideas. Those people should be encouraged because in plenty of different ideas, the solution is often hidden.
12. Enable provoking authorities. Let yourself as an authority be asked even unpleasant questions. Not just let it, but provoke associates to ask you challenging questions. This way you will reach abundance of useful information.
13. Avoid building authorities by leaders. Authorities should be built vice versa, down-upside, in other words authority must be promoted by colleagues and associates.

⁸ Kemiči, O. (1995). *Kako razmišlja strateg. (How Does a Strategist Think). Privredni pregled, Beograd*

In all these presented views, how to stimulate dealing with innovative work is determined by the role of leader. Leaders can communicate through language and in the way that will enable those whom they lead to understand the importance of the work they do, before all reaching higher cause. In the work we have already mentioned that for not dealing with innovative work the leader should be blamed for, not the system. But, who can be a leader and does leader promotion have to follow traditional way (promotion by higher hierarchy levels) or something else? We share the opinion that the other way, that is promotion by the employees, has to prevail.

What should be a necessary pre-condition that has to be met in order to become a leader? Before all, it is possession of adequate knowledge and professionalism. Beside these qualities leader has to be someone who can make associate "interested" in doing the things the leader wants them to do. And leader by rule wants to work in the interest of the organization, not neglected the personal interests of those taking part in the process. Very interesting are points of view made by eminent professor Velimir Srica, professor at Faculty of Economy in Zagreb, where he in one interview given for magazine "Dialogue", says: "in stable situations, when there are no challenges and no conflicts and everything is clear to everybody, it is almost all the same who is leading us..." (...). How come the critical situations in the organizations? Taking into account the influence of exterior factor that we can influence just a bit or not at all, we come to the point of view that for bringing the organization into non-stable position is responsible the person who is running it. And who runs the organization then? Managers do this - managers who also had the role of leaders in those times. That is exactly why we think that leaders are necessary even in the period when system is in a stable position, in order not to bring the system into a critical state due to possible interior failures and not-recognizing possible exterior factors that can influence the system.

Dilemma is also whether a leader was born, destined to be a leader, or it is the consequence of permanent education and work "on themselves". John Lock's thesis that a man is "tabula rasa", blank board where life is writing the pages all the time, is only partly true. Besides these genetic assumptions, each man has to work "on themselves" all the time. There are no universal leaders. Each situation demands different approach and different profile of leadership.

Why do we mention this and why do we talk about this? We talk about this because leader is a basic creator of innovative climate in organization, and innovations are basic triggers of development. Leader has to encourage innovative activities and has to support people who dare to express their ideas notwithstanding the result of the same ideas. Leader has to pay special attention to people who stand out from standards that is clichés. Hamel considers that innovations almost always come from "haters", that is people who are almost always contrary to other. Good innovators must be people with passion, and people we have already mentioned as "haters" or "people contrary to others" are exactly those ones who are creative, innovative and with adventurous spirit.⁹

Furthermore, leaders must have followers who will go towards the fulfilment of the objectives leader, that is group, wants. Leaders must show to managers and all employees the importance of higher causes. The most important aim of the organization is to reach competitive advantage that has to base on innovations, and especially those innovations in the field of management.

4. WHAT SHOULD AN INNOVATIVE ORGANIZATION POSSESS?

Organization that wants to base its survival, growth and development on innovativity, must redesign considerably its standard system of mutual connections and relations and subsystems. That organization must to:¹⁰

1. Considerately decrease the depth of hierarchical structure, that is reduce the number of indirect relations between higher and lower organizational levels. Networking is necessary but the network integration is the key factor for the complex innovative issues to be successfully solved.
2. Establish lattice organizational structure, particularly strengthening the knot points.
3. Strengthen and simplify considerably mutual system of communication on all levels with special aim to raise level of responsibility to level of self-responsibility, but not base it on the level of fear and

⁹ www.quantum21.net – Interview with professor Velimir Srica. Faculty of Economy in Zagreb

¹⁰ Gari, H. (2010). Budućnost menadžmenta (Future of Management). ASSEE, Novi Sad

power. The same way develop the climate in organization that duty becomes self-duty, not at all task given from "above".

4. There is no innovating without experimenting, and there is no experimenting without money. Possibility for all employees to deal with innovating should be provided, as well as part of means they can spend for those purposes. It must not be allowed that costs depress innovations. It is certain that organization cannot and must not allow uncontrolled waste of either time or money for experiments, especially those ones which chances for success are not very high.
5. Establish also adequate system for appraising connected to results. Basic principle must be: better the results, higher the prizes. The difference between prizes must be established: prizes for those whose contribution is bigger in difference to those whose contribution is more moderate.
6. Leader must be "produced" by a group, not at all by formal structure.
7. Provide support by all stakeholders, shareholders, because it is their money that is spent. This is particularly important in big corporations where there is a big dispersion of ownership and where managers as well as leaders are frequently devoid of adequate control by owners from many different reasons.
8. Cherish the cult of difference.

Those are some of the features that organization which wants to have the attribute of innovative one should or must possess. Without innovations there is neither growth nor development, and very survival is put into jeopardy. However, the innovation management means the process of making decisions or taking some actions going all the way from creating an idea to its realisation with the aim of achieving business excellence.

5. CONCLUSION

Based on what we elaborated in the work, it is clear that innovating is something we should cherish, and it must be incorporate part of behaviour in each organization. Only those organizations that understood innovations as issue of gaining and maintaining competitive advantage as well as mere survival at the market, have chances to succeed. Innovations must not be a privilege of only a narrow circle of people in organization. Opinion that only people who are imaginative and especially gifted can deal with innovations is particularly present. Innovating is before all work and knowledge, and only after them other elements come. Many organizations have seen that if they understand their gained leadership position for granted and something that will last forever, make a mistake and see their competitive advantage erodes quickly. It is lost mainly to the fact that they neglected the need of constant innovating and the fact that innovating is not an act, but an ever-lasting process. Probably the time comes when we will talk less about long-life of companies, but more about the results they had. It is a matter of time when employees in their working life would survive the company and when we will talk about this. Companies will appear, fulfil their mission and disappear. Time interval for all this will certainly shorten. Innovations promote the need for constant changes. They influence all business aspects and often include the changes of the companies' business models.

We have to point out that among managers of middle level there is still very present the thesis that the system should be blamed for organization's failure. No, people are exclusive factors for failure that is leaders who did not want or did not know how to run the company. It is an undisputable fact that there is resistance among managers in organizations towards changes. Changes can show incapability of managerial staff to adjust to those changes, more precisely to uncover their inabilities and jeopardize their easy position in the company.

Further research should be directed towards defining the leaders' role in creating and implementing the innovative atmosphere in companies. How should the employees be encouraged to accept the fact that the leaders are not elected according to the hierarchy but they are promoted by the people they work with and the organization they work in? It should also be clearly stated what exactly an organization expects from its leader, since the leader is expected to be the key figure of all changes that the organization goes through from the state it was found in to the state it intends to achieve. Such changes, which do not necessarily guarantee the success of the organization, require time, patience and money. How to make the proper conditions so that the environment could promote its leaders as well as the leaders could create the

environment capable of maintaining innovativity of the organization? This is not an easy task and it requires the engagement of all the employees and particularly that of the leader.

THE GENERAL MODEL OF ATTITUDE ADJUSTMENT AMONG SUBJECTS WITHIN THE ORGANISATIONS IN THE PROCESS OF FINDING AND REALISATION OF ORGANISATION INTEREST

Srđan Blagojević¹, Dragan Bojanić²

¹ Univerzitet odbrane u Beogradu, Rektorat, srdjanblagojevic80@gmail.com

² Univerzitet odbrane u Beogradu, Rektorat, draganbojanic@yahoo.com

Summary: *Functioning of any organisation without agreed actions of its subjects is utterly inconceivable. However, the ground of adjustment, as a necessary process that takes place in almost all organisations, is not addressed in the modern literature. To understand the process of adjustment, as well as its phases and stage, one needs to be well acquainted with the process of organising and organisation.*

Key Words: *adjustment, harmonization, organisation, achievement, directions of action, to achieve*

INTRODUCTION

Finding the interest of the organisation is not just a simple product of thinking, a decision about what the organisation needs at one time and what could be the most beneficial on a long term basis, what and how to do it at some point. Namely, in order to come to any conclusion about the interest one must never overlook the fact that there are numerous entities involved in this process and that they are the bearers of different interests. Interests relating to various matters, and may be realised according to different subjects. Some interests are obviously internal, while others are external. In the process of finding the interests of the organisation a lot of adjustment and harmonization is required during its various stages and phases. Due to the specific needs and interests of the organisation's functioning, the subjects of an organisation adjust and harmonize goals and directions of an action to achieve those goals.

1. THE MEANING OF ADJUSTMENT

In order to explain the general pattern of compromise more effectively, we must point out the general meaning of the term compliance first. In Serbian, the word adjustment means aligned, to reconcile, agreement (with something), to agree. To conform to each other means to reconcile, to agree. Coherence is a property, the condition of what is consistent, harmonized, ie. harmonious.¹¹

To agree means to bring each other in agreement. In addition, *to agree* means *to balance* and *to conform*.¹² There is the appearance of Equalization concepts of alignment and harmonization which is the case with the sources and everyday practice,. Although seemingly similar, and often explained in reference books, these concepts differ significantly.

It is similar to English. Most of English dictionaries explain the word adjustment as tuning, in order to align, to adjust, adapting, or harmonization, acts in the process of harmonization, etc. The second term in English which is used is *to tune* and it means adjustment, alignment and harmonization, and primarily relates to the harmonization of legislation, harmonization of prices, etc. Also, to confirm that we have the translation of English word *compatibility* (compatibility) which means consistent, harmony, to agree, etc.

However, there is a clear distinction between harmonization and alignment, and the two terms can not be considered synonymous. The reasons for this are numerous. The difference between the concepts of alignment and harmonization, in terms of methodology, reflected in the fact that reconciliation is possible only in the first stage of harmonization, it is not a synonym. Synchronization, in essence, means the elimination of barriers to the implementation of a decision. Also, it can be argued that harmonization is only one of the harmonization of procedures, ie. part of the harmonization process.

¹¹ Dictionary of Serbian literary language, Matica Srpska, Novi Sad, 2007 pp. 1412.

¹² Ibid

Alignment assumes operational behavior – action while it limits the harmonization of intellectual action. Thus, the concept of alignment is defined as the process of achieving certain goals, ie. achieving a certain behavior that meets agreed standards. Alignment is, therefore, the actual behavior in accordance with agreed standards. This definition emphasizes that harmonization is a process, and the effect of this process is the alignment of a number of subjects.

Subjects of compliance can be a powerful and obedient executor of orders, or equal entities. By convention, alignment, for example, includes not only the order and the powerful but obedient executor of the previous, actual consent, not imposed. Such is the interdependence of subjects depends on alignment and strong influence of each of the subjects in the process. The award arises here as a material incentive, or penalty for non-compliance.

2. GOALS OF ATTITUDES HARMONIZATION IN THE PROCESS OF FINDING ORGANISATIONS INTEREST

Each goal is a reasonable definition of a desirable or a possible situation. The existence of objective precondition for the emergence of a new organisational system, through the system the individual and society achieve articulated goals.

Therefore, the characteristics and importance of each specific target are based on certain principles that should be adapted to structure and functioning of the system in order to achieve a specific goal.¹³

In the process of achieving the goals of an organisation, there are two key moments of interest i.e. the organisation and its implementation.¹⁴

This is confirmed by the fact that the interest must be:

1. identified;
2. classified;
3. selection;
4. articulation of the interests of such organisations;
5. approval to collect the relevant subjects to be proclaimed as the interests of the organisation;

The interests of the organisation is to move from the sphere of thought in the realm of facts and actions, so that the organisation seeks to achieve its collective power of ideas about their interests.¹⁵

Alignment refers to the behavior of entities acting within the organisation, as well as subjects with the organisation:

- communities;
- organisations;
- institutions;
- individual stakeholders in order to achieve the organisation's interests.

Alignment prior to harmonization of positions, ie the achievement of mental, psychological, emotional and rational consensus on:

- problems;
- solutions (problem solving);

The objectives of harmonization need to overcome initial differences in attitudes and behaviors among entities that make up the organisation and to ensure their common functional activity. This is one reason why they can not be classified as general goals.

It is entirely appropriate to classify them, according to the areas concerned and in order of their realization. It also aims to be divided into levels: strategic goals, operational goals and concrete (instrumental) goals.

¹³ Kukoleca S.,(1972) Basic Theory of Organisational Systems, FON, Belgrade.

¹⁴ Term "Interest" derived from latin word interesum, interesse, means takes part in something, to be engaged in something, search extensively: Small political encyclopaedia,(1966), Moder administration, Belgrade, pp. 390.

¹⁵ About interests in general and interest on political field look widely:Termiz Dz., Milosavljevic S. (2000), Handbook for politicology of methodology , Sarajevo, pp 20-21.

The ultimate goal of implementation of the harmonization process is overcoming differences in attitudes and actions of entities of the organisation. This creates a precondition for ensuring certain level of competence that is essential to organisations able to respond to current and future challenges, increase efficiency, effectiveness, cost, and enable efficient use of resources, and to provide flexibility and adaptability of the system, as well as the harmonization of its developmental components with the overall development of society.

3. GENERAL MODEL OF ADJUSTMENT

The model is based on the adjustment for the harmonization of social reality in the daily coordination of behavior and actions of various entities aimed at achieving certain aims and objectives. Therefore, the alignment model is the product of the application of modeling methods that have been allocated to the necessary observations, the typical process of adjustment factors in the dynamics of social practice.

Adjustment is a social process of interaction of two or more participants, according to established rules or provisions of the decision. Therefore, the alignment of behavior and actions necessarily require prior awareness of the need and purpose of alignment and the need to establish certain relationships. These relations are, as a rule, essentially hierarchical, although they might be their various manifestations.

Given that the adjustment of social process, the development of a model we are using to engage the general model of an ideal case study of social phenomena. The essential factors of this model are:

Social situation which in itself includes a natural component of the impact of social processes;

The basic setting you take from this part of the above models can be formulated: what is happening on planet Earth, takes place in a situation that is necessarily complex. Accordingly, the adjustment takes place in a situation, a situation is a complex and subject to adjustment.

3.1 The subjects-actors in a social situation;

It is undisputed that no social situation without contributions, activities and acting social subjects - people, whether their behavior and actions are conscious, rational or instinctive. For this component we take the setting of rational behavior and acting companies organisations, because the alignment occurs as a rational action that is reasonable and willing subjects in relation to each other dependencies.

3.2 The needs, interests and goals

The needs, interests and goals are the third component of the model from which we take the needs of companies setting organisations to target, purposeful activity meet specific needs. Commitment to align the behavior and actions are necessary to target and willing to at least double sense:

1. each type of work involving more subjects, it must be played in a certain order, according to a schedule and space, coordinated and synchronized - aimed at achieving the goal. The first instance aim here is to achieve harmony in the behavior and acting subjects;
2. Second collateral, ie. basic aim is to conduct concerted action is appropriate and intended, that the results of that kind of behavior and action of water reach the achievement of desired and intended, defined as an action target.

3.3 Activities

Their interests and goals are achieved primarily by agents of the organisation by its meaningful, purposeful psychophysical, rational, timely activity or omission of some activities. This setting model as a whole relates to compliance. As a process, reconciliation is taking place at various levels of the organisation. It is essential, permanent feature that can not be maintained without a certain degree of harmonization in important areas of functioning of the organisation.

3.4 Methods and techniques of action

Human society, from individuals to organisations or institutions, in the action use (use) a variety of methods and techniques of action (various instruments and procedures). This point applies to the model approximation. So we can conclude the existence of regulations, information and communication, presentation and counter-thesis (antithesis), presenting arguments, debate, draw inferences, evaluation, compliance, consent orders and so on. In various direct and indirect manifestations.

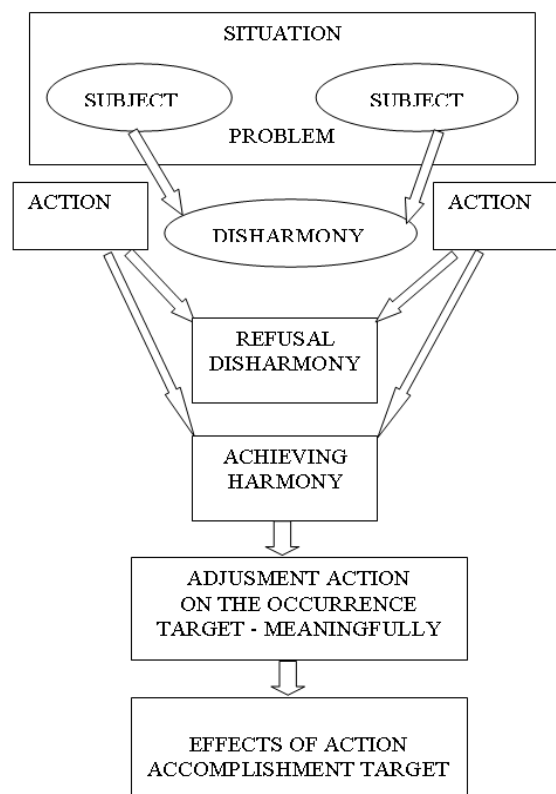

3.5 The effects of adjustments

All of these methods and tools help to achieve various degrees of effects, and effects of a two-sphere and sphere to sphere and compliance effects of concerted action.

Starting from the above we can conclude that an essential factor model of action and compliance behavior in principle equal partners as follows:

1. taking note of the need for adjustments in a given situation;
2. identification and articulation of such non-compliance issues and compliance cases;
3. initiative to begin the process of harmonization and notification of it;
4. consultation on the initiative;
5. official schedule of the approximation: the time and place, participants, and the problem closer to the subject, deadlines and procedures;
6. methods and means in the work on harmonization; mismatch detection, establishment of relations between the odds, the distribution of roles; resistance (content, format);

Planning the effects and recognize - effects assessment.

Picture: The general model adjustments process

Motives in the harmonization process are certainly benefits and damages suffered by the subjects and compliance with respect to those who suffer the damage and what the consequences or the damage they can use: individual, collective, general. The main relationship in the process of harmonization are certainly interdependent entities.

The subject of harmonization can be represented through the answers to several questions including: what? (Refers to what is being harmonized, ie. The strengths and assets) how much? (Refers to how much of which coordinates) when? (Referring to the time ordered for the alignment of object alignment); what? (Refers to funds that are needed to harmonize certain committed).

As is characteristic of each process, and the matching process includes specific phases:

- phase of informing and explaining;
- phase of agreement on a plan of execution;
- stages of completion;
- social effects of the execution phase.

Basis adjustments can be classified into four groups and to harmonize:

- adjustment based on reconciliation (by agreement, by mutual agreement);
- adjustment based on the order;
- alignment using the power and violence;
- combined.

Which of these groups, adjustments will be applied, depends on the structure alignment of entities and their relationships. The quality of decisions depends on the contribution of information and ideas harmonizing entities, their communication skills, prediction, reasoning, the degree to which the discussion focused on the problem and how to resolve certain inconsistencies and confusion.¹⁶

In each of these groups of adjustment, it is desirable that the subjects have some ability to negotiate for the purpose of negotiating and reaching a mutual agreement. Negotiation capabilities allow operators to harmonize the best way to communicate a problem, they laid his proposed solutions and the subsequent controversy with subjects, provide consent for the development and implementation plan for the solution of the problem.¹⁷

4. CONCLUSION

Opting for the treatment of this subject, we were aware that we can, within this study include all issues of this complex process of harmonization, let alone adequately resolved by science. So we started from the basic, scientifically validated and generally accepted knowledge. The complexity of this process is reflected in the fact that it is influenced by many factors and environmental conditions as well as the numerous parties involved in it.

We conclude that the purpose of compromise among the subjects of an organisation and operation of their achievement to overcome initial differences in attitudes and behaviors among subjects of a system. Also, the matching process relates to the conduct, acting within the system, as well as with other systems in society, and it precedes the true harmonization of positions, i.e. the achievement of mental, psychological, emotional and rational consensus on problems and solutions, which is the way of solving problems.

INNOVATION, MANAGEMENT AND BUSINESS SUCCESS

Slavka Draskovic

English School of Business, slavkadraskovic@yahoo.com

Abstract: New global world has developed new paradigm of success that includes need for constant change, knowledge based society and a paradigm of innovation as a part of it. The paper focuses on innovation paradigm and analyzes possible connection of innovation and business success. It is based on the research done among US business leaders of Serbian descent followed by structural and qualitative analysis of their life stories and biographies and autobiographies of more than fifty American business leaders of the 20th and 21st century. As a result of a search for the structure and success patterns in gathered material, the Scheme of Success is developed. The Scheme defines success as a process and gives the patterns/elements of that process one should follow in order to be successful. Innovation, any form of pioneering undertaking, is shown to be one of those defined, inevitable elements of any process of big business success.

By analyzing business leaders narratives and biographies, the paper deals with the topic of leadership and innovation using newest leadership study methodology flows which include more qualitative methodology in leadership studies.

Key words: innovation, business leaders, leadership, elements of success, scheme of success.

1. INTRODUCTION

Success is a concept that attracts attention and is desired by most people, although the meaning of this term is relative. While the term success is often identified with wealth and prosperity, its meaning can be different for different people and connected with achieving a certain goal. Wealth and prosperity usually come as a result of achieving a set of professional and personal goals. In this paper success is understood in the same way as it is used in the American myth of success that is, gaining wealth and climbing the social ladder from the lower to the highest social level.

How to be successful in achieving an objective has always been concern of human societies. Most of the research related to business success was conducted as a part of management and leadership in organization studies, having effectiveness of a manager in its focus. Global market and technology and continuous education led to need for innovation as the key success factor. And vice-versa, an ever-growing need for innovation and diversification led to the creation of a new kind of global competition and the need of continuous education of workforce in order to track the constant changes that this kind of technological environment and competition brings. A new paradigm of success has been developed that includes need for constant change and development of organizations and of people meaning knowledge based society and a paradigm of innovation as a part of it.

The author gathered and analyzed autobiographical stories of six American business leaders of Serbian origin and more than fifty other US business leaders' autobiographies and biographies. The autobiographies and biographies gave the corpus of facts which was then structurally analyzed for patterns and themes that are repeating.

The themes that were repeatedly present in every narrative were: 1. Hard work, long working hours 2) Personality traits that helped them succeed 3) Other people and institutions help that leaders had during their business career and how it was beneficial to their success. 4) Innovation, pioneering endeavor and novelties that leader introduced, 5) Crisis and risk, critical situations in which leaders found themselves in during their career 6) Circumstances and taking the opportunities. (Draskovic, 2010)

2. THE SCHEME OF SUCCESS

By grouping together the themes in the narratives one more theme was also recognized: Unacceptance of the existing situation and decision to act. All of these themes make elements of the Success Scheme. (Draskovic, 2010, 2011) We will describe briefly each of the Success Scheme elements and the Scheme

itself before we focus on one of success elements – Innovation - and analyze its place at the Scheme and it's relation to success.

(1) **Unacceptance of the situation** they found themselves, decision to change that, and **action** is the starting point of business leader's narratives of their business success. Determination to confront the situation and eventually leave their home is starting point for both Serbian Americans and other American leaders. They are not satisfied with conditions of their life, even revolt against it and very often leave their homes in search of better future.

(2) **Hard work** is the main element of the success scheme of US business leaders. Serbian Americans start to work very early, practically from their childhood. They work from dusk to dawn, work hard and sacrifice personal and family life. The same was found in the US business leaders biographies like Clarence Vulu, DeBartolo and others who started working when they were ten, twelve, fifteen, just like their poor ancestors in 19th century.

(3) **Innovation and pioneering undertaking** is another common element of the US business leaders success stories. Each and every one of them, including US business leaders of Serbian descent was an innovator and a pioneer in their fields of business. This element of success will be discussed more in the next chapter.

(4) **Personality** that is required according to both Serbian American leaders narratives and their US colleges biographies is the following: High ambitions and a need to prove oneself combined with perseverance, diligence and strong will. Hard and disciplined work is as important as good communication, honesty, team work, partnership, and respect for others and the community. It is also important to have vision and creativity and a strong moral code.

(5) **Circumstances** are recognized to have role in success stories in contemporary America. Even since 1939, in biographies of the American business leaders one can find the idea that it was not only hard work that contributed to success but also luck or circumstances. It was Henry Ford who said that he succeeded because he was in the right place at the right time. (Mayo, Nohria 2005.) But it is up to an individual to recognize opportunities. The circumstances that affect success are shown by the following diagram (Przulj, Draskovic, 2012):

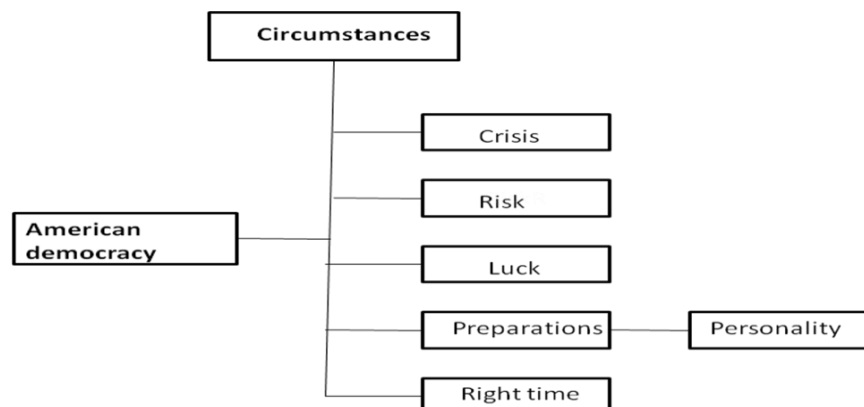

Figure 1: Impact of circumstances on success (Draskovic, 2012)

(6) **Crises** are not only part of the circumstances, but have their own impact on success. The individual narratives show several crises during the career, with at least one major crisis. Successful people are motivated by crisis, the crisis represents a challenge that influences change and helps them to advance in their career.

(7) No one has succeeded alone. All successful people have received **help** of some sort. An important principle to gain help is that it must have been deserved, with business leaders previous records, previous behavior that develops trust and respect, etc. The following diagram shows usual sources of help.

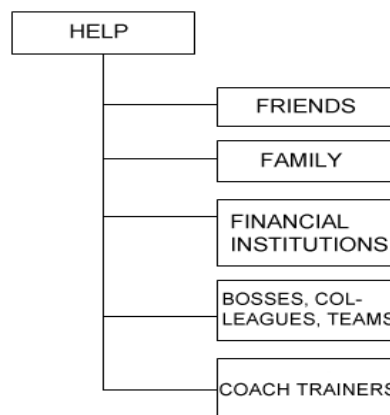

Figure 2: Sources of Help (Przulj, Draskovic, 2012)

Finally, there is a change of situation at some point resulting from all of the previous: hard work, loans, crisis, not giving up i.e. persistence, several attempts, help from others. Elements of success are graphically shown in the scheme on Figure 3:

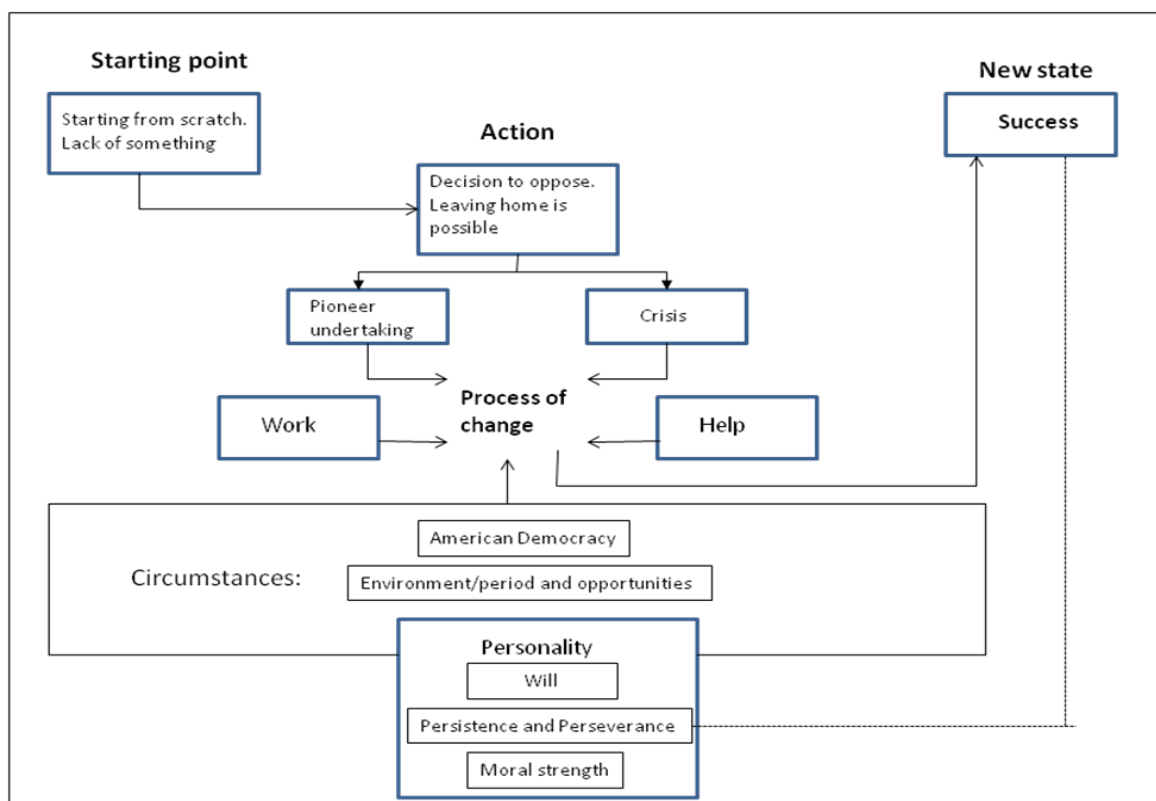

Figure 3: Success Scheme (Draskovic, 2010)

The scheme shows starting position as unfavorable in relation to later status. This position represents the lack of something, situation that needs to be changed. An action is connected with innovation of some sort (pioneer undertaking), inevitable crisis and risks. They initiate change, but for the change to happen two more elements are needed: hard work and help from others. Finally, the whole process is followed by circumstances needed to climb to the next level. These are social-economic system that supports success (American democracy), new areas of business, new environment, but also of the person and her readiness to recognize and take chances. Not until all of these elements are combined together can a higher level change occur.

3. INOVATION, MANAGEMENT AND SUCCESS

The environment is increasingly dynamic and competitive. There is a need to have people at every level who are oriented toward learning and continuous improvement. Organizational learning involves acquiring and using new knowledge. Learning Organization is the term for organizations that learn rapidly and use knowledge to become more effective. (Chawla, 1995) This kind of organization has embedded values of learning, innovation, experimentation, flexibility and initiative. Knowledge is diffused through the organization as they nurture ideas and support changes initiated by people at lower levels. Concept of learning organization is connected with the experimenting, risk acceptance and right to make mistakes.

Among different types of organizational change there is the organizational approach: organization can change and develop as it improves human capability, commitment, and creativity by increasing individual and organizational learning, strengthening cultural values that support flexibility and innovation. (Yukl, 2010) This type of development encourage appreciation for flexibility and innovation, set innovation goals, encourage and facilitate learning by individuals and teams, help people improve their mental models, leverage learning from surprises and failures, encourage and facilitate sharing of knowledge and ideas and Reward entrepreneurial behavior.

How leaders influence organizational performance (effectiveness) is one of the most important questions in strategic leadership. It is seen as dependant of three types of performance determinants: Efficiency and process reliability, Innovation and adaptation and Human resources and relations. (Yukl, 2010) The focus of this paper is on Innovation as the performance determinant.

Global environment changes the character and the essence of the innovation process. Innovations become inseparable part of business success and of competitiveness. Too many commodities and services at the global market and too many information urge need for new and different. There for the innovations get critical importance.

In addition, we are arguing that innovation was always important for business success. Looking into the way US business leaders earned their fortune, there is one pattern striking for our attention: repeating in each and every biography that each of leaders has been inovator in his field of work, and has given something new to the business and the community. Whenever we find a wealthy and succesfull manager, we can find pioneering business undertaking including new ideas, new products or new ways of selling, new way of advertising etc. From Carnegie in steel industry and Ford in the automobile industry to new Silicon Valley richmen, all has built their empire on a new and innovative businesses. The same is with the Serbian Diaspora US business leaders. In every narrative we found the story of a pioneering undertaking of a particular business leader. (Draskovic, 2010, 2011) Each of them has been pioneer in his fields of work: Michael Djordjevic has made a *Capital Guaranty* corporation that has for the first time connected banking and insurance business; Mandaric and Selak introduced new technologies, one in ICT industry in Silicon Valley, the other in offset print in Chicago Illinois; Mijušković has introduced at the time new multilevel sale model into Avon, US corporation etc. I have always been promoted on the basis of innovations I was introducing, says Mijuskovic. (Draskovic, 2010).

Alex Machaskee introduced new way of dealing with workers unions as well as new way of combatting with the competition; (Draskovic, 2010) Martin Selak, another US business leader of Serbian descent, has been pioneer in one of the sectors that emerged in late 60s – offset printing. He has today fourteen patents for the offset machine which made him and his company wealthy; Milan Mandaric was one of the pioneers in Silicon Valley inventing new technology use for the electronics of the developing PC industry; Vukovic has been one of the first to recognize the potential of the mobile home business becoming the King of the Mobile Parks in the US, etc. (Draskovic 2010)

Innovation is part of every US leader's business success. We have already mentioned pioneers undertaking at automobile industry which helped Henry Ford to become an icon of a self-made man. He began life as a farmer's son and quickly became rich and famous. His main innovation is the design of the Model T for the masses, but he also installed first mechanized assembly line to make production cheaper and faster. In steel industry Carnegie made his fortune with his innovations. One of his two great innovations was in the cheap and efficient mass production of steel by adopting and adapting the Bessemer process. The steel price dropped as a direct result. Carnegie's second invention was in his vertical integration of all suppliers of raw materials. Every other leader has in one way or another being part of some new and pioneering business. We will mention just few more examples: Famous Ball Brothers made a fortune within a few years

after added glass production to the business and, in 1884, produced their first fruit jar made of glass replacing wood jars; Frank Phillips, petroleum magnat was a pioneer in natural gas production and fuel for emerging avioindustry; Clarence Saunders has developed the first modern retail sales model of self service. His ideas have had a massive influence on the development of the modern supermarket. He was introducing innovations for most of his life trying to develop a truly automated store, developing Piggly Wiggly, Keedoozle, and Foodelectric store concepts; Juan Trippe has been the first to offer aircraft service to distant regions in US and also first to offer international air flights by his Pan Am company. He was also first to introduced three motor aircrafts which were able to exercise post as well as passenger service. (Mejo, Noria 2010)

Margaret Ratkin was first to produce what is today known as an organic food and Edward DeBartolo developed shopping malls, and was first to invent what will become shopping boulevards and consumption transformed into a social experience, place for not only clots buying but meeting friend, relaxing, going out with kinds, have a meal etc.

The same importance and connection of innovative management and success can be found in IT businesses. One example can be Dell Corporation. Dell started an informal business putting together and selling upgrade kits for personal computers. He made a fortune introducing innovation of selling PCs directly to customers which had enormous advantages over the conventional indirect retail channel. Dell Corporation introduced other innovations to industry first offering one month refund guarantee and was also first to offer industrial service at the buyer location. And everybody knows software interface that Bill Gates invented which revolutionized computer usage, etc.

These men and women have changed the way we work and live. Great successes are rarely won by playing safe. On the contrary, the biggest fortunes have been won by those willing to step outside the box and change the way the game is played. They are business innovators. For example, Jack Welch is perhaps most famous for streamlining GE, reducing management from 29 levels to only six, Steve Jobs, co-founder of Apple and chairman of Pixar is responsible for changing the way the world works and plays, and at the end of his autobiography, Sam Walton wrote that the most important rule in business is to break all the rules, which he did by his innovative and daring approach to business.

4. CONCLUSION

Invention as an element of success is not only part of the biographies and autobiographies of business leaders of this and previous century, but also a part of other contemporary narratives of success like popular literature which has made the success one of its subjects. But, in addition to that, innovation is also, nowadays, inevitable part of academic management literature. New trends in management recognize innovation to be not only element of successful management and managers, but of the organization effectiveness. As discussed earlier, in the world of globalization and constant change, innovation is not only seen as an element of success and effectiveness, but as a key element of effective management. At the beginning of the 21st century, we are witnessing the rule of innovation paradigm that puts innovation and new knowledge in a center of development of individuals, organizations and communities as a whole.

Although innovation as an element of success is underlined by modern global world demands and today's management practice and theories, its importance for achieving success has already been known for centuries. In traditional narrative forms, like fairy tales and myths, we can find pioneering undertaking and necessity of new in order to achieve goals. These traditional stories describe the ways in which a hero reaches the objectives and achieves set goals. Heroes' actions are usually something that he is doing for the first time, and he will be the one to do it for the first time in his community, thus setting a new standard of behavior. Opposing an enemy for the first time, or in a new way, never before being imposed to such a challenges and obstacles, all can be found in traditional stories. (Draskovic,2010) So, by seeing innovation as a part of the organizational development in a new and different perspective today is in a way reinventing innovation as an element of success. Successful Americans, including ones of Serbian origin, confirm that and teach us, based on their own experience, that innovation is inevitable part of any effective management and of any big business success.

INNOVATIVE MANAGEMENT AND OPERATIONS (BUSINESS) PERFORMANCE

Jovo T. Tauzović

Independent researcher into Systems Management Theory

Risan, Montenegro (e-mail: tauz@t-com.me)

To my granddaughter Mia Tauzović for her first birthday

Abstract *Using the principles of the Systems Management Theory, the definition of modern (innovative) management as a process of an effective and efficient union of (contemporary) operations (organizational) functions and (contemporary) management functions is specified in this work. For its determination it was possible to use the **innovative** (systems) methodology of **management** called **Tauzović's General Continuum (TGC)**, which can be applied on both theoretical and practical levels. By using the TGC, analysis of management concepts can be performed and a synthesis of those concepts can be given, which made it possible to determine the **performance** of the strategic and operational management parts first, followed by the organizational (operations) **performance system**, in a more detailed way. Since competitiveness (the **why**), quality (the **what**) and flexible efficiency (the **how**) are the main performance indicators, it is possible to give a brief conclusion as to **why** modern organizations exist - to be competitive and innovative, which means that they provide the right things (**what** - quality / in a timely and effective manner/) and in the right way (**how** - profitably /flexibly and efficiently/). This innovative management approach ensures **customer (consumes) satisfaction** and **manager (employee) loyalty**. Therefore, the contents of this work are focused on them, in order to test, accept, use and further research areas where they belong to.*

Keywords management, performance, operation, system, Tauzović's General Continuum (TGC)

1. INTDODUCTORY CONSOLIDATIONS

Continuous modern management improvement, as an all-embracing process of universal (and modular) goal setting and achieving, leads not only to new innovative management concepts and contemporary explanations of its procedures, but also to the detailed procedures regarding how to achieve those goals. By applying the principles of Modern Total Quality Management (MTQM), modern management research becomes easier to both understand and use. In order for a modern system to achieve, use, maintain and develop its (overall) capacity and provide opportunities for its further improvement (i.e. be competitive), the practice of successful organizations (systems) is to invest significant resources into specific systems prerequisites for management processes improvement. The most important structural prerequisites for these purposes may include: 1. (investing in) research and development, 2. integration resources (people and facilities), 3. finding modern management methodologies that enable innovation, and 4. continuous improvement through a comprehensive system.

Systems Management Theory is an all-embracing management process (as a **practical theory which first "raises" real data, through information and knowledge, to the level of theory, and then "transforms" it into concepts**) as its basis. It divides a system into: (i) natural, (ii) technical, (iii) organizational and (iv) social components. The systems approach defines systems as sets of interrelated elements, components or subsystems (with their mutual relations) that, if functioning harmoniously, can provide synergistic outputs. In the systems approach, systems are open (in that they have permissive borders), as opposed to analytical systems where are considered to be closed. Open systems are influenced by their environments, which may be there:

1. General environment (economic, technical, financial, informational, political, social, etc. – as being parts of the general market), or macro-environment and
2. Working (determined) environment (competitors, suppliers, collaborators, customers – as being parts of the goal /market/ markets), or micro-environment.

Starting from the general and working environments, modern management should be performed at all levels of management, namely: 1) the institutional level (or level of planning /PL/), 2) the strategic level (or level of organizing /OR/), 3) the operational level (or level of directing /DI/) and 4) the control level (or level of controlling /CO/), or its separate parts - (1) strategic (s - levels of planning and organizing) and (2) operational (o - levels of directing and controlling) (Taufzović, J. T. 2009). Since design and improvement of a system can be considered modern methodologies inherent in modifying a system, design and improvement of modern systems are performed on the strategic part, while the design is done because of more significant and complete environmental impact, and the improvement is mainly done due to lower or increased influence ("requirements") of the operational management part.

Using MTQM, as a modern systems management approach aimed at continuously improving the value of products (goods, information, management and services) through design and (systems) processes improvements it is possible for management to not only to achieve their goals, but also make their procedures more acceptable and understandable for managers (employees) and customers (consumers) of the products. This modern strategy, among other things, represents a very good basis for all-embracing innovative management processes of design (redesign), improvement and all-embracing (research and management /in the narrow sense/) modern systems management. Among such innovative methodologies, modern methodologies (of research and) of management, based on an overall development of business (as a special type of organizational) systems, starting from work unit (as a basic organizational system), i.e. the main systems unit of business organization itself, to the system of its direct (working - as goal /market/ markets or business activity market) and indirect (general - as other markets or business market) environment, important role. In these considerations, the existence of (modern) operations systems as extensions (or upgrading) of operational system parts such as marketing (MA), resources (RE), operations (understood in a narrower /or production/ sense - OP) and finances (FI) stands out. By conducting contemporary research into the general traditional hierarchy of systems, the existence of operations systems, was also proven, which was crucial for the establishment of new methodologies for their, management. For contemporary research, operations systems can be defined as mutually interrelated sets of extended (or upgraded) systems operations.

Determining the necessity of operations systems (Taufzović, J. T. 1998) is of particular importance for all economic activities, i.e. what people do in the absence of all-embracing resources to overcome shortages. As an extension (or upgrade) of the system operations which are used for management determining and achieving, **operations systems are basic and major parts of the wider business system (organization), which have to participate in (preparing and) making all management decisions, because only they can understand, accept, design, further improve and implement the decisions.** As these operations system features are of **vital importance for business organization**, the **business performances** refer to **operations performances**. Therefore, modern management operations systems are subsystems for business systems (organizations), and they have production systems consisting of work units (as organizational units' /systems/ consisting of people and facilities) as their subsystems.

2. TAUZOVIĆ'S GENERAL CONTINUUM (TGC)

Modern systems approach and analysis of results obtained through all-embracing research carried out within the research project "Modern Management of Operations Systems" (Taufzović, J. T. 1998), may lead to systems synthesis so that components (or functions) of operations systems may be globally (theoretically and practically) shown, and studied in terms of certain areas of activity (processes), namely: 1.P - Activities of preparations (1.1.Pe - External and 1.2.Pi - Internal), 2.A - Activities of analysis, 3.S - Activities of synthesis and 4.C - Activities of control. Further analysis of such relations leads to consideration of what kinds of relations may be used for theoretical and practical needs (of management) through:

{ → 1.P - Activities of preparations (1.1.Pe - Activities of /total/ needs /or requirements/ for the system existence ← → 1.2.Pi - Activities of system policies /opportunities or strategies/) →
→ 2. A - Activities of system support (or inputs) →
→ 3. S - Activities of system supply (or transformation of inputs into outputs) →
→ 4. C - Activities of system assessment (/improvement/ or outputs)→} (Figures 1 and 2).

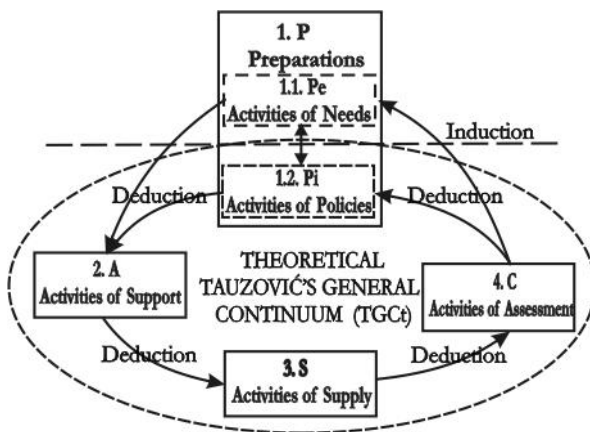

Figure 1 – Theoretical Tazovici's General Continuum (TGCT)

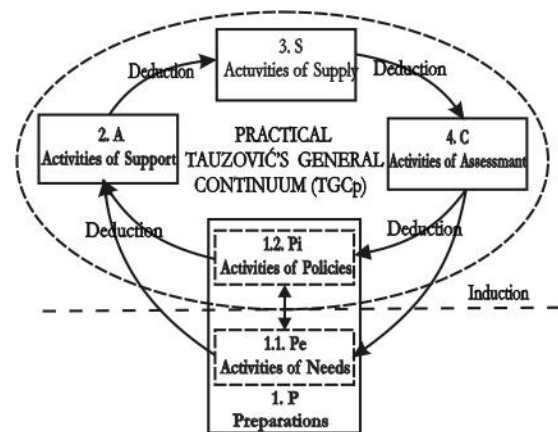

Figure 2 – Practical Tazovici's General Continuum (TGCP)

Using this **innovative** (modern systems) **methodology**, called **Tazovici's General Continuum (TGC)**, it is possible to resolve problems of the system and all-embracing management, through subsequent use of the continuum of four sets: (i) cyclical, (ii) iterative, (iii) continuous and (iv) spiral activities in TGC, based on modern model of operations systems management consisting, apart from the level of the working /and general/ environment, also of four levels: /1/ institutional (planning), /2/ strategic (organizing), /3/ operational (directing) and /4/ control (controlling) (Tazovici, J. T. 1998). Such a management methodology can be divided into two parts:

- (i) **inductive part** – consisting of 1.P – Activities of preparations (1.1.Pe – Activities of /overall/ needs /or requirements/ and 1.2.Pi – Activities of policies /opportunities or strategies/ ($\rightarrow 1.P \rightarrow 1.1.Pe \leftarrow \rightarrow 1.2.Pi \rightarrow$), and
- (ii) **deductive part** – consisting of 2.A – Activities of support, 3.S – Activities of supply and 4.C – Activities of improvement (/assessment/ $\rightarrow 2.A \rightarrow 3.S \rightarrow 4.C \rightarrow$) (Figures 1 and 2).

Through the application of the TGC, it is possible to conditionally display it as a modern (i) theoretical, social-organizational or strategic application, mostly directed to "soft" systems (social and organizational – **TGCT**) (Figure 1) and (ii) practical, modern natural-technical or operational application, primarily referring to modern (supplied with organizational /operations/ functions) traditionally called "hard" systems (known as natural and technical – **TGCP**) (Figure 2). Various forms of the TGC model (TGCT and TGCP) are directed to a more acceptable understanding and monitoring of their use in all-embracing management (research and management) of various types of modern systems or system parts, as well as their internal levels. Such forms of systems management offer a good foundation for further initiation and general development of not only future management methodologies, but also business organization **performance** standards.

When considering an all-embracing management approach, the TGC application may be used, both when looking at specific contexts and the overall "picture". It is applicable both at a strategic or theoretical (TGCT) level and at an operational or practical (TGCP) level, for each part or management level separately, and is even applicable to certain parts (activities) of each management level. In all cases of TGC application, the prior procedure refers to **why** and **what** should be done (as induction), and the subsequent one to **how** it should be done (as deduction), which again becomes **why** and **what** should be done, etc.

3. MODERN (INNOVATIVE) MANAGEMENT

The application of the TGC not only confirmed many existing solutions and solved some existing operational issues, but it also uncovered the absence of earlier, traditional and advanced methodologies, not only in business systems, but also in other economic, and theoretical assumptions (Tazovici, J. T. 2009). A particularly important result obtained by using the TGC is the determination of the value of an operations system's existence (originally defined as sets of upgraded operations of organizational functions). The need for operations system existence also meant that there was a need to redefine and modernize the (traditional) hierarchy of (business) organizational systems (Tazovici, J. T. 2009). Modern organizational systems hierarchy, instead of the traditional eight levels, has nine, with the additional level being the **operations**

system. This consideration is based on the first six hierarchical levels (systems), as follows: 1. work unit (as the basic organizational unit /system/ consisting of technical and human resources intended for the performance /safety/ of one /specific/ type of product), 2. production system (as an organized group of /related/ work units intended for the performance /production/ of specific products /goods, information, management and services/), **3. operations system** (as an organized set of all /designed/ work units /or production systems/), 4. organization (as an organizational system specified for meeting specific needs /working and general/ environment), 5. markets of certain business activities (as goal /market/ markets /working environment/) and 6. business market (as general market /general environment/). The first four hierarchical levels (systems) belong to the organization, while the last two are its environment (Taufzović, J. T. 1998).

Defining (modern /innovative/) management (Taufzović, J. T. 2006), as a process of the effective and efficient union of: (1) marketing (MA□), for purposes of planning (□ PL), (2) resources organizing (OR□ □ RE), (3) operations directing (DI□ □ OP), and (4) finances controlling (CO□ □ FI), activities of (modern) management can be presented through the activities of Taufzović's General Continuum (TGC) – 1. Preparations (P), 2. Analysis (A), 3. Synthesis (S) and 4. Control (C), and in that way organizational (operations), determined by customers, and management functions, determined by managers, are effectively and efficiently united, for security needs from users of the product in question. Therefore, organizational functions (the **why** and the **what**) should, through management, be effectively and efficiently brought into unison in order to determine the **how** to proceed.

For modern operations systems (research and) management, as well as for development, "considerations" are usually based on the achievement of a definite (general /strategic, designed/ and individual or specific /operational, production/) quality of future products of the system, which would be the basis for the system to enable competitiveness in its environment. A detailed systems analysis led to the conclusion that the level of: (i) controlling must use **real (practical) data**, (ii) directing – **information** (obtained from real data), (iii) organizing – **knowledge** (extended by information of the real data) and (iv) planning – **theory** (supplemented by the knowledge determined on the organizing level) (Taufzović, J. T. 1998), while for the environment (especially working) management, **concepts** (as distinct ideas and views based on relevant theory and practice /experience/) are used (Taufzović, J. T. 2009).

As a single unit, the strategic and operational management of (organizational /operations/) system – with its constituent parts, constitutes a mutually cyclical, iterative, continuous and spiral continuum. The management of each part gives a unique contribution to all-embracing decision-making and implementation.

Since the modern management in general, can be divided into strategic (**s**) and operational (**o**) factors, management parts can be further divided into two levels each, namely: (1) strategic – (i) planning (PL, as strategic policies /1.2. Psi/ – which takes into consideration the strategic preparation of planning, i.e. strategic need, as general strategic marketing /Mas/ – 1.Pse) (Figure 3) and (ii) organizing (OR – strategic support /2.As/, strategic supply /3.Ss/ and strategic improvement /4.Cs/ and (2) operational – (iii) directing (DI - including its external preparation /1.1. Poe/, i.e. operational need, as an individual operational marketing is a part of/ strategic management /Mao/) and (iv) controlling (CO – operational support /2.Ao/, operational supply /3.So/ and operational improvement /4.Co/) (Figure 3). Planning (PL), based on marketing, and the design (including improvement), i.e. organizing of operations (OO) are achieved by the use of strategic management, while operational management is used for contracting, i.e. directing (CN) and performing, i.e. controlling operations (PR), thus, using already organized (designed and improved) operations. While designing (redesigning) the operations (organization) (for needs of general environment or business market, as general market) the goal (market) markets (working environment or business activity market) are chosen. While improving, the already designed organization is adjusted to better goals achievement (of working environment) (as much as possible). Since through management, goal markets are determined from general one, it has goal markets as its basis.

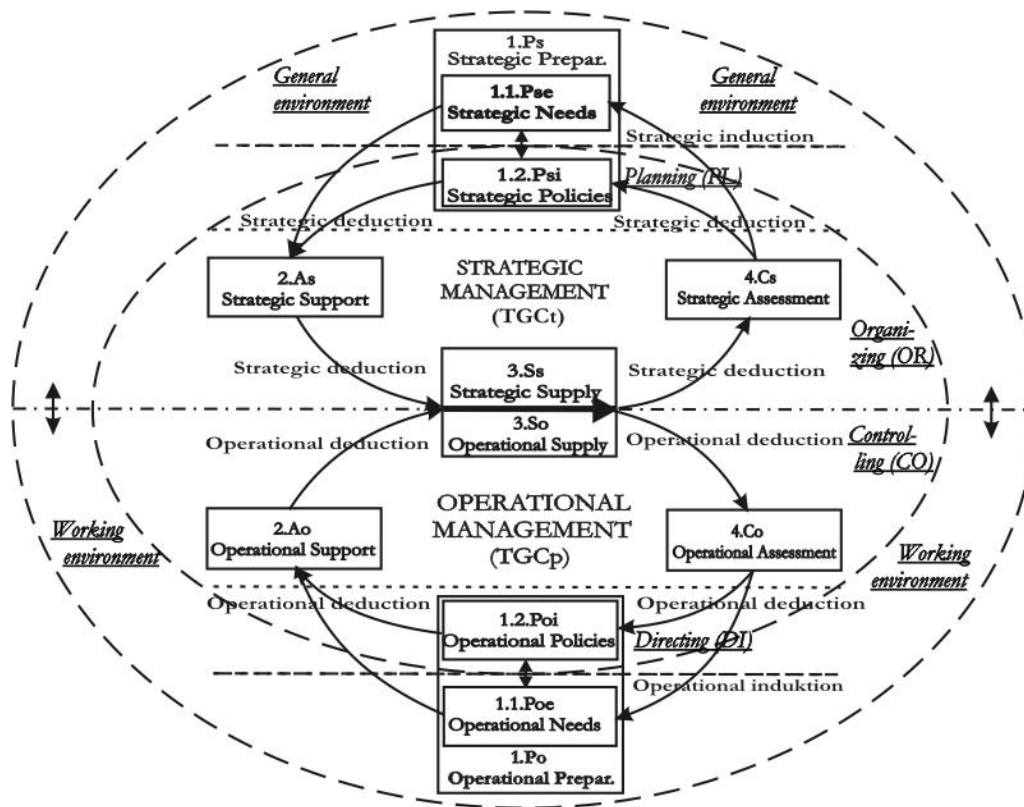

Figure 3 – Modern (innovative) management of (business) organization
(according to Tazović, J.T. 2012b)

While establishing business organizations, in addition to strategic (i) preparations (strategic external and internal) activities, strategic (ii) support activities (as strategic inputs), (iii) supply activities (as strategic transformations of inputs into outputs) and (iv) improvement activities (as strategic outputs) are determined. Determining the strategic (activities) supply as a synthesis of strategic management – designing (and improving) operations (organization) (3.Ss) (Figure 3), i.e. an all-embracing supply for which the (business) organization is designed, is of particular significance. Considering such a supply as a strategic one, it can be viewed as **(all-embracing) basic (operations) organization supply**. By analogous consideration of performance of (business) operations operational (activities) supply, presented through its synthesis – the transformation of (production) inputs into outputs (3.So) (Figure 3) can be viewed as operational supply or production system supply, as **supported (productive) organization supply**. Since organizations can operationally supply (i.e. produce), the maximum of what it has been strategically supplied (determined by design and improvement), operational supply (as production - 3.So) can therefore be considered as "subsystem" of strategic supply (which can provide designed and improved operations – 3.Ss). By establishing the direct connection of these two supplies – as a **whole organizational (business) supply** – it is possible to more easily view the (all-embracing innovative) organization (system) management as well. The division of (all-embracing) (business) organizational management into strategic (s) and operational (o) parts can be displayed by the Tazović's General Continuum (TGCT and TGCp) organization (Figure 3). By using TGCT with the strategic management, (business) organization (its operations systems) is designed, while, using TGCp with operational management, the use of already designed (and improved) operations systems as production systems is determined. In this way, it is determined **what** can be done at strategic part, while operational part enables **how** it should be done in order to "satisfy" **why** (business) organization does that. Strategic management (as integrated management /satisfies the contemporary definition/) is done through the process:

{ □ Ps □ As □ Ss □ Cs □ }

of organizations (operations) design (and improvement), while operational management (as integrated management /since it satisfies the contemporary definition too/) is done through the process:

{ □ Po □ Ao □ So □ Co □ }

of product production (using operations system) (Figure 3). Although these two management parts can be viewed separately, (business) organizations management is done through the all-embracing process:

$$\{\square \text{ Ps } \square \text{ As } \square \text{ Ss } (\square \text{ Cs } \square \text{ Ps } \square \text{ As } \square \text{ Ss}) \square \\ \square (\text{So } \square \text{ Co } \square \text{ Po } \square \text{ Ao}) \text{ So } \square \text{ Co } \square \text{ Po } \square \}$$

(Figure 3), where the needs to control specific management parts is indicated in (round) brackets.

Symbolically viewing, incorporating strategic management supply (3.Ss) and operational management supply (3.So) capabilities of operations and production system are brought into direct connection, as a unified whole (system) which can be viewed as a **static** (a determined structure) in the first case, and as **dynamic** (using process through structure) whole (the system), in the second case.

4. OPERATIONS (BUSINESS) PERFORMANCE

Considering that (business) organization represents what its performance (as a process of assessing how well its operations can produce and improve their products) shows, if it wants to be competitive the market, it must design and employ systems (of measurement results) performance, which provide feedback from its activities, which are needed not only to control, but also to improve its processes. Since one can manage only what can be measured, operations performance is assessed through the results of their measurements. Because of that, an organization must first define exactly what the units of measure used to evaluate their performance. The general rule must be as more general as necessary and as more specific as possible.

In organizations, their operations systems have the greatest impact on productivity, and hence profitability. However, since the role of operations is to achieve the defined objectives as effectively and efficiently as possible, this means that operations systems are responsible not only for achieving the productivity, and thus the profitability of the organization (as interior operations performances), but also for achieving its competitiveness (as external operations performances). Although advance management could have accepted the possibility for both strategic and operational management to use the same performance systems (of evaluation and improvement measures) in modern (innovative) management, different, mutually harmonized (analogue) performance systems are used (Tauzović, J. T. 2012a), namely:

- 1) for the strategic part, **strategic system of operations performances** should be implemented as design of the organization (operations systems) {→ 1. (1.1. General competitiveness (as operations) ← → 1.2. General quality (as operations) → 2. Productivity (directed to incomes /by choosing more appropriate markets/) → 3. Efficiency → 4. Effectiveness →} (Tauzović, J. T. 2008) and
- 2) for operational part, **operational system of operations performances** should be implemented as usage of operations systems for production of (certain /individual/) products { → 1. (1.1. Individual /products/ competitiveness → ← 1.2. Individual /products/ quality) → 2. (Products) Costs → 3. (Products) Production flexibility → 4. Timeliness of product arrival (to goal market) →} (Tauzović, J. T. 1998).

For determining the optimal strategic measures (of evaluation and improvement) systems operations performances, quality (intellectual) simulation is used (which uses a small number of data to determine /relatively/ much information) (according to Tauzović, J. T. 2009), and for determining the optimal operational measures (of evaluation and improvement) systems performances, quantity (technical) simulation is used (which uses a great number of data to determine /relatively/ little information). Having strategic and operational system performance as the basis, **organizational (business) system of operations performances** is defined. It is {→ 1. (1.1. Competitiveness ← → 1.2. Quality) → 2. Profitability (based on productivity) → 3. Flexible Efficiency → 4. Timeliness Effectiveness →}. For all-embracing preparations {→ 1.(1.1. Competitiveness ← → 1.2 Quality) →}, thus, for **sufficient competitiveness necessary quality** should be determined. For determining individual measures (of evaluation and improvement) of performance: (1.1.) Competitiveness requires **concepts**, (1.2.) Quality – **/real/ data**, (2) Profitability (based on productivity) – **information**, (3) Flexible efficiency – **knowledge** and (4) Timeliness effectiveness – **theory**.

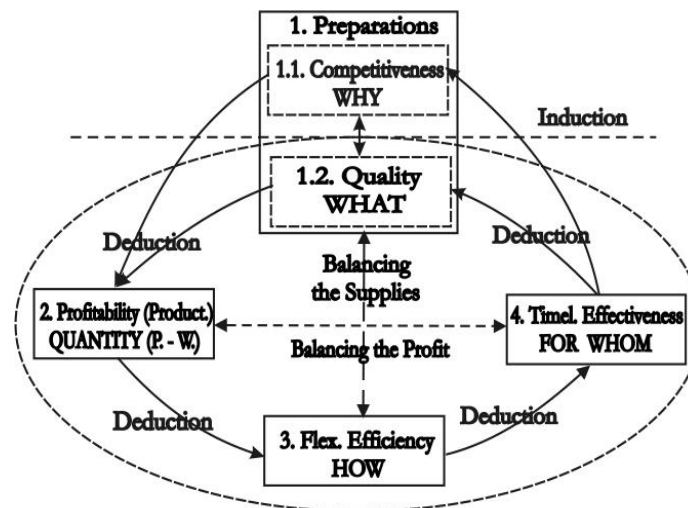

Figure 4 – Tazovici's General Continuum of the balancing supplies and profit

By 1.1 Competitiveness, the **why** of participating in the market will have been determined, with what being determined by 1.2. the **quality**. Furthermore, the **quantity (where /place/ and when)** will be revealed by 2. Profitability, the **how** becoming evident by 3. Flexible Efficiently, and lastly, the **for whom** being clarified by 4 Timeliness Effectiveness. Therefore, all factors are present for the TGC to be effective – the **why**, **what** and **how** contribute to balancing the supplies, while **quantity** and **for whom** represent profit balancing (as the difference between total incomes and total expenses) – as is represented in Figure 4. This same logic can also be applied to both strategic and operational performance measurement (in the context of a continuous improvement function).

In this way of supplies balancing, thus **1.1. Competitiveness (the way)**, **1.2. Quality (the what)** and **3. Flexible Efficiency (the how)** provides the possibility of determining the modern concept of competitiveness. It could be:

The **competitiveness of an organization** (the **why**) is considered the degree to which it can, under free and fair market conditions, provide (produce) quality products (the **what**) to suit the **customer's needs (satisfied consumers)**, in addition to maintaining and improving the **welfare of its managers (loyal employees)** (the **how**) (according to Tazovici, J. T. 1998, p. 169).

This can be considered to be systems processes of using (real) data led to the initial establishment of future concepts, which means the basis of the future (innovative) management. Therefore, modern **Systems Management Theory** should be replaced by future **Systems Management Concepts**.

5. CONCLUSION

Although it is possible to a more detailed conclusion, a concise one is sufficient, as follows: To the question **why** (modern) organizations exist, the answer would be: to be **competitive**, which means that their management is innovative and provides the right things (**what** – the quality /effectively/) in the right way (**how** – profitably /efficiently/). This means that only organizations that are competitive (**why**), effective (**what**) and efficient (**how**) can survive and continue to develop on the business activities markets, and thus on the business market too. Therefore, **innovative (business) organizations management** should provide both **satisfied customers** and **loyal managers (as modern operations /business/ performances)**, which is the essence of the content presented in this work.

Therefore, **innovative management** ensures **customers (consumers) satisfaction** and **managers (employee) loyalty**. As the contents of this work are focused on them, in order to test, accept, use, and further research areas where they belong, these modern (innovative) research of modern management and operations (business) performance may be the basis for the future ones.

MODULAR ORGANISATION: A RISK OR A CHANCE OF NETWORK CONNECTIVITY OF COMPANIES IN MODERN BUSINESS

Tihomir Spremo

Faculty of Economics Pale - University of East Sarajevo, e-mail: tihomir.spremo@ekofis.org

Summary: *This paper analyses the effect of the modular network form, as a modern network organisation model, on the efficiency of the organisational restructuring of a company. In particular, characteristics are discussed and ways in which modular network, as a form of network connectivity, can – despite successful answers to the demands of the today's environment – carry certain risks.*

The paper tries to point out appropriate structural arrangements through which an organisation is involved in global operations, or through which it operates and successfully competes in global terms. The aim is to provide a concise way of the explanation of possible advantages and disadvantages of modular forms of organisation structure that can be used in the process of restructuring and redesigning companies in the Republic of Srpska, as well as in B&H as a whole.

For the design of modular forms of organisational structures, Michael Porter's value chain analysis is used, which in the theory of competitiveness represents a very important tool for such research.

In the today's dynamic and competitive environment, companies must design their own organisational units, so that internal and external boundaries of their organisations are more flexible and permeable. In order to increase their efficiency, companies are often forced to form strategic alliances based on the capabilities of other organisations.

Keywords: *modular organisations, risk, value chain, modern business.*

INTRODUCTION

The paper starts from the fact that the modern world, business environment and companies themselves are in constant change and turbulence. In an environment characterized by risk, sudden and radical changes, survival and success are achieved only by those organisations that adapt to new conditions successfully and on time. In such conditions, management transfers to new strategies with which companies in the process of reorganisation, (changes in external and internal organizations), gain competitive advantages. In an uncertain and high-risk environment, organisation models that in relatively stable condition were effective have now become inadequate. The business result is not influenced only by success with the customer, but also by the sum of interactions of suppliers, distributors, competitors and changes in macro environment.

One of the important characteristics of modern business is related to the efficient process of business restructuring. The main objective of restructuring is greater market positioning in the context of constant changes in business environment. With the increasing and unpredictable changes in the market environment, the management company is expected not only to adjust quickly and on time, but also to notice the possibilities of these changes and react properly.

Flexibility, innovation and continuous business improvement are the elements that become the part of a strategic approach in building of competitive advantage. Great scientific and technological achievements in recent decades have turned the world into a global village in which the production methods and techniques are becoming more uniform. Companies are facing an increasingly common problem of finding a way of adapting to the new, changing business conditions. Due to these characteristics transformation process of companies is inevitable and unstoppable. Classical forms of organisations are becoming increasingly dysfunctional under the influence of environmental factors that management should effectively respond to. Contemporary companies react to the new dynamic of market conditions and increased uncertainty with insurance strategies and risk, entering into cooperative relations with other companies creating a strategic network of stronger or weaker related companies.

In recent years, companies are beginning to apply the concept of network organisation even more, because it allows them much greater flexibility and competitiveness in the global and turbulent business environment. Although various development forms of business network organisations are around in practice for many years, the network business concept is still very important.

The previous period in the Republic of Srpska, as well as in B&H showed that privatisation was not enough for successful transformation of public companies into joint stock companies, without significant role of organisational design, but that the change of their macro and micro organisation was necessary as well. It is essential that managers create models of organisational structures that will be adequate with the environment and compatible with organisational design of company's market economy. Accumulated activities in the value chain in large companies, especially in public companies are giving importance to the study of network forms, which are formed by using the concept of value chain.

Although today the modular organisation as a form of network-affiliated companies is quite successful form of organising the network of companies, especially as it stimulates the development of new products by engaging suppliers whose talents and knowledge are often better than those of the employees in the company, and with relatively little capital and a small management team can achieve high business performance, managers must calculate the possible losses of key skills and control over suppliers as one of the potential business risks.

1. ORGANISATIONAL DESIGN: THE ELEMENT OF STRATEGIC COMPETENCE

Organisational design is an essential element of strategic competence or potential of the company that determines its strategic position. In this sense, organisational design must be aligned with the strategies as a way of achieving the objectives of business. There are no rules that determine the organisational design that is required to implement each type of strategy.

The company's management establishes its organisational structure, if business activities to be performed are known, and it determines the resources to be used and goals to be achieved within a certain period. There are situations where the structure should be changed to enable the implementation of the new strategy. However, the choice of each strategy is influenced by the reality and potential of the existing organisational structures. There is no doubt that neither the strategy nor structure can be determined independently of each other. Decisions about the organisational structure must be made in light of the strategic position of the company, because the application of the strategy will be unsuccessful if the organisational structure is not designed to fit the strategic needs and constraints.

The organisational design should be viewed as an element of strategic capability of the company. Therefore, the relationship between the company and the environment should not be regarded as a structure or strategy. In order to perceive the contribution to the successful adaptation of organisational structures and the impact on the environment, it is necessary to consider company's key dimensions in reacting to changes in business environment. Compliance of strategies and structures is the assumption of rational response of the company to changes in the environment and ensuring the more favorable strategic position. Implementation of the strategy is possible if there is a power in the company that is willing and able to implement the change.

The management company in Republic of Srpska, in both private and public sector, should initiate a reorganisation to reduce the size and "thinning" of the organisation, in order to increase efficiency and competitiveness of the market. The resistance of the reorganisation is open on many levels because it has resulted in layoffs of employees. However, the transformation is a radical change that entails sacrifice and management of large and public companies are left with no choice. Since public companies are under state control, their transformation is not just a matter of management but are also in the interests of the state and citizens who are beneficiaries of their services. Managers of large companies in the Republic of Srpska of which a number are in the public sector¹⁸ must reject the strategy known in literature as "all under its own roof" and a hierarchical organisation. Following the example of companies in other transition economies, it is necessary to adopt an organisation based on the principles of competency-based and interorganisational design which holds the interdependant companies together.

¹⁸ Good examples are: Railways RS Stock Company Doboj, Mixed Holding "Electric" Republic of Srpska, Stock company Trebinje and Public Enterprise "The forests of the Republic of Srpska" Sokolac.

Network models can serve businesses and public companies to be revitalised and to introduce the principles of the market business within larger systems, rather than introducing administrative relations. The network is a group of independent companies that specialise in particular stages in the business chain. The network consists of the central company (core) and peripheral companies. The central company takes over the role of a broker that connects the other participants in the network and coordinates their activities.

Managers in modern organisations realise that traditional hierarchical designs are often not adequate for the entire dynamic and complex environment they are facing. Responding to market demands in terms of flexibility and innovations, managers find creative ways of structuring and organizing work and creating organisations that will be able to respond better to the needs of customers, employees and other organisational factors (Twomey, 2002).

Information systems and technology have had a significant participation in the development of the company for the last two to three decades. Leavitt and Whisler were among the first to write that the IT will enable large organisations to recentralise their organisational control, predicting the impact of IT on organisations (Leavitt & Whisler 1958). The organisational and management concepts, such as centralisation versus decentralisation, span of control, functional specialisation, the balance of authority and responsibility, and administrative mechanisms for coordination and control are derived from this general set of principles that were developed in specific circumstances for a long period of time. Although these concepts are acceptable, even today, it seems that the information-technology approaches could significantly alter some of those first principles. The result is that some forms of organising can be made relatively inefficient. Professional and academic communities have strong and consistent views on how the new organisational logic should be predicted according to the capabilities that are offered by current and upcoming trends in information technology and information systems. This structure was enabled by the recent advances in inter-organisational networking of computers.

In the Republic of Srpska most companies are not concerned enough about the information technologies as an opportunity to influence the economic and organisational performance, which is a limiting factor as a new approach of introducing technical and technological basis for the implementation of organisational changes.

2. NETWORK ORGANISATION AS A FORM OF INTER-ORGANISATIONAL DESIGN

The search for high flexibility by managers resulted in the creation of new forms of organisational design which is called the network structure (Snow, Miles & Coleman, 1992). The basis of the network structure means that organisations divide the most important functions into separate companies which are connected with organisational core of the parent organization. For this structure it is significant having the presence of a strong organisational nucleus which gathers around a number of other organisations, vendors, suppliers, traders, brokers, financial organisations etc. Network organisation is a form inter-organisational design with specific goals. This specific purpose is the reason why organisations connect to the network, and because it makes the access to efficient production, distribution, marketing and other essential business functions under the contract. Network structure is inconsistent with the parts of the structure that have accentuated vertical level of the management structure and whose organizations seek to control their own development through ownership. In such organizations, research and development is carried out at headquarters, production takes place in manufacturing facilities that are owned by the company and sales and marketing is performed by their own staff. In the network structure most of the functions are performed outside the organisation and coordination are mutually connected by a computer. This provides managers with a high degree of flexibility, and organization to focus on what they know best.

The network structure corresponds to most companies such as toys manufacturers and sports shoes and clothes industries that require a high level of flexibility in order to respond quickly to frequent changes in product design. Network structure form corresponds to other companies whose manufacturing activities require cheap labour, and which can best used under a contract with foreign suppliers (Robbins, 1992).

The network organisation is the potential structural opportunity for managers who want to reduce or eliminate organisation restrictions. That is a small organisation that performs major business functions by external supply (Miles, Snow, Matthews, Miles G., & Coleman, 1997). This approach allows organisations to concentrate on what they do best and to transfer other activities onto companies who can best perform such activities. Many large organisations apply the network structure in their production. Companies such as Nike¹⁹, Reebok, and Cisco

¹⁹ Nike is primarily a development and marketing company that works with organizations to produce sports shoes for athletes.

Systems realise that they can engage in great businesses, without not being the owners of production facilities²⁰ (Reed, Reinhardt & Sains, 2002). The essence of network organisation is in the difference from the old forms of creating organisational structures that carry a certain degree of bureaucracy. Organisations are required to be both flexible and stable, and extremely efficient at the same time.

The reality of internationalisation flow and the creation of a global economy have led to growing pressure on contemporary organisations due to the appearance of so-called hyper-competition. The need for adaptation and innovation concepts of operations initiated by the wave of global economic crises are inevitable for most of the companies. In such circumstances, managers are forced to re-examine the existing and to seek the new forms of organisational structures to be able to resist the complex and continuous changes in the environment. The idea that comes from this environment is to maintain core strategic functions as its own, while the rest of the work is given to the most competent suppliers (Carpenter, Banner & Erdogan, 2009).

The ideal of the modern organisation is a model that will enable the company to deal with many complex problems. In an independent and high-risk environment the organisation models that were efficient in relatively stable conditions, have now become inapplicable. Modern companies operating in the global marketplace, characterised by constant changes, uncertainties and risks, can achieve competitive advantages by cooperating in some of the network forms, such as: modular, open and virtual (Dess, Rasheed, McLaughlin & Priem, 1995).

3. MODULAR ORGANISATION

One of the innovations in the field of organisational restructuring is the appearance of a so-called "modular corporation" (Shawn, 1993). There are many such organisations characterised by an extremely flexible structure able to respond to new market challenges, technological changes, changes in the financial markets etc. They consist of a large network of suppliers who are flexible and ready to react quickly to changing needs and tastes of consumers. These organisations enjoy a number of advantages such as lower costs, which gives them the ability to successfully create competitive advantages. Organisational effectiveness is achieved through centralised control that is focused on key areas, primarily research and development, design, market research, technology development and investment. Production and distribution in particular have been entrusted to a large network of external associates.

Modular organization is the manufacturing organization that uses external suppliers to ensure production components or modules which are then assembled into final products. An easy way to understand the modular structure is to apply the analogy of building a house (Ketchen&Hult, 2002). The same way the traditional organizational structure has fairly stable boundaries, traditional house is also an important facility that requires extra effort and longer time to build. Just as the prefabricated house parts are assembled on a separate location, and then re-assembled in a location that meets the needs of the owner, the modular organization may need to be redesigned quickly. In addition to the industry of clothing and sports footwear, car manufacturers²¹ are leading in this type of modular organization (Kerwin, 1998).

4. ADVANTAGES AND LIMITATIONS OF MODULAR NETWORK FORMS

Managers have realised that in addition to efficiency, which is made by constant contact with all the employees, continuous control and preoccupation of employees in time using is an excessive way of controlling the necessary resources. It is more economical to tie employees with a contract outside the organisation, through special agents, and use their services when needed (Ramstead, 1997).

When it comes to supplying goods and services, modular organization engages the associates for those functions that are not vital, obtaining the knowledge and the quality of the best in the industry, while retaining strategic control. External collaborators are used to produce certain parts, as well as for the direction and implementation of logistics. The value chain by Michael Porter could be useful or the design of organizational structure.

²⁰ Ericsson gave its production and even some research and development capacity to more productive contractors in New Delhi, Singapore, California and in other global locations.

²¹ For example, General Motors (GM) has a modular factory in Brazil where external suppliers provide engineering products and car parts. The modules are delivered directly to the assembly line where they are a small number of GM employees assemble them into finished cars.

The value chain can be used as a framework for identifying key primary and secondary activities that the company undertakes in order to create value. The key question is: what actions the company should perform on its own with its employees, and for which it needs to engage external collaborators? (Rossetti & Choi, 2005). Such activities transform the organization into a central point surrounded by a network of external suppliers and experts, whose parts can be added and removed (Tully, 1993).

One of the branches of production where a modular type is widely represented is the industry of clothing and footwear. Figure 1. demonstrates the value chain of modular organizational structure. The value chain provides the systematic division of the company to individual actions, and can be used to test models of grouping activities or the way that these activities could be grouped. Companies like Nike and Reebok have been able to focus their business where they can dominate, such as design and marketing of modern footwear. Nike has very limited production facilities, and Reebok does not have one factory in their ownership. These two companies hire foreign associates in Taiwan, South Korea and other countries that produce almost full range of their shoes. The companies derive significant profits from small increases in sales by avoiding large investments in fixed assets and facilities. With modular network of organizational structures Nike and Reebok keep pace with the changing demands of their customers because their suppliers are able to adapt very quickly to the manufacturing of new products.

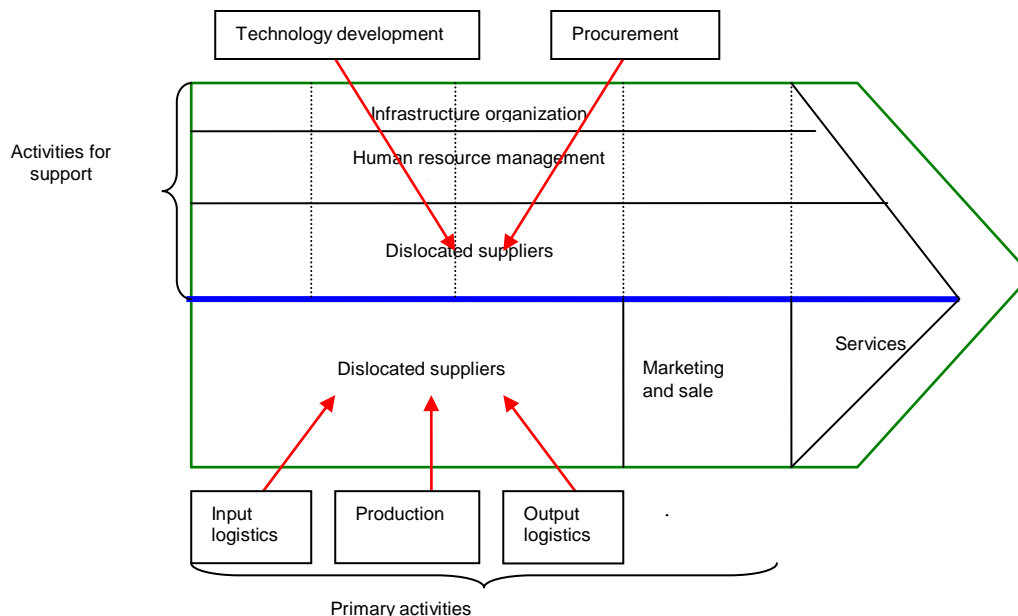

Figure 1: The value chain of modular organisation

Modular organizational structure that corresponds to the value chain will enhance the company's ability to gain and maintain competitive advantage. Company of modular network structure, with hiring of external associates to carry out non-essential operations, has the following advantages (Dess, Lumpkin & Eisner, 2007):

- ⇒ It can reduce overall costs and stimulate new product development by engaging subcontractors whose capabilities are better than those held by employees of the company.
- ⇒ It creates conditions for greater employment capacity, it achieves inventory savings and avoids the danger of using only one production technology.
- ⇒ The company may use its rare resources on areas where it has a competitive advantage by engaging the external associates. This way it creates more resources for financing research funds and development, as well as the employment of best experts and constant education of employees.
- ⇒ The company has the opportunity to make the best of knowledge and skills of its subcontractors in the supply chain, which provides accelerated learning of organisation.

The modular structure runs basic knowledge and skills through engagement of associates and is not restricted by capital. A small management team in a modular company with a relatively small capital involvement gives the opportunity to realise a lot of challenging and seemingly inaccessible strategic goals (Gottfredson, Puryear & Phillips, 2005). Since there is no need for significant capital investment especially in construction, modular company is creating a lot of opportunities for a rapid growth. To make a modular

form of organisation successful, it is essential to have certain prerequisites. Close cooperation with suppliers is necessary for the interests of all parties, while trying to find reliable vendors who are willing to protect trade secrets. Companies also need a reliable supplier in terms of commitment of financial, material and other resources to reduce costs and achieve leadership in the market as strategic objectives. Modular company must also make the selection of appropriate knowledge and competence that they will keep for themselves, meaning that they will not have to hire external associates. Modular company will not hire external collaborators for any activity that is related to one of their basic skills and knowledge and must always be cautious when making decisions about the engagement of specialists, because it could jeopardise its long-term competitive advantage.

Despite numerous advantages of modular network forms it is important for managers to recognize the possible risks of this type of organizational structure. Important strategic issues according to Quinn and Hilmer (Quinn & Hilmer, 1994) are: loss of key skills or developing the wrong skills, loss of inter-functional skills and loss of control over the supplier.

Involvement of a number of external consultants in the organisational structure may be counterproductive because it carries too much of their own knowledge neglecting requirements for maintaining their own abilities at the level necessary for the production of its basic components. Over time, the skills that once formed the basis of the organization can disappear. Knowledge and skills acquired through the interaction of individuals from different organizational units of a company are of inter-functional nature and through the cooperation of its employees it can assist in resolving problems of certain organizational units. Communication between different parts of the organization may be hampered if the company decides to hire external associates for its key functional tasks, such as production, because in this case, a company together with its employees must integrate their own activities with a brand new external supplier.

A particular disadvantage of modular forms of organization occurs when products produced by outside associates, give suppliers too much power in relation to producers. This situation is possible when a manufacturer of key components depends only on one supplier, or a few of them. In this way the manufacturer can be "captured" by a supplier that has a key role in its success. It is known that the company Nike solves this problem by regularly sending its employees to work in supplier factories, responsible for a certain product, and for bringing the highest level managers and technical team from suppliers firms to their headquarters. In this way, Nike constantly keeps track of the potential events and situations by building trust with suppliers while developing long term relationships with them.

CONCLUSION

The occurrence of modular network organisation has generated the strategy change in companies and large enterprises, which were faced with a phenomenon of rapid, often unpredictable changes in the global environment in recent years. A powerful wave of changes caused by the development of sophisticated technology, new categories of customers with high demands, marked the modern business. In such conditions, the management company chooses the new strategy that enables the company to compete in the rapidly changing and unpredictable environment. Changes in strategy imply changes in external and internal company organisation. Theoretical studies and practical examples show that the strategic changes went in the direction of network organisation, which enabled companies to achieve competitive advantage in a changing global environment. All assumptions concerning the modular organisation as the network form of organisational structure suggest that the choice of this model of organisational structures must meet several criteria and conditions. Modular organisation has significant advantages and disadvantages for the successful implementation of this structure. Management companies must reckon with the risk that accompanies the modular organisation. The presented examples of companies known in the theory and practice that successfully apply a modular form of network organisational structures can not be understood as regularity, but rather as a system of thinking in selecting the appropriate solutions. It could be argued that the theoretical assumptions presented in this paper should be a guideline for deciding on the structure for analysing problems and access to inadequate validation. In this regard, each specific organisation needs to review its structure, to study theoretical models and to ultimately make the decision that is appropriate to the specific case. Selecting a specific model should be based on the situational approach.

This means that when designing an organisation one must have in mind a set of heterogeneous organisational design variables that characterise the global business environment. The best organisational structure is considered to be the one that allows the successful achievement of company objectives, and which is at the same time, favorable to its size, technology and competitive environment.

Because large and public companies in the Republic of Srpska, as well as in B&H have massive, inefficient and expensive organisations, because the conditions are favorable for it, changing conditions must inevitably lead to changes in their organisational structure. As a possible solution for the re-design of the organisation model of the modular network forms, despite the hazards and risks, is one of the acceptable solutions. Proximity to the developed European markets is a priority for faster delivery of goods, and at the same time it also allows transfer of knowledge, technology and production. It also represents the convenience for connecting the domestic and foreign partners and the spreading of inter-organisational learning through modular form of network connectivity.

Abstract: *Public Enterprise PTT Serbia is a very complex technical, technological and organizational system, with strictly defined objectives, components, processes and relationships, whose operation implies the existence of appropriate infrastructure, most important of which are the units of the postal network, in which it offers services to customers. This paper aims to show how important it is to measure the performance of the public sector and how to do it. There are several ways to measure performance, but this paper presents the application of a DEA model through a real example. It is a mathematical programming model, which is successfully used for the assessment of organizational units, particularly in nonprofit and service sectors. It is shown how to calculate the efficiency of organizational units based on input and output values. The data can be most useful to the top management of the company in order to monitor the effectiveness of certain organizational units, and in decision making.*

Key words: *performance measurement, postal service, public sector, post office, DEA method*

1. INTRODUCTION

Measuring the performance of a public company is both a complex and necessary task. It is complex because the objectives of a public company, which according to its performance ought to be assessed, are many and often conflicting. It is necessary because a rigorous and objective evaluation of performance of public company is the most obvious escape from debates which are all too often passionate. Finally, a study of good performance can be used by public managers and by public authorities as a pragmatic and pedagogical tool towards improvement in monitoring and resource usage.

Typically a public company, such as the national postal operator with no direct competitors, private or public, applies performance measurement approach which is based on the objectives of the company.

One of the most important principles in any business is the principle of efficiency which consists of achieving the highest possible economic effects. In order to create biggest possible output with less input. The problem arises in determining the efficiency of the units that have more diverse inputs and outputs, and when the inputs and outputs can't be reduced to the same unit of measurement.

The application of Data Envelopment Analysis (DEA) involves an established procedure that is to be applied properly in order to obtain valid results, and thus make accurate and precise conclusions. If the variables that exist in the model are not properly chosen, the results can be inaccurate and could give a false picture, and not realistically show the situation. So we should be alert to the fact that the DEA method compares the effectiveness of each organizational unit and therefore we should make sure that the DEA model constraints are satisfied.

2. THE PERFORMANCE ASSESSMENT

The simplest measure of performance is undoubtedly the level of profit, which is consistent with maximizing revenue and performance, as the primary objective of the owner. In the case of public sector if the economic prosperity is achieved by following the suggestions of the state (society as a whole), the main objectives are mainly multivariate, due to the many aspects of social protection. As a result, the goals, which are represented by the public managers, are also multivariate, and performance monitoring becomes more complex.

Multivariate goals usually determine the performance of public enterprises. Numerous difficulties arise when one takes into account each of them (*Perelman & Pestieau, 1993*).

1. The goals can not always be fully compatible with each other. For example, it is known that the maximum loading rate from the allocative point of view is desirable in services such as transport and communication, but in terms of distribution it can be unacceptable. Thus, in assessing the overall performance of such services, there must be a balance between these two criteria.

2. Measuring the degree to which these goals are met is quite a difficult task as it first involves the calculation of the indicators of performance for each of them, and then determining each weight coefficient. This can not be done without the subjective participation of decision-maker.

3. Excessive or insufficient production in relation to what is technically feasible can not be justified regardless of any of the above objectives (macroeconomic, allocative, redistributive). In contrast, over-employment of labor, which is inefficiency, is justified by the macroeconomic reasons of employment policy.

4. The exchange between allocative and non-allocative goals can affect control of the company. Indeed, the company may be allocatively inefficient for two reasons. It has to meet non-allocative goals and/or managers need to pursue their own goals (power, prestige and salary). Difficulties arise in separating these two sources of inefficiency, which are often arguments in favor of privatization.

Precisely because of these difficulties, most public companies opt for measuring performance based on efficiency. The reasons for this decision were manifold. First, measuring the extent to which a public company achieves its goals too ambitious. On the other hand, measurement of efficiency allows for estimates, which are consistent with the multiple objectives of the company. Measuring efficiency does not require of us to pre-determine whether or not other goals are met and to what extent. It can also be used not only when the private and public sectors are comparable, but also when public companies are operating in isolation, with an unmatched or non-competitive activities, such as postal services. Another advantage is that the efficiency depends on the data, which are easily available in most cases. Although, the efficiency is only a partial indicator of performance. However, compared to traditional indicators such as price, profitability or productivity, efficiency measurement is more difficult for business enterprises that operate in the market with variable structure.

Efficiency of public enterprises can be divided into two classes:

- allocative, includes productivity and efficiency
- non-allocative, includes equity, the balance of financial and macroeconomic policy.

Allocative efficiency means that the observed unit which is the focus of decision making process seeks to minimize the cost of a certain level of output by selecting the appropriate inputs for a given set of input prices, assuming that the considered organization is fully technically efficient. The efficiency of resource allocation is expressed as a percentage, where 100% or 1 indicates that the organization is properly using inputs to minimize production costs. An organization that is in engineering (technical) terms efficient can be allocatively inefficient, since it does not use inputs in the appropriate proportion in relation to given prices.

Non-allocative efficiency can be calculated when the technology of production is defined for all units that are to be assessed, in such way as not to limit the amount of inputs required to manufacture a certain quantity of output. An organization that operates best with respect to all other observed units is totally technically efficient and can be defined as best practice. Other units are assessed in relation to the best and their technical efficiency is expressed as a percentage of best practices. The technical efficiency is affected by the efficiency of management and operational level of the observed entity. This means that the percentage of technical efficiency is the operational measure of organizational entities without regard to price and production costs.

One of the advantages of efficiency measurement is that it relies on the physical data that are readily available in many cases and generally more reliable than financial or accounting data. Unlike most partial indicators of performance, efficiency may involve a large number of inputs and outputs, including qualitative aspects. The idea that the efficiency is independent of the other objectives assigned to the production units, especially of allocative efficiency, is disputed. The production unit can be forced to be technically inefficient if it is forced to employ too much or too little of production factors without the ability to quickly adapt its input-output vector and thus remain on the efficiency margin.

3. PERFORMANCE IN POSTAL SERVICES

There are different types of methods for measuring the efficiency of postal services. Whatever the method chosen, one should know that the measurement of efficiency is a relative category. Often used term is "best practice" of production units. It is the production unit which operates best in relation to all other observed units, and it is considered to be totally technically efficient and can be defined as best practice. For this reason, the sample of observations is crucial. It is important that they come from similar conditions. We should take into account the geographic, demographic, and time differences, which are present throughout the country. In any case, for an industry such as postal services, which in most countries have a monopoly, this kind of problem can not be completely avoided. It is necessary to introduce exogenous environmental factors, in order to cope with the spatial differences, changing trends, and with time differences.

All the proposed methods for measuring the effectiveness have a common frontier concept, which states that the efficient units are "on" the frontier of production function, while the inefficient work "under" the frontier (i.e. in the interior of their production functions). The term "frontier of best practices," which Farrell used in 1957 to originally designate production line, estimates best practice frontier from the statistic data. (*Perelman & Pestieau, 1989*). The two main alternative methodologies are available: parametric and nonparametric. The difference between them is the technique that is used to describe the formal boundaries. In the first case common is a function with constant parameters. Its parameters are estimated by statistical or other methods in such a way that the graph of the best one is defined and the observations are at or below the graph. Then, the efficiency of each observation is calculated in terms of the distance between that value and the graph of the estimated function, which is considered to be the limit of the production function.

To determine the limits of production, parametric stochastic method is used. It involves estimation of production function. First of all, it is about the data. It should be noted that there is a problem of data availability. Variables that describe the activity of sending parcels show an extremely wide range of operations, going from small to very large post offices. Also, there are different combinations of production factors. The data, which represent the input and output from postal activities, in most cases is not homogeneous. Measuring the efficiency of business would be easy if the analytical form of the production function was known. However, in practice, its shape is generally unknown and there is only data on levels of output achieved for particular input vectors of several similar organizations. Therefore, in practice "nonparametric" approach is usually used to measure efficiency. This approach requires the imposition of the analytical form of the function that defines the relationship between independent and dependent variables.

For non-parametric methodology some formal properties are the points on the production function. The data is then "enveloped", but not by the graphic of the function whose parameters are estimated, but instead it is determined whether or not each observed point can be an element of the border, under the chosen assumptions. Theoretical limit of efficiency in practice is difficult to determine because the procedure assumes that theoretically best practice in the respective areas is known, but it is difficult to calculate it for the given set of units, because usually not all the information about their business is known. In real situations usually the only known data is related to the units that are to be assessed. Based on this data we could assume which practice is the best. However, it is difficult to state with certainty that a surveyed organization is reaching best practice. It is particularly difficult to define best practices for service organizations with complex inputs where can happen that the observed points do not cover the entire range of possible combinations of input values.

Using non-parametric methodology tends to prevail in the public sector, an area in which the concept of production function is not clearly defined. The two most popular methods are nonparametric DEA (data envelopment analysis) and FDH (free disposal hull) (*Pestieau, 2007*).

4. DEA MODEL

Data envelopment analysis is introduced by Charns, Cooper and Rhodes in 1978. DEA is a tool for measuring and monitoring the efficiency of organizational performance. Organizational units are defined as units that are to be assessed - DMU (Decision Making Unit). This name was introduced to show that DEA can be used to measure the effectiveness of different types of entities that operate in a similar way. DEA was initially intended to measure the effectiveness of nonprofit organizations, for which it is difficult to measure outputs that are not necessarily expressed in the same units of measurement (e.g. for hospitals inputs can be number of successfully performed operations and the percentage of utilization of hospital beds, while profit as an economic measures expressed in monetary units is not taken into account). Therefore it is difficult to define and measure the real effectiveness of the nonprofit organization. Efficiency, as one of the operating parameters which are given special attention when assessing the performance of organizational units, can be precisely measured through the ratio of achieved outputs and inputs used to produce them. Scaling problem is solved singularly so that the efficiency is expressed as a number between 0 and 1.

Based on the data inputs and outputs, the DEA method assesses whether a unit which is evaluated is efficient or not with respect to the remaining units included in the analysis, or whether it is on the efficiency frontier. With DEA method, distribution of points is observed and line is constructed around them that surrounds them - "envelope". Thus the name of the method - data envelopment analysis (*Savić & Martić, 2009*). The limit of efficiency in economic terms is empirically derived maximum output that each unit of decision making can achieve with the given inputs and acts as an envelope for the inefficient units. The

method analyzes each decision making unit and checks if its inputs can be enveloped from below (given output can be achieved with less inputs) given the input values of the remaining units, and if it is possible to envelope its outputs from the top (greater output can be produced with a given input) based on the outputs of the remaining units. If the unit can be enveloped it is relatively inefficient, and if not, it participates in forming the boundary of efficiency, which here is equivalent to the marginal production function.

Therefore, DEA is a mathematical programming technique that allows us to determine whether the entity is efficient or not, relative to other entities involved in the analysis, based on data on its inputs and outputs. (Krčedinac, Čangalović, Kovačević- Vujčić, Martić, Vujošević, 2006) It is a non-parametric approach because it does not require *a priori* assumption about the analytical form of the production function. While the parametric approaches are focused on central tendencies, and performance assessment of an entity is based on the average performance, the DEA is a border method that consists of a series of optimizations (one for each entity included in the analysis). For each DMU maximal performance measure is calculated in relation to all other units in this group of conditions that must be at or below the extreme limit, which is called the limit of efficiency. The measure of efficiency that DEA provides is relative because it depends on which entities are included in the analysis and how many there are, as well as the number and structure of inputs and outputs.

1.1. Slacks- based measure of efficiency

A slacks-based measure of efficiency (SBM) (Tone, 2001), is non-radial and deals with input/output slacks directly. The SBM returns an efficiency measure between 0 and 1, and gives unity if and only if the DMU concerned is on the frontiers of the production possibility set with no input/ output slacks. In that respect, SBM differs from traditional radial measures of efficiency that do not take account of the existence of slacks.

$$\min \rho = \frac{1 - \frac{1}{m} \sum_{i=1}^m \frac{s_i}{x_{i0}}}{1 + \frac{1}{s} \sum_{i=1}^s \frac{s_i^+}{y_{i0}}} \quad (1)$$

subject to

$$x_0 = X\lambda + s^- \quad (2)$$

$$y_0 = Y\lambda - s^+ \quad (3)$$

$$\lambda \geq 0, s^- \geq 0, s^+ \geq 0. \quad (4)$$

1.1.1. An SBM with undesirable outputs

Suppose that there are n DMUs (decision making units) each having three factors (Tone, 2003): inputs, good outputs and bad (undesirable) outputs, as represented by three vectors $x \in R^m$, $y^g \in R^{s_1}$ and $y^b \in R^{s_2}$, respectively. Matrices X, Y^g and Y^b can be defined as follows.

$X = [x_1, \dots, x_n] \in R^{m \times n}$, $Y^g = [y_1^g, \dots, y_n^g] \in R^{s_1 \times n}$ and $Y^b = [y_1^b, \dots, y_n^b] \in R^{s_2 \times n}$. Assuming that the $X > 0, Y^g > 0$ and $Y^b > 0$.

The production possibility set (P) is defined by

$$P = \{(x, y^g, y^b) | x \geq X\lambda, y^g \leq Y^g\lambda, y^b \geq Y^b\lambda, \lambda \geq 0\} \quad (5)$$

where $\lambda \in R^n$ is intensity vector.

A $DMU_0 (x_0, y_0^g, y_0^b)$ is efficient in the presence of undesirable outputs if there is no vector $(x, y^g, y^b) \in P$ such that $x_0 \geq x, y_0^g \leq y^g$ and $y_0^b \geq y^b$ with at least one strict inequality.

$$\rho^* = \frac{1 - \frac{1}{m} \sum_{i=1}^m \frac{s_i}{x_{i0}}}{1 + \frac{1}{s_1 + s_2} \left(\sum_{r=1}^{s_1} \frac{s_r^g}{y_{r0}^g} + \sum_{r=1}^{s_2} \frac{s_r^b}{y_{r0}^b} \right)} \quad (6)$$

subject to

$$x_0 = X\lambda + s^- \quad (7)$$

$$y_0^g = Y^g\lambda - s^g \quad (8)$$

$$y_0^b = Y^b\lambda + s^b \quad (9)$$

$$s^- \geq 0, s^g \geq 0, s^b \geq 0, \lambda \geq 0. \quad (10)$$

The vectors $s^- \in R^m$ and $s^b \in R^{s_2}$ correspond to excesses in inputs and bad outputs, respectively, while $s^g \in R^{s_1}$ expresses shortages in good outputs. The objective function (6) strictly decreases with respect to $s_i^- (\forall i)$, $s_r^g (\forall r)$ and $s_r^b (\forall r)$ and the objective value satisfies $0 < \rho^* \leq 1$. Let an optimal solution of the above program be $(\lambda^*, s^{-*}, s^{g*}, s^{b*})$.

5. EXAMPLE OF DETERMINING THE EFFICIENCY OF POSTAL NETWORK UNITS

In order to illustrate the most important feature of DEA, we show an example of efficiency evaluation of thirteen units of the postal network of "Post of Serbia". Criterion for choosing a post office that will be included in this analysis was their business volume, and therefore the revenue they bring to their company. For each of them we will measure efficiency based on input (number of employees, number of counters and number of delivery districts) and output variables (total volume of services expressed in standard minutes and the total annual income). Although there are variables, which surely influence the efficiency of the postal network units, these quantities are the basis for determining the order and size of a post office. Therefore, they are most common elements of the analysis. Table 1 shows the values of input and output variables.

Postal network units are chosen based on their ranking. The rank of each unit is determined by two output (Total Annual Volume in Standard Hours and Total Annual Income). These outputs are influenced by 3 main inputs: Number of Employees, Number of Counters and Number of Districts. The fifteen postal units used in these example are the biggest postal units in Serbia and are therefor chosen for this analysis.

Table 1. Values of variable in the DEA model

	Number of Employees	Number of Counters	Number of Districts	Total Annual Volume in Standard Minutes	Total Annual Income
DMU 1	198	15	36	11.077.664,00	225.044.594,86
DMU 2	68	6	25	4.780.587,00	64.082.882,47
DMU 3	113	7	48	9.618.020,00	97.640.436,61
DMU 4	75	9	29	6.372.212,00	56.612.171,92
DMU 5	78	8	22	5.735.813,00	72.052.492,77
DMU 6	55	6	17	3.823.762,00	119.035.278,91
DMU 7	124	10	42	7.654.976,00	132.736.780,91
DMU 8	80	6	30	5.926.661,00	50.774.166,79
DMU 9	94	7	36	6.583.342,00	44.996.393,34
DMU 10	55	7	17	4.304.488,00	77.374.798,66
DMU 11	144	13	60	12.853.431,00	204.014.628,33
DMU 12	165	18	43	10.908.715,00	205.703.273,73
DMU 13	202	11	46	13.116.412,00	170.890.835,47
DMU 14	156	8	36	14.151.320,00	148.285.797,08
DMU 15	101	12	32	7.149.184,00	132.052.898,10

To calculate the efficiency we will use input-oriented DEA model, which means that the goal is minimizing the input for the current output. This model was chosen in order to minimize the input size, as the costs related to these variables, and above all, staff costs represent a major cost for the company and should be minimized. However, in this example we have one peculiarity. Output "Total Annual Volume in Standard Minutes" is undesirable output, because the goal is to minimize rather than maximize the output. That is, the goal is to minimize the time that is consumed to achieve the desired output. As this is not in accordance with the laws of the DEA model which maximize the output, it is necessary to use its specific case which observes undesirable outputs, such as the one in this example. A special case is BadOutput model, which will be described below.

5.1. Bad output model

Let us decompose the output matrix Y into (Y^g, Y^b) where Y^g and Y^b denote good (desirable) and bad (undesirable) output matrices, respectively. For a DMU (x_0, y_0) , the decomposition is denoted as (x_0, y_0^g, y_0^b) .

We consider the production possibility set defined by:

$$P = \{(x, y^g, y^b) | x \geq X\lambda, y^g \leq Y^g\lambda, L \leq e\lambda \leq U, \lambda \geq 0\} \quad (11)$$

Where λ is the intensity vector, and L and U are the lower and upper bounds of the intensity vector, respectively. We define the efficiency status in this framework as follows (Tone, 2001).

A DMU (x_0, y_0^g, y_0^b) is efficient in the presence of bad outputs, if there is no vector $(x, y^g, y^b) \in P$ such that $x_0 \geq x, y_0^g \leq y^g, y_0^b \geq y^b$ with at least one strict inequality.

$$\rho^* = \min \frac{1 - \frac{1}{m} \sum_{i=1}^m \frac{s_{i0}^-}{x_{i0}}}{1 + \frac{1}{s} \left(\sum_{r=1}^{s_1} \frac{s_r^g}{y_{r0}^g} + \sum_{r=1}^{s_2} \frac{s_r^b}{y_{r0}^b} \right)} \quad (12)$$

subject to

$$x_0 = X\lambda + s^- \quad (13)$$

$$y_0^g = Y^g\lambda - s^g \quad (14)$$

$$L \leq e\lambda \leq U \quad (16)$$

$$s^-, s^g, s^b, \lambda \geq 0 \quad (17)$$

The vectors s^- and s^b correspond to excesses in inputs and bad outputs, respectively, while s^g expresses shortages in good outputs. s_1 and s_2 denote the number of elements in s^b and s^g and $s = s_1 + s_2$. Let an optimal solution of the above program be (ρ^*, s^-, s^g, s^b) . Then we can demonstrate that the DMU x_0, y_0^g, y_0^b is efficient in the presence of undesirable outputs if and only if $\rho^* = 1$, i.e., $s^- = 0, s^g = 0, s^b = 0$. If the DMU is inefficient, i.e., $\rho^* < 1$, it can be improved and become efficient by deleting the excesses in inputs and bad outputs and augmenting the shortfalls in good outputs by the following projection.

$$\begin{aligned} x_0 &\leftarrow x_0 - \\ y_0^g &\leftarrow y_0^g + \\ y_0^b &\leftarrow y_0^b + \end{aligned}$$

There are two variants of DEA models:

- DEA model with Constant Return to Scale (CRS model)
- DEA model with Variable Return to Scale (VRS model)

Table 2. Overview of solutions in DEA solver

		CRS model		VRS model	
No.	DMU	Score	Rank	Score	Rank
1	DMU 1	0,61746	2	1	1
2	DMU 2	0,347646	10	0,542637	9
3	DMU 3	0,347268	11	0,401202	13
4	DMU 4	0,231985	14	0,378045	14
5	DMU 5	0,346246	12	0,497494	10

6	DMU 6	1	1	1	1
7	DMU 7	0,440721	8	0,496817	11
8	DMU 8	0,235249	13	0,406239	12
9	DMU 9	0,173518	15	0,314005	15
10	DMU 10	0,511077	4	0,718744	6
11	DMU 11	0,517041	3	1	1
12	DMU 12	0,511014	5	0,87827	5
13	DMU 13	0,440193	9	0,584056	7
14	DMU 14	0,491042	6	1	1
15	DMU 15	0,48425	7	0,545363	8

The difference between these two models is that in the CRS model, it is understood that inputs increase, will be the same as outputs increase. In the VRS model, it does not necessarily mean that output will increase as much as the input. Given the nature of the variables that were used in this example, it is more realistic to use VRS model, because certain level of increase in inputs does not imply the same level increase in output parameters. For our example it is more adequate to use the VRS model, because if, for example, the number of employees is reduced by 10%, it does not necessarily mean that the total annual income will be increased by 10%.

For the example shown in this paper, efficiency will be calculated using both models (Table 2). According to the result obtained using the CRS model, only one post office is efficient and that is DMU 6. Others are inefficient. DMU 6 is efficient because, regardless of the small volume of inputs in relation to other post offices, it has much smaller number of standard minutes (which is good in our case; as we have noted that output is badoutput) and also significantly higher annual income. For this reason it stood out as the only one efficient. Other DMUs (although inefficient) are ranked in comparison to DMU 6, as it represents best practice.

If VRS model is implemented, four DMU proved to be efficient because the model is considerably more flexible than the CRS model, since it allows variable return to scale. In mutual comparison, four of the units are efficient (DMU 1, DMU 6, DMU 11, DMU 14), while others aren't. The reason these units are deemed efficient, above all, is their total annual income.

According to the solution obtained by applying the DEA model with Constant Return to Scale inefficient units can become efficient by reducing the volume of input variables. DMU 13 efficiency is 44% which means it's not efficient. To become more efficient, number of employees has to be reduced to 79 (by 60.91%), number of counters to 9 (by 21.69%), number of delivery districts to 24 (i.e. by 46.94%) and total volume of services in standard minutes should be reduced to 5.489.514,44 (by 58.15%). With these changes, total annual revenue would remain unchanged.

Table 3. Overview of solutions in DEA solver for DMU 13

DMU 13	CRS model			VRS model		
Efficiency	0,440192719			0,584056464		
Employees	202	78,96	-0,61	202	124,9499334	-38,14%
Counters	11	8,61	-0,22	11	10,40244336	-5,43%
Districts	46	24,41	-0,47	46	26,29404709	-42,84%
Total Annual Volume in Standard Minutes	13116412	5489514,44	-0,58	13116412	7372083,41	-43,79%
Total Annual Income	170.890.835,5	170.890.835,47	0,00	170.890.835,5	170.890.835,5	0,00%

According to the solution obtained by applying the DEA model with Variable Return to Scale, DMU 13 would be efficient if the number of employees is decreased to 125 (by 38.14%), the number of counters reduced to 11 (by 5.43%), number of delivery districts to 26 (by 42.84%) and total annual volume of services decreased to 7,372,083.41 (by 43.79%). With these changes, the total annual income would remain unchanged.

6. CONCLUSION

In order to give an answer to the question of how to improve public sector efficiency, it is important to understand the sources of inefficiency and to distinguish two cases: the case when there is another institutional alternative and the case where service can be provided only by the public sector.

If we talk about the case when there is no competition, it is widely recognized that what leads to inefficiency is not the type of ownership, but the absence of competition or at least rival candidates. Orientation towards private ownership can really reduce inefficiencies, primarily due to the different business behavior, which is necessary in circumstances where there is competition.

The point to note is that performance measurement is possible if you can get good data. This is a relatively positive view, as opposed to those who believe that performance measurement in the social field is not possible. It is clear that the effectiveness is likely to be more convincing as a measure if it focuses on the narrow production unit - for example a unit of postal network - than the broad units, for example the entire postal system of the country. At the same time, political debate and public policy are often conducted at an aggregate level. Therefore, we believe that measuring public sector efficiency has to go through individuals and to focus on steps because of the effects of public spending. The efficiency can be seriously measured, when focusing on the manufacturing unit with well-defined technology. Studies in which performance measurement is conducted must be interpreted with caution and it is necessary to act towards improving the quality and quantity of data.

The most common method used to calculate the efficiency of units primarily in the nonprofit service sector (schools, hospitals, banks, post offices, railways...) where the outputs are not measured in monetary units, but the effectiveness depends on the quality and scope of services provided. In addition, it is characteristic of non-profit organizations that the relationship between inputs and outputs of the system is very complex and often almost impossible to describe formally.

A key result of the DEA is measure of relative efficiency which is determined for each DMU. Moreover, DEA provides information that is relevant to the further work management of efficient and inefficient units. For inefficient units DEA provides information about what to do to become efficiency, and for efficient how to work more efficiently.

The results given by the DEA method produces a quantitative basis for the allocation of resources between units that are assessed and it is one of the reasons the method is widely used in practice. The goal of redistribution program is to move some resources into units in which they will be used more efficiently.

Abstract- *The aim of this work is to explain the way in which mail delivery operates, indicate the problems with the organization of delivery districts and, finally, offer a model for dynamic management of a mail delivery service. Taking into consideration that delivery costs for letters amount to 50.2%, whereas parcel delivery costs make up to 38.6% of the total mail delivery costs (NERA National Economic Research Associates, 2004), this aspect is of special significance for postal operators. Considering different conditions for conducting delivery (urban areas, rural areas, civil engineering construction sites and building construction sites, terrain configuration, and so on) we propose a system for managing mail delivery using the postal address code (PAC). This paper resulted from a research project funded by the Ministry of Education and Science of the Republic of Serbia, under the name of "Reengineering the operator network of the universal postal service, with the organizational synergy of governmental and economic resources" (TR36040).*

Key words: mail, area, postman, PAC, delivery, dynamics, itinerary

1. INTRODUCTION

Postal traffic is the delivery of mail from a sender to a recipient anywhere in the world. It is a universal human right to have the opportunity to send and receive mail without discrimination and regardless of residence. The very receipt of mail varies and the modalities are adjusted to the users through various access points of the postal network. The transfer of mail is also adjusted to the technological development of a postal operator and it is not a critical phase of the process. The critical phase is the delivery of mail to the home address of the recipient. This is why we have devoted special attention to the delivery of mail which represents the most complex phase in terms of organization and it also induces the highest costs for postal operators.

The quality of postal services as well as the customer satisfaction mostly depends on the organization of delivery service. It is not possible to approach the organization of delivery in urban and rural environments in the same way. Moreover, it is not possible to consider civil engineering construction sites and building construction sites in the same way. It is also not the same to deliver mail in the clustered villages situated in the plains and scattered villages typical of central Serbia.

On the other hand, the organization of mail delivery depends on the number of households and their structure, the number of legal entities and, finally, the number and kind of mails that are supposed to be delivered. However, all statistical characteristics of certain areas are not sufficient for drawing the right conclusions and organizing delivery areas rationally, but one also needs to consider the load dynamics based on various segments of the territory. It is a well-known fact that delivery service is more loaded on the days when utility bills are being delivered and less loaded on the other days. Therefore, the aim is to achieve the optimal organization of delivery service that will increase the quality of the offered services, decrease the load on postmen on extreme days and, in the end, result in the overall decrease of delivery to postal operators in the delivery phase.

One of the ways to achieve the abovementioned is to organize a model of the dynamic management of mail delivery service in the way it will be presented in this work. Unfortunately, there are almost no academic resources in this field that we can refer to, except for partial experience of foreign postal services. The key parameter for dynamic management of mail delivery, which will be discussed later on in the paper, is the introduction of PAC on behalf of the Public Enterprise of PTT Communications "Srbija". On behalf of the Universal Postal Union it was estimated as an exceptionally efficient way of improving the technological methods in postal traffic. Apart from PAC, in order to achieve the dynamic management of mail delivery, high importance must be attributed to automation and computerization of the technological processes of receipt,

processing and transportation of mail. The opportune information in the delivery post office about the quantities, kinds and distribution of mail enables the opportune decision-making process as well.

2. THE EXISTING ORGANIZATION OF MAIL DELIVERY

It is the obligation of the Public Postal Operator to organize the delivery of mail on the entire territory of the Republic of Serbia in accordance with the quality standards established by the Republic Agency for Postal Traffic. This actually means that the territory of the Republic is divided into districts where the delivery of mail is organized in three different ways: mail is delivered on each workday (this applies to places with bigger population- narrow area), twice a week (populated places in rural areas- wider area) and once a week (rural areas with low population density- the widest delivery area). Narrower delivery areas have a larger population and more postal deliveries per capita, whereas on wider and the widest delivery area the distances that are covered make up for the biggest part of work and consequently the biggest part of the costs entailed. In a wider and the widest delivery areas, where possible, postmen use different transportation means in order to reduce the time spent in unproductive travelling.

Therefore, delivery service is organized according to the districts that are covered by postmen. Districts are created on the basis of multiple parameters such as: the number of households, the number of legal entities, the number of mails, the distances that are covered and other specificities (Z.Marković & V.Savičević, 1998). However, it has been noted that in reality the districts are not equally loaded and this load is also unequal throughout the month. This creates a number of difficulties and irrationalities.

In the transportation phases, mail is sorted and transported to delivery offices. When it reaches delivery offices, the mail is further sorted into the mail that is directly handed to the recipients and the mail that is delivered to the recipients' post office box. The mail that is supposed to be delivered to home addresses is further divided according to districts and given to postmen that then sort it according to the itinerary. Therefore, when it comes to ordinary mail, it is necessary to sort the mail at least three times in the delivery office before the deliverer can start the delivery. As far as special letter-post services are concerned (registered mail, insured letter, COD (Cash on Delivery) letter, money orders,...) it is necessary to register and charge them before sorting them according to the itinerary. The major problem that postmen encounter in narrow areas is the weight of the mail on the days of high load when it is physically impossible to carry all the mail so it is necessary to divide and carry it to the delivery warehouses, if they exist. Bicycles with bags, mopeds or hand strollers can relieve this problem. However, other problems, such as safety-related problems, can occur. For example, sometimes it is necessary to deliver mail personally to an apartment building and a bicycle or a moped has to be left outside in the street. Each district has its own specific characteristics and it is impossible to find universal solutions to the whole territory of the country. This paper will not consider all the problems encountered by mail deliverers, but it will emphasize the organization of delivery area in order to achieve equalization of the load.

3. BRIEFLY ABOUT PAC

PAC- Postal Address Code is a six-digit number that is a single-valued definition of the delivery territory and it indicates: a street, a part of the street, a nameless road, an apartment building, an institution, a residential area or a part of the residential area (Marković D., Radojičić V., Petrović D. & Marković Z., 2003). The group of individual PACs offers a single-valued definition of the delivery district and the order of PACs on the travel itinerary is defined by the postman's itinerary within the districts. When PAC is used to define the part of the street then this is done to aid the delivery so it is possible to define the part of the street, its position with reference to the crossroad or it is possible to divide the segment of the territory in some other way that will present the single-valued definition of the delivery office, delivery region and the position on the itinerary.

The first two digits of the PAC define municipality or more municipalities and represent the rough territorial division. The third and the fourth digit indicate the delivery district and they are also a single-valued definition of the post office. The fifth and the sixth digit define the exact location of the recipient, that is to say, they define the region and its position within the itinerary.

The extended PAC, composed of six additional characters, defines the house number, the number of the entrance and the apartment number. The extended PAK must include twelve characters in order to address the mail, but this case will not be considered since the extended PAC has not been implemented and it can be generated from the very address itself.

The PAC enables a simpler sorting of mail because it is not necessary to read the address and know the streets (there are sometimes more streets of the same name at some locations), but the sorting is done according to the groups of digits. The first two digits are used as a single-valued definition of the processing center, the other two define the delivery office and the last two define the delivery district.

4. THE MODEL OF THE DYNAMIC MANAGEMENT OF MAIL DELIVERY

In the exposition thus far we have provided necessary information in order to comprehend all the complexities of the problem of organization of mail delivery. If we want to derive a theoretical model based on this, it is necessary to conduct certain simplifications or to observe only certain kinds of districts of similar characteristics. However, generally speaking, the abovementioned situation can be represented with the figure 1.

Each district is defined by a number of PACs and the basic distance that must be travelled in order to cover the entire district. Additional distances that need to be covered depend on the number of deliveries as well as urban characteristics. The extent to which the working hours of a postman are used efficiently depends on the distance that is covered as well as the kind and number of deliveries. In order to deliver certain kinds of mail the average norms have been defined so that each postman's productivity can be estimated separately. The productivity is estimated as follows:

$$\text{Productivity} = \left(\sum_{i=1}^i VP_i * N_i + PP \right) / VPD * 100 \quad \text{where} \quad (1)$$

VP- The number of delivered mail of i kind

N- the average norm for i kind expressed in norm minutes

PP- the total distance covered on the district

VPD- the time spend on delivery in minutes

i- the number of observed kinds of deliveries

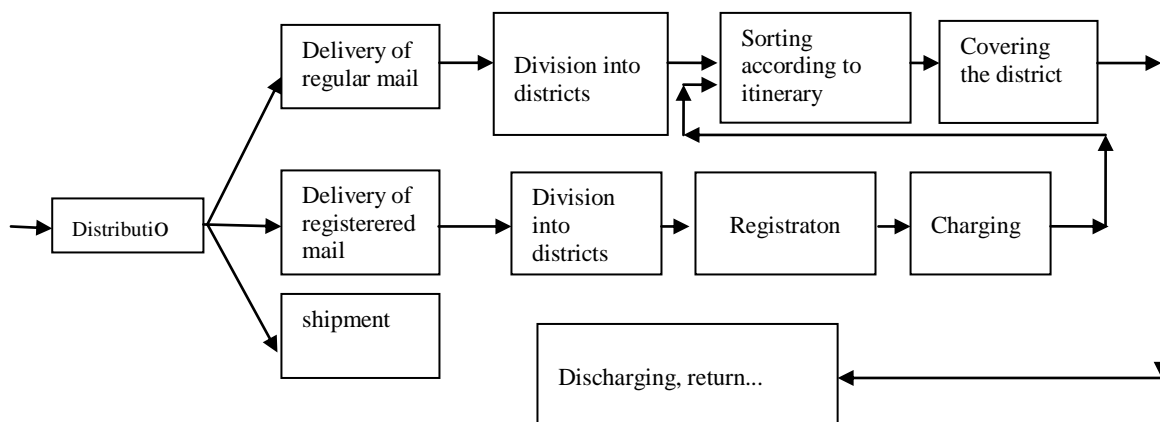

Figure 1. The simplified scheme of the business operations flow

Figure 2. The division of delivery area into delivery districts

The aim is to make a postman's productivity equal throughout the districts and on all workdays. How can this be achieved?

The achievement of this goal is not simple. The equalization can be achieved if we enable the uniform influx of mail, whose volume as well as the kinds of mail that constitute it, is known in advance. Some laws can be defined using statistical measurements but this is not sufficient for an efficient and rational control of delivery service.

By considering the abovementioned problem and recording the load that postmen experience on a daily basis, within a longer time period (a month) and in accordance with the segments of PAC districts, it is possible to achieve the equalization of the load throughout all districts. Based on the same methodology we can now define the PAC productivity as follows:

$$Productivity_{PAC} = (\sum_{i=1}^i VP_i * N_i + PPP) / VPD * 100; \text{ where:} \quad (2)$$

- VP- The number of delivered mail of i kind per PAC
- N- the average norm for i kind expressed in norm minutes
- PP- the total distance covered per PAC
- VPD- the time spent on delivery in minutes
- i- The kind of delivered mail

As it is impossible to measure the time spent on the delivery per PAC, then as a result we receive the share of PAC productivity in the overall productivity of the district. This enables us to, considering all the districts in the delivery office, we organize new district division so that the deviation of the total district productivity stays within $\pm 5\%$. The simple combination of PACs will enable equalization of the load of each district within the delivery office. It is not possible to achieve this equalization on a daily level because of the unequal incoming influxes of mail for each delivery district. However, it is possible to do so on a monthly level. There are predictable laws for incoming influxes on a monthly level, which is, from the point of view of organization of delivery service, much more important.

Considering the fact that there are constant population fluctuations as well as fluctuations in the number of legal entities in the field, it is necessary to measure the deviations of the overall district productivity and intervene once the deviation crosses a certain boundary. This procedure will be made significantly easier by the automation of business procedures in the processing phase because we can get exact results of the load for each PAC, which enables the quick responsiveness in order to change the district boundaries.

In this way we achieve the equalization of the monthly load of the delivery districts but we do not solve other problems that are present during the organization of delivery. A typical problem regarding the organization of delivery service is absence from work. The lack of work force is, namely, not always possible to predict and it is therefore important to organize an uninterrupted mail delivery with the available human resources. In these cases it is the most rational option to organize teams formed by three, four, five or six employees. Actually, when a postman is absent from work, the employees who are in charge of the neighbouring districts become responsible for the workload of the absent postman. It is possible to create extended districts in advance and divide PACs in order to achieve equalization of extended regions. In the situation where we know the PAC load in advance for the specified day (delivery post office receives the notice in the morning about the receipt of the mail for each PAC) it is possible to achieve equalization only for that given day. On the following figure there is an approximate division of PACs into neighbouring districts. District1 is overtaken by districts 2 and 3 and district 4 by districts 5, 6, and 7.

In a similar way we can dynamically control the districts for a special letter-post delivery as well as organize the delivery of mail according to the separate categories. We have already mentioned that postmen are unequally loaded throughout the month and that they experience the highest workload on the days when utility bills are being delivered. This is true for 4-6 days a month and on the other days the number of deliveries is insufficient for achieving full productivity. Since utility bills are delivered each month and since their number and the way they are sorted is already known, it is possible to organize the delivery service so that more people are employed only on these tasks and that the regions are created according to the standard influxes of mail. In this way we would achieve equalization of the load throughout the month and we would not harm the quality of postal services. The delivery of utility bills is technically simpler. They are

usually sorted according to the postman's itinerary and it is not necessary to deliver them personally but they are delivered in the mail box. Therefore, the time of delivery does not need to be during the postmen's working hours and other people might be employed for this task on an outside employment contract or a temporary employment contract. The delivery fee for utility bills would be defined in advance and it would depend on the specific characteristics of PACs regarding the building typology, urban characteristics,

mailbox condition, and so on. The same principle can be applied when it comes to delivery of direct mail, information about elections, and other kind of mail which does not repeat and which is not predictable in the long run. This kind of organization of delivery means that each delivery office has a sufficient number of people that can be invited and engaged within a short time period. All of the abovementioned conditions are applicable to delivery offices that cover more than four delivery districts, whereas for smaller countryside post offices this model is not entirely applicable

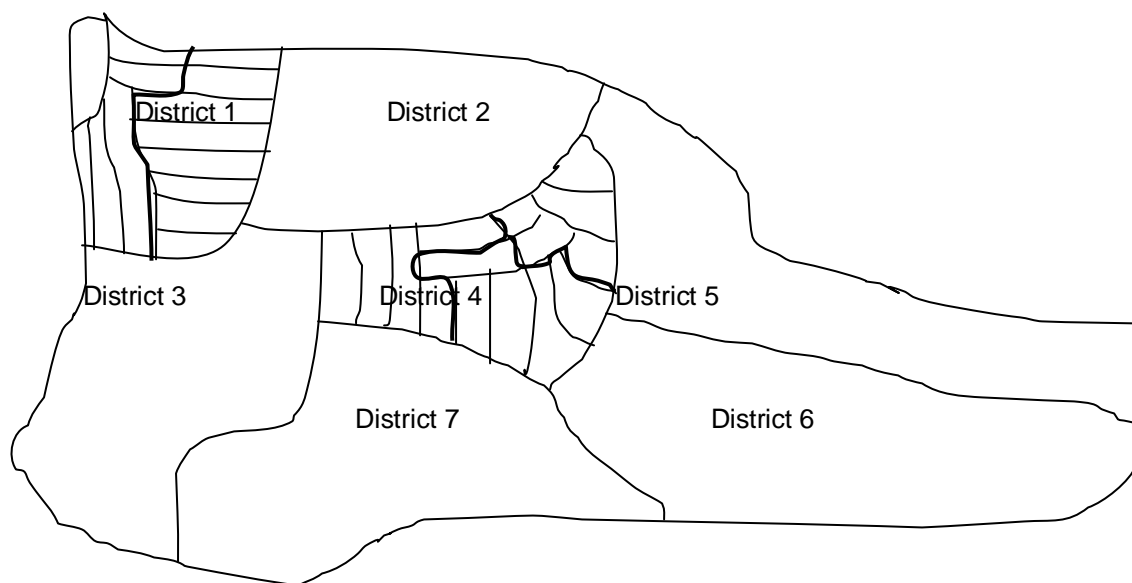

Figure 3. The example of the district division by the extension of the neighbouring districts

In rural areas a somewhat different logic can be applied. By determining wider and the widest districts we define the days of the week when delivery is conducted in these districts. Dynamic management of mail delivery service in rural areas involves the organization that takes into account the incoming influx of mail and the delivery that is organized according to the received mail. If there is too much mail for one hamlet on a certain day then the deliverer will deliver the mail on that day regardless of the fact whether the itinerary contains another district for which there is not the sufficient amount of mail. In this way the unproductive distance that is covered per mail is decreased, that is to say, the delivery costs are decreased and the quality is enhanced.

To approach the delivery service in this way, it is necessary to provide accurate and timely information about the number and kinds of mail that will arrive for delivery in delivery offices. This is possible only if a full automation of business procedures is achieved in the phases of receipt and processing (Marković Z., 2009) as well as close collaboration with customers that hand in utility bills and negotiate the delivery of a larger number of mail (direct mail, and so on).

5. CONCLUSION

The delivery of mail is a complex business procedure with a series of specificities. The quality of offered services as well as the profitability of postal services depends on the rational organization of mail delivery. Apart from that, the motivation of postmen to do their job properly also depends on good organization. It is necessary to conduct the right rationalization in order to achieve equalization of postmen's load, achieve their productivity and overcome the cases of sudden absence from work. Most of these problems can be solved by the dynamic management of mail delivery service as it has been presented in this paper.

Public Enterprise of PTT Communications "Srbija" is intensively working on creating conditions to enable all the necessary information in the delivery offices that is needed for the dynamic management of mail delivery service through automation of the processing of delivery mail and through the new corporate PosTis application that will enable the necessary information infrastructure.

Abstract: *In the modern economic environment, characterized by turbulent circumstances and a future that is difficult to predict, the survival, growth and development of any business entity depends on proper management of all available resources. Limited resources, the need for rapid adaptation to changes in the business environment and the achievement of the organization's goals, requires corporate governance based on efficiency. Corporate governance is particularly important for countries in transition and their efforts to end the transition process and catch up with developed countries. This is the case with Serbia, which has been on the transition path for more than two decades. Where is Serbia today in the implementation of corporate governance and what are the problems in its implementation, are the issues addressed in this paper.*

Keywords: *corporate, management, corporate governance, privatization, public companies*

1. INTRODUCTION

Corporate governance was no part of the reality of the economy in the socialist countries. The heritage of the socialist-type of planned economy, i.e. controlled allocation of resources to certain sectors, is characteristic for all the countries in transition. It goes without saying that in such controlled economy, no market of securities existed, or was insignificant. Also, due to the non-existence or under development of the financial markets, banks neither played the role of key financial mediators, therefore did not develop in that direction. Besides, considerable lagging behind compared with the developed countries is present in the countries in transition. Hence, in order to accelerate their economic development and reduce their lagging behind the developed economies in the world, these countries must insist on professional, corporate governance. The key of successful economic transformation toward market economy is development of corporations and respective institutions of corporate governance (Babić, 2004).

2. PREREQUISITE FOR THE DEVELOPMENT OF CORPORATE GOVERNANCE IN THE COUNTRIES IN TRANSITION

Transition process requires building of a new system of the rules of conduct (organization culture), requires new institutions. Institutional framework enabling the construction of an efficient system of corporate governance rests on the following (CIPE, 2002):

- Legal regulative must take a clear position regarding private property because investors are not interested in investing in the countries where no private property rights are guaranteed;
- Legal regulative must protect the rights of suppliers, employees and creditors;
- Regulated banking sector in the way as to enable functioning of the financial market and corporate sector;
- Developed market of securities;
- Market for corporate governance where takes-over happen;
- Developed markets forcing corporation to act efficiently, effectively and economically in the fighting of competition;
- Developed mechanisms that regulate insolvency and bankruptcy so that capital may be reallocated in time;
- Proper privatization that should create adequate ownership structure and basis for the creation of corporate relations in business environment;
- Independent judicial system;

- Developed anti-corruption strategy and related construction of adequate taxation system;
- Reduction of bureaucracy and inefficiency;
- Quality financial media that will enable quality supervision of managers, investors, creditors and corporate management structures;
- Active role of all stakeholders, which should enable understanding and realizing the true relevance of corporate governance.

Key transition process is privatization process. This process makes key impact on the structure of corporate ownership, and the selected privatization method on corporate governance. The transition process in Serbia lasting over 20 years, with still unpredictable outcome, requires detailed analysis of the privatization process.

3. PRIVATIZATION PROCESS IN THE REPUBLIC OF SERBIA

Privatization process in the Republic of Serbia from 1988 – 2000

At the end of the 1980s economic development in SFRY (Socialist Federal Republic of Yugoslavia), therefore in the Republic of Serbia, as one of its federal units, pointed to the emergence of a general crisis. High and galloping inflation, drop of the size of industrial production, followed by the rise of unemployment, required implementation of adequate measures. A wider reform of the economic system was undertaken resting on the following three: liberalization, stabilization and privatization. Because of the high inflation it was the economic reforms that were first undertaken, aimed at achieving macroeconomic stabilization of the country. Liberalization implied the liberalization of prices and opening up of economy. Amendments to the Constitution in 1988 created constitutional possibilities for emergence of different forms of ownership. For the first time the analysis of the crisis clearly pointed to the anonymity of ownership i.e. social ownership, as the most important cause for the crisis. The self-management organizations of associated labour as well as their superior organization form – organizations of associated labour showed chronic accumulative incompetence. This fact had as a consequence a lack of its own means for financing modernization and development, which resulted in increased indebtedness and dependence from local and foreign loans. This resulted in determining privatization model - capitalization. It was considered that this partial privatization would lead to increased efficiency of the economy. A series of legal acts and enactments (Law on Enterprises, 1988; Law on Turnover and Management of Social Capital, 1989) defined the forms of ownership and enterprises were classified on this basis. For all that, all the companies had the same rights and responsibilities on the market, in the transfer of money and in other economic activities. These changes resulted in unwished-for outcome, therefore the reforms continued in 1990. Social capital could be transformed in any form of property. The transfer of ownership could not be carried out without compensation. The sale of companies, partial or total, had to be effected on economic principles. The transfer of ownership was based on workers' shareholding. All companies in social ownership could sell part of their capital by issuing internal shares and sell them with discount. These, internal shares, could not be put on sale on securities market. During the 1990, 1200 social companies changed their status and became mixed companies. In 1991 Serbia passed the Law on Conditions and Procedures for turning public property into other forms of ownership. Relevant characteristic of the federal and republican law which determined and directed implementation of the privatization was that privatization was not mandatory. However with emergence of hyperinflation, privatization process, under then valid laws, became interesting, again. Possibility to buy companies for insignificant Dinar amounts, through various embezzlement and manipulation by the company's management, underestimated the companies even more, so that individuals and certain groups became rich through various ungrounded and uneconomical acts. This method of financing privatization brought about drastic redistribution of social/public capital and national wealth to the benefit of individuals. Until 1993, over 51,64% of companies were privatized on the territory of Serbia. Out of the 3678 companies, which was their total in 1991, until the mentioned period 1899 of them were privatized.

Table 1: Privatized companies before 1993

Territory	Number of companies	Privatized			Privatized in %
		federal	republican	Total	
Serbia proper	2.381	670	322	992	41,67
Vojvodina	993	527	194	721	72,63
Kosovo	304	3	183	186	61,21
Total	3.678	1.200	699	1.899	51,64

Source: Sokić S., *Kapital u ekonomiji tranzicije*, Zavet, Beograd, 2005, p 479.

Privatization continued during the 1994 until July, in the same manner, when the National Parliament passed the Law on changes and amendments to the law on conditions and procedure for turning the public ownership into other forms of ownership. This law, better known as Law on Revaluation, brought about the retroactive revaluation of the social capital and the sums for which shares were bought at the time of hyperinflation. Privatization process was back at the beginning.

Next attempt at implementing reforms has been on since 1998. It was in that year that the Law on Companies and Law on basis for transfer of the public capital. It was this legislation that meant breaking-up with worker's self-managing decision making. Also introduced were assembly, managing and supervisory board, while management consisted of C.E.O., managing board and other. Privatization that was based on the already mentioned legislative regulations brought nothing new. Only a small number of companies were privatized. At the end of 2000, 350 companies entered privatization process which was completed in 18 companies only (Begović, et.al, 2000).

Privatization process in the Republic of Serbia after 2000

In July 2001 the Law on Privatization was passed. Following were main goals of this Law: creation of open economy and ownership structure, investments maximization in real sector, social and political acceptability and establishing clear ownership structure; corporative management based on ownership structure. A set of laws, regulations and enactments were passed for implementation of this law. Taking in consideration the experience of other eastern European countries in transition, as well as circumstances in Serbia, selling model was adopted as privatization model. Methods of sale are public tenders and public auctions. Larger part of the social or state capital of the company being privatized (70%) is sold to strategic investors. Between the two options, dispersive ownership and single investors, the latter model was selected as considered more convenient in terms of corporate management. As for the privatization in 2001, it is relevant to point out that legal regulative annulled voluntarism of privatization in Serbia. During 2006, after the disintegration between Serbia and Montenegro, the Constitution of Serbia was voted and confirmed. This highest legal act, is different from those dating from before in the sense that it does not contain social ownership as form of ownership. Since 2002 following results were scored concerning privatization.

Table 2: Privatization in Serbia in the period 2002-2010

	Number of sold companies (T+A+Tk)*	People employed (T+A+Tk)	Selling price (T+A+Tk) in mill. EUR	Investments	Social programme (T+A+Tk)
2002	211	37.320	318,8	320,1	145,8
2003	638	76.927	839,9	319,8	128,3
2004	237	38.808	153,9	99,6	2,6
2005	317	58.931	370,9	98,6	0
2006	281	45.962	239,9	152,2	0
2007	316	45.011	434,5	103,6	0
2008	277	27.187	253,2	62,2	0
2009	94	9.119	48,8	24,6	0
2010	34	1.634	13,3	1,4	0
Total	2.405	340.899	2.673,1	1.181,9	276,7

Note: *T-tenders, A-auctions, Tk- capital market

According to the data available, 2405 companies have been sold since the beginning of privatization. 1682 socially owned companies were sold by tenders and auctions, while 723 have been sold on capital market (Ministry of Finance of the Republic of Serbia, 2010). Euro 669 million-worth income was made on capital, while Euro 2 billion (Ministry of Finance of the Republic of Serbia, 2010) -worth income was made on sale by tenders and auctions. Beside aforementioned, also Euro 1.22 billion-worth contracted investment, while Euro 0.28 billion was made tied with the social programme, contracted during the sale of the company. The highest total income per structure (direct sale, contracted investment, social programme) was made on sale by tender and resulted from sale of big companies. A number of the big companies went through restructuring process before the sale. 596 contracts (Ministry of Finance of the Republic of Serbia, 2010) concerning sale of companies by tender and auction were broken. Reasons for breaking of the contracts are

buyers' disrespect of their contractual obligations which were various: non-payment of installments, disrespect of investment and social programme, managing corporate property contrary to the contracts signed, etc. What is characteristic for 2009 and 2010 is drop in the sale of companies, which was consequence of the approaching end of the privatization process of the socially owned companies. In the preceding period the buyers bought up companies for which they showed interest, so that companies for which no interest was shown still remained unsold. Out of these several hundred mainly small companies, smaller number, for which the state showed interest, changed ownership structure, were transferred to state ownership. As for the remaining companies, they were liquidated for buying unattractive companies.

Privatization process of public companies

The next phase in the privatization process is privatization of public companies. Only after this process, necessary economic ambience will be created for a more efficient economy. As an important economy factor, with their activity and efficiency, they seriously influence the efficiency of economy as a whole. Thanks to their activity, a great many of these companies, have monopolistic position. There are over 500 public companies in Serbia today. They are characterized by high indebtedness, high level of liquidity, insolvency, operating with losses. Thanks to the activity they engage in, great many of these companies have monopolistic position. Their characteristic is high indebtedness, rather low current liquidity, insolvency, doing business with losses, low profit and high income per employee. In the economy of Serbia today, there exist 590 public companies, and over 550 are losers (Ilić, 2011) in what they do. Participation in management bodies of these companies is attractive today, too, and is reason for their fighting. Namely, basic characteristic of these companies is inefficiency, and the answer to the question how to raise the efficiency in these companies is privatization. However, with privatization of companies several elements have to be considered. Thanks to the activities they are engaged in, the specific features in production and services and their distribution, one part of such companies have monopolistic position, and such position is a form of state monopoly. Basic motive for creating such monopoly is protection of general interests. When privatizing these companies there is a danger of monopoly position being mistaken for private monopoly position. What motivates capital is profit, and it is not interested in the protection of general interest but in taking monopolistic position. By giving away the state monopoly position to private capital, its turning into private monopoly, would lead to redistribution of profit of the entire economy to the benefit of monopolistic companies of public sector of the economy. This would unfavourably affect economic growth, leading to unstable conditions for business that would negatively affect development, first of all investments. It is also important to determine clear conditions under which privatization will be effected, and surely special attention must be paid to:

- protection of general interest when changing prices,
- conditions of doing business, same
- level of obligatory investments,
- capitalization and increased participation of private capital in the company's total capital, etc.
-

This, further means, that this privatization phase can not be limited, in terms of time, as well as that adequate, quality solutions are required that will be supported by adequate regulative. Concerning how and at what rate this privatization will develop, it depends on economic goals the achievement of which the privatization will aspire to. One can conclude from the stated that privatization process in Serbia, has not been completed yet, not 20 years after. Corporate management that should have been implemented in the economy of Serbia, can not seriously affect the efficiency of economy i.e. either the growth or development that could reduce lagging behind the developed countries.

4. SECURITIES MARKET IN THE REPUBLIC OF SERBIA

Non-development of securities market is regular phenomenon in transition countries. Beside the small offer, the demand is low, for not too many investors who appear on the stock exchange, main reason for this being low level of trust. When talking about (non)development of the securities market in Serbia one should bear in mind that, beside the already said, it is also the consequence of:

- long transition;
- low level of economic activity;
- privatization process which takes too long and is only partially completed;
- foreign direct investments which arrived at a lesser size than expected which specially refers to so-called "greenfield" investment, which should have significantly contributed to corporate management in Serbia, first of all through transfer of knowledge and technology, etc.

5. ATTAINED LEVEL OF DEVELOPMENT AND CORPORATE GOVERNANCE PERSPECTIVE IN THE REPUBLIC OF SERBIA

On the basis of everything said so far, following two questions pose themselves:

- How far has Serbia gone in the development of corporate governance?
- What are perspectives of corporate governance in Serbia?

In order to answer the first question it is necessary to see the place and position of Serbia compared with other countries, both from immediate neighbourhood and wider. "Global Competitiveness Report" published by World Economic Forum, can be used for that purpose. The Report shows indicators that are specially important for corporate management in Serbia.

Table 3: Corporate governance indicators in Serbia

Indicator	2008/2009 (134) ¹			2009/2010 (133)			2010/2011 (139)			2011/2012 (142)			tendency of dk ²		
	rank	dk ³	pk ⁴	rank	dk	pk	rank	dk	pk	rank	dk	pk			
Ownership rights	108	3,6	4,7	111	3,4	4,5	122	3,2	4,4	126	3,1	4,3	↓	↓	↓

Source: World Economic Forum, Global Competitiveness Report 2011-2012, Global Competitiveness Report 2010-2011, Global Competitiveness Report 2009-2010, Global Competitiveness Report 2008-2009

Note:

¹Number of the countries observed

²Tendency of dk represents the attained coefficient compared to the former value. Downward arrow indicates decline, while upward arrow indicates raise of the value of the coefficient.

³dk represents attained value of the coefficient in the observed period. Minimal coefficient value is 1-the worst result. maximal is 7- best possible result.

⁴pk represents average coefficient value

A general conclusion can be drawn from the presented data that over the past several years there has been a permanent deterioration of the environment necessary for corporate governance system development. In a huge majority of the presented indicators over the reported period, there has been a downward trend of the achieved coefficient. In the presented indicators, Serbia has not reached the coefficient value above the average in a single indicator. It has been mentioned earlier that a certain level of institutional framework

development is necessary for corporate governance to thrive. Institutional development level in Serbia is, according to the Report on Global Competitiveness in 2011-2012, and according to which Serbia is ranked 121st as the worst ranked country among the countries in its immediate neighbourhood. It has been mentioned earlier in this text that Serbia has only partially completed its privatization process, which is a

necessary prerequisite for the corporate governance development. The following indicators serve to describe the institutions responsible for regulation of the property and property rights' sector: Ownership Rights and Intellectual Property Protection; and the achieved values show that this area has not yet been adequately regulated to facilitate corporate governance development. The following indicators describe the management sector: Brain Drain, Professional Management Reliance Levels, Availability of Scientists and Engineers and Personnel Training Scope. Brain drain has been evident in Serbia for several decades now, so that it has become a chronic issue. Failure to overturn this process in the century that is going to be the century of grey cells will certainly have negative consequences on the future perspectives of Serbia. In addition to this, the rapid downturn of the Availability of Scientists and Engineers indicator is evident from this Table. Since the practice of commissioning professional managerial tasks is still underdeveloped in Serbia, and since the managerial staff still lack the necessary knowledge and skills, and while respecting the fact that investments in research and development have been modest only, it can safely be concluded that Serbia lacks both quality and quantity of human resources necessary for adequate corporate governance. The foreign direct investments in Serbia are expected to exert considerable influence on its economic growth and development, but also on the technology transfer, know-how and introduction of corporate governance. The following indicators describe the achieved results in this area: Foreign Direct Investments and Technology Transfer, and Legal Regulations' Influence on Foreign Direct Investments. As for the market in general, (relevant indicators: Local Competitiveness Levels, Market Domination Levels, Antimonopoly Politics Effects) it can be concluded that the market is not adequately developed and that it is a market with no significant competition, which cannot be an auspicious climate for corporate governance development. Inefficiency and lack of antimonopoly policy, weak foreign capital presence and weak business legal framework, which only insufficiently implements the instruments aimed to attract the foreign investments, all point out to the need for the relevant factors to do much more than they have so far. Quality and quantity of the local suppliers has not reached a satisfactory level either. The level of cluster development, as an indicator of the form of connections between corporations and one of the ways to reach the globalized market, has not reached the necessary or the desired level yet. The legal infrastructure indicators show that it is still far away from the level necessary for the corporate governance development (Independence in Work of Judiciary, Legal Framework Efficaciousness in Dispute Resolution, Legal Framework Efficiency in Contract Reviewing). The achieved level of Small Shareholders' Protection is especially worrying, because in 2011, just as in the previous years, only Ukraine and Bosnia and Herzegovina have been ranked worse than Serbia. Corporate reporting is an important external mechanism of corporate governance Its indicator, Auditing Strengthening and Standard Reporting, points out that it is necessary to invest much more efforts in this area in order to achieve any significant progress. Companies in Serbia are not sufficiently prepared for the corporate governance, which is corroborated by the Readiness to Commission Monitoring indicator.

Table 4 : Largest obstacles to doing business in the countries of the Western Balkans (non-Eu member states) in 2011-2012

	Serbi	Croati	BH	Macedoni	Montenegr	Albania
Corruption	2	2	3	3	3	2
State administration	1	1	2	2	2	3
Political instability	3	3	4	4	4	4
Access to finances	4	4	1	1	1	1

Source: World Economic Forum, Global Competitiveness Report 2011-2012

The issue of corruption is present and ranked high in the description of the Biggest obstacles for business in all the former SFRY countries. According to the World Bank definition corruption is the abuse of office for the purpose of personal gain. Corruption can be petty (accepting small gifts, providing different small favours), or substantial, in cases where it turns into criminal offense. Presence of corruptive practices and deep-rootedness of corruption in a society influence, among other things, the Government spending by diverting it into the less productive areas, which exerts negative influence on the economic growth.

Table5 :Ranking of the biggest obstacles to doing business in Serbia in the period 2008-2012

	2008-2009	2009-2010	2010-2011	2011-2012
Corruption	2	1	1	2
Administration inefficiency	3	4	2	1
Political instability	1	2	3	3
Access to finances	6	3	4	4

Source: World Economic Forum, Global Competitiveness Report 2011-2012, Global Competitiveness Report 2010-2011, Global Competitiveness Report 2009-2010, Global Competitiveness Report 2008-2009

Over the past years in Serbia, the problem of corruption has become more and more important and it is one of the biggest obstacles to business, coupled with the inefficient administration and political instability.

6. CONCLUSION

Conclusion about the achieved level of corporate management in Serbia can be drawn from indicator Efficiency of corporate governance, which in the observed period shows dropping tendency and ranks Serbia as 136 out of the 142 countries. Ranked behind Serbia are only: Tajikistan, East Timor, Angola, Mauritania and Libya.

From all the stated, it is clear that in building corporate governance system Serbia is at the very beginning. It is quite sure that such system cannot be constructed over night and that it takes some time for that. What can be said with certainty is that it is natural for Serbia to head to building a closed model of corporate governance (Ivković,2011). Reasons for such a choice are in the following facts:

- Financial markets in Serbia, especially those needed are not well developed and it cannot be expected to develop in relatively short time;
- Banks in Serbia's economy, as their source of financial means have central place, which is one of basic characteristics of closed model of corporate governance;
- Historically viewed, from the point of view of participation of employed in management, tradition exists concerning participation of workers in management.

In the conditions of cyclic activity of economic crisis globally, the issue of efficiency of economic system and economic subjects becomes even more tense and requires reconsideration of strategies and policy of growth and development at all levels. World economic crisis has additionally worsened the picture of the economy of Serbia so that it is today ranked 70% levels of the GNP in 1989 (EBRD,2011).

In such ambience corporate governance, understood as professional management, and its implementation in the economic system of Serbia is very important for the efficiency of the use of resources as well as growth and development of the national economy.

Abstract: *The success of companies is often, but not at all times, measured by various performance indicators. However, there is no unified approach to determine neither the value nor the success of the company. This paper presents various, most commonly used approaches in setting performance-based success. Through in-depth secondary research, the reader will be provided with meaningful insights in approaches or methodologies for establishing world's best companies. The paper focuses mainly on for-profit companies and therefore does not deal with the success of NGOs, public and non-profit organizations. The findings of the paper are very interesting. They show that there is no unique success measurement system and each and every one has more or less pros and cons. However, even with these drawbacks, one must take them into account and cannot formulate economy-related research without them. The results of the paper are important to every scholar or researcher who is as a side input using some sort of company success rankings. The paper enables readers to gain critical opinion on most used rankings and to create a rational and founded starting point for their further research.*

Keywords: *performance, success, ranking, list, company*

1. INTRODUCTION

Performance management is not a new concept any more. It has been around for some time now. Companies seeking for successful managing models in an ever-changing environment have been looking into performances in order to determine strongpoints and areas for improvement. But the big question is what performances should be looked at. What are these gold letters that tells us whether our organization is on a good way or not? What is the rationale behind this question. The success of the company nowadays should be measured by the way ahead not the way behind. Therefore, how we will know what company is heading the good way and thus successful?

There is neither unique methodology nor unified set of performance that would provide us with an eye opening experience on the organizations' success. So, are we tumbling in the dark, or at least in the fog with this concept? This question could lead us back to the definition of the success of one company. What are the most successful companies and why?

There is not unique worldwide-accepted list for this either. But there are few very well recognized. This paper will present the most important listings that even with some flaws could represent the world's best.

2. LISTS

There are numerous organizations dealing with listings. As the organizations providing them, so are the lists very different. Most popular and widely accepted ones are: Forbes's Global 2000, Fortune Global 500, Financial Times Global 500 and many more. The best known and the most quoted list in Serbia, is Ekonomika Media Group's Top 300. No matter the depth of the scientific research, you cannot talk about successfulness of the company without taking into account one or more of these lists. In this paper the most used ones will be presented more into depth, explaining methodologies and/or approaches for preparing rankings. This review would be of great use in creating an insight as a base for a critical opinion regarding these lists in terms of secondary side input for research.

2.1. Forbes

Certainly most popular hence most used lists are ones published by Forbes. Forbes has been dealing with rankings of various entities for several decades now. It provides lists regarding almost every segment of living:

- Rich lists such as world's billionaires, richest people from several countries, etc.

- People lists such as top earning CEOs, top-earning dead celebrities, world's most powerful women, the celebrity 100, world's top-earning models, etc.
- Companies lists such as America's best small companies, world's most innovative companies, America's largest private companies, global high performers, global 2000 leading companies, etc.
- Money and investing lists such as best brokerage analysts, the 200 largest U.S. charities etc.
- Places lists such as best countries for business, best places for business and careers, best cities for singles, most expensive zip codes etc.
- Sports lists such as the business of baseball, basketball, football, top-paid tennis stars, etc.
- Technology lists such as tech's top deal makers, the 25 fastest-growing tech companies, etc.
- Education lists such as top colleges, best business schools, best college buys.

But what is important for us are in business widely used list of most successful or more valuable companies. Some of these lists will be presented here in order to provide readers with common understanding of what they actually represent.

2.1.1. Global 2000 – The World's Biggest Companies

The list of The World's Biggest Companies is made based on composite ranking of sales, profit, asset and market value. (DeCarlo, Global High Performers, 2011) The list is compiled using Interactive Data, Thomson Reuters Fundamentals and Worldscope databases via FactSet Research Systems for publicly traded companies. Exploitation of these databases enables search for the biggest companies considering 4 indicators: sales, profit, asset and market value. All financial numbers are consolidated, taken from last fiscal year financial data, and expressed in dollars. (DeCarlo, Methodology: How We Crunch The Numbers, 2012)

The first step in ranking is forming separate lists of top 2000 by each indicator: Sales 2000, Profit 2000, Asset 2000 and Market Value 2000. For each separate list there is minimal requirement that each company has to meet and each company must qualify in at least one of the separate lists in order to become candidate for Global 2000. The preconditions for the separate lists are for companies to have (Forbes staff, 2011):

- Sales at least 3,3 billion dollars,
- Profit at least 207,9 billion dollars,
- Assets least 6,59 billion dollars and
- Market value least 4,14 billion dollars.

Each company gets separate score for each indicator, based on the fact how it is ranked on separate 2000 list. If it does not meet some of minimal requirement, company gets zero points for that indicator. By adding this four scores equally pondered, each company gets total score number. (Forbes staff, 2011) Total score achieved then represents a key for ranking the companies.

2.1.2. Global High Performers

Global high performers are well-managed, agile companies with high growth, which enable them to become benchmark for their industry. The aim is to find companies that represent global superstar. The starting point for finding such companies is Forbes's Global 2000 list. The companies are considered to be global since they operate in America, as well on their local markets. The precondition to become candidate for Global High Performers is for company to earn in average 56% of revenue outside their country. Additionally, companies must have at least 1 billion dollars sales and positive shareholder's equity. (DeCarlo, Global High Performers, 2011)

The first step in creating list is to analyse companies from all industries, excepting trading companies, from Global 2000 list and assess them according to long-term and short-term sales growth, income growth, return on capital and total return to shareholders. Earnings projections are considered too and after these analyses, 5 companies from each industry are carefully chosen. (DeCarlo, Global High Performers, 2011)

Listed companies can be sorted according to industry, average 5 years sales growth, average 5 years net profit growth, average 5 years total revenue, projected earnings per share growth, debt ratio and country origin.

2.1.3. Platinum 400 – the Best Big Companies in America

The candidates for Platinum 400 are American and foreign corporation with significant presents in USA, which embodies about 1000 corporations with at least 1 billion dollars revenue in the last fiscal year, share price at least 5 dollars per share and positive equity. (Forbes staff, 2008)

The companies that could be ranked extremely high, but that are not suitable for platinum mark are excluded from ranking. The help in that task is achieved from Audit Integrity, witch judge risk attached to accounting practise and appearance of unwanted events such as class action litigation, financial restatements, internal control deficiencies, securities and exchange enforcement actions and stock price performance. If company gets law score with Audit Integrity, it will be expelled from further ranking process. Security analyst reports are being checked too, searching for negative news about candidates, as well as for projections regarding earnings that might indicate decline of growth rate. Audit Integrity also assesses financial condition of a company as strong, average or weak, based on a number of financial ratios, such as current and quick ratio. (Forbes staff, 2008)

Companies are divided into 26 industries, and in each industry companies are ranked according to different growth rates and value measures. The companies are chosen based on sales and earnings growth, debt ratio, earnings outlook and stock market returns. Forbes methodology ranks companies according to 1-year and 5 years data, to take into account a long-term success as well as most resent performances. The success is measured by sale and earnings growth and return to shareholders. According to this measuers and other data, including analyst reviews and accounting and governance ratings from Audit Integrity, one best-managed company is chosen from each industry. (Zajac, 2008)The ranking system also includes consensus about long-term earnings growth and debt ratio forecast. After pondering these indicators, each company gets composite number as well as overall rank within industry. (Forbes staff, 2008)

For calculating 5 years growth rate, it is necessary to have data for 6 years period. Growth rates for period shorter than 5 years are marked with footnote. When there is less than 4 years available data, the growth rate is considered unavailable. The comparisons regarding last 12 months include most resent 4 quarters and comparable 4 quarters from previous year. (Forbes staff, 2008)

For sales growth rate and earnings per share Forbes methodology uses lest squares method. This equation, adjusted for sharp fluctuations, provides result that tightly reflects average growth rate. One of lest squares method limitations is that it cannot include negative values. If earnings are negative at the beginning of the period, growth rate is calculated with the first positive year. If earnings are negative in the middle of measuring period, that year is excluded from calculation, and the rest of period with positive earning will be considered. The assumption that lies behind this is that single loss cannot be representative for long/term performances. If company has loss during more than one year and has great fluctuations in earnings, the program does not calculate 5 years growth rate and the result is meaningless. (Forbes staff, 2008)

Revenues, net income, operating and profit margins measures are from last 12 months data.Profit margin is calculated as net income divided by net sales. Revenue is taken as net sales plus other operating revenues. Operating profit is calculating as net sales minus cost of goods sold, selling, general and administrative expense and research and development costs. Data for calculating debt ratio are taken from the last Balance sheet. Debt includes long-term debt and capitalized leases. Total capital includes long-term debt, shareholders equity, minority interest, deferred taxes and investment tax credits. (Forbes staff, 2008)

400 best-ranked companies can be sorted by 5 years total revenue, sales and net income. The list can be filtered by industry too.

2.1.4. The Top 20 Small Public Companies In America

To become candidate for The Top 20 Small Public Companies In America, companies must be publicly traded for at least on year, have annual revenue between 5 million and 1 billiondollars and boast a stock price not less than 5 \$ per share. For apples-to-apples comparisons, financial institutions, REITs, utilities and limited partnerships are excluded. Ranking is based on earnings growth, sale growth and return on equity during last 12 months and last 5 years. Share performance comparing to similar companies is taken into account too. (Badenhausen, 2011)

The rank is based on:

- Sales during last 12 months,
- Five years annualized sales growth,

- Five years annualized earnings per share growth,
- Five years average return on equity.

2.1.5. America's Largest Private Companies

Forbes also provides the list of America's largest private companies based on total revenue. Most companies from the list do not have intention to change its private status. Whenever it is possible, the revenues are reduced by sales of publicly traded subsidiaries. (Murphy, 2011)

Candidates for this list must have revenue as least 2 billion dollars. Candidates cannot be companies that do not pay income tax, mutually owned companies, cooperatives, companies with less than 100 employees, companies that are more than 50% owned by another public, private or foreign company and companies with main activity in auto dealerships and real estate investment and/or management. (Murphy, 2011)

2.1.6. Asia's 200 Best Under A Billion

The companies need to have growth in both sales and earnings in order to become candidate for this list. Additionally, their yearly revenue must be between 5 million and 1 billion dollars and they have to be publicly traded during last three years. (Settimi, 2011)

The companies are ranked according to earnings growth, sales growth and return on equity during last 12 months and during the last 3 years. (Settimi, 2011)

2.1.7. Asia's Fab 50 Companies – the Best of Asia-Pacific's Biggest Listed Companies

In order to be Asia's Fab 50, the companies must have at least 3 billion dollars in revenue or market capitalisation. The ranking is based on 5 years revenue, operating earnings and return on capital, followed by consideration of recent results and share price movements. If company is has too much debt or government own at least half of shares it will be excluded from the list. (DeCarlo & Koppisch, Asia's Fab 50, 2011) The companies from the list can be sorted by country origin, market value, sales and industry.

2.2. Fortune Magazine

Magazine Fortune deals with various business and social areas, but it is also known for its annual features ranking companies, from different points of view.

2.2.1. Fortune Global 500

Fortune Global 500, created by magazine Fortune is a list of the biggest companies in the World, sorted by total revenue. Inside this list, Fortune provides specific lists such as European Top 50 made of 50 European companies with the highest revenue derived from Global 500. List can be further used to select companies from Global 500 based on specific country, industry or city. (Fortune Magazine)

Fortune considers there 500 companies in the light of top performance companies, providing insight into their rank based on chosen performances, as success indicator. These performances are: (Fortune Magazine, 2006):

- Revenue growth,
- Percentage revenue change,
- Income,
- Income growth,
- Percentage income change,
- Profit margins,
- Return on assets,
- Number of employees,
- Revenue per employee,
- Assets per employee.

2.2.2. The other lists

Fortune also creates other list of successful companies, such as (Fortune Magazine):

- 100 best companies to work for,
- 50 most profitable companies measured by income, profit margin and return on equity,
- 50 biggest companies according to market share, shareholder's equity and number of employees,
- Biggest investment companies ranked by shareholders return in the period of 1, 5 or 10 years,

- 25 top companies for leaders, based on different fact regarding management and promotion policy,
- 100 fastest-growing companies, with the most rapid growth measured by combination of earnings growth, revenue growth and total return for 3 years period,
- World's most admired companies; created according to questioner in which they asked business people about what are the companies they admire the most.

2.3. Bloomberg Businessweek: Global Top 40

Bloomberg Businessweek provides the list of 40 best companies in the world. Some of the strategies that company apply in order to get to the list are commitment to innovation, diversified portfolios, aggressive expansion, strong leadership and clear vision of future. (Deprez, 2009) The list of Top 40 creates consultant company A.T. Kearney. for Businessweek. They use Thomson Reuters methodology for ranking: the first step is to calculate median value growth rate (market capitalisation growth after deducting any capital increase) and sales growth rate for the last 50 years for about 2500 publicly listed companies around the world. (Bloomberg Businessweek) In order to become a candidate, a company must have more than 10 billion dollars in sale, with at least quarter from outside their country, positive value growth, and above average sales growth. (Deprez, 2009)

The companies are ranked according to sales growth and value creation. (Deprez, 2009) When it comes to growth, it is calculated as median value for 1 year and 5 years earnings per share growth for the group with exclusion of those that do not fall into top half. Afterwards the current ratio price-earnings for *MSCI World index* is considered and all companies with ratio under that are eliminated. (Jespersen & Kalwarski, 2009)

Bloomberg Businessweek also provides a list of 50 most innovative companies that Boston Consulting Group (BCG) creates for them based on questioner sent to senior executives around the world where they named the most innovative company outside their industry.

2.4. A.T. Kearney: Global Champions

Global Champions, list of 25 companies created by A.T. Kearney, is made of companies chosen between 2500 biggest international companies in the world that have superior performances during 5 years period. Those companies have 15% average growth rate, while the sample as a whole has this growth rate just 8%. According to the study they conducted, the best performance companies are those who combine long-term strategic planning with skilful execution. The analysis showed that the company size, nor market position are not precondition for superior growth or protection from market fluctuations. (A.T. Kearney, 2009)

2.5. Financial Times: Global 500

Global 500 is a Financial Times list of companies ranked by market capitalisation. The higher market price of company's shares, the higher the rank. Market capitalisation is calculated by multiplying share price on March 31st by number of issued shares. The candidates for the list are all companies with free float (portion of shares in market circulation) at least 15%. Companies are then valued based on shares listed on the share market. The total value of listed shares is considered even if the part is tightly held. Unlisted lines of stock are excluded. Investment companies are excluded too. (Dullforce, FT Global 500, 2011)

Other performances that are considered in the Global 500 rank are: rank in the previous year, country origin, market capitalization, sector, turnover, net income, total assets, number of employees, price, price/earnings ratio and dividend yield. (Dullforce, FT Global 500, 2011)

Financial Times provides additional lists FT 500 for Europe, USA, Great Britain and Japan. They also create tables that show newcomers to the list, companies who fell out of the list, the biggest rise and drop on the list market capitalisation by sector or country, as well as the rank of all companies from Global 500 in their sector. (Dullforce, FT Global 500 method and background, 2008)

2.6. Serbian Ministry of Finance: 100 the most successful companies

Serbian Ministry of Finance creates the list of 100 most successful companies in Serbia, based on net income. Beside net income, the list provides data about some other performance indicators, as a success measures: profit margin, net profit change regarding previous year, operating revenue, operating revenue change from the previous year and number of employees. Using this list, the Ministry extracts a separate list of ten most profitable companies, measured by profit margin. (Ministarstvo finansija, 2011)

2.7. Deloitte: 500 biggest companies from Central Europe

Deloitte Company creates list of 500 top companies based on sales revenue. Besides revenue, Deloitte considers some other performance indicators, such as revenue change from previous year, net profit, and change of net profit since previous year. Top 500 is made according to consolidated revenues for the fiscal year, and companies are grouped by industry and country origin. (Deloitte, 2009)

Deloitte also creates additional list of 25 biggest companies measured by market capitalization.

2.8. Ekonom: east Media Group (EMG): Top 300

The most recognized and the most quoted list of best companies in Serbia is Top 300 created and published by Ekonom: east Media Group. This list is comprised of 300 most successful companies in Serbia, measured by the level of operative revenue. (Ekonom: east Media Group, 2011)

Top 300 rank is used for creating additional lists of most successful companies according to other important performance indicators (Ekonom: east Media Group, 2011):

- Top 20 – by operative revenue growth; it ranks 20 most successful companies according to percentage growth of operative revenue regarding previous year.
- Top 20 – by EBITDA; EMG ranks 20 most successful companies measured by earnings before income, tax, depreciation and amortization.
- Top 20 – by earning before tax; it ranks 20 most successful companies by the level of earning before tax in current year.
- Top 20 – by EBITDA margin; the list is consisted of 20 most successful companies measured by earnings before income, tax, depreciation and amortization margin.
- Top 10 – central Serbia; the list of 10 most successful companies from Central Serbia, ranked by operative revenue in previous year.
- Top 10 – Vojvodina; the rank of 10 most successful companies by operative revenue in previous year, from Vojvodina territory.

3. PROS AND CONS FOR DIFFERENT RANKING CRITERIA

Each of the rankings has its strengths and weaknesses in terms of determining the world's top performance companies.

For example, using solely revenue as a measure, does not take into account differences in expenditures for the same amount of incoming revenue, and thus gives a bias towards revenue-heavy retailers. Plus, the rankings may not take into account the impact of variations in accounting standards, among other factors. (Bedell, 2010) Turnover, does not adequately allow for banks and some financial services companies, while profits will be distorted by write-offs. (Dullforce, FT Global 500 method and background, 2008)

A common problem affecting most methods other than market capitalisation is timing. As profit and turnover figures come from annual reports, any ranking based on them must be out of date. (Dullforce, FT Global 500 method and background, 2008) On the other hand, using market value involves a single snapshot of the relative value that investors put on the company, without accounting for variations due to seasonality, the impact of positive or negative news headlines about the company, rumours about mergers and acquisitions, executive changes, and the many other factors that affect share price on a daily basis. Additionally, listing only public companies excludes privately-owned and wholly state-owned corporations. (Bedell, 2010) In contrast, it can also be argued that a ranking based on market capitalisations contains a forward-looking element in the sense that share prices include a view on investors' expectations. (Dullforce, FT Global 500 method and background, 2008). Even with issues mentioned above, one must not avoid these rankings, but rather take it into account with some reserve.

4. CONCLUSION

Many researchers from both scientific and non-scientific arena use various rankings and lists in they work as a side input for the success of the companies. Whether financially focused or not, a research must have in mind what does it mean being i.e. 34th in the Forbes 2000, of 53rd in EMG top 300. This paper has pioneered insight behind the scenes of these lists, giving a clarification and methodological baseline for these ranking. This is what every "consumer" of these products should have in mind when "buying" some of them.

One may conclude that some or most of these lists are far away from being perfect measurement tool of success, let alone the uniqueness or unified approach. However we must not neglect these since they

influence global perception more than some far more sophisticated methodologies of valuation. On the other hand, we must not take them for granted believing that the results of these rankings are “word of god”.

So, to conclude: ranking lists of companies based on performances, described in this paper, are something we must take into account when talking about successfulness of organizations, but also something we can't thoroughly believe, but use it more as a point of departure, rather than destination.

STRATEGIC DEFENCE PERFORMANCE MANAGEMENT

Dejan Stojković¹, Ljupča Stojanović²

¹Ministry of Defence, Republic of Serbia, dej.stojkovic@mod.gov.rs

²Ministry of the Interior, Republic of Serbia

Abstract: Strategic defence performance management has a very important role in an overall process of defence system management. This paper presents results of an analysis of many different approaches and explains main features of strategic defence performance management. The paper can be useful for defence and public management practitioners and researchers.

Keywords: defence, performance, management, balanced scorecard. 1. introduction

In a performance-oriented era, organizational efficiency and effectiveness plays a central role no matter the industry or sector involved. Performance management is an ongoing, systematic approach to improving results. The performance aspects in the defence sector started to be viewed and considered with primary interest in the last ten-fifteen years. The fundamental benefit of performance management is that it enables defence systems to provide better results for the public and a higher level of national and international security.

One of the performance management concepts with increased adoption in the defence sector is the Balanced Scorecard. United States Army, UK Ministry of Defence or Canadian Department of National Defence, are amongst the recognized implementers of performance architectures based on Balanced Scorecard.

2. PERFORMANCE MANAGEMENT IN THE PUBLIC SECTOR

Performance management within public sector organisations has always been a difficult and controversial area. However, with continuing pressures for accountability and value for money it is one which requires appropriate management attention.

Accountability demands on the public sector increase every year. Public sector organizations are carefully examined by legislators and the public and compelled to do more with less funding. Those organizations must strive to find new ways to improve their performance and satisfy public needs with constrained resources.

Performance management in the public sector is an ongoing, systematic approach to improving results through evidence-based decision making, continuous organizational learning, and a focus on accountability for performance. Performance management is integrated into all aspects of an organization's management and policy-making processes, transforming an organization's practices so it is focused on achieving improved results for the public (National Performance Management Advisory Commission, 2010).

Performance management within public sector organisations cannot take place in isolation. It needs to be incorporated into general organizational management system (Figure 1).

Figure 1: Performance management within general organizational management system (Accounts Commission for Scotland, 1998)

The key metric for public sector organizations' performance is not financial, but rather mission effectiveness. However, mission effectiveness is not a definite and static issue. Usually, organizations have a general mission, which includes many specific sub-missions. At any given time, some sub-missions may be more important for the public than others may. The establishment of priorities among organizational sub-missions is an ongoing strategic planning responsibility.

There are significant differences between public and private sector organizations. The only clear similarity between the two is in the desire for "customer satisfaction", but even here, there is a difference, because the definition of "customer" is different in the two cases. Some of similarities and differences between public and private sector organizations are given in Table 1 (Arveson, P., 1999).

Table 1: Similarities and differences between public and private sector organizations

Feature	Public Sector	Private Sector
General Strategic Goal	mission effectiveness	competitiveness
General Financial Goals	cost reduction; efficiency	profit; growth; market share
Values	accountability to public; integrity; fairness	innovation; creativity; good will; recognition
Desired Outcome	customer satisfaction	customer satisfaction
Stakeholders	taxpayers; inspectors; legislators	stockholders; owners; market
Budget Priorities Defined by:	leadership; legislators; planners	customer demand
Justification for secrecy	national security	protection of intellectual capital; proprietary knowledge
Key Success Factors	best management practices	growth rate; earnings; market share
	sameness; economies of scale	uniqueness
	standardized technology	advanced technology

Performance management implementation should help public sector organizations to address the performance challenges they face. Some of them are listed below.

Satisfy stakeholders' needs and expectations. Performance management involves setting objectives and targets that are in accordance with stakeholders' needs and expectations. It focuses the organizations' resources and efforts toward achieving results that will provide appropriate benefit to their stakeholders.

Results improvement within resource constraints. Public sector organizations are constantly challenged to provide high-quality services and improved outcomes within limited resources. Performance management addresses this challenge by promoting the application of effective and efficient approaches and by encouraging a culture of continuous improvement in order to get the best results for the least amount of resources.

Commitment to better serve the public. In an era of complexity and rapid environment changes, it is necessary to engage all public employees, not just top officials and managers, in finding ways to better serve the public. All public employees should be committed to provide the best service to the public.

The need to gain and keep the public's trust and confidence. Performance management improves accountability and supports confidence in public sector organizations not only by enhancing organizations' ability to communicate performance information but also by giving organizations the right tools for improving results.

Performance management in the public sector organizations should be based on following principles (National Performance Management Advisory Commission, 2010):

- A results focus permeates strategies, processes, the organizational culture, and decisions;
- Information, measures, goals, priorities, and activities are relevant to the priorities and well-being of the public organizations and the community;
- Information related to performance, decisions, regulations, and processes is transparent — easy to access, use, and understand;
- Goals, programs, activities, and resources are aligned with priorities and desired results;

- Decisions and processes are driven by timely, accurate, and meaningful data;
- Practices are sustainable over time and across organizational changes;
- Performance management transforms the organization, its management, and the policymaking process.

Performance management uses evidence from measurement to support planning, funding, and operations within the public sector organizations. Better information enables elected officials and managers to recognize success, identify problem areas, and respond with appropriate actions in order to provide better services to the public.

3. DEFENCE PERFORMANCE MANAGEMENT

Performance management plays very important role in developing of defence capabilities that are necessary for protection of national security and national interests.

Defence performance management is an ongoing and iterative process. Figure 2 presents circular-flow model of defence performance management (Angelis, D., Webb, N., 2009).

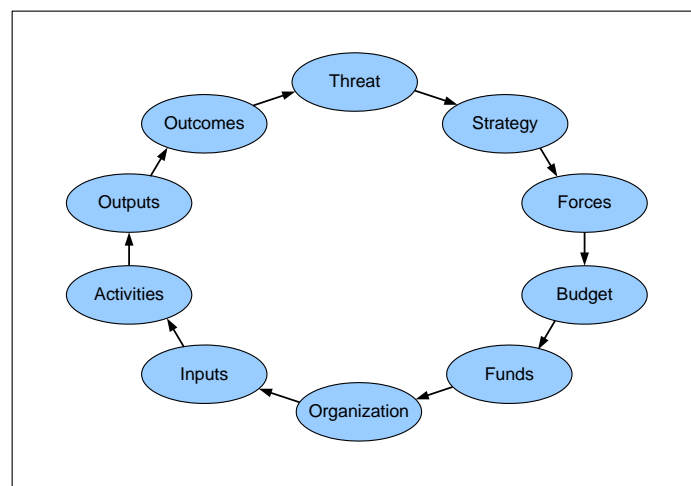

Figure 2: Circular-flow of defence performance management

Beginning at the top with threats, responsible governmental body develops defence policies and strategies based on an assessment of the threat environment. The next step is developing of plan for forces needed to implement the policies and strategies and prepare budgets for personnel, equipment, and other inputs needed to provide defence activities.

Once appropriations are enacted, different types of funds flow to organizations through different apportionments. Each defence organization provides inputs (personnel, materials, infrastructure, etc.) needed to undertake its own activities and missions. Activities combine and engage the inputs to produce outputs.

Efficiency as the quality of being able to do a task successfully, without wasting time, money or energy is reflected in the “inputs to activities to outputs” part of the model. Rather than focusing on budgeting processes, efficiency requires understanding the outputs, including the ability to measure outputs and assign them to the inputs used to generate them. Efficiency answers the question, *are we doing things right?*

Effectiveness comes from the “outputs to outcomes” part of the model. It describes how well the defence outputs performed relative to the strategies or high-level goals that the organization set out to achieve. Effectiveness also answers the question, *are we doing the right things?*

Outcomes are results, consequences, effects, or impacts of direct importance to stakeholders. Outcomes depend on the generated output and on the interaction of the output with the environment and the

interpretation of stakeholders as to the success of that interaction. For example, reaching the goal of providing national security could be measured by how members of the public feel about whether they are “safe”, whether “we are winning the battle”, or “how many attacks occur daily”. Clearly, there are many measures, each with some utility for a particular audience and none fully measuring the „success” of the goal of providing national security (Angelis, D., Webb, N., 2009).

Desirable metrics flow from the goals and show whether the defence is effective and efficient. Developing useful measures requires some understanding of types and characteristics of good measures.

There are three different types of performance measures: natural measures, constructed measures, and proxy measures (Keeney, R., Gregory, R., 2005).

Natural measures are in general use and have a common interpretation. Most natural measures can be counted or physically measured. They also have the property that they directly measure the degree to which a performance target is met. For instance, if the objective is to minimize cost, then we can directly measure how well we achieve that objective in dollars, because the dollar is a natural measure for cost.

Often, particularly in the public sector, it is difficult to find a suitable natural measure. In such cases, we might use a proxy measure, that is, one that is related to the performance target but does not measure it directly. For instance, if we want to measure personnel safety, we might use the number of accidents as a proxy measure.

In many cases, there is no clear understanding of how defence performance should be measured, so it might be necessary to use a constructed measure, one that describes different levels of achievement and assigns a numerical value to each level. To assess, for instance, a safety hazard, a simple constructed scale might be: 5 - Fatal injury; 4 - Permanent disabling injury; 3 - Disabling injury; 2 - Injury causing time off work and 1 - First aid only. Constructed scales involve some degree of subjectivity; therefore, each level must be carefully described to reduce ambiguity.

Finding the right measures requires careful consideration of many parameters. In addition, the measures should have some properties. Keeney and Gregory suggest following five desirable properties to keep in mind as we develop measures (Keeney, R., Gregory, R., 2005):

1. **Unambiguous** - The relationship between the measure and the performance target should be clear and easy to interpret;
2. **Comprehensive** - All possible levels of performance are covered by the measure;
3. **Direct** - The measure should directly reflect the desired performance;
4. **Operational** - The data being used to measure performance is available or can be obtained with a reasonable amount of cost and effort;
5. **Understandable** - Everyone agrees on what is being measured and how it will be measured.

The development and selection of defence performance measures are complex and difficult tasks. Measuring performance in the defence sector generally requires the use of proxies to substitute for direct measures of outcomes and/or constructed measures related to desired outcomes and may require similar measures of outputs. Good measures provide decision makers with useful information while encouraging desirable behaviour that contributes to the achievement of goals and objectives.

4. DEFENCE BALANCED SCORECARD

The key to any successful organization is its ability to create and sustain value production today and into the future. The use of the balanced scorecard can play a vital role in helping organizations achieve that goal.

Initially proposed as a performance measurement system, the Balanced Scorecard concept evolved over time to a more comprehensive performance management system, to finally be transformed in a strategic management system for managing organizational performance and presenting a more “balanced” view of organizational performance.

The balanced scorecard is a strategic planning and performance management system that is broadly applicable to organisations regardless of size or type. It is widely used across sectors and increasingly in the public sector.

The balanced scorecard is used by strategic decision makers to make the right decisions about their business. It provides a method of aligning business activities to the vision and strategy of the organisation, monitoring organisational performance against strategic objectives and, in the process, improves internal and external communication.

Performance management in many ministries of defence is based on the balanced scorecard approach. Ministries of defence adapted the original Kaplan and Norton balanced scorecard model so that it better serves their requirements. The balanced scorecard enables the defence management to monitor performance, both current and forecast, in pursuit of strategic objectives.

The UK Ministry of Defence applied the balanced scorecard for many years. At the beginning, the scorecard had the four perspectives of Purpose, Resources, Enabling Processes and Future. In 2009, they made same adjustment and replaced Purpose with Outputs perspective (Figure 3). The perspectives cover the whole of the defence principal areas of business. Performance against each of the objectives is assessed on a quarterly basis.

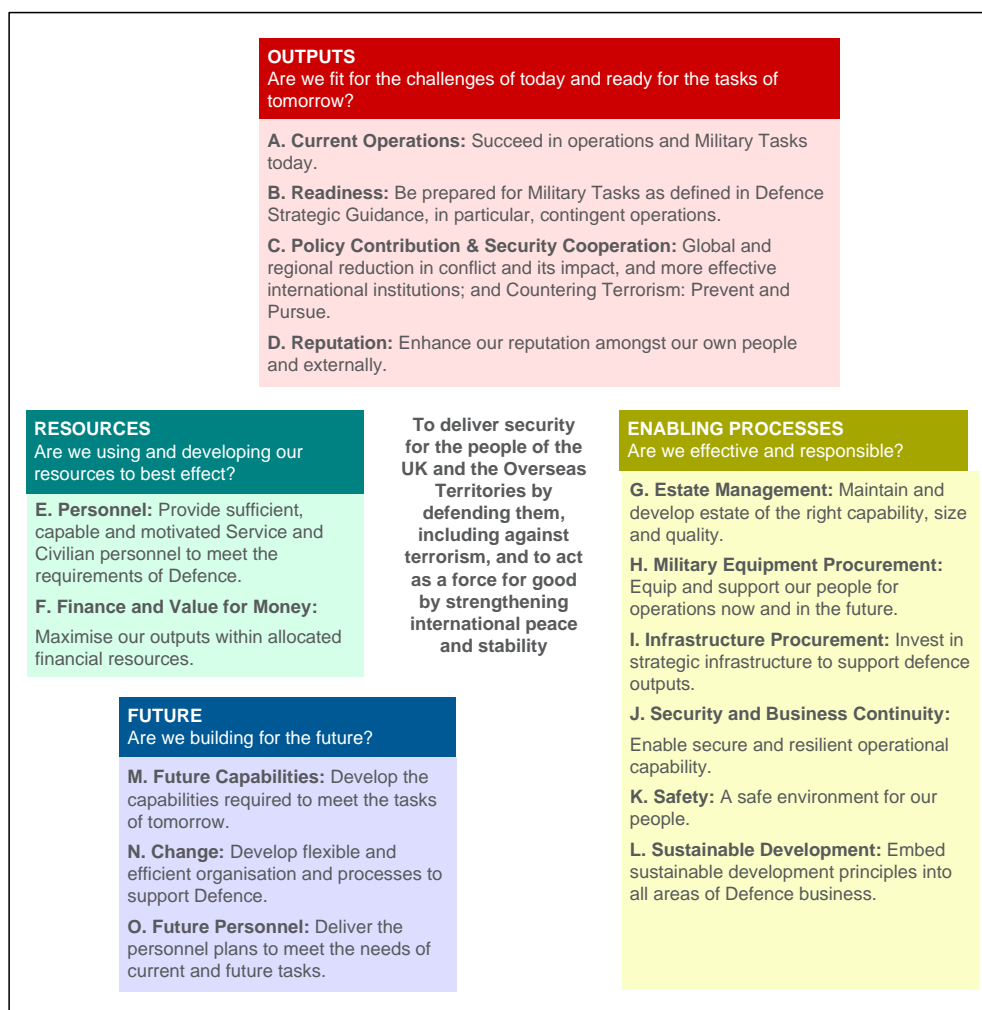

Figure 3: UK Defence scorecard (UK Ministry of Defence, 2009)

In 2010, the UK Ministry of Defence decided to manage defence performance through the new Defence Performance framework. Quarterly, a Performance and Risk Report is produced in order to show progress in implementing the Defence Board Strategic Objectives from the plan. Annually, on the rolling basis, Sub Strategies owners and Top Level Budget holders report on implementation of their Sub Strategies. Strategic Performance Risk Report is produced as well, in order to enable the Defence Board to evaluate and adjust Strategy (UK Ministry of Defence, 2010).

One of the key characteristics of the Canadian Department of National Defence (DND) Performance Management framework is the Balanced Scorecard. The Balanced Scorecard includes following four perspectives: Shape future defence and security outcomes; Deliver defence outputs; Manage program resources, and Professional, effective and sustainable defence team. For each perspective, key strategic objectives are established and the cause and effect linkages are established between them in the Strategy Map (Figure 4). Key performance Indicators are identified under each perspective, linking the strategic goals with the Defence Task and Change initiatives (Gillis, 2004).

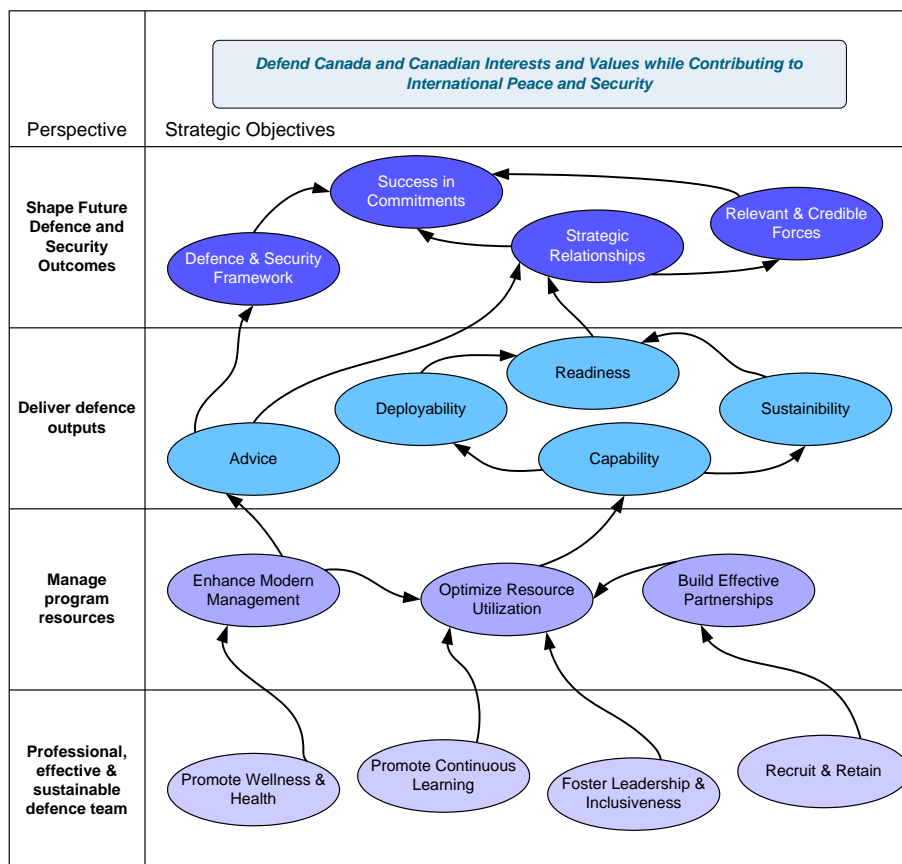

Figure 4: Canadian Defence Strategy Map (Gillis, 2004)

The Ministry of Defence of the Republic of Serbia is developing own strategic performance management system which purpose is to support accomplishment of strategic objectives and development of an entire defence system. Major strategic performance indicators and metrics are defined through the planning, programming, budgeting and execution process that is introduced in 2008.

The Serbian Defence System recognized a balanced scorecard as a useful tool for strategic performance management, but a process of strategy map development is not over. Strategic defence objectives are defined into Long-term defence system development plan that is adopted by National Assembly in 2011. The basic orientation is to develop defence capabilities through performing task within main capability inputs: doctrine; organization; training; material; personnel; leadership; facility; and interoperability.

6. CONCLUSION

Defence performance management is an ongoing and iterative process that requires a sustained effort. It is a constantly evolving process that supports producing appropriate results for the institutions and the public.

Strategic performance management plays very important role in developing of defence capabilities that are necessary for protection of national security and national interests. The development and selection of

defence performance measures are crucial issues for providing decision makers with useful information while encouraging desirable behaviour that contributes to the achievement of goals and objectives.

The balanced scorecard is a strategic management system that enables defence institutions to clarify their vision and strategy and translate them into action. It provides feedback around both the internal business processes and external outcomes in order to continuously improve strategic defence performance and results.

THEORETICAL AND METHODOLOGICAL APPROACHES TO MODELS OF PERFORMANCE MEASUREMENT

Bojana Vukovic¹, Kristina Mijic²

¹Faculty of Economics Subotica, University of Novi Sad, bojanavuk@ef.uns.ac.rs

²Faculty of Economics Subotica, University of Novi Sad, mijick@ef.uns.ac.rs

Abstract *In order to evaluate theoretical approaches and methodological steps of models for the measurement of business activity, success and structural disorders in business, this paper will address the measuring of performance of business companies in the fields of metallurgy, chemical, pharmaceutical and food industries in Serbia. The research will be based on a sample of 30 financial statements of companies in the mentioned industries in 2009 and 2010. Using Kralicek's Quick Test, Altman's EMS Model, Kralicek's functions of discrimination and The Growth Equilibrium Model, the paper will present current business activities and performance of industrial companies in Serbia. Measuring business performance of industrial companies is intended to indicate a limited ability of the model and highlight the need for a more comprehensive access to all the factors affecting business performance in order to have better conditions for making relevant conclusions.*

Key words: *business performance, models, industrial companies*

INTRODUCTION

There is a lot of challenges according to the company management in the contemporary business conditions. The initial assumption of an efficient company management is developed system of measurement, which requires that the system of performance measurement should be improved. The system of performance measurement is an integral part of the control and management systems of companies. Performance measurements have been valuable tools in achieving setting goals and implementing defined strategy of enterprise. Like all tools, they need periodic review to eliminate some, update others, and add new ones in order to meet changing needs in changing business conditions. Measuring business performance develops need for identifying key market and structural factors. In this direction, evaluation of business performance operations is the need of company's management.

More efficient and effective performance measurement system, better implementation of defined strategy in the function of next vision and mission of company. Performance measurement provides a more efficient management, more successful control of management and more efficient operation of companies in the contemporary business (Neely, 1998, str.15). By process of measurements are therefore identify the company's resources and determine the key factors that have impact on its performance. Performance measurement, based only on the use of financial indicators, does not meet the needs of modern companies, due to the limited predictive ability in business performance and future possibilities for their improvement. Therefore, in addition to access to performance measurement which primarily includes financial ratios, there often should be taken into account the non-financial ratios which represent a significant criterion for making conclusions about the success of their business.

1. THEORETICAL APPROACH TO THE ANALYSIS AND EVALUATION OF MEASURING BUSINESS PERFORMANCE

The performances of the company include the company's ability to grow and develop through business activity. Building an effective system of company management requires the development of effective performance measurement system. Performance measurement system links the company's strategy with current operations, providing relevant information on the achievement of the objectives in the function of defined strategy. By measuring the performance of companies, we come to the conclusion about the ability and resources of companies, and the current position of the company in order to define measures for the possible improvement of company performance (Andric i Vukovic, 2011, pp 509). There would be derived evaluation from business operations by monitor, analysis and evaluate performance, based on the financial

statements that reflect the use of company resources. Financial ratios are usually presented in the form of model in order to predict difficulties in the functioning of business companies. In accordance

with these, there were developed models which analyze the general situation of business companies. This group of models, among others, belong Kralicek's Quick test, Altman's EMS model and Kralicek's functions of discrimination. Application of these models is based on the assumption that the company emerges as a purposeful system that is able to form intent, to build a meaningful resources and instructions how to use resources, taking into account the fact that the signs of crisis and instability are result of the transition to a higher level and form of development (Tintor, 2009, pp 403). Taking this into account, the application of these models should allow making conclusions about a healthy business companies or state of existence of structural inconsistencies in the business.

Kralicek's Quick test, as one of the models that analyze the general situation of business companies, is based on the two sets of indicators that measure the financial strength and earning ability of the company. In this regard, it is therefore, the areas of financing as a potential of the company and incomes as a way of using potential. Indicator of the financial situation is measured by the ratio of equity to total sources of financing and the ratio of a year generated cash flow to debt reduced by current assets. Indicators of measuring the financial strength should indicate the indirect coverage of property and protection against risk, by determining the time period for payment of liabilities based on inflow from operating business companies (Tintor, 2009, pp 393). The ability of investing assets to result in some yield and the height of cash flow in company's income reflect the company's ability to earn or to use resources.

General empirical studies conducted in the United States have led to the creation of EMS model (Emerging Market Scoring) in order to assess the financial health of companies based on the previously developed Altman's model. The original Altman's model was one of the most famous and applicable models for predicting bankruptcy. Looking at the ratio of working capital to total assets, retained earnings to total assets, gross profit to total assets, market value of equity to book value of liabilities, incomes from sales to total assets, there was developed a model that found its application in companies quoted on the Stock Exchange. In further research, there was replaced market value of equity by carrying value of equity and on these bases has developed a revised Z score model whose aim was to show the structural distortions in business. Based on this model, in further efforts was developed EMS model (Emerging Market Scoring) for markets outside the U.S., based on the first four aggregate indicators, as most general criterion for assessing the financial strength of companies. According to the conducted research in 2011 year, indicators of business performance had some weaknesses that were manifested in the limited ability of prediction (Muminovic i Pavlovic, 2011, pp 363).

After developing Quick test, Kralicek paid attention on the development of new measurement of company's performance, in order to create models that lead to early indications of structural disturbance and disturbed capacity for long-term business success. In this regard, Kralicek was developed an indicator, called function of discrimination, based on six parameters that determine the ability of companies business. Ratio of net cash flow to liabilities, total assets to liabilities, gross profit to total assets, gross profit to operating income, inventories to operating income, operating income to average assets represented the new sets of measurement of business and success of companies.

All these models are aimed at identifying the strengths, resources, efficiency and measurement of key success factors of business. They should react to weaknesses and critical areas of business. However, it has often not assumed the identification of existing critical areas, but also requires consideration of the initial phase of development of critical areas. In this direction, there should be examined what is the structure of compliance with the dynamics of operating income. To look into this structure, there has developed a model called Growth Equilibrium. This model presents the growth rate of the volume of business or operating income that the company earns from cash flow in operating activities (Walsh, 1996, pp. 198). Because it is a balanced growth, it can be achieved only through a business that is not characterized by any surpluses or shortages of cash. By measuring the ratios of retained earnings to sales, ratios of current assets to sales and the rates of growth of sales, there is determined the size of the cash flow through a combination of these three groups of indicators. Thus, by determination of the parameters of growth, ratios of business income to retained earnings and current assets which in the relationship with income affect the formation of cash flow, it can be concluded that the amount of cash flow is proportional to the combination of this values.

2. METHODOLOGICAL APPROACH TO THE ANALYSIS AND EVALUATION OF MEASURING BUSINESS PERFORMANCE

Methodological approach to analyzing and evaluating business performance has perceived the business activity with the potential signaling disturbed ability for long-term successful business of companies in the food, metal, chemical and pharmaceutical industries in Serbia in the period 2009-2010. The performance of business operations are measured based on the Kralicek's Quick test, Altman's EMS model, Kralicek's function of discrimination (Table 1) and Growth Equilibrium model (Table 2). The study was based on a sample of 30 financial statements of industrial companies which are available on the official website of the Agency for Business Registers.

Table 1: Indicators of Business Performance of Industrial Companies in Serbia by Kralicek's Quick test, EMS Model and Kralicek's function of discrimination

Indicators	Metal industry		Chemical and pharmaceutical industry		Food industry		Reference Values of Indicators
	2009	2010	2009	2010	2009	2010	
1.Kralicek Quick test							
1.1 Equity share in total of liabilities and equity	59.49%	48.44%	43.92%	28.34%	30.65%	43.92%	50%-50% traditionally financing rule, 60%-40% optimal structure of capital
1.2 The rate of return	-0.30%	3.87%	2.93%	1.39%	2.77%	2.93%	>1, higher the value of indicator
2. Z scor EMS model	2.79	3.52	4.95	3.98	4.94	5.99	Z scor<1,1= distress zone 1,1<Z scor< 2,6= gray zone Z>2,6=safe zone
3.Kralicek's function of discrimination	-3.75	1.38	1.62	-0.11	1.47	1.45	1-the average company 2-very good company 3-excellent company

Starting from Kralicek's Quick test and taking into account its limited power to predict, by using this model to evaluate the performance of industrial companies in Serbia, we can conclude that the situation is not at a high level (figure 1, figure 2 and figure 3). By measuring the financial strength of companies on the basis of established indicators of Quick test, the results showed that the company in any industry can not cover liability by cash flow from business operations, since the value of the indicator is negative in both years, with a tendency of slight deterioration in the dynamics. Therefore, companies were characterized by threatened financial power as a result of inability to cover liabilities. By far, the worst financial capabilities had companies in the field of metal industry, which was characterized by the lowest participation of someone else's capital (not it's own) in total of liabilities and equity with 40.51% in 2009 year and 51.56% in 2010. year. The companies in chemical and pharmaceutical industries were largely indebtedness, and there was a negative trend since the indebtedness increased in the dynamics. In this regard, on the one dinar of equity came 0.72 dinars of debt in 2010, unlike 2009 where on the one dinar of capital came 0.69 dinars debts. The share of equity in total of liabilities and equity of companies in the food industry were increasing from 30.65% in 2009. to 43.92% in 2010., but the ratios of their own and someone else's capital in the structure of liabilities was not in accordance with the requirements of the traditional rules of financing or optimal capital structure that provides the minimum average weighted cost of capital after tax, and thereby maximize the value of the

company (Rodić, Vukelić, i Andrić, 2011, pp. 224). The main cause of the increase in indebtedness was the loss of long-term funding and lack of working capital.

The dynamics of the power of making profit of industrial companies in Serbia indicated that the lowest level of return on capital had the companies in the chemical and pharmaceutical industries. However, if takes into account the situation in the European Union, we would come to a completely opposite trend which indicate that the major industrial areas were precisely in the field of chemical and pharmaceutical industries. There was a decline in the rate of return, with minor 2.93% to 1.39%. in 2010. In the food industry recorded a slight increase in the rate of return on capital from 2.77% in 2009. to 2.93% in 2010. In observed time period, the food industry as a labor intensive industry was characterized by the largest decline in participation in Europe. Threatened profitability was characterized companies in the metal industry in 2009, because there was the loss as a measure of return of invested capital. Low profitability and productivity of industrial companies were the result of weakening economic strength, low purchasing power of domestic and weak competitiveness of the foreign markets. The slight improvement in terms of the rate of return on invested capital was characterized company in metal industry in 2010, transferring from zone of loss to zone of gain, achieving return on equity of 3.87%. Generally looking at industry as a whole, there was recorded an unsatisfactory level of utilization of industrial capacity of only 43.4% in 2009. (Ministry of Economy and Regional Development, 2011, www.ntp.rs) This statement was consistent with the general trend of business operations in Serbia and the dynamics of the power of making profit, which indicated that there were existed a low degree of return on investment and a weak economy and rational use of resources. The amount of cash flow in the company's income recorded a positive trend in food, chemical and pharmaceutical industries. The amount of cash flow in income from core activities of the company was little contributed earning capacity. The largest negative effects of operations reflected in the metal industry which was characterized by lower cash flows from operating activities. Taking into account the importance of the metal industry for the economic development of certain industries and the region due to the production of almost all means of production and reproduction of a large number of materials, it was evident that the reduced inflow of cash would have impact on other industries. Considering these facts, by using Quick test, we concluded that the way of using potential and the level of earning power were indicated an unenviable ability of the business of industrial companies in the reporting period. The most favorable trends was characterized the food industry, while the most threatened business performance was recorded companies in the metal industry, which was completely understandable according to the situation in the production and processing of metals in Serbia in observed period. The reduced volume of business and risk of low ability of earning power were indicated the reduction of economic power and potential of business in the reporting period. Of course, all results should be interpreted with caution. If it is concluded that the business ability of the company is not at a high level, based on data from financial statements, and if the predictions based on this information is not promising, it will not necessarily mean that the operating ability of companies is threatened in the following period. For this assessment is necessary overarching insight into the internal and external factors and circumstances of business companies with information on whether the companies entered into the process of restructuring and improving its performance. A comprehensive review, among other things, requires information on the amount of risk factors, retail prices of products, market position of vulnerable products industry, the intensity of the yield per unit of industrial capacity and physical consumption.

Figure 1: Performances of Metal Industry according to Kralicek's Quick Test

Figure 2: Performances of Chemical and Pharmaceutical Industry according to Kralicek's Quick Test

Figure 3: Performances of Food Industry according to Kralicek's Quick Test

Taking into account the limited power of prediction, by using the EMS model as a measurement for performance of business companies in Serbia, we came to the conclusion that the metal, chemical, pharmaceutical and food industries were recorded good business results, which characterized safe zone in the business, according to the reference values of EMS model (figure 4).

Figure 4: Performances of Industrial Companies in Serbia According to EMS Model

Using Kralicek's function of discrimination, we could conclude that the best business performances were recorded companies in the food industry (figure 5). The negative value of the indicator of function of discrimination in 2009 year had companies in the metal industry or companies in chemical and

pharmaceutical industry in 2010 year, according to the scale of function of discrimination, which was indicated threatened financial viability of the company. In order to comprehend the causes of disadvantaged

of business performance, we should examine the dynamics of the fall in the volume of production, speed of reduction in incomes and whether and to what extent companies are able to cover accrued current liabilities resulting from a reduced volume of business. A low production base of industrial production had evident impact on vulnerable business performance, and which, among other things, characterized by unfavorable interest rates that limited investment in expanding production and lack of financial resources for investment in industrial production.

Figure 5: Performances of Industrial Companies in Serbia According to Kralicek's Function of Discrimination

The role of these models in evaluating performance of business was primarily aimed at signaling the structural disorders or unfavorable indicators to continue business in the future. However, if you want to look at the dynamics of business performance through compliance with the volume of business or the scope of operating income, a more representative model for the application is the model of Growth Equilibrium (Table 2). The application of Growth Equilibrium indicated that there was a balanced growth for the business of companies in the field of metal and food industry in 2010. This was largely the result of low growth of income compared to the volume of assets which was implied reduction in turnover ratio as an indicator of the ability of business companies. Reducing in the volume of business activity suggested a reduced cost-effectiveness and efficiency of use of resources, without providing adequate volume of earnings as a source of financial resources. In addition of course, it should be examined the level of solvency, efficiency and increasing capacity in the future with additional costs associated with the survival of existing and breaking into new markets. Economic conditions are a key factor in the dynamics of volume of economy, with the appropriate determinants of balanced growth, on the basis of compliance between the rates of growth and height of cash from operating activities.

Table 2: Indicators of Business Performances of Industrial Companies in Serbia by Growth Equilibrium

Indicator of Growth Equilibrium	2009	2010
Metal industry	-0.05	0.20
Chemical and Pharmaceutical Industry	4,65	2,58
Food Industry	1,44	-5,25

CONCLUSION

Performance measurement is aimed at understanding the results of operations or production volume, total revenue, profit and consumptions and investments to achieve these results in order to determine the capabilities, potential and efficiency of business operations. Theoretical and methodological models of diagnosis status and performance of business companies in the fields of metallurgy, chemical, pharmaceutical and food industries in Serbia were aimed to show the possibility of these models in

evaluating business activities and the ability for long-term successful business enterprise. Using Kralicek's Quick test, EMS models, Kralicek's function of discrimination, the model of Growth Equilibrium was pointed

to a variety of adverse trends and performance indicators of industrial companies due to, among other things, threatened financial strength and a minor degree of the rate of return. Since these models are characterized by different parameters for assessing business performance, according to the criteria of reference values, we have two different situations: according to one model, performance of the company are categorized as threatened business performance, while according to other model, performance of the company are categorized in the safe zone of operation with healthy business performance. According to these facts, we should interpret these results with caution, because of the evident weaknesses in the evaluation of business performance. Extent to which these models can be taken and how representative the results of their use in measuring the performance of business are, without considering the other circumstances of the matter, undoubtedly requires a more comprehensive approach to business performance measurement.

Taking into account the limited predictive ability, theoretical approach to applied models and the results achieved with its implementation, we perform a single conclusion that for representativeness and usefulness of the results of performance measurement of business operations, we should gain a comprehensive insight into the circumstances, key factors and economic conditions which have directly or indirectly impact on business performance.

EXPLORING THE MECHANISMS FOR IMPLEMENTING A RISK MANAGEMENT PROCESS: OVERALL APPROACH AND PRACTICAL EXAMPLE

Laura Juznik Rotar¹, Mitja Kozar²

¹Higher School of Business and Management Novo mesto, laura_juznik@yahoo.com

²Gorenje d.d., mitja.kozar@gorenje.com

Abstract: *The aim of this paper is to explore the mechanisms for implementing a risk management process into an organisation. A way of exploring the mechanisms for implementing a risk management process is to break it down into its component parts and examine what each part should contribute to the overall risk management process. The main aim of the empirical part of the paper is on the other hand to present empirical research of risk management focusing on forecasting sales using a neural network method. A neural network is a powerful data modeling tool that is able to capture and represent complex input/output relationships. Integrating an overall risk management process into an organisation can significantly improve the respond of an organisation to unplanned events (good or bad) and rises its ability to compete, not to mention the objectives of an organisation are easier to achieve and resources are allocated effectively. Applying neural network method produced consistently accurate sales forecast. However, effort should be put in proper preparation of dataset. This paper has a tremendous added value for all risk management officers, CFOs and all others involved in risk management process. The added value is shown in the description of theoretical risk management model which is upgraded with a practical approach example.*

Keywords:

1. INTRODUCTION

Risk is inescapable in business activity. Economic activity by definition commits present resources to an uncertain future. The one thing that is certain about the future is its uncertainty, its risks. Hence, to take the risks is the essence of economic activity. Nearly all operational tasks and processes are now viewed through the prism of risk (Chapman, 2011). Risk has become shorthand for any corporate activity. It is thought not possible to create a business that does not take risks. The end result of successful strategic direction setting must be capacity to take a greater risk, because this is the only way to improve entrepreneurial performance. Organisations that are more risk conscious have for a long time known that actively managing risk and opportunity provides them with a decisive competitive advantage. Taking and managing risk is the essence of business survival and growth.

Enterprise risk management is a response to the sense of inadequacy in using a silo-based approach to manage increasingly interdependent risks. Enterprise risk management is about understanding the interdependencies between the risks, how the materialisation of a risk in one business area may increase the impact of risks in another business area (see for example Duckert, 2011; Moeller, 2011; Monahan, 2008). Under enterprise risk management all risk areas should function as parts of an integrated, strategic and enterprise-wide system. While risk management is coordinated with senior-level oversight, employees at all levels of the organisation using enterprise risk management are encouraged to view risk management as an integral and ongoing part of their jobs (Fraser and Simkins, 2010).

Early empirical work on enterprise risk management investigated why companies adopted enterprise risk management and most studies utilized survey data. The first study by Colquitt, Hoyt and Lee (1999) investigated the characteristics and extent of integrated risk management. They found that political risk, exchange rate risk and interest rate risk were the three most common nonoperational risks handled by the risk management department. Other early work on enterprise risk management included a focus on the determinants of enterprise risk management. Liebenberg and Hoyt (2003) compared firms that appointed a chief risk officer to a matched sample. They found that firms that appoint a chief risk officer are more likely to be financially leveraged. Similar study can be found in Pagach and Warr (2008). More recent work on enterprise risk management has examined additional determinants of enterprise risk management adoption (see for example Desender, 2007; Beasley, Pagach and Warr, 2008). The earlier studies moved beyond the enterprise risk management adoption question and examine the aspects of whether enterprise risk management adds value. Gates, Nicolas and Walker (2009) extend the early work by examining the value seen inside the company as measured by better decision making and increased profitability.

Without a shadow of a doubt, businesses nowadays operate in an entirely different environment compared with just a few years ago. The adoption of expansion strategies, such as investment in emerging markets, developing significant new products, acquisition, organisational restructuring can all increase an organisation's risk exposure. The main aim of risk management process, as seen as one of the structure of enterprise risk management, is to ensure that organisation is able to respond to unplanned events (good or bad) and rises its ability to compete. The process is successful when enough scenarios are prepared to capture as many different risks as possible and the way how to handle it. In the first stage, the goal of risk management process and people included in such process is to incorporate risks and different scenarios in business and strategic planning of organisation and at the same time to provide the top management with information on current business environment.

The aim of this paper is to explore the mechanisms for implementing a risk management process into an organisation. A way of exploring the mechanisms for implementing a risk management process is to break it down into its component parts and examine what each part should contribute to the overall risk management process. The main aim of the empirical part of the paper is on the other hand to present empirical research of risk management focusing on forecasting sales using a neural network method.

The paper is structured as follows. The introduction is followed by an overview of the risk management process where the proposed stages of the process are described in detail. It is followed by an empirical example of risk management applying neural network method. The paper concludes with a short summary of the main findings.

2. THE RISK MANAGEMENT PROCESS

A way of exploring the mechanisms for implementing a risk management process is to break it down into its component parts and examine what each part should contribute to the overall risk management process. It is proposed here that the risk management process is broken down into the following stages: organisation, methodology, setting the sources of risk, keeping the process up to date. While activities follow a largely sequential pattern, it may be an iterative process over time. For example, as new risks are identified the earlier processes of identification and analysis are revisited and the subsequent processes are repeated through to the implementation of risk response action. The proposed stages are described in detail below.

2.1 Organisation

The risk management process represents strategically important process which can in certain situations act as a framework for changes in business decisions. That is why the process functioning is connected with the top management directly (usually it operates under the chief financial officer) and what is more, the flow of information is provided to the highest levels of organisation.

On the other hand it is important that identification of operational risks is suitably managed and that adequate controls are available to regulate the risk management process. In such a manner a completely newly identified or changed risks should be managed as soon as possible. To be able to ensure that, the roles and responsibilities in the risk management process have to be clearly defined. The board of directors (top management) at the top level is empowered with the authority to confirm and directly track the risk management process, whereas the subordinate body consisting of key process representatives is given the authority to ensure the efficiency and effectiveness of the process functioning. At the operational level there is an ongoing risk management process as a composite part of current processes and represents a mindset of each and every employee. Operational identification, assessment and management is implemented by system trail, which is the fundamental for trend analysis of constant risk management process improvements over the time period.

2.2 Methodology

The methodology which is usually implemented in risk evaluation is based on interaction between the likelihood of risk and consequences that might the risk impose to the business process or to organisation as a whole. When we try to define the probability, it is important to take into consideration the history of a certain event as well as the estimated frequency of such an event (for example the event occurs on each x's repeated process).

According to the mutual influence of both risk parameters, it is presented as a product of numerically estimated levels. Risk management strategy is defined according to the obtained results and represents a framework for setting certain actions and the deadline until the actions has to be taken. A set of actions is implemented periodically (determining the activities, deadlines and decision makers) and is known as risk treatment plan. On the level of a business group unified risk management is especially a great challenge in the area of providing the compatibility of methodologies. For certain areas, processes the more sophisticated methodologies are used, whereas the results of such methodologies have to be adjusted in accordance to be a logic complementary of an overall risk assessment.

2.3 Setting the sources of risk

A way of setting the sources of risk is to consider that risk emanates from two primary areas (see figure 1): from within the organisation itself (labelled as internal risk) and from the environment or context within which the organisation operates and over which it has no control (labelled as external risk). Such classification shows the relationship with the international risk standard ISO 31000 respectively.

What is more, setting the sources of risk in the overall process is as much important as the proper use and suitably chosen optimisation method for risk evaluation. The value of a risk management process is reduced without a clear understanding of the sources of risk and how they should be responded to. It is expected to carefully examine the sources of risk in order not to forget any to include into a catalog of risk. The catalog of risk consists of a set of predetermined risk where each is described with additional parameters needed to properly estimate the risk.

Financial risk	
Internal risk	External risk
<ul style="list-style-type: none"> Internal financial control / Internal audit Fraud exposure Historical liabilities Investment Capex decisions Liquidity and cashflow 	<ul style="list-style-type: none"> Risk of accounting standards Interest rate risk Currency risk Credit risk
Infrastructure risk	
Internal risk	External risk
<ul style="list-style-type: none"> Personnel risk (new employees) Risk of proper qualifications and competencies Health risk and safety at work Working environment risk Computer /IT systems risk 	<ul style="list-style-type: none"> Communication risk Distribution risk Suppliers/contractors risk Terrorism Natural catastrophe Epidemics
Reputation and goodwill risk

<ul style="list-style-type: none"> Mergers and acquisitions risk Research and development risk Intellectual property risk Contractual risk 	<ul style="list-style-type: none"> Economic risk Technological development risk Competition risk on the market Demand risk and users needs risk on the market Legal and market needs risk

Figure 1: Setting the sources of risk

Risks that are monitored during the risk management process represent the set of risk. It is written and evaluated in the catalog of risk which has to be kept up to date by the whole team which is devoted to risk management process in the organisation. It should have not been forgotten to harmonize the set of risk with business needs as well as with operational functioning of business processes.

2.4 Keeping the process up to date

Keeping the risk management process up to date is the most important factor especially in the area of risk management, which has the impact on efficiency, effectiveness and quality of the overall risk management process. At the highest level it is reflected in the appropriateness of the risk management process according to the business objectives. Within such process the period of checking the up to date process depends on the objectives considered. Business objectives are connected with the strategy and vision of an organisation (organisation's risk) and they do change regarding the branch of industry and long-term objectives of an organisation. For the set of risk and method to evaluate risk we can take an assumption that they are rarely changed, whereas in the case of major changes on the level of organisation's performance they change. These changes are mostly faced when expanding to new business activities or branches of industry, which can be related with acquisitions of new companies, business expansion onto different political-economic zones or when changing critical business partners.

Keeping the risk management process up to date is on one hand dynamic, on the other hand simplified taking into consideration project management or project oriented work where goals and risk are defined by establishing the project or in the stage of preparing project elaborat. Risk here is short to medium-term as in most cases risk is terminated by the project duration (when objective goals of a project are accomplished), partly it is transferred to the subject of a project - usually this is a process (when we want to accomplish earmarked goals of a project).

Process risks are the most operational connected risk as they are connected with the process goals as well as with the resources needed for process functioning. Set of risk can be mapped from earmarked project goals in the case of process that is a consequence of previously implemented project, on the other hand the process set of risk partly indicates the transfer of risk that are connected with the strategy and vision as requests of vision and as well as strategy are delegated to the process level.

Keeping the risk management process up to date is inevitably directly connected with setting the goals no matter the level where they are determined and tracked. When goals change it is always necessary to conduct an audit of risk management process, above all it is necessary to check the catalog of risk and set of controls and measures which are established to managing the risk.

Besides ensuring the suitability of risk management process it is also necessary to take into consideration the influences of external world when conducting risk management. Mostly we deal with process controls performed by external auditors and process consistency with valid standards and recommendations which are valid for the branch of industry and on general in the area of risk management.

If the risk management process is to be up to date we need to regularly supervise the controls and measures which are in the role to manage the risk. This is done by checking whether have the planned risk response actions been implemented or have the potential opportunities been examined and results obtained and to what extent the intensity of controls is used.

3. EMPIRICAL EXAMPLE OF RISK MANAGEMENT

Our empirical example of risk management focuses on forecasting sales using a rich database provided by a company which is a leading manufacturer of home appliances. The motivation for choosing the sales forecasting area is that this area is becoming more important in everyday business, not to mention risks involved here (for example economic downturns, changing trends and fashions, increased competition, manufacturer recalls). Sales forecasting is a crucial part of the financial planning of a business. Good forecasting models can increase efficiency of businesses, they are saving money on excess inventory, increase profit and serve its customers better.

There are several methods that can produce consistently accurate sales forecasts. One of them is neural network which we apply in empirical research. A neural network is a powerful data modeling tool that is able to capture and represent complex input/output relationships. The motivation for the development of neural network technology stemmed from the desire to develop an artificial system that could perform "intelligent" tasks similar to those performed by the human brain. Neural networks resemble the human brain in the following two ways:

1. A neural network acquires knowledge through learning.
2. A neural network's knowledge is stored within inter-neuron connection strengths known as synaptic weights.

The true power and advantage of neural networks lies in their ability to represent both linear and non-linear relationships and in their ability to learn these relationships directly from the data being modeled. Traditional linear models are simply inadequate when it comes to modeling data that contains non-linear characteristics.

The most common neural network model is the multilayer perceptron (MLP). This type of neural network is known as a supervised network because it requires a desired output in order to learn. The goal of this type of network is to create a model that correctly maps the input to the output using historical data so that the model can then be used to produce the output when the desired output is unknown (cited from NeuroSolutions.com).

3.1 Data and variables

Proper preparation of dataset is the most important and with no doubt the most time-consuming step in working with neural networks. It is very important to have the right amount of data. Too much data may increase training time of a neural network and even deteriorate network performance. If we have a dataset with a small number of cases, then the neural network will not have enough information about the problem to train correctly. Our dataset, which is based on historical data on sales, contains 1995 cases. From our primary dataset we also removed data with missing values and detected outliers. We have also carefully chosen the variables that should best represent the problem that we want to analyze. In order to include such variables we firstly performed multiple regression analysis to see which variables statistically significantly influence our dependent variable (that is sales). From table 1 we can see that such variables are brand name and type of product. Other variables (such as month of sales) did not perform statistical significant influence on our dependent variable and were therefore excluded from analysis. Since both independent variables are categorical, we also pay attention that categories for both variables are well presented in different combination to ensure that neural network will be able to find the differences and that the results will be valid and reliable.

Table 1: Statistically significant coefficients

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	32,202	1,281		25,142	,000
brand	2,480	,099	,221	25,169	,000
type	-,048	,014	-,029	-3,348	,001

3.2 Empirical application

3.2.1 Analysis

In this step the data is partitioned onto training, test and validation set. The training set is a part of input dataset used for neural network training, i.e. for adjustment of network weights. The validation set is a part of dataset used to tune network topology or network parameters other than weights. The statistical program itself retain the best network (the network with the lowest error on validation set). Whereas the test set is a part of input dataset used only to test how well the neural network will perform on new data. The test set is

used after the network is ready (trained), to test what errors will occur during future network application. This set is not used during training and thus can be considered as consisting of new data entered by the user for the neural network application. The partition of data can be done manually or automatically by statistical program. Our dataset is partitioned accordingly: 68% for training set; 16% for validation set and 16% for test set.

3.2.2 Preprocessing

Preprocessing transforms the data to make it suitable for neural network. For example, scaling numeric values and transforming text values into numeric ones. It is to mention that neural networks work only with numeric data. Numeric columns are automatically scaled during data preprocessing. For input columns (in our case brand name and type of product) scaling range is $[-1..1]$. For the target column (in our case sales) scaling range depends on activation function of the output layer: linear output layer activation function (scaling range $-1..1$); logistic (sigmoid) output layer activation function (scaling range $0..1$); hyperbolic tangent output layer activation function (scaling range $-1..1$); softmax output layer activation function (scaling range $0..1$). In table 2 there are some details of the preprocessing stage.

Table 2: Variable details of the preprocessing stage

Variable	Column type	Format	Scaling range	Scaling factor
Type of product	Input	Numerical	$[-1..1]$	0,068966
Brand name	Input	Numerical	$[-1..1]$	0,083333
Sales	Output	Numerical	$[0..1]$	0,003226

3.2.3 Design

This step helps us to design the most efficient neural network architecture. If we want to design a network, we have to specify the network architecture (number of hidden layers and units in each layer) and network properties (error and activation function). A network with too few hidden units only roughly discovers hidden dependencies in the data whereby the network produces a significant number of errors. A network with too many hidden units will tend to memorize all the data instead of finding relations that also lead to bigger network errors. We have chosen a topology with one hidden layer and with one hidden unit. The neural network architecture most efficient for our case was 2-2-1. Whereas activation functions for hidden layers are (see for example Haykin, 1998; McNeil, Frey and Embrechts, 2011):

- Linear: this function produces its input as its output or in other words, just passes the activation level directly as the output. Its output range is $[-inf..inf]$.
- Logistic: this function has a sigmoid curve and is calculated using the following formula: $F(x) = 1 / (1 + e^{-x})$. Its output range is $[0..1]$. This function is used most often and was selected also in our case.
- Hyperbolic tangent: this function also has a sigmoid curve and is calculated using the following formula: $F(x) = (e^x - e^{-x}) / (e^x + e^{-x})$. Its output range is $[-1..1]$. Empirically, it is often found that this function performs better than the logistic function.

3.2.4 Training

To train the network we selected back propagation training algorithm which is the most popular algorithm for training of multilayer perceptron. However there are some drawbacks such as slow convergence, we need to tune up the learning rate and momentum parameters.

Figure 2: The dataset errors graph

In figure 2 the dataset errors graph plots the average absolute dataset error vs. iteration on training and/or validation set. Because we deal with regression problem, we can see from the graph how the absolute error is reduced from iteration to iteration.

3.2.5 Testing

Network testing is performed after training completion. Testing can help us to analyze performance of the trained network. According to regression situation in our case we have two indication of quality of trained network: absolute error (AE) and absolute relative error (ARE). The difference between the actual value of the target column and the corresponding network output. The difference is displayed in absolute values and in percentage terms. In our case the AE is 32,052541, whereas the ARE is 6,135216.

3.2.6 Query

In this step we can query the trained network either we enter query manually, load the file or we select records from the loaded dataset. From the figure 3 we can see that our trained network performs well as the output lies not far away from the confidence limits (which are calculated using the average absolute error on the test set).

Figure 3: Confidence limits for the output

4. CONCLUSION

The risk management process represents strategically important process which can in certain situations act as a framework for changes in business decisions. That is why the process functioning is connected with the top management directly (usually it operates under the chief financial officer) and what is more, the flow of information is provided to the highest levels of organisation.

The main aim of this paper is to explore the mechanisms for implementing a risk management process into an organisation. It is proposed that the risk management process is broken down into the following stages: organisation, methodology, setting the sources of risk, keeping the process up to date. Whereas in the empirical part of the paper the proposed theoretical model is upgraded with a practical approach example focusing on forecasting sales using a neural network method.

The paper contributes to the better understanding of the risk management process as well as to the implementing different quantitative methods at different stages of risk management process. It also

contributes to the relatively thin literature in the field of risk management process and empirical application of different quantitative methods into the process.

Abstract: *Designing local services to meet the needs of local citizens is a constant challenge that can only be met by strong commitment to continual improvements. Across the public sector, citizens increasingly and rightly expect good value. An important step forward in helping local authorities in providing services creating greater value for all stakeholders is measuring the process outputs. The results presented here include a common set of indicators representing a great framework for determining the level of local self-government process performance. This paper contains practical findings and results from the project conducted in three municipalities in Bosnia and Herzegovina and may represent guidance and tools for identifying the sources of stakeholder satisfaction. It recognizes a good set of indicators as a key tool for achieving municipal strategic aims, and suggests the aspects that need to be monitored toward sustainable development by combining the best practice around the world.*

Key words: *process, process approach, process performance indicators, process improvements, management systems*

INTRODUCTION

Modern business trends as well as growing need for emphasizing customer satisfaction, and other stakeholders' in nowadays, have had a great influence on public institutions to change their way of thinking and operating and have forced them to put the main focus on the final service users. This has contributed to a growing number of local self-governments initiating and/or implementing projects in the domain of certification of quality management systems as a first step towards achieving the ultimate satisfaction of stakeholders. By maintaining established/certified management systems, local self-governments eventually realized all the benefits which have influenced their aspirations for further improvements of those systems. For the implementation of the mentioned improvements as well as for their clear determination and quantification, it was necessary to establish appropriate mechanisms for monitoring system performance. In order to be able to evaluate actual process performance, it is important to have a clear and shared understanding of process outputs and related key performance indicators (KPIs) (Brocke & Rosemann, 2010). Process-oriented and cost-effectively measured KPIs provide a valuable source for the translation of strategic objectives to process-specific goals and facilitate effective process control. Key process performance indicators need to be defined in accordance to system approach as the basis for the implementation of effective management system.

It is a further development of the implemented/certified quality management systems that is the main topic of this paper which relies on empirical knowledge and the methods and techniques applied during the project "Improvement of Municipal Business Process Management".

The project is implemented in three municipalities in Bosnia and Herzegovina characterized by high similarity in their geographical location, size, population structure and staff hired in the municipalities. All three municipalities have certified quality management systems, designed at the same time and by the same model, by the same consultants.

The aim of the project was to improve processes of the local governments and to define a set of indicators for their monitoring, all with a view to improve service quality and provide the basis for the sustainable development of municipalities, in this case by creating a framework for continuous process improvements.

The project was implemented in three phases:

1. Assignment 1 - Visit to the municipalities and assessment of municipal business process management;

2. Assignment 2 - Training on the improvement of municipal business process management;
- 3.
4. Assignment 3 - Workshops - Choosing indicators for municipal process performance measurement.

The core of this paper is the last phase of the project.

CHOOSING INDICATORS FOR MUNICIPAL PROCESS PERFORMANCE

The selection of indicators as the last phase of this project was conducted after a detailed analysis of the current situation in all three municipalities, after provided guidelines for improvements and trained key representatives for the implementation of the methods for process improvements in all three municipalities.

The procedure is carried out through three sub-phases:

- Selection of a potential set of indicators by the consultant;
- Evaluation and update of the potential set of indicators by local self-government representatives;
- Final selection of indicators by the consultant, based on the rating given by the local self-governments' representatives.

The most important was the second sub-phase, which had the largest contribution to the selection of the optimal set of indicators, adapted and applied in all three local self-governments. This sub-phase is conducted in the form of workshops.

Sub-phase 1

In order to assure required quality of this Assignment results, it was necessary to adequately prepare both consultants and participants. Municipalities' representatives were delivered the instructions on how to conduct preparations for participation in the workshops. Furthermore, it was necessary for participants to explore and collect data on existing methods of processes monitoring for which they are responsible, including indicators for their monitoring.

The preparation of consultant team consisted of defining the set of potential indicators for process monitoring and criteria for their final selection. Those indicators were defined on the basis of relevant strategic documents of municipalities around the world including Bosnia and Herzegovina and its surrounding areas, suggestions of international organizations (such as United Nations) as well as national strategies of sustainable development. However, it was impossible just to copy knowledge and experiences of other more developed societies. Relevant KPIs can differ in their nature, including financial, quantitative, qualitative, or time-based data, and will be dependent on the strategic drivers for the specific enterprise process (Brocke & Rosemann, 2010). Real obstacles came on with the indicators in use in the most urban municipalities which would not be appropriate for this project due to lack of statistical data, lower society awareness and different culture. Furthermore, there were other issues with the possible set of indicators concerning their objectivity and difficulties to quantify them. All this created the strong need to approach very careful to defining the potential set of indicators for these municipalities.

There are certain scientific and technical criteria, which an indicator needs to satisfy. It should (Custance, 2002):

- be representative,
- be scientifically valid,
- be simple, easy to interpret and resonant to its key audience,
- show trends over time and be capable of being updated at regular intervals,
- give early warning about irreversible trends where possible,
- be sensitive to the changes it is meant to indicate,
- be based on readily available data or be available at reasonable cost,
- be based on data adequately documented and of known quality,
- has a target level or guideline against which to compare it.

Criteria for selecting indicators in this project were (Ditor, 2001):

- Scientific or theoretical acceptance of indicators,
- Representativeness of indicators for the problem of sustainable development,

- The ability of indicators to show the connection between causes and effect,
- The importance and comprehensibility of indicators for the user,
- Comparability of indicators to tolerance limits, standards and regulations,
- Compatibility with other indicators of local communities,
- Adequacy of indicators in compared to the size of the local community,
- Adequacy of indicators in regard to the type, accuracy, scope and time availability of the data,
- Cost acceptability of indicators.

When choosing potential set of indicators, the emphasize was on simple, not on complex indicators because it is concluded that if good set of simple indicators is defined it is, on that basis, easy to get data on appropriate complex indicator. For example, the percentage of literate inhabitants is simple indicator, on which basis, combined with other simple indicators, it is possible to conclude about human development index as complex indicator which consists of a greater number of simple indicators.

There are so many potential indicators, so it is very useful to group them together. However, there are different opinions on how to collect together similar indicator under the same group. Alternative ways of grouping indicators has developed over the years each suggesting the most acceptable framework.

Table 1: Framework for indicators (Cartwright, 2000)

Two themes	<ul style="list-style-type: none"> ▪ carrying capacity (resources use/pollution/biodiversity) ▪ quality of life
Three themes	<ul style="list-style-type: none"> ▪ environment ▪ society ▪ the economy
Five themes	<ul style="list-style-type: none"> ▪ goods and services which meet people's needs but involve the use of fewer natural resources ▪ sustainable communities for people to live and work in ▪ manage and protect our environment and resources ▪ send the right signals ▪ international action

Some surveys (Cartwright, 2000) showed preference for grouping indicators into the three themes of environment, society and the economy, with 81% of respondent choosing this option. Their reasons included that it was the most "manageable" and "easy to explain to the public". Furthermore, these categories are in line with the most of local authorities' efforts to achieve well-being in the areas of economic, social and environmental aspects. Methodology used in our project was based on these findings.

Sub-phase 2

The process of indicators selection needs to be participative and involve key players who can represent relevant needs for sustainable development, such as policy makers, businesses, non-government organizations – NGOs, the public, etc, as mentioned in (Custance, 2002). However, existing obstacles in the three municipalities has influenced municipals' stuff to be the only stakeholder representative. Thus, active participation of local self-governments' representatives was vital for the success of the project, especially the role of top management was important. It is up to executive process leaders to create an environment and culture of continuous improvement and educate managers and staff in the importance of improving and managing business processes. Executive process leaders need to ensure that KPIs reflect this business process-focus, or indeed, if necessary enforce it (Jeston & Nelis, 2008). Finally, it is critical that executives understand that they will usually get what they decide to measure. If a measure is poorly chosen or if it has unintended side effects, then performance will suffer. Thus, time spent developing and selecting good measures and aligning them with strategic goals is usually time well spent (Harmon, 2007).

Measuring role performance is useless unless the organization ensures that people understand why the measures established are important to the organization (Jeston & Nelis, 2006). Thus, workshops were carried out according to defined plan. Three groups of participants for three areas (economy, society and environment) were formed. Each group consisted of representatives from all three municipalities who are, within his/her authority and responsibility, in the same or similar area. In that way, knowledge and interests of participants were equal in each group. They, in teamwork, were dealing with specific problems related to their area of work.

This Assignment was carried out through two phases. The first phase was introductory lecture aiming to renew knowledge gained during Assignment 2 as well as to familiarize participants with method of further work. Time spent on lecture was less than 15% of overall spent time, whereas the rest of time was dedicated to direct interactive work with participants which was the second phase of the assessment conducted in the form of workshops. The second phase played key role in indicator selection and participants were pretty involved and active during entire workshop, while consulting team took over the role of moderator and just was giving directions for work and discussion which were led in certain periods of work in order to make selection of indicators as good as possible.

Participants were given the pre-paired set of potential indicators which should be evaluated and, if necessary, supplemented in order to get the final set of indicators which will be monitored by the municipalities in the future. The selection and evaluation of indicators during workshops was conducted in several sessions:

1. Indicators which refer to the situation in observed area are selected from overall set of indicators. Each participant individually made the selection of indicators which, to his/her mind, in the best way provide data for the situation in one of the three areas (economy, society and environment) and according to that, a new set of indicators was formed as the union of all indicators which are selected by all participants.
2. The new set of indicators was re-analysed and reduced to the optimal number of indicators. This choice was performed in the way that each proposed indicator was analysed, the discussion on it was led on the level of the whole group of participants and, by the consensus, the decision on whether the indicator reflects the situation in the observing areas (previous, future or the potential for development of that area) was made. In such way, about 30% previously selected indicators were eliminated.
3. When the new set of indicators was selected and significantly reduced comparing to the original set by joint work of group, the re-selection was performed. Depending on number of indicators selected after last iteration of selecting, participants were given the task to choose 5-10 most important indicators which reflect the situation in observed area in the best and the most comprehensive way. Then, all votes for each indicator were counted and on the basis of number of votes, the rang list of indicators was made.
4. The most important indicators, as well as those without votes which were on the list after the second iteration of selecting, were evaluated using the scale from 1 to 3. Criteria for evaluation were availability and reliability of data on values of observed indicators. Evaluation was conducted on the level of the whole group and each mark was given by the consensus. Method of evaluation was the following:
 - Mark 1 was given to indicator for which there is no reliable data, there is no organization that monitor such data, costs for collecting those data are too high and much time is necessary;
 - Mark 2 was given to indicator for which there is no reliable data but there are estimated values of that indicator;
 - Mark 3 was given to indicator which values have already been monitored in reliable and acceptable way by the municipality or some other organization, so costs and time necessary for collecting those data are very low or they do not exist at all.

Sub-phase 3

After the workshops, selected set of indicators was re-analysed and compared to the initial set. This analysis was performed by consultants, taking into consideration information gained during the workshops. Each of those indicators were evaluated by grade 1 to 3, per each of predefined criteria. Value of indicators according to the criteria was defined by multiplying the values (weights) of the criteria with the score given to indicator. Final evaluation of indicators was conducted by summing total value of all indicators under each of the criteria. Criteria evaluation was done using the AHP method by consulting team. General Criteria for final selection of indicators were:

- Representativeness of indicators for the problem of sustainable development,
- The importance and comprehensibility of indicators for the user ,
- Adequacy of indicators in compared to the size of the local community,
- Cost acceptability of indicators.

Indicators were evaluated according to the following table.

Table 2: Framework for indicator evaluation

	K1	K2		Kn	Total value	Rang
	PK1	PK2		PKn		
Score I1						
Value I1						
Score I2						
Value I2						

K – criteria for selection of indicators

PK – value of criteria got by AHP method

Score I - score of the importance of indicators to criteria K (1 to 3)

Value I – value of indicator got by multiplying the score of indicator and value of criteria which score was obtained by

Total value - the sum of all indicator values I

The following table shows examples of indicators selected to be monitored by the three local self-governments which represents the basis for setting the future development strategies, goals and targets.

Table 3: List of indicators

Group	Nº	Indicator	Definition	Source
Environment	1.	The quantity of waste	The quantity of waste generated annually in total and in areas: <ul style="list-style-type: none"> Industrial waste from households, Dangerous and safe waste. Unit of measure: t, m ³ , t/inhabitant, t/national income	Indicators of sustainable development: guidelines and methodologies, Commission on Sustainable Development; Sustainable Development Indicators Set for Scotland
	2.	The quantity of treated waste	The quantity of waste that has been recycled, composted or incinerated; in total and as a part of the total quantity of the waste. Unit of measure: t, m ³ ,t/inhabitant, %	UK Govt Sustainable Development – Indicators; National strategy of sustainable development of Serbia
	3.	Number of illegal landfills	Unit of measure: #	Defined by municipality representatives and consultant team
	4.	The quantity of communal waste which has duly been disposed	The quantity of waste which has been disposed on appropriate landfills; in total and as a part of the total quantity of the waste. Unit of measure: t, m ³ , %	National strategy of sustainable development of Montenegro
	5.	The amount of investment in new capacity	Total monetary value of investment in new capacity on the annual level. Unit of measure: €	Defined by municipality representatives and consultant team
Economy	6.	Amount of investment into the economy by sectors	Amount of investment into the economy by sectors on the annual level (agriculture, tourism, manufacturing, services). Unit of measure: €	Montreal Process Criterion and Indicators for Sustainable Forest Management
	7.	Amount of income by sectors	Unit of measure: €	The World Bank Environment Department
	8.	Gross domestic product	Unit of measure: €, €/inhabitant	The World Bank Environment Department
	9.	The number of registered business systems according to categories and types	Unit of measure: #	Defined by municipality representatives and consultant team
	10.	The degree of utilization of available land	Land used for economy in relation to the total available land. Unit of measure: %	Indicators for sustainable development for Norway
Social	11.	Number of inhabitants attending secondary/primary school	On the annual level according to gender. Unit of measure: #	Indicators of sustainable development: guidelines and methodologies, Commission on Sustainable Development
	12.	Number of inhabitants who use or need social care	Number of inhabitants who use or need social care (under-age and adults). Unit of measure: %	Sustainable Development Indicators for Sweden

13.	Population growth	Number of births on the annual level. <i>Unit of measure: #</i>	Sustainable Development Indicators in Australia: Progress on their development
14.	Degree of mortality	Number of deaths on the annual level. <i>Unit of measure: #</i>	Sustainable Development Indicators in Australia: Progress on their development

CONCLUSION

Growing efforts for sustainable development has influenced local self-governments to continuously question their operation regarding improvement of their citizens' quality of life. Measuring its contribution to stakeholder satisfaction represents the necessary step in achieving this goal. Considering processes as the basis of an effective management system requires a systematic approach to defining the indicators of its performance. It is obvious that PDCA methodology is impossible to be implemented if there are no values enabling comparison to needed or wanted situation in terms of process performance. However, there are hundreds of potential indicators and number of frameworks which are appropriate for use at the local level. Therefore, guidance could be helpful to assist local authorities in making their selection. Methodologies useful in this kind of communities must meet some important challenges, including a lack of statistic data, different level of development and an absence of society-wide awareness. That is the reason why no other stakeholders but municipality representatives were engaged in selection of indicators which is the one of the most important aspects of this process. Therefore, defined set includes some of the indicators that are not even recognized in developed societies, but represent very important parameters for these municipalities. Indicators defined in these three local self-governments represent a combination of the best knowledge and experience around the world on the one hand, and needs of the local communities in the areas of economics, society and environment, on the other side. Proposed indicators and used methodology are appropriate for use in other local self-governments in our country as well as in surrounding countries and may represent good tool for achieving sustainable development.

PROSPECTS OF “KOLUBARA SURFACE COAL MINES” IN THE LIGHT OF EUROPEAN INTEGRATIONS OF THE REPUBLIC OF SERBIA

Đorđe Stojković,

Planning and Analysis Department of the “Kolubara Surface Coal Mines”, djordje.stojkovic@rbkolubara.co.rs

Abstract: *In March 2012, the European Union granted Serbia a membership candidate status. In the near future, Serbia is going to become a member state of the European Union and Serbian economy is going to find itself in the open European market. This new status will provide Serbian companies with new opportunities such as lesser obstacles for export and much more availability of capital at European markets with lower interest rates than now and much more possibilities for investment. The purpose of this paper is to show how “Kolubara Surface Coal Mines” will meet the challenges of the European market, especially now when planned investment projects in nuclear power plants are taking place. It will be essential to know how to successfully manage surplus quantities of coal produced in the “Kolubara Surface Coal Mines” and how to keep production at the current rate. At this point it is very important to use all available benefits of EU integrations and undertake further efforts in order to increase export as well as to keep the current employment rate and not allow it to go into a painful downsizing process. Literature used for the purpose of writing this paper is exclusively from publicly available records and does not represent official plans of the “Kolubara Mining Basin” or “Electric Power Industry of Serbia”, even though it is based on the behavior of these two companies in the past years and their public records of business within the Serbian market..*

Keywords: *European Union, Kolubara Surface Coal Mines, export, EU integration, nuclear power plants*

1. INTRODUCTION

Kolubara Mining Basin (further in text Kolubara) is a Limited Liability Company, and the biggest integral part of Electric Power Industry of Serbia. As the biggest exploiter of coal in Serbia, it is situated 60km South-West from Belgrade, occupying surface of 600 square km. Available reserves of coal in this region are estimated around 2 billion tones. If we consider current projected intensity of digging, these available reserves are projected to run out by the year 2060. Kolubara has four active surface mines: Field B, Field D, Tamnava Western Field and Veliki Crljeni, but with the investment of 650 million euro's in next 5 years opening of new mines is absolutely possible. Most of the Kolubara coal (90%) is used in thermal power plants (“Nikola Tesla” I and II, “Kolubara A” and “Morava”), for electricity production. Consumption of remaining 10% is divided between different sectors of industry and widespread market. Official data shows that 52% or 17 billion kWh of electricity comes from Kolubaracoal (<http://www.rbkolubara.rs/>).

Serbia is not primarily oriented toward export, but is mainly focused on export promotion. Having this in mind, and the fact that in 2010 Electric Power Industry of Serbia has exported 700 million kWh of electricity and 1.3 billion kWh in 2009; one could see the potential that Kolubara has in reducing deficit in balance of payment. Therefore, Serbia could be considerate as an exporter country for electricity. Having into consideration that all Kolubara coal is mostly used for Serbian thermal power plants needs, surplus is commonly exported or distributed for a widespread consumption. Although creating electric power from firing coal is a distinguished mark of old Techno-Economic Paradigm, hence in Strategy of Energetic Development of Republic of Serbia, alternative energy sources are considered such “pure energy” from wind or solar power, further development of hydro power plants, still there is serious attention on Kolubara's development. Confirmation of this development could be seen in the level of planned investments that goes up to (*Energetic Strategy of Republic of Serbia until 2015, Ministry of Energetic of Republic of Serbia*) the amount of 650 million euro's until 2015.

When analyzing the current and future state of Kolubara, it is important to mention that in March 2012 The European Union has granted Serbia membership candidate status. In the near future Serbia is going to become a member state of European Union and Serbian economy is going to find itself in the open European market. This new status will provide Serbian companies with new opportunities such as lesser obstacles for export and much more availability of capital at European markets with lower interest rates than now and much more possibilities for investments.

This article has the following structure. After this introduction, first part explains...

2. GOING EU, GOING FOR BETTER OR FOR WORSE, GOING NUCLEAR

Becoming EU member state provides a country with various benefits, but also there are obstacles. Namely, Bulgaria was forced to shut down its nuclear reactors at "Kozlodyn" nuclear power plant, which were declared unsafe by European agencies, since they were based on Soviet technology. Decommissioning those reactors became one of the conditions for Bulgarian EU membership. According to ENSREG (European Safety Regulators Group) data in Bulgaria at the moment there are: a two reactors - type WWER 1000, model 320 - currently in operation; four reactors - type WWER 440, model 230 - being prepared for decommissioning; two reactors - type WWER 1000, model 466 - under licensing, design approval stage; and one research reactor under reconstruction. (<http://www.ensreg.eu/country-profile/bulgaria>). Since these decommissioning decreased electricity exports, Bulgaria all together with Russia plans to build a brand new nuclear power plant generation near town of Belene, which will also be power plant name. (*Electric Power Company of Serbia Company Bulletin "kWh", 2010*)

Bearing Bulgarian case in mind, there is a legitimate reason to be concerned for the future of any industry in the light of new EU membership, especially when considering EU standards in safety and environment protection. However, there is no reason to fear of shutting down production in Kolubara, because from August 2008, entire production process got licensed according to ISO 9001, ISO 14001 and OHSAS 18001 demands of International Standards and is constantly upgrading, which enables Kolubara to be competitive in the European market.

Nuclear power plants in Serbia do not exist, since they are prohibited by the Law. However, investing into nuclear facilities outside borders of the Republic of Serbia is not forbidden. Hence, in last two years negotiations are taking place about Serbian participating in the building of nuclear power plant Belene in Bulgaria. Investing in nuclear energy would increase Serbia's energetic potentials, but on the other hand this cheaper type of energy would jeopardize more expensive one, gained from thermal power plants operated on coal. At this point of discussion, the problem of lowering demand for Kolubara coal could emerge, which will consequently lower productions, and finally would lead to downsizing and laying-off work force. Having in mind that Kolubara has over 10.000 active employees and another 10.000 or even more depends on Kolubara in supporting industries, any shock on it would be enormous impact on employment and economy of Serbia in general. Solution could be found in increasing of export of coal to those countries, whose economy is based on old Techno-Economic Paradigm and that would be almost every country of former Yugoslavia.

Table 1: Kolubara's export for period 2007 - 2009

COUNTRY / YEAR	2007.	2008.	2009.
Montenegro	876.400,00	143.191,34	No export
Macedonia	3.737.215,15	3.027.328,56	No export
Romania	1.126.888,60	1.133.261,51	20.628,46
TOTAL €	5.740.503,75	4.303.781,41	20.628,46

(According to Kolubara Commerce Division, Internal Financial Report 2007-2009)

Table 1 shows Kolubara's export for period 2007 - 2009, shown in euros, hence there was no export in 2010 and 2011. As we can see from it, main export markets are Balkan countries. As already mentioned in the Introduction that export is not main priority for this company and only surplus of coal is exported. Main concerns of this company are Serbian power plants. Nevertheless, this data showed to us that this company is capable of exporting and has experience in exports and a huge market, so widening efforts on export shouldn't be hard to do.

Here we should mention that Bosnia and Herzegovina widespread market is covered by third party companies, which are just re-selling Kolubara coal, investing only in transport and reaching profit margins up to 500%.

Situation at home widespread market is not very different from Bosnian-Herzegovian market. This is all because of mantra that says: "Our main concern at Kolubara is stability of Electro-energetic sector of Serbia." This is a very good formula when country is in a state of war, but when country is moving towards EU membership, so does economy and soon this mantra shall be revised with following: and market demands, market demands, market demands.

There is another potentially big market in region: Croatia. Namely, Croatia does not produce coal, but has thermal power plant “Plomin”, which is operating on coal. Strength of this power plant is 335 MW and for sole

purposes of operating and need of cement and food processing industry, Croatia imported 1.9 million tons of coal in 2010. Croatian Electric-power Company applied to construct third unit of 500 MW at “Plomine”, which will increase Croatian energetic potential, but will make Croatia more dependent on coal import, because it will be more than double than in 2010 (*Coal industry across Europe 2011, EURACOAL, 2011*). Bearing this in mind, Kolubara could focus on Croatian market. Proximity of the market is in our favor, which means we can be competitive with price, considering low costs of train transportation.

From all this we could learn one important fact, about present state of this company and that is: Kolubara is...

3. NOT IN SELLING COAL BUSINESS

Kolubara behaves as a self-sufficient giant, with the possibility wheatear to sell its product or not. In market economy there is no such dilemma. If there is a market, one should do business on it. Leaving home market to re-selling companies is not that painful and unfixable, as not exporting for two years. Home market can be swiftly taken over, by simple action of withdrawing supplies to re-selling companies and organizing network of coal distribution facilities, throughout country. Hence this product has no close substitutes at home market; this company could behave as monopolist and soon take over distribution of its product to widespread market. Foreign market is another story. Leaving markets unattended for two years, especially the foreign ones, where close substitutes could be offered by other companies is a very risky business. So, this company should as soon as possible become a proactive in order to survive in following years, when Serbia enters EU and open energy market becomes a reality. At open energy market consumers could choose from which company they are going to buy electricity from and Electric-power Industry of Serbia is going to have a lot of competition. That's why it is important for Kolubara to become a dominant player on widespread market of coal at home and in the Balkan region, hence electricity could be bought cheaper, but it is not cheap to use electricity for heating purposes. Coal is highly appreciated energy-generating product by households and Kolubara coal is a brand in Balkan region. Of course, household consumption of coal, could never meet thermal power plant consumption, but in market economy no consumer or market should be ignored or left aside. Every euro counts. Besides power plants and household consumption, there is a lot of industry need for coal; steel producers and other energy-intensive industry use coal.

4. FIRING COAL FOR ELECTRICITY-EUROPEAN PRESENT AND FUTURE

Figure 5: Cost of Power Generation
(Source; Study “Future Role of Coal in Europe” by Prognos AG, Berlin & Basel, 2007)

Future of Coal Industry in Europe is bright, as long as costs of electric-power generated from coal are at low rate. Study commissioned by the European Association for Coal and Lignite (EURACOAL) from the “Prognos” AG Berlin, says that costs of power generation from coal (marked as “Lignite” on the chart; Lignite is a type of coal exploited at Kolubara mines) are lowest from all other ways of power generations except nuclear, of course. They took into considering various scenarios with wide range of taxes on pollution and European policies. As we can see from the chart in each and every case Lignite is still cheaper from any

other fossil fuel. This low-cost trend will be present throughout the next decade until 2030.

Figure 6: Power Generation in Europe
(Eurostat Yearbook 2011: Energy)

Latest Eurostat data shows us that share of coal in power generation mix in Europe is 26,7% (of which hard coal is 16,1% and lignite is 10,6%). Nuclear power plants are just 1,1% more engaged in this mix, so the coal and lignite combined are second best, third place goes to gas with 23% share. All other ways of power generating combined such as: oil, wind, biomass, hydropower and other can't beat coal share and are behind it by 4,5%. From the 2006 to 2011 share of coal in power generation according to Eurostat Yearbooks vary from 31% to last year's 26,7%.

These are facts of the present days, but let us see some prognoses for the decades to come.

Next charts (*VGB Powertech E.V. Facts and Figures 2011/12, Electricity Generation*) represent projected growth in electricity generation worldwide until 2035 and in EU until 2030. As far the world in general, taking 2008 for the base year, until 2035 electricity production shall rise for 63%. By that time share of fossil fuels will be 70%, which is around 90% increase on the base year. Coal consumption for electricity generation will double by 2035 and its share in power generation mix will rise to more than 50%.

Chart on the right is focused on the EU electricity generation until 2030, taking 2008 for the base year. Here we don't see such a drastic need for increase in production of energy; such is on the world level and this 25% increase in production we could call "steady 25". Share of fossil fuels here is 50% and it is clear that EU regulations concerning environment contributed that percentage be on the substantial lower level than in world in general. Coal is shown here with a major share; therefore coal industry has no reason to worry. Maybe this prognosis is too optimistically in favor of clean energy, time will show. Important thing is: coal doesn't lose its significance to European electric-power industry.

Source: Eurostat, IEA, VGB

Figure 7: Expected growth in electricity generation

(VGB PowerTech E.V. Facts and Figures 2011/2012)

Figure 1, showed us that coal industry is most cost efficient in power generation from fossil fuel and it shall be so within the next 20 years or so. Figure 2 illustrated present facts about big role of coal in energy mix of the EU. Finally, Figure 3 anticipated trends in power generation and showed despite, harsh regulatory surrounding in EU, concerning environment which is harsher every day, coal industry will not lose its position, as a provider of most cost efficient energy-generating product. We can go that far to say: European electric-power industry cannot be imagined without coal. So, European coal industry has a future and Kolubara must find its place in that future.

After considering perspectives of coal industry in Europe in general, now we need to focus to a central thing in economy...

5. CHEAP MONEY, WHO COULD ASK FOR ANYTHING MORE?

Money is not just a piece of paper or metal. Money is merchandise too and as one, it has its price. In Serbia money is expensive merchandise. Economy relies heavily on money, but usually price of money shows state of the country's economy. Serbian economy survived very tough two decades, first decade marked war and

economic sanctions and second transition to market economy. Those are reasons why in Serbia in year 2012, money is considered most expensive merchandise. Companies can't meet both investment and current business needs. Long term credits are used to finance current needs; golden rule of financial management is broken every day. Only big systems such Kolubara can function without turbulence. When buying equipment which are usually multi-million deals Kolubara gets credit directly from the manufacturer of equipment and that kind line of credit is ten times better than the ones offered on the Serbian financial market. So, Kolubara can finance investments because it is huge company and State of Serbia is backing it, so international partners trust her.

Good example of excellent credit conditions Kolubara gets can be found in credit obtained back in 2008 from EBRD (European Bank for Rebuilding and Development) and KfW Bank to finance entire mining system at Tamnava Western Field. Sum obtained through this credit is 72 million euros and is used mostly in acquiring mining equipment from German corporation Thyssen Krupp (*Kolubara Company Bulletin, December 29, 2008*). Here is important role of Thyssen Krupp, because mission of KfW Bank is to finance German economy worldwide and to promote its growth, so indirectly Thyssen Krupp is the one who is crediting Kolubara, not banks. Without reliable partner this kind of credit couldn't be acquired nowhere. So, reputation is the main advantage of Kolubara in doing business across worldwide and Kolubara's reputation altogether with Government backing represents magic formula in business. Domestic banks in Serbia neither have potential to finance these sorts of project, nor did they are interest in it.

But what is with financing current business? For that sort of financing every company in Serbia is forced to turn to local finance market, which consists merely of banks, because Belgrade Stock Market is not developed like European markets. Banks have enormous interest rate, no matter if you are big or small company, whether it is your family business for 30 years or the State is backing you interest rates are just too high. To conclude: short-term money is expensive at the moment not only to small companies, but to the giants like Kolubara too.

With Serbia accession into the European Union all this has to change. Interest rate has to go down. It's only logical. Bank couldn't calculate into their interest rates "high country risk" to make money more expensive. Surely there is one benefit for Kolubara, when Serbia joins EU and that is: cheap money. Financing current business won't be so expensive then. By opening country to the EU, more options for raising cheap money for companies are emerging. Acces to European financial markets becomes reality. Kolubara can go public and enlist on some of the big European stock markets. Surely that is the easiest way to raise cheap money for business. No more banks with sky high interest rates, when going public. That opens up new topics which aren't subject of this paper, but it is clear that going enlisted to some European stock market is an option that opens to Serbian companies, once the country joins EU.

6. CONCLUSION

Kolubara is a giant in coal mining, both for Serbian and European market. Its main preoccupation is to maintain quality and in-time distribution to Serbian coal firing plant, generating more than 50% of electricity produced in Serbia. This company successfully meets this goal, which is the only goal on its agenda. Another potential goal could be export. With all condition for exports Kolubara needs to re-invent itself as an export oriented company. A lot of markets in the Balkan region are available to be taken over. Home widespread market is also unattended and must be won in the near future.

Even though coal industry is highly energy active, coal remains one of the cornerstones of world energetic industry. Part 4 of this paper showed us, that coal has tendency to remain most cost efficient energy generating product if we exclude nuclear energy, until forth decade of XXI century. Coal industry in Europe has a bright future; coal reserves of Kolubara are great and estimated to run out by 2060, so this company has a future in Europe too, because coal is vital part of energetic mix of the European Union.

Problem that each and every company in Serbian economy, regardless of sector, faces is connected to the price of money. Money is expensive merchandise in Serbian economy. With Serbian membership to the European Union, companies will have opportunity to borrow money on the European markets. Many of them could enlist to some European Stock Markets and gain access to new sources of capital. So, Serbian membership in the EU will make money cheap and that is just what economy needs.

INCREMENTAL INTERVAL REGRESSION TREE LEARNING WITH MEAN VARIANCE NUMERICAL DATA STREAMS

Dima Alberg

Department of Industrial Engineering and Management, SCE - Shamoon College of Engineering,
Beer-Sheva, Israel, dimitria@sce.ac.il

Abstract: *In this paper, we present a novel method for interval regression tree incremental learning with mean variance patterned numerical data streams. The proposed Mean Variance Interval Regression Tree (MVIRT) algorithm transforms continuous temporal data into two statistical moments according to a user-specified time resolution and builds a regression model tree for estimating the prediction interval of the target variable. The main property of the algorithm is the time-based incremental mean variance tree induction algorithm accompanied by novel time resolution and an outliers detection mechanism. Results of the real world data stream show that the MVIRT algorithm produces more accurate and easily interpretable prediction models than other state-of-the-art batch incremental model tree methods.*

Keywords: prediction, regression tree, incremental learning, data stream mining, interval prediction

INTRODUCTION

A sequence of instances, such as sensor transmitted data, geospatial location, tick - by - tick stock prices and exchange rates, electric signals and voltage, the values of which may be recorded and observed continuously in time, is called a *data stream*. The sources of data streams include meteorological and financial data, network monitoring, web applications, sensor networks, etc.

In regression, the attribute for which values are being predicted is numeric (continuous-valued and ordered) rather than categorical (discrete valued and unordered). This attribute can be referred as the predicted attribute. Note that regression⁷ can also be viewed as a mapping function, $Y=f(X)$, where X is the input and the output is a continuous or ordered value Y . Thus, the regression problem in data streams will be considered as the problem of learning a function of several input attributes from the past stream data with the goal of estimating as accurately as possible the value of a numerical target attribute in the future stream data.

The classical batch regression tree methods for predicting a numerical target variable build upon the supervised divide-and-conquer approach. In terms of the terminal node (leaf) representation, these methods can be classified into following categories:

- constant or mean value
- model
- interval prediction

The main difference between the methods is that the model and the interval representations, unlike the mean value approach, employ more complex prediction models with the aim of improving the target variable prediction accuracy. An efficient batch regression model tree algorithm ensures that the model construction and prediction can be processed with consistently improving accuracy, as new information is incorporated. Moreover, smaller trees, i.e., those which do not have too many splits, are easier to get and to interpret. In many real world applications, which contain large data masses the regression model tree fast processing and ease of interpretation is just as important as predictive accuracy^{6, 10}.

According to Holmes et al.⁸ the batch - incremental algorithms place hard restrictions on regression tree learning. First, a model must be induced incrementally. Second, the instances processing time must keep up with their speed of arrival. Third, a model may only use a constant amount of memory while providing an accurate and updated prediction model at any point in time. Therefore to overcome these restrictions Bifet et al.^{3, 4} introduced the new class of the ensemble batch - incremental algorithms. These algorithms usually apply an ensemble of sliding window methods and split the data stream into a stream of disjoint batches whereas each data batch can be processed in the order of its arrival using one of batch regression tree algorithms, which are discussed much deeper in the next section.

MINING DATA STREAMS WITH MODEL TREE REGRESSION METHODS

Although regression trees are well-studied class of learners, little research has been done in the area of incremental regression tree induction. The problem becomes even harder if the learning must deal with continuous data streams. That means that the regression tree learner becomes fully incremental and must be updated with every new arriving instance. In an incremental learning system, the data instances arrive sequentially in time. Each instance represents a snapshot of the changing system environment at time t . Since data streams are very long and often open-ended, the system must be updated using one instance at a time. Each instance is discarded as soon as it is used for updating.

Potts^{11, 12} brings together the batch and incremental versions of the two splitting rules of regression linear model tree with two unified frameworks Online - RD and RA. The proposed tree models are built from the top down, using one of two statistical tests to determine both the split point and whether to carry on splitting. They use the Chow⁴ test, a standard statistical test for homogeneity amongst sub-samples.

Alberg and Last^{1,2} introduced MOPT (Mean Output Prediction Tree) algorithm for interval prediction of numeric target variables from temporally aggregated numerical data, where each aggregated data instance is represented by its mean and variance. The proposed algorithm differs from the state-of-the-art regression algorithms in the splitting of each input and output feature to two moments according to the input time resolution and it can also identify the most appropriate prediction time resolution that minimizes the prediction error and builds more compact interval based regression tree. The main disadvantages of the MOPT algorithm is posed by the fact that is not using an explicit time resolution detection mechanism and thus is not suitable for dealing with massive data streams, which may include distribution change patterns and can require excessive memory and processing power resources.

Ikonovska et al.⁹ describe the FIMT-DD (Fast and Incremental Model Tree with Drift Detection) algorithm which is an advanced adaptation of the FIMT (Fast and Incremental Model Tree) and FIRT (Fast and Incremental Regression Tree) algorithms and uses an explicit change detection method (DD) for dynamic environments and time-changing distributions. The main difference between FIRT and FIMT algorithms concludes in the fact that FIRT has no linear models in the leaves. According to the authors, the main advantages of the FIMT-DD are that it is competitive with batch algorithms in terms of accuracy, enables local change detection, and avoiding the costs of re-growing the whole tree when only local changes are necessary.

The common disadvantage of the represented methods that they are unable to detect changes properly and adapt their tree models with a minimal loss of accuracy. A simple way to cope with this problem is to calculate every possible splitting point. As a result, the task becomes computationally expensive and it has a negative effect on the algorithm scalability. This non-trivial problem raise the need of incremental algorithms with fast execution and response time, which are able to detect changes properly and adapt their tree models with a minimal loss of accuracy.

THE MEAN VARIANCE INTERVAL REGRESSION TREE MVIRT METHODOLOGY

The Mean Variance Interval Regression Tree (MVIRT) algorithm introduced in this paper requires continuous aggregated temporal variables, represented in the form of two unbiased estimators (sample average and variance) and produces an interval batch incremental interval regression tree for a numeric target variable Y .

In our algorithm the average and variance of each variable will be mapped in univariate Mahalanobis distance based on auxiliary control variable $M(\cdot)$ that should respond to changes in both statistical moments. The proposed approach enables to ignore outliers, which cause to prediction instability and model overfitting effect, and thus achieve a considerable reduction in the size of the induced tree.

$$X_i \sim \{\bar{x}_i(r); \hat{s}_{x_i}^2(r)\}, \text{ where } i \in (1, \dots, N) \quad (1)$$

Suppose that each instance i of input variable X is represented by two aggregated mean and variance estimators $\bar{x}_i(r)$ and $\hat{s}_{x_i}^2(r)$ for a given temporal measurement aggregation resolution r . Let $x_A(r)$ and $x_S(r)$ be the sample average values over all instances, and let $V_A(\bar{x}_i(r))$ and $V_S(\hat{s}_{x_i}^2(r))$ be the sample variance of the corresponding unbiased estimators. The corresponding sample covariance

between $\{\bar{x}_i(r); \hat{s}_{x_i}^2(r)\}$ is denoted by $V_{AS}^2(\bar{x}_i(r), \hat{s}_{x_i}^2(r))$ and the Mahalanobis distance between the two measured statistical moments of the input variable X is calculated by:

$$M_i(\bar{x}_i(r); \hat{s}_{x_i}^2(r)) = \frac{N}{V_A V_S - V_{AS}} \cdot (*), \text{ where} \quad (2)$$

$$(*) = V_S \cdot (\bar{x}_i(r) - x_A)^2 + V_A \cdot (\hat{s}_{x_i}^2(r) - x_S) - 2\sqrt{V_{AS}} \cdot (\bar{x}_i(r) - x_A) \cdot (\hat{s}_{x_i}^2(r) - x_S)$$

To identify outlying values of M_i we need to determine its probability distribution. The proposed distance metric under the null hypothesis (which includes the assumption of multivariate normality of X variable) has a chi square - distribution with two degrees of freedom and express Mahalanobis multivariate standardized distance between the values of the current two first moments. For example, if the input variable averages remains at the values x_A and x_S then values of $M(\cdot)$ should be less than the $\chi_{\alpha,2}^2$ and greater than 0, where $\chi_{\alpha,2}^2$ is the upper α percentage point of the chi-square distribution with two degrees of freedom. If at least one of the averages shifts to some new value, then the probability that the statistical moment $\chi_{\alpha,2}^2$ exceeds the limit increases. In the tree induction algorithm the confidence interval limits of the M distance metric are calculated by:

$$UCL(M_i) = \frac{2(r-1)(n-1)}{rn-r-1} F_{\alpha/2, 2, rn-r+1} \quad (3)$$

$$LCL(M_i) = \frac{2(r-1)(n-1)}{rn-r-1} F_{1-\alpha/2, 2, rn-r+1}$$

where r is a temporal aggregation resolution.

THE MVIRT TREE SPLITTING PROCEDURE

In the instance splitting stage of the MVIRT algorithm we assume that we have a set of n training instances at a given node. The pseudo code in Figure 1 finds the best split for predicting the mean of a numeric target variable. This procedure applies to splitting the values of bivariate numeric input variables, where each variable is represented by the sample mean $AVG(X)$ and variance $VAR(X)$ according to the predefined temporal aggregation resolution r .

The splitting procedure includes three main steps. The first step consists of the Mahalanobis distance calculation for numeric input variable X in every instance (see Equation 2) and outliers detection procedure. The second step contains incremental time resolutions logic mechanism which increasing current time resolution TR when all input variables instances are outliers. It should be noted that if the number of outliers equals to the number of training instances, then the algorithm ignores a given input variable and shifts to the next one or returns the tree. The third final step is aimed at selecting the best estimator (sample average or variance) for input variable. In this step, the algorithm calculates the absolute differences ratio between the value of MX and the values of the estimators $MAVG$ and $MVAR$ in the best splitting instance of X and chooses the best node estimator (Best_Contributor), which minimizes that difference ratio.

Figure 1: MVIRT splitting criterion pseudo code

MVIRT(α , TR, X, Y) splitting procedure	
Input	User defined , α
Args:	Current time resolution, r The mean-variance input variables, X The mean-variance target variable, Y
Output:	The best split point for input attribute X
Pseudocode body:

<pre> # Time resolution setting If {C} is empty Then #Shift to the next input variable Call recursively MVIRT(α , TR, X, Y) If all input variables instances are outliers (<u>concept drift is detected</u>) Then # Increase time resolution TR for current input variable TR = r - - If TR is empty Then Return MVIRT Tree Else Call recursively MVIRT(α, TR, X, Y) End If End If End If </pre>	(2)
<pre> # Best contribution variable detection For each instance in {C} Do: MY = M (AVG(Y), VAR(Y)) MXY = M (M(X), M(Y)) #Mahalanobis distance between averages of X and Y MAVG = M (AVG(X), AVG (Y)) (formula 2) #Mahalanobis distance between variances of X and Y MVAR = M (VAR(X), VAR (Y)) (formula 2) Next Best_Contribution_Ratio = Max(MXY - MAVG , MXY - MVAR)/ MXY #Best split value for current input variable X in time resolution TR Return Split (TR; Best_Contributor (Avg/Var) ; Best_Split_Value) </pre>	(3)

THE MVIRT TREE LEAF CONSTRUCTION PROCEDURE

In each terminal node the MVIRT algorithm computes the bounds of a prediction interval for the corresponding tree leaf with a user-defined confidence level $1-\alpha$ using the following equations:

$$\begin{cases} \bar{y}_i \mp t_{1-\alpha/2, n_l-1} \cdot \hat{s}_{y_i} \sqrt{(1+1/n_l)}, n_l \leq 30 \\ \bar{y}_i \mp z_{\alpha/2} \cdot \hat{s}_{y_i} \sqrt{(1+1/n_l)}, n_l > 30 \end{cases} \quad (4)$$

where $i \in (1, \dots, n_l)$ are tree leaf instances and \bar{y}_i, \hat{s}_{y_i} represent mean and standard deviation estimators of the tree leaf. Thus, when the confidence level equals to zero (i.e. $\alpha=100\%$) then the corresponding values of $t_{0.5}$ and $z_{0.5}$ distributions are equal to zero, the MVIRT model transforms the interval representation of a tree leaf into the sample average of the target variable. This fact is very useful in the sense of experimental comparison between MVIRT tree and other, point estimation regression tree algorithms.

EL NINO DATA SET

The El Nino data stream is available at the UCI KDD Archive (<http://www.ics.uci.edu>). This data was collected with the Tropical Atmosphere Ocean (TAO) array, which was developed by the international

Tropical Ocean Global Atmosphere (TOGA) program (<http://www.pmel.noaa.gov>). The TAO array consists of nearly 70 moored buoys spanning the equatorial Pacific, measuring oceanographic and surface meteorological variables critical for improved detection, understanding and prediction of seasonal to inter-annual climate variations originating in the tropics, most notably those related to the El Nino/Southern Oscillation (ENSO) cycles. This data stream was collected on a daily basis and contains 178,080 numerical instances from March 1980 to June 1998. Each instance in the data stream has the following numerical attributes: date, latitude, longitude, zonal winds (west<0, east>0), meridional winds (south<0, north>0), relative humidity, air temperature, sea surface temperature and subsurface temperatures down to a depth of 500 meters. The latitude and longitude in the data showed that the buoys moved around to different locations. The wind data, both the zonal and meridional winds fluctuated between -10 m/s and 10 m/s. Relative humidity values in the tropical Pacific were typically between 70% and 90%. Both air temperature and sea surface temperature fluctuated between 20 and 30 degrees Celsius. The target (prediction) attribute in the El Nino data stream is sea surface temperature (SST), which is identified by warmer than normal sea surface temperatures.

There are missing values in the data. As mentioned earlier, not all buoys are able to measure current attributes because these values may be missing dependent on an individual buoy. The missing values replacement operation was performed with both time series neighbors average value interpolating procedure. Finally in order to evaluate the predictive performance, the set of all examples was split into learning and testing examples sets in proportion 70:30.

The MVIRT algorithm performance is compared to three state-of-the-art incremental model tree algorithms implemented by the Rapid Miner which were tuned with time series plug-in: M5P¹³, M5-Rules¹⁴, RepTree¹⁴. Due to the memory and time constraints, it was very important to evaluate the capabilities of all algorithms to learn incrementally and correctly and at the same time to construct an appropriately small model tree. Therefore in each experiment we applied the constant months sliding window mechanism. These algorithms do not typically provide interval predictions therefore, to overcome this limitation we have used the average sliding windows mean estimator to make point predictions in our comparative evaluation experiment. Finally, in order to improve the algorithm scalability, we tuned M5P and RepTree with bagging evaluation mechanism which was implemented in Java API of WEKA package.

The results in Table 1 show that under Average Root Mean Square Error (A[RMSE]) and Average Explained Variability (A[EV]) criteria the MVIRT and the RETIS-M algorithms are more accurate than other proposed algorithms in terms of t-Student pair-wise test difference. We have denoted by * the cases where the p value of the difference between MVIRT and other algorithms is smaller than or equal to 5%. The MVIRT algorithm outperforms significantly the other algorithms in the terms of Average Cost Complexity Measure (A[CCM]). Finally, we will consider that our proposed MVIRT tree models are more interpretable than RETIS tree models in terms of Average Tree Size (A[TS]) measure (7 vs. 23).

Table 1: El Nino data set learners comparison

Learner	A[RMSE]	A[TS]	A[CCM]	A[EV]
B-M5R	0.84*	7	1.01*	0.46*
B-M5P	0.83*	10	1.07*	0.47*
B-REPT	1.57*	5	1.69*	NA
M5 RLS	0.86*	7	1.03*	0.45*
M5P TR	0.84*	8	1.03*	0.46*
MVIRT	0.60	7	0.77	0.62
REPT	1.57*	3	1.64*	NA
RETIS	0.63	23	1.18*	0.60

CONCLUSIONS AND FUTURE WORK

In this paper, we have presented the two moments MVIRT algorithm, which is able to predict values of numeric attributes in massive temporal data sets. The proposed algorithm differs from the state-of-the-art regression algorithms in the splitting of each input continuous feature according to the best mean variance contributor, identifies outliers in the training data and as result builds more compact interval prediction tree. The conducted experiment indicate that the proposed MVIRT algorithm produces more accurate and compact models by comparison to the state-of-the-art regression tree algorithms. In our opinion, the proposed algorithm is only the first step towards a family of truly scalable and fast regression tree algorithms. We see two immediate extensions for the future work. First, our general aim is to construct online accurate and robust multi-r target variable forecasting mechanism, which in turn can be used for massive data streams prediction. Second, we can look into other possible analytical methods for the split point selection, which may reduce the algorithm time and space complexity.

Abstract: *This paper deals with the influence of customers' foreknowledge on satisfaction with mobile operating systems (OS). The need for investigating this issue comes from the fact that customers' loyalty and the analysis of factors affecting it are important for the corporations' success. The producers of mobile OS are investing millions of EUR into mobile OS and mobile application development. This is one of the main reasons for the analysis of customers' satisfaction with mobile OS, taking into account customers' foreknowledge, awareness, and information. Our findings have shown that the most satisfied customers are the ones that often follow new trends related to mobile phones and mobile OS. We have also found that customers that are completely familiar with current models of mobile phones are much more satisfied with mobile OS than the customers who are not. The difference in customers' satisfaction with mobile OS performance, in relation to the phone usage frequency, is also significant. The results of this research point to the current state of the market in Serbia, providing guidelines for mobile OS producers and some references for understanding mobile phone customers.*

Keywords: *mobile operating systems, mobile phones, customers' satisfaction, customers' loyalty, customers' foreknowledge*

1. INTRODUCTION

Choosing the mobile phone has always been a decision that requires certain level of customers' awareness. Some customers need less time and foreknowledge, some need much more, but one thing is certain: their choice would depend on how well they are informed.

Release of smart phones has made it not only the matter of the phone, but also the matter of mobile operating systems (OS). Capabilities of mobile OS have opened the door to endless list of possibilities (Seongwon, Kwangeak, & Bong Gyou, 2011; Milutinovic et al., 2011). However, main goal of all the efforts that producers are putting into the improvement of OS and applications development is creating and breeding customer satisfaction and loyalty (CS&L). This concept has attracted quite a lot of attention in recent years (Diaz, Martin-Consuegra, & Esteban, 2011; Bayraktar et al., 2012). Oliver (1981) defined customer satisfaction as "the summary psychological state resulting when the emotion surrounding disconfirmed expectations is coupled with the consumer's prior feelings about the consumption experience". Many researchers have recognized the need for investigating the customers' satisfaction, experience, and loyalty (Deng et al., 2010; Verkasalo, 2010; Lee, 2011; Bong-Won, & Kun Chang, 2011; Lee et al., 2011). Most of these studies emphasize that customer loyalty and analysis of factors affecting it are important for the corporations' success. Furthermore, they agree that customer satisfaction is the main important mediate goal for the corporations on their way to obtaining economic success. According to Deng et al. (2010), trust, customer satisfaction, and switching cost directly enhance customer loyalty. Tektas (2011), among others, claims that satisfaction, perceived value and reputation have direct effects on customers' behavioural intentions.

In any case, the fact is that giant multinational corporations - the producers of the mobile OS - are investing millions of EUR into the mobile OS and mobile application development. Consequently, one of the reasons to conduct the survey, concerning the customers' satisfaction with mobile OS is the fact that, as Shye (2010) reports, holistic, objective and precise data on mobile customer behavior and experience are needed in today's product development and marketing activities. Other reason is obvious: "There are nearly 7 billion people in the world. In 2011, a smart device - be it a tablet, smart phone or a PC - was sold for one out of every seven of those people, according to estimates from International Data Corp. The research firm reports that about 946 million smart devices were shipped last year at a market valuation of \$489 billion. Mobile is

booming, with nearly 500 million of those devices being of the smart phone variety. The world is becoming connected, and growth does not project to slow any time soon" (Rowinski, 2011).

All abovementioned research upholds that customers' satisfaction depends on their experience, while the customers' experience is directly connected with their foreknowledge on mobile phones and mobile OS. This is the main reason to analyze customers' satisfaction with mobile OS, regarding the customers' foreknowledge, awareness, and information.

According to data from the Statistical Office of Serbia (SORS, 2012), situation in Serbia is such: mobile phones employ about 4.8 million citizens. At age 25 to 54, even 94% of citizens use mobile phones while that number drops significantly in age from 55 to 74, where mobile phones are used by 61.7% of men and 58.2% of women. This study presents the results of a research regarding the current state of customers' satisfaction with mobile OS in Serbia, primarily focusing on drawing the attention of large multinational companies - the producers.

The conceptual framework of the conducted research is briefly presented in Section 2. Third section explains the survey in detail, focusing on the research sample, instruments, and methodology. Fourth section presents the results of the research, and finally, the concluding remarks are given.

2. PROBLEM DEFINITION

This study is primarily focused on investigating whether the customers' foreknowledge and familiarity with the mobile phones and mobile OS, influence their satisfaction with mobile OS. Measurement of the customers' satisfaction is based on their experience with specified OS. Perception of customers' experience can influence their decision to continue using the same mobile OS, or to choose another. It is very important to investigate customers' satisfaction with mobile OS because the producers are constantly struggling in the huge inconsistent market, spending enormous sums of money in order to succeed.

Our primer assumption was that the difference in customers' satisfaction with mobile OS, among users, regarding to how often they follow trends related to the mobile phones, is statistically significant. In order to prove this assumption, we have carried out a survey which envelopes the posted problem.

Second assumption supposes that the difference in customers' satisfaction with mobile OS, regarding their familiarity with current models of mobile phones, is statistically significant. Supporting research includes measuring of the differences in customers' satisfaction with mobile OS performances regarding the frequency of mobile phone usage.

3. SAMPLING AND METHODOLOGY

The study was conducted in Serbia, using the online survey. The survey was anonymous. It was conducted using random sampling methodology. Collected sample consisted of 340 respondents.

The questions used in the survey were grouped in four parts. The first part addressed demographic data, including data on age, sex, education level, average mark on studies and the employment. The second part of the questionnaire was related to the mobile phone usage frequency and foreknowledge. It included questions on how often do customers follow trends related to the mobile phones and mobile OS, are they familiar with current models of mobile phones, which mobile phone do they use, for which purpose do they mostly use their mobile phones, do they use multitasking and how frequently do they use mobile phone.

The third part of the questionnaire was related to customers' opinion on quality characteristics of mobile OS. Following characteristics were examined:

- Functionality
- Speed
- Use simplicity
- Price and quality ratio
- Multitasking
- Availability and possibility of installing new applications
- Bagging
- Internet surfing simplicity

Similarly, the fourth part was related to customers' opinion on quality characteristics of mobile phones:

- Shape and form
- Keypad
- Screen size and resolution
- Camera resolution and photograph quality
- Quality of conversation
- Quality of sound
- Additional equipment

Customers' satisfaction on mobile OS and mobile phones was measured using two variables, obtained in this research. The variables are:

- *OS Satisfaction* – it measures customers' satisfaction with mobile OS. It consists of the questions from the third part of the questionnaire.
- *Phone Satisfaction* – it measures customers' satisfaction with mobile phones, consisting of the questions from the fourth part of the questionnaire.

To create these variables, we defined two scales. Both of them were created using 5-point Likert scale. The first variable *OS Satisfaction* consisted of nine questions that comprise the first construct. A Cronbach's alpha coefficient for internal consistency of the scale was 0.859, pointing out on a good internal consistency (Cronbach, 1951; George & Mallery, 2003). The second variable *Phone Satisfaction* consisted of seven items in a construct. Cronbach's alpha coefficient was 0.865, again pointing out on a good internal consistency.

Respondents were mostly aged from 20 to 25 (65%), and 25 to 30 (24%). Regarding the education, 48% were graduates, while 24% have finished high school, 17% were bachelors and 11% have finished postgraduate studies. The percentage of males was 41, and females 59. Respondents were mostly employed (59%), while 13% were unemployed, and there were 26% of students. There were 10% of customers, who use a phone for business purpose, while 46% use it for private and 44% for both private and business purpose. Information on customers' foreknowledge and experience with mobile OS and phones, collected in the survey, is presented in Table 1.

Table 1: Customers' foreknowledge on mobile phones and mobile OS

Groups	Customers' foreknowledge (%)		
How often do customers follow trends related to the mobile phones?	Rarely	Medium	Often
	27	21	52
Are customers familiar with current models of mobile phones?	Not at all	Partly	Completely
	7	68	25
How frequently do customers use mobile phones?	Rarely	Medium	Very often
	5	21	74

In order to establish the accuracy of our assumptions appropriate parametric tests were performed. Kolmogorov-Smirnov test established if the variables were normally distributed, in order to confirm the assumption of the parametric tests. We used parametric independent samples t-test in order to establish the difference between two groups, and accordingly the ANOVA test (Lilliefors, 1967), to establish the difference among three or more observed independent groups. To track statistically significant differences, we used Tukey multiple comparisons test. The means were calculated in order to locate the differences (among which groups do the differences occur).

4. RESULTS

Central part of the research is related to the variable *OS Satisfaction*, which is directly associated with our initial assumptions. We used Kolmogorov-Smirnov test of normality to investigate whether the variable is normally distributed. Table 2 presents the test result, as well as the descriptive characteristics of the given variable. The significance for the variable *OS Satisfaction* is greater than 0.05, which proves the null hypothesis that it is normally distributed value, i.e. that there are no significant deviations from normal distribution.

Table 2: Kolmogorov-Smirnov test of normality

	Mean	Standard deviation	Kolmogorov-Smirnov Z	Significance
OS Satisfaction	33.362	6.898	1.284	0.074

Table 3 presents the results of confirmatory data analysis. Leven's Homogeneity of variance test had confirmed that the assumption on homogeneity of variances among the groups was not disturbed in any of the assumptions. We used parametric ANOVA test to establish whether there was a statistically significant difference among specified groups.

Table 3: The results of the ANOVA data analysis

Assumption	Test value
The difference in customers' satisfaction with mobile OS, among the groups of users formed regarding to how often they follow trends related to the mobile phones, is statistically significant.	21.526**
The difference in customers' satisfaction with mobile OS, among the groups of users formed regarding their familiarity with current models of mobile phones, is statistically significant.	13.049**
The difference in customers' satisfaction with mobile OS performances, among customers regarding the phone usage frequency, is statistically significant.	7.685**

* $p < 0.05$, ** $p < 0.01$

The first assumption presumes that the difference in customers' satisfaction with mobile OS, regarding to how often they follow trends related to the mobile phones, is statistically significant. Customers were divided in three groups, according to the answer to the question on how often they follow new trends: *rarely*, *medium*, and *often* (Table 1). The results of parametric ANOVA test showed that the difference in satisfaction among the specified groups is statistically significant at 0.01 level of significance. The value of F statistics was 21.526, $p < 0.000$, which proves that these groups are not equally satisfied with mobile OS. Influence of the difference expressed by η^2 (eta-squared) indicator is 0.113, which indicates that the influence is large (Cohen, 1988). The subsequent analysis using Tukey HSD test, showed that these differences occur among all three groups (*rarely*: $M=30.424$, $SD=6.927$; *medium*: $M=33.337$, $SD=6.663$; *often*: $M=37.124$, $SD=5.54$). It is evident, from Figure 1(a), that customers, who often follow trends related to the mobile phones, are most satisfied with mobile OS, followed by customers that *medially* follow trends related to the mobile phones and customers that *rarely* follow trends related to the mobile phones.

Figure 1: Differences in customers' satisfaction among users regarding
(a) how often they follow trends related to the mobile phones,
(b) their familiarity with current models of mobile phones, and (c) usage frequency.

Second assumption presumes that the difference in satisfaction with mobile OS performance among customers, regarding their familiarity with current models of mobile phones, is statistically significant. There were also three groups of customers according to how they answered the question about their familiarity with

current models of mobile phones: *not at all*, *partly*, and *completely* (Table 1). The results of parametric ANOVA test showed that the difference in satisfaction among the specified groups is statistically significant at 0.01 level of significance. The value of F statistics was 13.049, $p < 0.000$, which proves that these groups are not equally satisfied with mobile OS. Influence of the difference expressed by η^2 (eta-squared) indicator is 0.072, which indicates that the influence is medium (Cohen, 1988). The subsequent analysis with Tukey HSD test, showed that these differences occur among all three groups here as well (*not at all*: $M=29.405$, $SD=7.002$; *partly*: $M=33.362$, $SD=6.844$; *completely*: $M=36.382$, $SD=6.898$). The differences are presented in Figure 1(b) and we can see that customers, who are not familiar with current models of mobile phones, are less satisfied with mobile OS than other groups. Customers that are partly familiar are more satisfied and customers that are completely familiar with current state of the market are most satisfied with their choice of mobile OS.

In the course of the research, we have also tested if the difference in customers' satisfaction, regarding the phone usage frequency, was significant. The groups of customers according to this criterion are customers that use phone: *rarely*, *medium*, and *very often* (Table 1). The results of ANOVA test show that there is a statistically significant difference in satisfaction among these groups at 0.01 level of significance. The value of F statistics was 7.685, $p=0.001$, proving that these groups are not equally satisfied with mobile OS. The η^2 (eta-squared) indicator is 0.044, reporting on the medium influence (Cohen, 1988). The results of Tukey HSD test, showed that the differences occur among the group that uses phone *very often* ($M=34.277$, $SD=6.66$), and two other groups (*rarely*: $M=30.909$, $SD=7.569$; *medium*: $M=31.126$, $SD=6.958$). Other two groups (*rarely* and *medium*) do not differ from each other with statistical significance. Differences are shown in Figure 1(c).

5. CONCLUSION

As elaborated in Section 1, previous studies have reported that customers' satisfaction and loyalty is greatly influenced by their experience and proficiency. Our research has brought us to numerous conclusions, and first among them is concerning precisely the verification of these claims. Our findings have shown that the most satisfied customers are ones that often follow new trends related to the mobile phones and mobile OS, and are well informed on the current state of market. These customers know what is new on the market, what are the performances of phones and mobile OS, how much do the companies invest in their products and what are they going to get by buying the product. It is certain that these customers will choose carefully when buying the product and that they find information very valuable. Far less satisfied are the customers that do not follow trends related to the mobile phones. These customers are not going to choose the product by mobile OS performance criterion, but some other criterion, such as price/quality relation, basic functions, etc. This is why producers not only have to build strong brands, but also to find the right balance between the mobile OS performance quality and prices, which are directly connected with customers' consumption abilities.

Secondly, we showed that the difference in customers' satisfaction with mobile OS performances among customers, regarding their familiarity with current models of mobile phones, is statistically significant. Customers, who are not familiar with current models of mobile phones, are less satisfied with mobile OS than other groups. Customers that are partly familiar with it are more satisfied and customers that are completely familiar with current state of the mobile phone market are most satisfied with their choice of mobile OS. Major smart phone manufacturers are very important players on the market and the quality of their products strongly influences the success of mobile OS producers.

Finally, we have also found that the difference in customers' satisfaction with mobile OS performances, regarding the phone usage frequency, was significant. Customers that use phone very often are more satisfied with mobile OS performances than customers who use it medially or rarely. This is why the frequent users are more likely to chose carefully and "give it a deep thought", considering not only the phone characteristics but also the mobile OS characteristics, before buying the phone.

The results of this research are very useful since they point to the current state of the market in Serbia. It is clear that the perception of customers' experience and foreknowledge can greatly influence their decision to continue using the same mobile OS, or possibly choose another. This could be the guideline for mobile OS producers, as well as the directive for their future actions and strategies, providing them some references for understanding mobile phone customers.

Abstract: *This paper discusses the prediction of customer satisfaction with mobile operating systems (OS) using the classification and regression trees (CART) method. This reliable and effective decision-making technique provides high prediction accuracy with a simple representation. It provides transparent results and minimizes user intervention in the analysis process. One of the main goals of this research was solving a predictive task, concerning the prediction of continuous variables. It was necessary to investigate users' opinions on mobile OS, since they affect producers' success, and that is an important goal for the corporations on their way to obtaining economic success. Results show that the CART technique achieves very high accuracy, that it can easily handle numerical variables and provides some explanations for understanding customers' decisions and choices, guiding OS producers to success on the large, unstable and fast-growing market.*

Keywords: *data mining, classification and regression trees (CART), decision trees, customer satisfaction, mobile operating systems, mobile phones*

1. INTRODUCTION

Data mining is a powerful technology with great potential to help companies focus on the most important information in their data warehouses (Fayyad, Piatetsky-Shapiro, & Smyth, 1996; Xu, & Zhang, 2005). Data mining tools can predict future trends and behaviors, allowing businesses to make proactive, knowledge-driven decisions (Sharma, Goyal, & Mittal, 2008). They scan databases for hidden patterns, finding predictive information that experts may miss because it lies outside their expectations. Technologies that have been developed in the area of data mining and knowledge discovery in databases became necessary since the traditional analysis of data has been insufficient for a very long time (Frawley, Piatetsky-Shapiro, & Matheus, 1991). The automated, prospective analyses offered by data mining move beyond the analyses of past events provided by retrospective tools typical of decision support systems. Data mining tools can answer business questions that traditionally were too much time consuming to resolve.

Data mining is the application of specific algorithms for extracting patterns from data (Fayyad, Piatetsky-Shapiro, & Smyth, 1996). It is a process that consists of applying data analysis and discovery algorithms that, under acceptable computational efficiency limitations, produce a particular enumeration of patterns (or models) over the data. The space of patterns is often infinite, and the enumeration of patterns involves some form of search in this space. Practical computational constraints place severe limits on the subspace that can be explored by data mining algorithms.

Tasks supported by data mining include prediction, segmentation, dependency modeling, summarization, and change and deviation detection. Data mining can be used for solving descriptive and predictive tasks. Descriptive data mining tasks are concerned with finding interesting patterns in the data, as well as interesting clusters and subgroups of data. Predictive data mining starts from the entire data set and aims to induce a predictive model that holds on the data, and can be used for prediction or classification of unprocessed instances. Data mining has been frequently used to solve different predictive tasks (Ramaswami, & Bhaskaran, 2010; Hong et al., 2011). Various data mining methods are used for predictive tasks, and the most popular are decision trees, neural networks, logistic regression, multiple regression, generalized linear models, discriminate models, support vector machine models, etc.

This paper discusses the prediction of customers' satisfaction with mobile operating systems (OS) using the decision trees algorithm. Decision trees are a reliable and effective decision making technique that provides high prediction accuracy with a simple representation. Specifically, in our research we have analyzed the

data using classification and regression trees (CART) method. One of the main reasons for applying this specific method is precisely the importance of interpreting the results to users in an understandable way. In this sense, the analysis tools should provide transparent results and minimize user intervention in the process of analysis, which is one of the main characteristics of CART (see Section 3). Moreover, the main idea of the study is to illustrate how CART can be used for prediction of continuous variable (Karacan, & Goodman, 2012).

A number of scientific papers deal with the CART algorithm, but apply the method on different type of problems (Mohanty, Ravi, & Patra, 2010; Kashani, & Mohaymany, 2011). Lemon et al. (2006) used it to identify distinct and meaningful population subgroups, and they compared it to a traditional statistical logistic regression method. They concluded that CART is a promising research tool for the identification of at-risk populations in public health research and outreach. Toschke, Andreas and Rudiger (2005) consider that identification of children at high risk for childhood overweight is a major challenge in fighting the obesity epidemic and so they tried to identify the most powerful set of combined predictors for childhood overweight at school entry. They used CART analysis because they claim it provides a useful and precise tool for decision-making in the physician's daily routine by simple visual assessment of disease probability without the need of any calculations. CART has also been applied to the problem of prediction of methane emissions that can arise during extraction of a long wall panel for a range of coal productivities (Karacan, & Goodman, 2012). Lee et al. (2011) used CART to classify HSDPA network traffic applications, comparing the results with support vector machine (SVM). They also took the initiative to compare CART to K-Means, the wired network traffic-clustering scheme, and showed that CART is more accurate for classification than is K-Means. According to Upendar, Gupta, and Singh (2012), the CART method is able to classify faults (classification of faults on power transmission lines) with very high precision under various fault conditions.

The subsequent part of the paper is organized as follows. The following section defines the problem this research tackles. Section 3 explains the CART methodology. The fourth section shows the results of CART analysis and their discussion. Finally, the conclusions are given.

2. RESEARCH FRAMEWORK AND PROBLEM STATEMENT

This paper deals with the problem of forecasting the customers' satisfaction with mobile OS based on the certain set of variables. The main idea is to find the expected satisfaction value, based on the analysis performed with the input data, collected within the survey.

The study was conducted using the anonymous online survey, and the collected sample consisted of 340 respondents. The questions used in the survey were grouped in four parts. The first part addressed demographic data, including data on age, sex, education level, average mark on studies and the employment. The second part of the questionnaire was related to the mobile phone usage frequency and foreknowledge. It included questions on how often do customers follow trends related to the mobile phones and mobile OS, are they familiar with current models of mobile phones, which mobile phone do they use, for which purpose do they mostly use their mobile phones, do they use multitasking and how frequently do they use mobile phone.

The third and the fourth part of the questionnaire were related to customers' opinion on quality characteristics of mobile OS and phones. Examined characteristics are presented in Table 1, (a) for mobile OS and (b) for mobile phones.

Table 1: Mobile OS and mobile phone quality characteristics

Mobile OS quality characteristics (a)	Mobile Phone quality characteristics (b)
<ul style="list-style-type: none"> ▪ Functionality ▪ Speed ▪ Use simplicity ▪ Price and quality ratio ▪ Multitasking ▪ Availability and possibility of installing new applications ▪ Amount of bugs ▪ Internet surfing simplicity 	<ul style="list-style-type: none"> ▪ Shape and form ▪ Keypad ▪ Screen size and resolution ▪ Camera resolution and image quality ▪ Quality of conversation ▪ Quality of sound ▪ Additional equipment

Customers' satisfaction on mobile OS and mobile phones was measured using two variables, obtained in this research. The variables are *OS Satisfaction* and *Phone Satisfaction*. *OS Satisfaction* measures customers' satisfaction with mobile OS. It consists of the questions from the third part of the questionnaire. *Phone Satisfaction* measures customers' satisfaction with mobile phones, consisting of the questions from the fourth part of the questionnaire. To create these variables, we defined two scales. Both were created using 5-point Likert scale. The first variable *OS Satisfaction* consisted of nine questions that comprise the first construct. A Cronbach's alpha coefficient for internal consistency of the scale was 0.859, pointing out on a good internal consistency (Cronbach, 1951; George & Mallery, 2003). The second variable *Phone Satisfaction* consisted of seven items in a construct. Cronbach's alpha coefficient was 0.865, again pointing out on a good internal consistency.

Respondents were mostly aged from 20 to 25 (65%), and 25 to 30 (24%). Regarding the education, 48% were graduates, while 24% have finished high school, 17% were bachelors and 11% have finished postgraduate studies. The percentage of males was 41, and females 59. Respondents were mostly employed (59%), while 13% were unemployed, and 26% were students. There were 10% of customers, who use phone for business purpose, while 46% use it for private and 44% for both private and business purpose. As for the information on customers' foreknowledge, 27% follow trends related to mobile phones rarely, 21% medially, and 52% often; 7% are not at all familiar with current models of mobile phones, 68% partly and 25% completely. We have also examined the frequency of phone usage: 5% of customers use mobile phone rarely, 21% medially, and 74% very often.

Set of input variables - the parameters of customers' satisfaction with mobile OS forecasting, are the demographic data from the first part of the questionnaire, and customers' characteristics from the second part of the questionnaire:

- *Age*
- *Sex*
- *Education* – the level of education
- *MarkAverage* – mark average during the studies
- *Employment* – are customers employed?
- *FollowTrends* – how often do customers follow trends related to the mobile phones?
- *ModelFamiliarity* - are customers familiar with current models of mobile phones?
- *PhoneType* – mobile phone brand
- *MobileOS* – the mobile operating system that customers are using
- *PhonePurpose* – the most frequent purpose for using the phone
- *Multitasking* – do they use multitasking?
- *Priv/Buss* – mostly private or business purpose
- *Tied* - how frequently do customers use mobile phones?
- *PhoneSatisfaction* - measures customers' satisfaction with mobile phones, consisting of the questions from the fourth part of the questionnaire.

3. METHODOLOGY

As indicated in Section 1, CART is one of the most popular decision tree methods. CART is the decision tree method used for classification and prediction. It illustrates the important prognostic variables as related to outcome. CART is a recursive partitioning method that builds classification and regression trees for predicting both, continuous dependent variables (regression) and categorical predictor variables

(classification). This is one of its best advantages compared to their antecedent C5.0 tree. Breiman, Friedman, Olshen and Stone (1984) popularized the classic CART algorithm.

One of the main reasons for applying this specific method is the fact that it gives the results that can be interpreted to users in an understandable way. In this sense, CART provides transparent results and minimizes user intervention in the process of analysis. It is a model of low complexity, but high transparency and accuracy. CART is widely used for estimating and prediction. The system is reliable, efficient and able to process a large set of entities (Linoff, & Berry, 2011).

CART is a tree shaped model, consisting of the set of branches and nodes (see Figure 1). This method recursively divides processed data to segments with similar values of the output fields. CART examines the input fields to find the best division measured by reduction of impurities resulting from the division. The division defines two subgroups, each divided again into two subgroups, and so on, until a stopping criterion is met. All divisions are binary. Decision trees systems with the top-down induction process, generate the tree from a given set of entities. Each internal node is labeled by the attribute, and the branches linking the nodes, are labeled by values of the attributes.

Tree construction process selects 'the most informative' attribute at each step, in order to minimize the expected number of cases necessary for classification. Let E be the current set (at the beginning the whole set) of processed entities, and let $c_1...c_N$ be the classes to place the entities (Lavrac, & Zupan, 2005). The algorithm for constructing the tree is consecutively called in each generated node. The construction of the tree ends if all the entities in the node belong to the same equivalence class c_i (or if another stopping criterion is met). This node, called the leaf, is labeled by the value of the class. Otherwise, 'the most informative' attribute, for example A_i is selected as the root of the sub-tree, and the currently processed set of entities E is divided into subsets E_i according to the values of the most informative attributes. Recursively, the sub-tree T_i is built for each E_i . Figure 1 shows the process of dividing data in order to obtain pure subsets (classes).

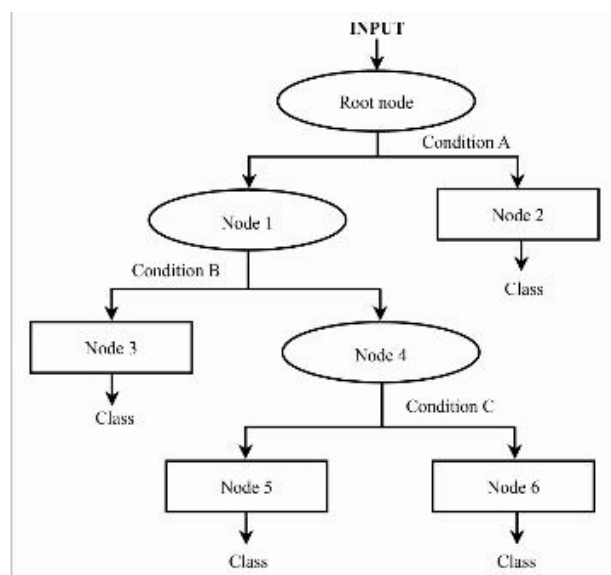

Figure 1: Dividing data in order to obtain pure subsets (classes)

Ideally, each leaf is labeled by exactly one class value. However, leaves could also be empty, if no entities with attribute values lead to the leaf; or they may be labeled by more than one class value (if there are processed entities with the same values of attributes and different values of the classes). Figure 2 shows the class assignment probability for the CART method.

Figure 2: Class assignment probability

One of the most important CART features is tree pruning, which is the mechanism for handling noisy data (Quinlan, 1993). In tree pruning, unreliable parts of tree are eliminated in order to increase the accuracy of classification when applying on new entities. CART provides an opportunity to grow the tree, and then it prunes the tree based on the cost-complexity algorithm, which adjusts the risk assessment based on the number of end nodes. This method, which allows the tree to grow out before pruning, can result in a smaller tree with better properties. Increasing the number of end-nodes generally reduces the risk for processed data, but the actual risk is higher when the model is applied to the new entities.

CART uses top-down approach in the process of building a tree. The main difference between CART and C5.0 tree algorithm (Quinlan, 1993) is that in the C5.0 construction of decision trees involves the classification into a finite set of discrete classes while in CART the decision variable can be discrete and continuous. In CART, the leaves consist of the prediction into a numeric value or a linear combination of variables (attributes). CART (Breiman et al., 1984) features both classification and regression tree learning.

One of the CARTs advantages is its robustness with the missing data. Second is that the large number of input fields does not require a long time to process. It is easily understandable and has a simple interpretation. It can process categorical and continual data output (in our example, the data is continual).

4. RESULTS

The results of the CART analysis, conducted in this research are presented in Table 2.

Table 2: The results of CART analysis: prediction of customers' satisfaction with mobile OS

CART model
PhoneSatisfaction <= 24.500 [Ave: 27.873, Effect: -5.489]
PhoneSatisfaction <= 15.500 [Ave: 20.333, Effect: -7.54] => 20.333
PhoneSatisfaction > 15.500 [Ave: 28.971, Effect: 1.098]
Mobile OS in [Android] [Ave: 34.312, Effect: 5.342] => 34.312
Mobile OS in [Symbian OS Windows Mobile I dont know] [Ave: 27.989, Effect: -0.982]
PhoneSatisfaction <= 21.500 [Ave: 26.171, Effect: -1.818]
UsageFrequency in [rarely medium] [Ave: 28.125, Effect: 1.954]
ModelFamiliarity in [not at all] [Ave: 23.833, Effect: -4.292] => 23.833
ModelFamiliarity in [partly] [Ave: 29.556, Effect: 1.431]
PhoneSatisfaction <= 19.500 [Ave: 33.333, Effect: 3.778] => 33.333
PhoneSatisfaction > 19.500 [Ave: 27.667, Effect: -1.889]
PhoneSatisfaction <= 20.500 [Ave: 25, Effect: -2.667] => 25.0
PhoneSatisfaction > 20.500 [Ave: 30.333, Effect: 2.667] => 30.333
UsageFrequency in [very often] [Ave: 23.412, Effect: -2.759]
Employment in [student] [Ave: 25.455, Effect: 2.043] => 25.455
Employment in [unemployed employed] [Ave: 19.667, Effect: -3.745] => 19.667
PhoneSatisfaction > 21.500 [Ave: 29.609, Effect: 1.62] => 29.609
PhoneSatisfaction > 24.500 [Ave: 36.279, Effect: 2.918]

```

PhoneSatisfaction <= 27.500 [ Ave: 33.309, Effect: -2.971 ]

        Mobile OS in [ Symbian OS Android Windows Mobile Apple iOS ] [ Ave: 40.153, Effect: 0.438 ]
          PhoneSatisfaction <= 32.500 [ Ave: 39.256, Effect: -0.896 ]
            PhoneType in [ nokia sony ericsson HTC ] [ Ave: 38.571, Effect: -0.685 ]
              Education in [ primary school high school bachelor ] [ Ave: 37, Effect: -1.571 ] => 37.0
              Education in [ master PhD ] [ Ave: 39.444, Effect: 0.873 ] => 39.444
            PhoneType in [ samsung iPhone other ] [ Ave: 41, Effect: 1.744 ] => 41.0
          PhoneSatisfaction > 32.500 [ Ave: 41.9, Effect: 1.747 ]
            AverageMark <= 7.800 [ Ave: 40.8, Effect: -1.1 ] => 40.8
            AverageMark > 7.800 [ Ave: 43, Effect: 1.1 ]
              PhoneType in [ nokia sony ericsson iPhone ] [ Ave: 44.75, Effect: 1.75 ] => 44.75
              PhoneType in [ samsung HTC other ] [ Ave: 41.833, Effect: -1.167 ] => 41.833
          Mobile OS in [ BlackBarry OS ] [ Ave: 33.25, Effect: -6.464 ] => 33.25

```

'The most informative' attribute selected in the first step is *PhoneSatisfaction*. If the customers' satisfaction with the phone is less than 15.5, than the predicted value of their satisfaction with mobile OS is 20.333. If the *PhoneSatisfaction* is more than 15.5 and if the customers use Android OS, than the predicted satisfaction with mobile OS is 34.312. If the *PhoneSatisfaction* is among 15.5 and 21.5, mobile OS is Symbian OS, Windows Mobile, or the customer is not sure of mobile OS, and if he is not familiar with current models of mobile phones, than the predicted satisfaction with mobile OS is 23.833, etc. It can be noted, from the model in Table 2, that customers who use multitasking are more satisfied with mobile OS than the ones who do not; that customers who use phone for private purposes are less satisfied with mobile OS than those who use it for business purposes; that customers who use phone very often are more satisfied than the less frequent users, etc. Generally, customers that are more satisfied with mobile phones are also more satisfied with mobile OS (details of the results are given in CART model, presented in Table 2).

Table 3: Variable importance

No.	Nodes	Importance
1	PhoneSatisfaction	0.1141
2	MobileOS	0.0945
3	PhoneFamiliarity	0.0913
4	Multitasking	0.0861
5	Sex	0.0846
6	Age	0.0846
7	FollowTrends	0.0846
8	Education	0.0777
9	PhoneType	0.0756
10	Employment	0.0689
11	AverageMark	0.0598

Importance of input variables is shown in Table 2. There were 14 input variables, and 11 of 14 had importance greater than 0.05. As expected, most important variables for predicting the customers'

satisfaction with mobile OS are *PhoneSatisfaction* and *MobileOS*, followed with *PhoneFamiliarity* and *Multitasking*. Unexpected result is that *PhoneType* and *FollowTrends* (how often do customers follow trends related to the mobile phones) are less important than some other variables, which at first glance, might have seemed less relevant: *Sex*, *Age*, and *Education*.

Table 4: Table name

Comparing \$R-OS Satisfaction with OS Satisfaction	
Minimum Error	-11.333
Maximum Error	10.583
Mean Error	0.0
Mean Absolute Error	2.993
Standard Deviation	3.816
Linear Correlation	0.833
Occurrences	340

Evaluation of the results is presented in Table 4. It shows that the maximum absolute error of the results is 11.333. The Pearson correlation coefficient is 0.833, $p < 0.001$, pointing that the correlation is strong and significant. Mean Absolute Error of the difference is 2.993 and SD of the difference is 3.816.

Figure 3: Prediction of customers' satisfaction using CART analysis

Figure 3 presents the differences between the results and the original data. We can notice from Figure 3 that there were no significant deviations of the results from original data. Interestingly, the range of real data is 9-45 and the range of the results is 19.667 to 44.75, which means that the model was unable to capture the low values of satisfaction with mobile OS. This is also evident from Figure 3. Moreover, SD for original data is 6.898, and SD for the CART model results is 5.746, pointing that the variability of the original data is higher than the variability of the results.

5. CONCLUSION

The main goal of this paper was to predict customers' satisfaction with mobile OS, based on the certain set of input variables, using the CART analysis. The main idea was to find the expected satisfaction value, based on the analysis performed using the input data (see Section 2). Based on the data, collected during the survey, we have measured the amount of customers' satisfaction with mobile OS. It was very important to investigate the users' opinions on mobile OS, since the mobile OS producers invest millions of EUR into the mobile OS and mobile application development. The concept of customer satisfaction and loyalty (CS&L) is important for the corporations' success, and it is the important goal for the corporations on their way to obtaining economic success.

Firstly, it can be concluded that CART technique is very simple and can achieve very high accuracy. Evaluation of the results shows that the Pearson correlation coefficient between the results and the original data is 0.833, $p < 0.001$, pointing that the correlation is strong and significant. Mean Absolute Error of the

difference is 2.993 and SD of difference is 3.816. The performance results, measured by the false positive and negative rates of CART, are in most cases larger than within other similar models.

Secondly, as Upendar, Gupta, and Singh (2012) report, besides the categorical variables, CART can easily handle numerical variables, which was the issue and the center of this research.

Finally, the results obtained in this research could provide some explanations for understanding customers' decisions and choices, guiding OS producers to success on the large, unstable and fast-growing market.

Abstract: Crises are as old as mankind. Even the biblical doctrine of the origin of the world indicates antagonistic relationships among people and between people and the natural environment. Regardless of the degree to which an approach to the analysis of human society development is scientific or dogmatic, it is an undisputed fact that the man is faced with great challenges in solving existential problems. Scientific and technological development and global impacts of activities in which a country can have a dramatic role beyond its borders, led to the development of crisis management as a new scientific discipline. Main characteristics of decision making in crisis situations arise from the nature of crisis situations, which usually develop rapidly and lead to various disturbances in the functioning of natural and social systems. They are characterized by: suddenness, uncertainty and time pressure (lack of time). Efficient and effective emergency responses depend on a stable set-up of the integrated management system in emergency situations and the quality and speed of gathering information about the crisis.

Keywords: crisis situation, crisis, disaster, conflict, decision-making

INTRODUCTION

Crisis situations (those caused by man and the natural ones) have a destabilizing effect on society. The destructive nature of emergency imposes the need for timely preparation of the reaction caused by crisis situation. Preparation is multilayer and generally includes:

- Preparing for emergencies;
- Prevent of formation of emergency;
- Response to emergencies;
- Measures for the rehabilitation of consequences of emergency situations.

Crisis management or Emergency Management is a specific management process that consists of several subprocesses. The integrity of crisis management provides an adequate response to the potential crisis or a crisis. Crisis management involves identifying the crisis, crisis response planning, coping with the crisis and resolving the crisis.

The appropriateness of engaging all subjects in resolving crisis situations, depends upon the quality and speed of gathering information about the resulting crisis, and on the other hand, from the stable established an integrated management system in emergency situations.

From decision makers are expected to know the standard operating procedures and to make decisions in the shortest possible period of time:

- have all current information from the field;
- in the decision making process have to involve all relevant data and information about the crisis;
- make the best decisions based on available data;
- formulate decisions about activities and adjust for the forces on the ground and distribute commands and instructions.

When considering a "crisis situation", whether they are consequence of natural disasters, or the result of human activity, it can be concluded that there are some basic characteristics that define them, such as:

- suddenness,
- uncertainty,
- time pressure.

These characteristics emphasize the importance of timely data collection, automated processing and their appropriate use of information obtained in the decision making process.

1. CRISIS SITUATION

The current world events and weaknesses which showed liberal capitalism and globalization, suggest an increased sensitivity of the global community to the formation of turbulent social events. One should not forget the natural disasters and disasters that in short period of time radically abolish decades of development of affected regions.¹

Speed, efficiency and coherence of responses of relevant subjects for resolving crisis decisively influence the level and extent of consequences of the crisis. Timely, consistent and coordinated activities, help to reduce the risk of compromising human life and health and reduce the total material damage. Thus society must prepare to react to a crisis situation and generally includes:

- Preparing for emergencies;
- Response to emergencies;
- Measures for the rehabilitation of consequences of emergency situations.

In order to better understand the nature of crises and its basic characteristics, it is necessary to unambiguously define the concepts of the term "crisis" and discuss the relationship with the similar concepts.

1.1. The concept of crisis

The word "crisis" is now often used in everyday speech. It is used in different contexts, to describe a personal situation, to describe a situation with potentially negative consequences for individual organizations, the wider region, or a complete company. Although often used, there is still no precise and unambiguous definition of the conceptual content of the term "crisis". The difficulty in defining the term is due to the prevalence of the term "crisis" in many different scientific disciplines (economics, history, politics, medicine, ecology, psychology, sociology, "catastrophe", public administration, political science and international relations, epidemiology, computer science, military science and others.). For instance there can be a crisis of personality in psychology, in medicine we talk about the height of the crisis as a serious illness (or crisis in the health system) while ecology indicates a critical threat to the environment. Even within the same scientific discipline, the notion of crisis takes on different meanings depending on the level of generality of the subject area (eg, micro and macro economics).

There is no generally accepted definition of a crisis. By Kathleen Fern-Banks crisis is a "major event with potentially negative consequences that affect the organization, company or industry, as well as its target audience, products, services or good name ...".² For Hamblin crisis is "an urgent situation in which all members of the group are faced at common threat",³ while Pauchant and Mitroff understand crisis as "a physical disorder that affects the system as a whole and threatens its basic assumptions, its essence and identity".⁴ Fink claims that the crisis is any event that could escalate in intensity, which may be in the spotlight of the media and governments, which can interfere with normal business operations and affect the company's image and profit".⁵ In the London School of PR crisis is defined as a serious incident that affects the person's safety, the environment, products and reputation of the organization.⁶ According to Person and Claire crisis is defined as "low probability event with major consequences that threaten the life of the organization, characterized by unclear causes, effects and means of solution, and the belief that decisions must be made quickly".⁷

The simplest definition of the crisis suggests that it is large and adverse event that occurs suddenly and brings negative consequences. Although sudden, the crisis in some cases is not unexpected, because there are usually some indicators that warn of potential occurrence of crises. If these warnings are not timely noticed, it's a sign that either there was insufficient information on the indicators, or they were not taken seriously.

⁶ London School of Public Relations, 1998.

⁷ Pearson, C. M. and J. A. Clair: Reaffirming Crisis Management, Academy of Management Review 23, 1998., p. 60.

Crisis situations can be defined as incidents that occur quickly and include any kind of threats for the country, its territory, citizens, armed forces, property, or vital interests. This threat leads to the creation of conditions for some kind of diplomatic, economic, political or security justification and necessity of the use of state, military and civilian institutions and agencies in order to preserve national values. Crisis situations can be caused by events in nature or man's influence. Some examples of emergencies include:

- natural disasters (floods, fires, earthquakes, snowfall, ...),
- terrorist attacks,
- industrial incidents,
- epidemics and pandemics,
- armed aggression from outside,
- riots and protests of the population, etc.⁸

In addition to sudden natural disasters, in most crises time period preceding the development of the crisis. If you understand the causes of such risks, it is necessary to establish a risk management process to eliminate or reduce the probability of crises. This means above all that is necessary to establish a stable system of organization in all areas where there is an increased risk of crisis. Stable and well-organized system is a good prevention for prevention of crisis situations.

Without going further into the difficulties of the concept of crisis, for the purposes of this paper will be accepted modern definition of crisis by Paul t'Hart, who believes that the crisis is "a serious threat to the basic structures or the fundamental values and norms of the social system which, in terms of time pressures and very uncertain situations, requires critical decision making".⁹ This definition has two important features. As an important priority states, that can be applied to all types of disturbances (environmental threats, crashes of command and information system (CIS), the economic crisis, conflicts within the country, riots, regional wars, explosions and natural disasters). Second, this definition focuses attention on the decisions necessary to resolve the resulting crisis.

1.2. Crisis and Disaster

In the everyday life we often use the term "crisis" and "catastrophe." Term generally describes undesirable event, natural or technological disaster, and they are often confused and used interchangeably. Like any scientific discipline, and crisis management is trying to make a systematic classification and definition of conceptual content.

According to Arjen Battalion, "it can not be formulated useful definition of a disaster without the proper definition of the term crisis, since the two concepts are inseparably linked." As well as when it comes to defining the term "crisis", there is no universal definition of the term "disaster". It also depends on the area in which it appears.

In defining "disaster" at the highest level of generality approach is from four different angles, including:

- According to the source or origin (natural or technological);
- The consequences (degree of loss and damage, the intensity and duration);
- According to the course (intervention of different actors, the capacity for response, organizations and communities);
- The level of risk that entails.¹⁰

The classic definition of a disaster (Kvaranteli), revolves around four key elements:

- description of the source,
- physical damage,
- social disorder and
- negative effects.

¹⁰ Lalonde, C.: In Search of Archetypes in Crises Management, Journal of Contingencies and Crisis Management, No. 2, June 2004.

Older versions have a focus on definitions of sources and impairments, but the recent on social disorder. The question is whether the definition of which includes a combination of these elements encompass the essence of the disaster.

In a joint consideration of the concept of "crisis" and "disaster", we differ processes of objectivized disorders and subjective process of collective thinking. "Crisis" refers to the process of perception disorder, a "catastrophe" to when a collective assess that process with negative terms. In this perspective, a disaster is a crisis with a bad end.

1.3. Crisis and conflict

Social conflicts are one of the major social phenomena. They dated throughout the history of the human society originating from a difference in the needs and interests between individuals and groups.

As a rule, the conflict of interests of individuals and groups lies in the heart of most sociological crises such as wars, demonstrations, terrorist attacks, kidnappings, most economic conflicts, crises and conflicts caused by cultural differences and so on. In addition to the conflict (conflict), milder forms that may precede the crisis are "disorders" and "emergency".

The disorder is seen as a time-limited dysfunction in the normal events that do not require too much potential to overcome social problems. They happen every day and do not necessarily lead to severe dysfunction of the system (different types of delays, the larger failures, strikes, etc..).

The state of emergency is not yet a crisis, but imposes extraordinary demands for the elimination of the causes. Social systems already have some established structures to address some emergency situations (larger fires, rescue operations in case of natural and other disasters, combat demonstrations and riots, etc..).

2. CHARACTERISTICS OF DECISION MAKING IN EMERGENCY RESPONSES

Basic characteristics of decision making in solving the crisis directly arise from the characteristics of crisis situations that are reflected through:¹¹

- Suddenness - The crisis usually occurs suddenly and unexpectedly, though in some cases there are indicators (indicators) that indicate possible emergence of a crisis (hurricane, etc..).
- Uncertainty - How the event that caused the crisis represents a possible future situation, that incitement and crisis follows the uncertainty that the future will bring. Therefore, planning the crisis management is under big uncertainty, (lacking the necessary information to make rational decisions).
- Time pressure - The third characteristic is the time pressure of the crisis and the need to work and make decisions very quickly, in terms of lack of time, in order to prevent or reduce the negative effects of the crisis.

It may be noted that the decision making process in resolving crises and uncertainty is characterized by ambiguity. The first and most important is the choice of the appropriate decision. Most often, the selection of the best alternative defining the outcome and results of activities undertaken. In terms of lack of knowledge of the probability of occurrence of upcoming events, it is difficult to single out one criterion for selection of variants as the most effective. The best-known criteria for decision making in these situations are as follows:

- criterion of pessimism,
- criterion of optimism,
- the criterion of minimum regret,
- criteria of rationality.

Implementation these criteria will be explained through the analysis of a decision making in situations of uncertainty in which they defined three types of action and decision-makers assumed three possible "states of nature" as shown in tables through the matrix C:

Table 1: The matrix C

¹¹

http://www.men.fon.rs/index.php?option=com_jotloader§ion=files&task=download&cid=132_789e5ec57049dc83daf2c7bf8ea45723&Itemid=132, prof. dr Petrović, Dejan, Krizni menadžment, prezentacija, slajd 5, 6 i 7.

i \ j		States of nature		
		N1	N2	N3
Variants of the decision-maker	S1	50	40	10
	S2	45	35	25
	S3	38	44	35

The elements of the matrix represent the effect achieved by the decision maker for each variant of acting, in all states of nature defined. Using the criteria for deciding when uncertainty should decide on the variants of action decision maker.

2.1. Wald's pessimistic criterion

Wald's pessimistic criterion to decision maker suggests extreme caution. It starts from the pessimistic assumption that for any selected option, occurs the most unfavorable state of nature to the decision maker. In other words we need to determine the worst result for each variant, and then choose the one option that ensures the best among the most unfavorable values ($\max_i \min_j$).

Table 2: Wald's pessimistic criterion

i \ j		States of nature			\min_j
		N1	N2	N3	
Variants of the decision-maker	S1	50	40	10	10
	S2	45	35	25	25
	S3	38	44	35	35
$\max_i \min_j$					35

Applying Wald's pessimistic criterion its suggest to decision maker to select an optimum S3.

2.2. Hurwicz's criterion of optimism

The criterion of complete optimism assumes that for decision maker is always best to perform a condition that allows the maximum possible effect for the selected variant. For each selected variant should determine the best value for the effect of these values, then select the best value by the decision maker. In accordance with the received value of the effect a variant of activity is chosen.

Table 3: Hurwicz's criterion of optimism

i \ j		States of nature			\min_j
		N1	N2	N3	
Variants of the decision-maker	S1	50	40	10	50
	S2	45	35	25	45
	S3	38	44	35	44
$\max_i \max_j$					50

Applying this criterion, to Hurwicz optimism-decision maker is proposed selection variants S1. Correction of complete optimism is done by coefficient optimism $0 < p < 1$. The coefficient of optimism is multiplied with the best value variant, and its complementary value $(1-p)$ is multiplied by the most unfavorable value variant. If you are resolved to put the example $p = 0.6$, we get the following result:

Table 4: Correction of optimism criteria

	max	min	
S1	50	10	$50 \times 0.6 + 10 \times 0.4 = 34$
S2	45	25	$45 \times 0.6 + 25 \times 0.4 = 37$
S3	44	35	$44 \times 0.6 + 35 \times 0.4 = 40.4$

After adjusting of criteria optimism, to decision maker is suggested to select variant S3.

2.3. Savage's criterion of minimum regret

Regret should be understood as a lost opportunity to choose the decision that to decision maker provides the best results. As a measure of regret is taken the difference between the results that could achieve the maximum good selection and results achieved as a result of the selected variant (before knowing the actual state of nature).

By calculating the value of regret for all of nature is getting the matrix of regret. For each variation in the matrix of regret it should be determining the least favorable results, and then choose the best among them and according to them to choose a variant action.

Table 5: Matrix of regret

i \ j		States of nature			min j
		N1	N2	N3	
Variants of the decision-maker	S1	0	4	25	25
	S2	5	9	10	10
	S3	12	0	0	12
min max $i \quad j$					10

Using the criteria of minimum of regret to the decision maker is suggested to select an optimum S2.

2.4. Laplace's criterion of rationality

This criterion is typical for decision making in risk situations. It is assumed that there are few situations in which the decision maker could not assign a probability of occurrence to states of nature (the environment, opponents). It is also recommended that all states have assigned equal probability, in which shall be $\sum p_j = 1$. Then, for each variant calculate the expected value and then the best is chosen with maximum expected value.

Table 6: Laplace's criterion of rationality

i \ j		States of nature			Expected values
		N1 $p_1=1/3$	N2 $p_2=1/3$	N3 $p_3=1/3$	
Variants of the decision-maker	S1	50	40	10	33,33
	S2	45	35	25	35
	S3	38	44	35	39
Maximum expected value					39

To the decision maker is suggested to select an optimum S3. Laplace criterion can be applied to a matrix of regret. In doing so, you get the following result:

Table 7: Implementation of Laplace criteria to matrix of regret

i \ j		States of nature			Expected values
		N1 $p_1=1/3$	N2 $p_2=1/3$	N3 $p_3=1/3$	
Variants of the decision-maker	S1	0	4	25	9,67
	S2	5	9	10	8
	S3	12	0	0	4
Minimum expected value					4

Applying of Laplace criterion on matrix of regret to decision maker is suggested to choose variant S3.

3. CONCLUSION

Emergency and crisis management preoccupy many theorists and practitioners involved in the process of managing the crisis. The study of the crisis management in our country is relatively recent and still in beginning, especially when it comes to the defense system (still in the stage of basic conceptual considerations). The main precondition for understanding the concepts of crisis management is to define the crisis and theoretical systematization of fundamental characteristics.

The term crisis causes a number of concerns. Involves uncertainty, suffering and testing, and points to an unknown future whose conditions can not be sufficiently clarified. This concept is comprehensive, so it can be said to represent pseudoconcept. For the purposes of this paper was accepted definition of crisis according to Paul t'Hart, who believes that the crisis is **"a serious threat to the basic structures or the fundamental values and norms of the social system which, in terms of time pressure and highly uncertain circumstances requires making critical decisions"**.

Crisis situations in the field of defense activities are significantly narrower concept than crises in general and specified in the defense strategy and doctrine through the defined mission. Mission of the Army are: (1) defending the state from external armed threat, (2) participation in building and maintaining peace in the region and the world, and (3) support in case of natural disasters.

Whether the crisis is caused due to natural disasters, or is result of human activity, it can be concluded that there are some basic characteristics that define them as follows: suddenness, uncertainty and time pressure. These characteristics negatively reflected on the decision making process because they assume a high degree of uncertainty. Decisions made in such circumstances, often have far-reaching consequences.

Since the destructive impact of a crisis is large and crisis can not be eliminated in the future, there has been a rapid development of new scientific discipline called **"crisis management"**.

Main characteristics of decision making in crisis situations arise from the nature of crisis situations, which usually develop rapidly and lead to various disturbances in the functioning of natural and social systems. Taking into account the specificities of crisis situations, modern decision theory have developed a special approach for decision making in emergency response - **contingency (situational) approach**, which takes into account the great state of dynamic change and uncertainty of events in connection with the crisis. The contingency approach neglect universal principles and solutions and highlight the extreme complexity of decision making in crisis situations. In its essence is a "diagnostic approach" that encourages decision makers to constantly analyze and understand the situation on the ground, and to promptly detect changes and to respond to them.

APPLYING THE CRITERIA OF DECISION-MAKING TRENDS IN UNCERTAIN SITUATIONS

Jelena R. Jovanovic¹, Dragan D. Milanovic², Radisav D. Djukic³

¹Technical College of Applied Studies, Cacak, jelena.jovanovic@vstss.com

²Faculty of Mechanical Engineering, University of Belgrade, ddmilanovic@mas.bg.ac.rs

³Manufacturing and Engineering Management Office, 'Sloboda' Co. Cacak, radisav.djukic@vstss.com

Abstract: *Threats to survival, uncertain trends in environment changes, a large number of constraints and market globalization are all imposing two key dimensions of production system strategy: predicting and risk-taking. The paper describes a quantitative approach to decision making when the probability distribution of future system states is unknown. Using statistical data on production trends for a selected product of 'Sloboda' Co., Cacak, Serbia, a mathematical model was defined, and criteria of decision-making trends were applied to design a production program.*

Keywords: *model, predicting, decision making, uncertainty, criteria, production program, production*

1. INTRODUCTION

Business and manufacturing systems (BMS) belong to a group of organizational, complex, dynamic and stochastic systems, where current state is known, which, influenced by management actions and environment impact, is transformed into one from a set of possible states. If corresponding inputs are not continuously provided due to entropy increase, these systems tend to degenerate. The production program is an instrument of business policy defined by the type and amount of products to be manufactured in a certain period of time having in mind the principle of "it should be produced what can be sold". The systems for armament and military equipment production have a specific place and role. Armament production and trade are governed by special legal provisions, with a high level of business globalization presence. Lacking reliable indicators of the marketing needs and possibilities, and taking into account the fact that production is often intended for 'unknown customers', require the analysis of goods sales dynamics in the previous period. Also, using the corresponding models and methods it will be possible to view the tendencies and to forecast the market absorption power.

2. PROBLEM ANALYSIS AND DESCRIPTION

Dynamic development, the results achieved and more than six decades long experience in special-purpose production have placed 'Sloboda' Co. Cacak, Serbia in a group of leading enterprises of metalworking industry in the Republic of Serbia. Special-purpose production program characteristics, thereby product features, have significant impact on the choice of technologies, number and structure of the range of products, development of products, utilization level of production capacities, supply of raw materials and parts, choice of suppliers and cooperating enterprises, defensive doctrine and the attitude of state. The purpose, complexity and characteristics of products all demand involvement of a number of technological disciplines such as machining, chemical and heat treatment, production of pyrotechnical mixtures and explosive composition of the product. This type of production requires provision of conditions for equipment maintenance and internal supply of special tools, power and fluids, therefore appropriate equipment for the purpose is a constituent component of total capacities to realize the foreseen production program. It should be pointed out that the character and purpose of products impose the highest possible quality and reliability level, which implies corresponding methods, equipment, qualified labor force and necessary polygonal testing of functional characteristics and reliability of parts, units and the product itself. Production program development is partly dependent of other plants that, being cooperating members, manufacture specific parts (gunpowder, caps) or items for using the products (pistols, rifles, guns). Basic characteristics of the range of products that are of significance for the system's dynamic equilibrium and management are: a large number of articles for various purposes produced in more than one variant, a complex structure of articles with a comparatively large number of parts and technological installment levels, a smaller number of principal parts installed in a number of articles limiting the production and delivery priority.

The analysis of market and production characteristics shows the significance of export participation. Threats to survival of special-purpose enterprises, uncertain trends of changes in the environment, a large number of

constraints and impact of diverse markets impose two key dimensions to the strategy: forecasting and risk-taking. Each product's lifetime is filled with dynamic changes viewed through changes in the volume of production as a function of time, so its presence in the production program is uncertain and is linked to adequate risk-taking. Under conditions of undefined production program for one or more than one product, most frequently due to the absence of contract, forecasting methods should be used in program design. In this way, the system could utilize production resources correspondingly, **time** as the only non-renewable resource and would be able to respond in real time to unexpected orders by short-term deliveries.

The problem of production results generalization with the aim to predict the likely trends is associated with a time interval, within which the behavior of BMS is analyzed, and time horizon for predicting, considering that the behavior of those systems is analyzed as a function of time. The time interval for statistical analysis must be chosen very carefully having in mind intensive and rapid changes of business system's state and relevant impacts on production program trends and production orientation. A set of data that defines the experimental sphere depends on BMS's business cycle duration, total number and frequency of the article's consecutive distribution in the production program, dynamics and volume of production per article and per year.

As the production program synthesizes a complex set of factors of stochastic and dynamic nature, the design of production program includes and summarizes two key contradictions: uncertainty of future states and quantification of relevant parameters. In accordance with the adopted concept of dealing with the problem of the program and production orientation, from forecasting to short-term planning, this paper presents a quantitative approach that summarizes regression and correlation analysis, extrapolation of trends and decision making based on applying rules and criteria that are used in the game theory. The concept proposed comprises:

- Establishment of regularity in trends of physical volume of production of the BMS in order to define the time dimension of business cycle (T).
- Analysis of the structure of production programs from the aspect of the article's consecutive distribution to establish the time interval relevant to statistical analysis (experimental area).
- Analysis of the market dynamics for the article, group of articles or production program, depending on the scope of investigations, in order to choose the approximative curves that define market absorption power.
- Defining the prediction time interval (prediction area) and designing possible states by extrapolation of trends in order to perceive alternatives in market behavior.
- Forming the game matrix for alternative-system states in the interval that comprises both the experimental area and the prediction area.
- Choice and application of criteria and methods for ranging the alternatives in order to make decisions that are, in a further procedure, susceptible to re-examination, using qualitative analysis.

Analyzing market and production characteristics of a chosen BMS (Djukic, et al., 2010), we established the production cycle length, $T=18$ years. Assuming that the experimental area should reflect the existing average (not extremely good, or extremely bad) conditions from the aspect of the article consecutive distribution in production programs during an 18-year period, a 5-year time interval was used to determine a statistical set of data – experimental area (Djukic, Zizovic & Jovanovic, 2010). The 18 years' period of business operations of 'Sloboda' Co. is characterized by manufacturing a broad range of products with pronounced dynamic trends in respect of the volume and distribution of products in production programs. Based on the analysis of production dynamics at 5-year intervals, the stochastic dependence of the volume of production trends is possible to describe using first-, second-, third- and fourth-degree polynomials, geometric and exponential regression, where the prediction area is determined by a 1-year time period (Djukic, et al., 2010). Developing a model of alternative-system states, choice of criteria, decision making method and decision making argumentation depend largely on manager's method and work style (Djukic, Dobricic & Djukic J., 2007; Lindsey, Pavur, 2009), use of appropriate software tools being desirable (Djukic & Jovanovic, 2009; Goodwin, Önköl, & Thomson, 2010).

In order to forecast market demands for anti-aircraft ammunition of cal 30-57 mm and aircraft ammunition of cal 30 mm, the dynamics of production was investigated for 32 products manufactured in a number of variants for various weapon systems. A 5-year production dynamics given in 10^3 pieces/year of a selected product-representative (R) is described by the relation (1).

$$R = \{\{t_1, Q_1\}, \{t_2, Q_2\}, \{t_3, Q_3\}, \{t_4, Q_4\}, \{t_5, Q_5\}\} = \{\{1, 234.3\}, \{2, 566.4\}, \{3, 256.3\}, \{4, 222.5\}, \{5, 350.6\}\} \quad (1)$$

Stochastic dependence of a product-representative sale as a function of time is described by six adopted types of approximative curves: linear regression, square regression, third-degree polynomial regression, fourth-degree polynomial regression, geometric and exponential regression.

Regressions were defined by the relations from (2) to (13) according to the choice of dependent and independent variable.

$$q_1(t) = 359,41 - 11,13 \cdot t \quad (2)$$

$$q_2(t) = 293,56 + 45,312857 \cdot t - 9,407143 \cdot t^2 \quad (3)$$

$$q_3(t) = -832,18 + 1626,709524 \cdot t - 612,482143 \cdot t^2 + 67,0083 \cdot t^3 \quad (4)$$

$$q_4(t) = -269,14 + 513,119167 \cdot t - 2745,9125 \cdot t^2 + 583,4583 \cdot t^3 - 43,0375 \cdot t^4 \quad (5)$$

$$q_5(t) = 301,73704546686 \cdot t^{0,01233317152} \quad (6)$$

$$q_6(t) = 317,30097620,9872533173 \quad (7)$$

$$t_1(q) = 3,44049 - 0,001351 \cdot q \quad (8)$$

$$t_2(q) = -8,512162 + 0,068391 \cdot q - 0,0000878495 \cdot q^2 \quad (9)$$

$$t_3(q) = 65,29945 - 0,5947887 \cdot q + 0,0017808 \cdot q^2 - 1,6383958 \cdot 10^{-6} \cdot q^3 \quad (10)$$

$$t_4(q) = 2890,026 - 37,345485 \cdot q + 0,17505 \cdot q^2 - 0,00035 \cdot q^3 + 2,49656 \cdot 10^{-7} \cdot q^4 \quad (11)$$

$$t_5(q) = 2,1556391448 \cdot q^{0,0331059257} \quad (12)$$

$$t_6(q) = 2,7527817876 \cdot 0,9998309645 \quad (13)$$

Data on production trends and corresponding regression curves are presented in Figs.1-4.

Figure 1: Experimental area of product R presented in coordinate system $\{t_i, q_i\}$

Figure 2: Regression functions $q_i(t)$ presented in experimental area and prediction area

Figure 3: Regression functions $t_i(q)$ presented in experimental area and prediction area

Figure 4: Multi-functions $p_i(t)$ inverse to regression functions $t_i(q)$ presented in coordinate system $\{t_i, q_i\}$

Figure 1 shows the dynamics of product R production analyzed over a 5-year period, Figure 2 shows production trends and regression curves $q_i = f_i(t)$ described by the relations (3) – (7), Figure 3 the dynamics of production and regression curves $t_i = f_i(q)$ described by the relations (8) – (13) and Figure 4 multi-functions $p_i(t)$ inverse to functions $t_i = f_i(q)$. Situations where it is little known about the future state of a system, and the distribution of probabilities for the event that decision is made on is unknown, are referred to as uncertain. Solving the prediction model requires the choice of one of the alternatives offered (regression curve). We can then use certain rules well-known in the Game Theory, i.e. the Theory of Statistical Solutions. Uncertainty situations do not have ingredients of conflict because the states of nature are a consequence of the alternatives (strategies) chosen by a decision maker. In order to overcome the above mentioned fact, apart from regressions $q_i = f_i(t)$, multi-functions $p_i = f_i(t)$ were introduced. To the maximum, six types of alternative curves $t_i(q)$ can define twelve multi-functions. A few criteria can be used in decision making, from extremely pessimistic to extremely optimistic. In ranking the alternatives three criteria of trends will be applied: standard error of the regression, coefficient (index) of determination and elasticity coefficient of demand.

- Standard error of the regression $K_1 \rightarrow$ principle of minimum

It is a mean value of original data deviation from estimated values obtained by corresponding regression curves (14). According to this criterion, the best alternative has the least standard error (15):

$$\{(t_i, q_i), i = \overline{1, n}\} \Rightarrow q_r \Rightarrow S_q = \sqrt{\frac{\sum_{i=1}^n (q_i - q_r)^2}{n}}, \quad \{(q_i, t_i), i = \overline{1, n}\} \Rightarrow t_r \Rightarrow S_t = \sqrt{\frac{\sum_{i=1}^n (t_i - t_r)^2}{n}} \quad (14)$$

$$K_1 = \min_i \{S_{q_i}, i = \overline{1, m}\} = \min_i \{S_{t_i}, i = \overline{1, k}\} \quad (15)$$

- Coefficient (index) of determination $K_2 \rightarrow$ principle of maximum

To measure the strengths of correlations between the observed characteristics, coefficient (index) of determination is applied (R_{iq}^2, R_{qt}^2), relations (16) and (17). The best alternative has the highest value of coefficient (index) (18):

$$\{(t_i, q_i), i = \overline{1, n}\} \Rightarrow q_r \Rightarrow \left\{ \bar{q} = \frac{\sum_{i=1}^n q_i}{n} \wedge S_q^2 = \frac{\sum_{i=1}^n (q_i - q_r)^2}{n} \wedge s_q^2 = \frac{\sum_{i=1}^n (q_i - \bar{q})^2}{n} \right\} \Rightarrow R_{iq}^2 = 1 - \frac{S_q^2}{s_q^2} \quad (16)$$

$$\{(q_i, t_i), i = \overline{1, n}\} \Rightarrow t_r \Rightarrow \left\{ \bar{t} = \frac{\sum_{i=1}^n t_i}{n} \wedge S_t^2 = \frac{\sum_{i=1}^n (t_i - t_r)^2}{n} \wedge s_t^2 = \frac{\sum_{i=1}^n (t_i - \bar{t})^2}{n} \right\} \Rightarrow R_{qt}^2 = 1 - \frac{S_t^2}{s_t^2} \quad (17)$$

$$K_2 = \max_i \{R_{iq_i}^2, i = \overline{1, m}\} = \max_i \{R_{qt_i}^2, i = \overline{1, k}\} \quad (18)$$

- Elasticity coefficient $K_3 \rightarrow$ principle of maximum

Elasticity between two characteristics is defined as a relationship between their relative changes. The thus obtained value is expressed by elasticity coefficient that indicates the per cent level of some quantity future change in case when the other quantity changes by 1 per cent from the observation level. The coefficient can represent arc elasticity (20) or point elasticity (21).

Figure 5: Regression curve $q = f(t)$ with designated initial point (A) and terminal point (B), absolute growth-rate (Δq) with respect to absolute time change (Δt)

$$\Delta q = q_B - q, \Delta t = t_B - t, r_q = \frac{\Delta q}{q}, r_t = \frac{\Delta t}{t} \quad (19)$$

$$\varepsilon_q = \frac{r_q}{r_t} = \frac{\frac{\Delta q}{q}}{\frac{\Delta t}{t}} = \frac{t}{q} \cdot \frac{\Delta q}{\Delta t}, \quad \varepsilon_t = \frac{q}{t} \cdot \frac{\Delta t}{\Delta q} \quad (20)$$

$$\varepsilon_q = \lim_{\Delta t \rightarrow 0} \frac{t}{q} \cdot \frac{\Delta q}{\Delta t} = \frac{t}{q} \cdot \lim_{\Delta t \rightarrow 0} \frac{\Delta q}{\Delta t} = \frac{t}{q} \cdot \frac{dq}{dt}, \quad \varepsilon_t = \frac{q}{t} \cdot \frac{dt}{dq} \quad (21)$$

Point elasticity coefficient shows a value for infinitesimally small value of the observed characteristics. The best alternative has the highest value of elasticity coefficient (22):

$$K_3 = \max_i \{ \varepsilon_{q_i}, i = \overline{1, m} \} = \max_i \{ \varepsilon_{t_i}, i = \overline{1, k} \} \quad (22)$$

3. PREDICTION AND DECISION MAKING MODEL

Six adopted types of approximative curves define a set of alternatives $q_i = f_i(t)$ and $p_i = f_i(t)$ in the game matrix, whereby we can determine the states of the systems $S_1 - S_5$ in the experimental area (5 years), while using trend extrapolation the state of the system S_6 in the prediction area (1 year) can be determined. Applying the adopted criteria of trends $K_1 - K_3$ we will choose optimal alternatives. The prediction and decision making model is presented in Table 1.

Table 1: Integrated model for prediction and decision making (alternatives – systems states – decision making criteria)

q _i ,p _k		S _j ,K _s	SYSTEMS STATES S _j , j = 1,2,...,6						CRITERIA K _s , s = 1,2,3		
			S ₁	S ₂	S ₃	S ₄	S ₅	S ₆	K ₁	K ₂	K ₃
ALTERNATIVES	q _i (t)	q ₁	348	337	326	315	304	293	127,4	0,01513	-0,228

	$p_5(t_4)$	234,3	566,4	256,3	222,5	350,6	218	0	1	-20,2
	$p_6(t_4)$	234,3	566,4	256,3	222,5	350,6	267	0	1	13,31
	$p_7(t_4)$	234,3	566,4	256,3	222,5	350,6	349	0	1	-33,7
	$p_8(t_4)$	234,3	566,4	256,3	222,5	350,6	567	0	1	538,2
	$p_9(t_5)$	-0,008	0,104	21674	33333	66666	90999	1,470	- 0,08066	0,033
	$p_{10}(t_6)$	5990	1890	-509	-2210	-3530	-4609	1,463	- 0,06970	0,779
	PRINCIPLE "MIN-MAX":							MIN	MAX	MAX
VALUE OF CRITERIA K_s :							0	1	538,2	
OPTIMAL ALTERNATIVE $p_k(t)$:							p_5, p_6, p_7, p_8	p_5, p_6, p_7, p_8	p_8	
IDEAL EXPLOITATION CAPACITY: $C_e = 600\ 000\ \text{kom/god}$										

Linear (t_1 – relation 8), geometric (t_5 – relation 12) and exponential (t_6 – relation 13) regressions define the states of the systems by functions p_1 , p_9 and p_{10} . A second-degree polynomial regression (t_2 – relation 9) is not included in the model because it does not define possible states (S_6) in the prediction area. A third-degree polynomial regression (t_3 – relation 10) defines three values of the state (S_6) by multi-functions p_2 , p_3 and p_4 . A fourth-degree polynomial regression (t_4 – relation 11) defines four values of the state (S_6) by multi-functions p_5 , p_6 , p_7 and p_8 . Considering that real values of the volume of production (Q_R) range from zero to ideal exploitation capacity (C_e), it is necessary in decision making to leave out the states of the system S_6 that are defined by the functions q_3 , q_4 , p_1 , p_9 and p_{10} . This means that the prediction model consists of two game matrices of the (4x6) and (7x6) formats. The criteria of trends will be applied to the alternatives defined by the relation (23). Relations (24) and (25) are used to define optimal alternatives (q^* , p^*).

$$Q_R \in [0, C_e] \Leftrightarrow \{q \in (q_1, q_2, q_5, q_6) \wedge p \in (p_k | k = \overline{2,8})\} \quad (23)$$

$$(K_1 \Rightarrow q^* = q_2 \wedge K_2 \Rightarrow q^* = q_2 \wedge K_3 \Rightarrow q^* = q_5) \Rightarrow \{q^* \in (q_2, q_5)\} \quad (24)$$

$$K_1 \Rightarrow p^* = (p_5, p_6, p_7, p_8) \wedge K_2 \Rightarrow p^* = (p_5, p_6, p_7, p_8) \wedge K_3 \Rightarrow p^* = p_8 \Rightarrow \{p^* \in (p_5, p_6, p_7, p_8)\} \quad (25)$$

4. CONCLUSION

Based on Table 1, Figure 6 and relations (24) and (25) it is possible to define the limits within which the future volume of production (Q_R) trends are predicted for the product – representative (R), relation (26):

$$\{q^* \in (q_2, q_5)\} \Rightarrow 227000 \leq Q_R \leq 308500 \wedge \{p^* \in (p_5, p_8)\} \Rightarrow 218000 \leq Q_R \leq 567000 \quad (26)$$

Figure 6: Exploitation capacity (C_e), production realized $S_1 - S_5$, regression curves $q_i(t)$, regression curves $p_k(t)$ inverse to the functions $t_i(q)$ and volume of production in the prediction area (S_6)

The paper presents the decision making process that synthesizes in itself several methods and techniques as a starting point for applying quantitative models, which no doubt represents progress compared to intuition and experience mainly dominating the prediction practice. Based on a 5-year analysis of business operations the production program was designed for the next year, and using the adopted criteria it ranges within limits defined by the relation (26). With a flow of time, it is possible to conclude that the volume of $Q_R = 306\,700$ pieces/year (indicated in Fig.6, on a rectilinear line $t=6$) was realized, which subsequently confirms the applicability of the methodology described.

APPLICATION OF MULTI-AGENT SYSTEMS IN SUPPLY CHAIN MANAGEMENT

Ksenija Mandić¹, Boris Delibašić²

¹ Crony d.o.o, ksenija.mandic@crony.rs

² University of Belgrade, Faculty of Organizational Sciences, delibasic.boris@fon.bg.ac.rs

Abstract: In traditional business, negotiation is viewed as a long process, which resulted in the development of computer methods to aid decision making. In recent years, great effort has been invested in the research and development of intelligent agents and multi-agent systems for the automation of negotiation in supply chain management. The main task of a multi-agent system is to link independently developed agents into a single system that allows collaboration and interaction among agents. In that way we get a much more efficient system for decision making in relation to the individual use of each agent. The aim of this paper is to highlight the positive effects that are achieved by the introduction of multi-agent technology in supply chain management. The application of multi-agent systems results in significant improvements in the field of communication and negotiation processes, cost reductions (the expenditure of time and resources), customer satisfaction, supply chain efficiency, reduction of human work, inventory control, virtual pooling etc.

Keywords: supply chain management, agent technology, the negotiation mechanism, multi-agent systems, intelligent agents.

1. INTRODUCTION

The rapid development of products and a dynamic market require companies to reconstruct their functions and positions in the modern industry. In such circumstances, the companies will take appropriate actions to remain competitive in the global market. Concurrent engineering - CE is a productive way to survive in the global marketplace, it can be realized by simultaneous work of experts who have different functions within the company in order to produce specific products of high quality and functionality with minimum spending of time and resources (Figure 1). The system of supply chain management is an effective approach to solve this complex situation. As an integrated network of suppliers, factories, warehouses, distribution centers and retail outlets, supply chain management system coordinates the processes in the entire logistics chain for faster and more flexible cooperation between companies, customers and suppliers.

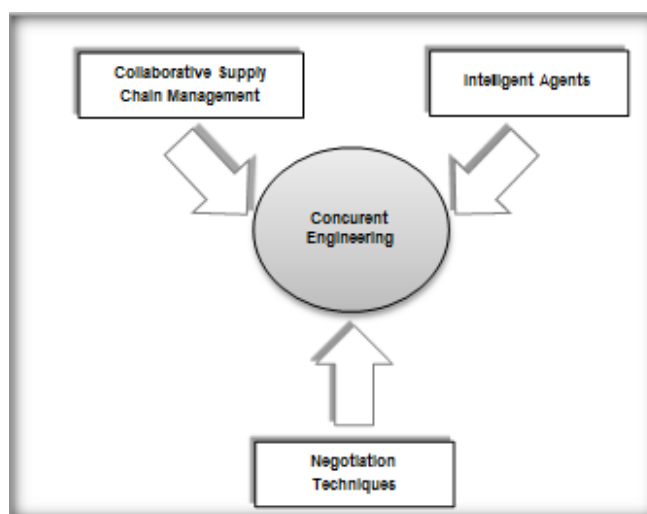

Figure 1: Assistants for CE realization (Ito & Salleh, 2000)

The cooperation of members in the supply chain management is a critical point in the implementation of effective supply chain; such implementation is not simple and cannot be efficiently implemented using only conventional mechanisms of information exchange. Hence arise in business the new forms of collaboration and organization to facilitate joint work of suppliers and customers, to exceed the traditional type of organization within the linear supply chain to engage a large number of independent agents whose goal is a virtual association and formation of *time-sharing* resources. Such arrangements are described in the *adaptive value network* (AVN): "Arrangement in which companies have close relationships, working together as a system that provides customized products and services, achieve quality and in a responsible and coordinated ways adapt to the changing environment" (Makatsoris, Chang & Richards, 2004).

The emergence of agent technology initiates the development of new architectures and modeling software and supply chain management (Liang & Huang, 2006). Agent programming (Jennings, 2000) is defined as a software development paradigm that combines artificial intelligence and distributed systems. In fact, agent programming is a set of software components that are designated as agents - autonomous and proactive agents who are able to communicate with each other (Wooldridge & Jennings, 1995). The application of agent technology provides to distributed environment, effective communication, thus making it easier to integrate the entire supply chain into an independent echelon of connected systems. Activities in the supply chain such as procurement, planning, monitoring, enforcement, etc., are represented by the software agent. Great effort has been made to establish agent and multi-agent systems in managing supply chains, especially for applications such as - manufacturing, planning, procurement (Shen & Norrie, 1999; Jennings, Norman, Faratin, O'Brien & Odgers, 2000; Leung, Wong & Sculli, 2006; Wong, Leung, Mark & Fung, 2006; Fang & Wong, 2010). In such systems, each agent operates on the basis of their internal models and the need to cooperate with other agents in the network. For example, an agent who represents the warehouse can immediately send stock availability to another agent who represents the customer in order to inform the customer about the availability of stock prior to ordering goods. This process in the business takes a lot of time even without the use of technologies.

2. AGENT TECHNOLOGY APPLICATION

The term software agent is very popular in recent years. Public entities and private companies spend a considerable amount of time, effort and money for research - development and promotion of the idea of a software agent. It is rather surprising, because in essence, software agents are doing what is expected of an advanced computer program that is able to in their environment perform a specific task with a certain degree of autonomy (i.e. without permanent leadership and human intervention). However, the real potential of this technology comes into play when you put together a number of software agents in the same environment. In such a case, a set of agents is viewed as multi-agent system where the agents are focused on each other and coordinate their activities so that you can avoid negative interactions with other agents and take advantage of their combined capacity.

The agent itself is a computer system that interacts with the environment, is capable of flexible and autonomous actions in dynamic and unpredictable multi-agent domains. Agents are autonomous software modules with the possibility perceptions and changing the state of the environment. The whole activity of agents is related to the environment in which it is located, i.e. the environment is the source of its observation and the object of its actions. In the software sense, agents are typically implemented as examples of object-oriented classes, with appropriate identity, characteristics (attributes) and the rules of behavior (methods) - Figure 2. The behavior of agents can ultimately be reduced to a mapping of type perception → action, where the mapping mechanism can be encoded in different ways: a simple table, logical rules (IF... THEN), or other techniques of decision making (neural networks, fuzzy logic), and similar (Žujović & Petrović (2005)). Coding (and therefore the decision-making process) determines the degree of agent's intelligence, which can range from simple reactive elements (type actions - response), to the complex structure of decision-making mechanism based on artificial intelligence techniques.

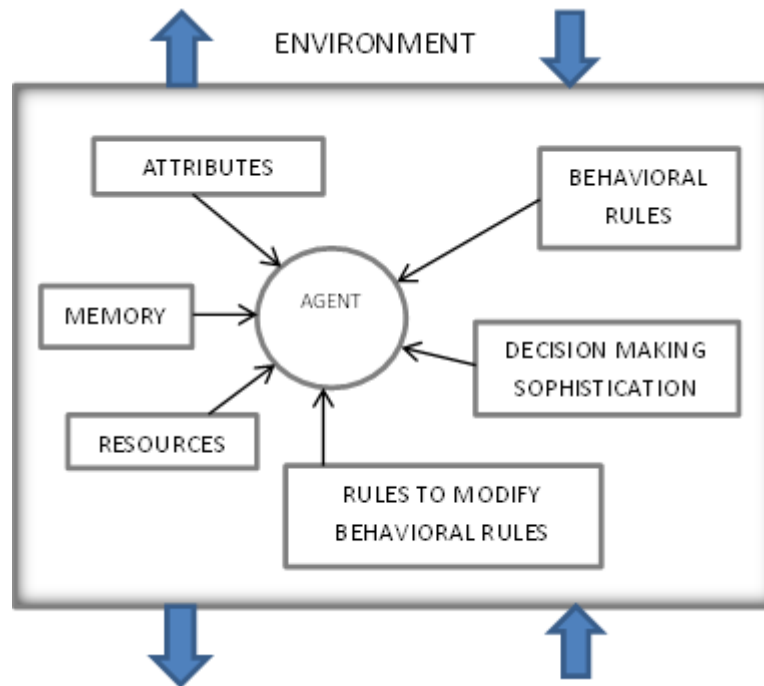

Figure 2: Schematic presentation of agent

For each agent one can observe the following elements (*Figure 3*): 1) the environment - managing environment or the environment under which the sensors are working, 2) sensors - allowing agents to perceive the environment, 3) effectors - which respond to the perception.

AGENT=ARCHITECTURE+PROGRAM

Figure 3: Agent's features (Russel & Norning, 1995)

To perceive the environment agent is using sensors to which the stimuli affect from the environment. The information gathered by the agent during the observation sequences is stored in the memory of the agent. The actions that the agent is able to perform depend on the sequence of observations. A mapping function is responsible for efficient and effective response of the agent. Mapping function maps the list of perceptual sequences during the action of the agent, and on the basis of this the table is compiled in response to each sequence of observations.

The program whereby the agent functions is a function on the basis of which the perception mapping is done in the course of action. A program that is selected must be compatible with the architecture of the agent. The architecture of agents is a determined methodology for building agents; it determines how the agent is decomposed into a series of modules and how these modules are connected. It is not only the structure of an agent but also shows the way in which modules perform their activities and link between the various agents. We cannot talk about the unique architecture of agents, but what it would be is dependent on the purpose of agents. Generally, the architecture of agents allows that the perception through the sensors be adjusted to the program, and to manage the program and pass the appropriate actions to effectors.

2.1 The importance of intelligent agents in the negotiation process

Often the term agent is used instead of the term intelligent agent - intelligence is defined as the presence of mechanisms of behavior aimed at solving a given goal. Due to the large amount of information that surrounds us in modern society, we need intelligent agents to enable efficient navigation. Intelligent agents (IA) are software that can automatically perform a task set to it by a person or other software (agent). When the agents are set once, they perform their tasks automatically, without further user intervention. These are most commonly used for automatic information search, for answering questions in the field of its knowledge, to inform users about interesting events (e.g. the emergence of a new article on the Internet, information on the possible occurrence of problems on the road between the initial and final destination, whether the given term appears somewhere on the web, etc.), for the current and personalized news, for intelligent decision-making process of users, to search the goods according to the criteria of most favorable price, for the provision of automated services such as checking of changes to web pages and the like.

The intelligent agent is defined as a program that aspires to the objectives and with minimal referrals, using intelligence or heuristic techniques. In addition to intelligence, the key features of intelligent agents are:

- learning - from the user, other agents, from other sources
- collaboration - working with other agents to achieve their goal
- mobility - the mobility of agents in the network, the realization on different computers
- personalization - the knowledge of their users, their interests and preferences
- adaptability - learning from different sources, from the user's actions. (Rudowsky, 2004)

These features facilitate the process of developing a complete system, helping to isolate abstract and irrelevant, and to focus on analysis and design of important characteristics of a particular problem (Garcia, Giret & Botti (2011)).

The role of IA is essential for successful communication process and negotiation between the company and suppliers; they provide us with relevant information to achieve objectives. The basis of negotiations is in reaching an agreement between the agents in providing services, and this approach has been used to manage conflicts that arise between the intelligent agents (Ito & Salleh, 2000). IA start with negotiations after defining the communication objectives, and end by making certain decisions during the process of using different strategies and techniques to generate the initial offer. They have high degree of self-determination and decide alone when, where and under what circumstances the actions will be performed. The interaction of agents can be directed to any particular action, change of the planned course of action and agreement on a common course of action. Interactions between agents enable rationalization and integration of the entire process of cooperation in the management of supply chains.

Figure 4 represents participants in the life cycle of negotiation: 1) the analyst and owner: describing and formalizing objectives, 2) designer: forming plans for achieving the goals of the agents through interactions, 3) implementer: implementing a designed strategy by using respective protocols and tools for achieving the goals. In the first step the life cycle of negotiation, the negotiation analysis suggests the need to acquire and model the individual settings for protocol and negotiation strategy. A negotiation mechanism of agent negotiation must have an adequate strategy and negotiation protocol (Fang & Wong, 2010; Chen, Peng, Finin, Labrou & Cost). Negotiation protocol is used to organize messages between agents, determine the flow and format of messages between the negotiating parties. On the other

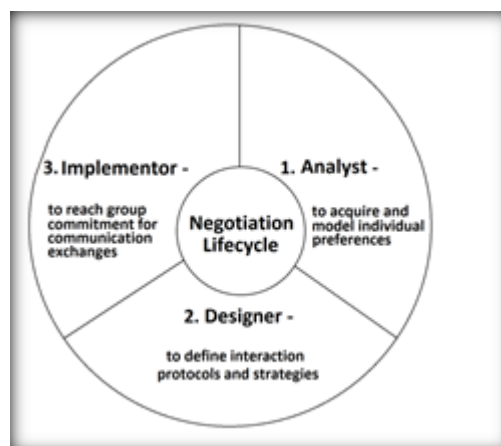

Figure 4: Life cycle phases of negotiations and participants in it (Ito & Salleh, 2000)

hand, the strategy of negotiating is a way in which negotiating party acts in order to achieve the best outcome of negotiation (e.g. what to assign - what you keep), so the strategy for each participant is personal. In the next step, designers tend to define strategies and protocols that will enable the achievement of objectives. In the final step, implementers are looking for group commitment through the communication exchange. IA work on behalf of its participants, and they have specific skills to manipulate other members according to their assignment using the plan and protocol of negotiation. When IA negotiates, it discovers its goals to the other members, identifies conflicts, seek solutions to conflicts and concentrates on finding the ideal solution for achieving their goals.

2.2 Evolution of multi-agent systems

The systems in which multiple agents work together to execute a task or solve common problem are called multi-agent systems (MAS). MAS represent an information technology that is rapidly developing as a result of agent technology, i.e. autonomous software modules that represent real-world objects. Such a system is in fact a broad network of software agents that collaborate to solve problems that are beyond the individual capacities or knowledge of any classical way of solving problems. Such systems are ideal for modeling problems for which there are several different methods for solving and multiple perspectives. In systems built in this way, instead of a control agent managing the process, the management is divided into several agents which according to their specialties assume responsibility in controlling the complex process. Using multi-agent system increases the overall security system in situations of cancellation of one of the agents, or the entire system can be automatically reconstructed or stopped in a controlled the way.

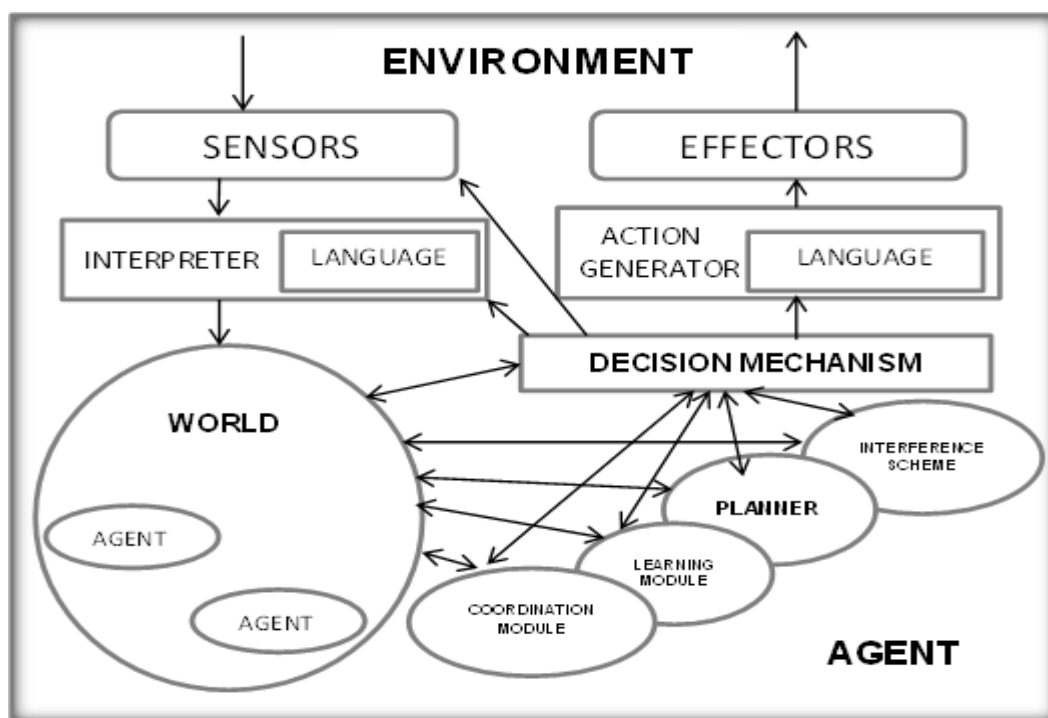

Figure 5: Architecture of agents: Components of agents in multi-agent systems

In such systems explicitly are modeled only the elements of the system, while the dynamics of the entire system is left to itself, i.e. it will arise spontaneously from the interaction of its own elements. Systems composed of agents consistently follow the system definition - a collection of elements in mutual interaction (Figure 5). This significantly facilitates the process of modeling, because the behavior of elements in most cases can be described precisely, whereas the behavior of the system is often so complex that it is impossible to express it in a formalized form. The overall aim of MAS is to create a system that specifically inter-connects agents and to allow the ensemble to function without the possibility of any individual adjustments (Ren & Anumba, 2003).

The conceptual basis of MAS is given in the theory of complex systems which rules are not explicitly defined, and there is no centralized element that governs the global dynamics (Zujovic, & Petrovic, 2005). According to this definition of the MAS we can exclude those systems where there is a central planner or designer that controls the decision-making processes of local agents. In other words, the MAS is defined as a completely decentralized system. Therefore, only systems that enable meaningful interaction between agents can be classified as true MAS.

MAS attracted great attention of experts from many different scientific fields, both in nature and in the social sciences. The growing interest in this type of networking occurs because of the possibility to ensure efficiency in solving problems in which the data, expertise and control are distributed. When designing MAS it is necessary to define the number of agents, a critical amount of time to perform the task, the dynamics of the arrival of the goals, communication costs, cost of failure, the impact of users, and the uncertainty of the environment. At the level of each agent the following should be defined: the initial state of the domain, the possible actions of other agents and the output actions of agents.

Multi-agent systems attempt to solve the whole problem by mutual cooperation and thus give a better answer to complex problems. This paper demonstrates how agent technology enables us to solve communication relationships in the distribution environment. Multi-agent simulations do not provide a solution to all problems, not necessarily make a replacement for the classic techniques of modeling and simulation. Instead, they should be treated as a complementary approach to conventional models, which are used when conventional techniques cannot give the desired results.

2.3 Application of MAS in SCM

Supply chain is a network that includes all the elements involved in materials transformation into a finished product and transporting it to the end user. Managing the supply chain becomes especially complex if it is based on outsourced functions which cover almost all activities from production, to sales and distribution. Such a situation introduces uncertainty into the business and results in delicate business relations, to be held and managed effectively. Therefore, MAS is trying to solve the whole problem by agents' collaboration. In the supply chains management to automate buyer-seller negotiation, as members of a supply chain the software agents are engaged (Kersten & Lo, 2003, Braun et al 2006). In this way, MAS can assist in solving complex problems and making decisions or support the people to decide. Agents are especially suitable for coordination in supply chains due to the following characteristics:

- Information, resources and control over data and resources are essentially distributed (Jenssen, 2004)
- The supply chain is adaptive and changes over time. Agents should serve as unifiers of components of supply chain management which is owned by the particular entity in the supply chain (Julka, Karimi & Srinivasan, 2002)

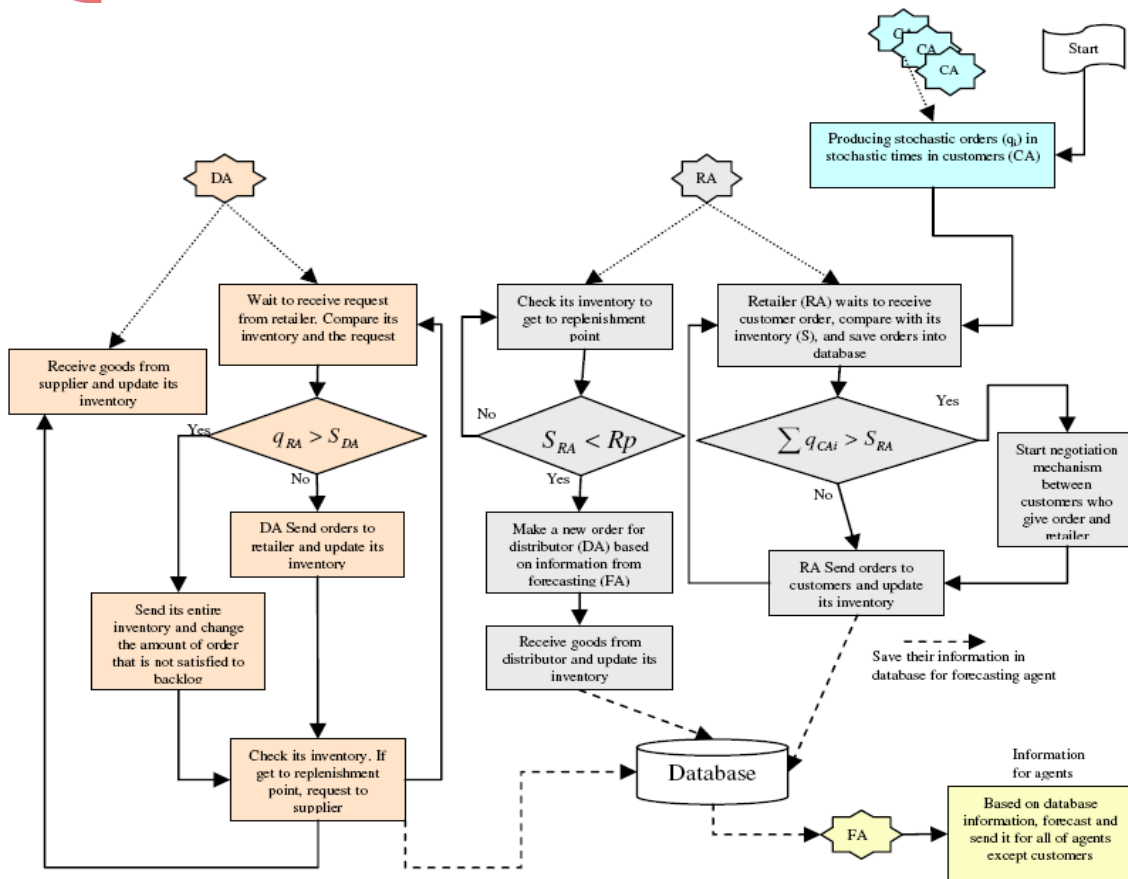

Figure 6: Schematic presentation of agents in SCM (Saberi and Charalampos, 2008)

The company is required to quickly and effectively respond to the order to meet customer requirements. However, an unexpected rush of orders causes delays in delivery and reduces efficiency. It is clear that to solve such problems one should develop a mechanism such as the MAS, which integrates various functions. In multi-agent environments, autonomous agents need to interact with one another to achieve their goals because reciprocal dependencies exist among them. In this context, negotiation is a fundamental tool to reach agreements among agents with conflictive goals in both competitive and collaborative scenarios (Monteserin & Amandi (2011)).

The proposed algorithm (Figure 6) demonstrates the concept of virtual markets and facilitates supply chain management in a dynamic environment. Although collaboration is a basic characteristics of virtual market (due to the changing environment and autonomous / heterogeneous nature of the members of the virtual market), it can only succeed if activities are properly managed in the supply chain. A schematic model follows the behavior of each individual agent (DA-agent distributor, RA- agent seller, CA-agent customer, FA-agent for the forecasting). It is evident that there is one database, which can be accessed by all the agents. Furthermore, agent for forecasting processes this information and forwards it to the agent seller and agent distributor.

3. EFFECTS OF APPLYING INTELLIGENT AGENTS AND MULTI-AGENT SYSTEMS

Technologies of intelligent agents and multi-agent systems represent one of the most promising directions for the development of a system based on the Internet and knowledge in logistics. Intelligent agents represent the organization within the logistics domain models and their logistics functions, processes, expertise and interaction with other organizations (Graudina & Grundspenkis, 2005).

MAS is currently used as an efficient way to solve a wide range of problems (Vallejo, Albusac, Mateos, Glez-Morcillo & Jimenez (2010)), in the field of planning, real-time control, robotics and many other industrial areas. Expansion of the use of MAS-based model of software engineering (Jennings, 2000) is based on: the use of autonomous agents that solve complex and distributed problems, use of language

(Bordin et al., 2006), or even making standards (Foundation for Intelligent Agents Physical, 2002). In other words, Agent programming is used to design a problem in cases where other approaches are insufficient and incomplete.

The reasons for the introduction of IA, and MAS in commercial systems are as follows:

- introducing this type of technology enables performance of various tasks such as making decisions, solving various problems that normally require the human intelligence, such as problem diagnosis, data classification, planning and negotiation;
- identify critical information with the input of resources, to monitor and take action based on the information context (information sharing, forecasting knowledge and use of the negotiating mechanisms);
- autonomously collect duties on behalf of users, this kind of programming does not require constant user intervention. Reduce human work by using the automated agents which act on behalf of the users. Spare the user from having to find, negotiate, and in general deal with buyers and sellers.
- such systems connect separate agents and create ensemble of functions that is beyond the capacity of any individual agent. This ensemble provides flexibility in the conduct of affairs, and is more efficient for solving complex problems;
- promote cooperation between members of the supply chain, although the interaction between the IA can lead to conflict and coalition. Negotiation techniques are used to overcome conflicts and coalitions in order to achieve agreement between agents rather than persuasion to accept the already existing solution. Negotiation is the core of many agent interactions;
- virtual pooling (virtual market concept) and *time-sharing* resources.

The positive effects achieved by the introduction of IA and the MAS:

- successful process of communication and negotiation between manufacturers and suppliers, based on what creates good communication networks that allow the satisfaction of customer requirements. MAS are inexpensive standardized communication infrastructure, which includes separate agents that interact in an open and *real-time* environment and provide transaction security;
- increases supply chain efficiency - integration and coordination of various systems and processes in the supply chain, facilitating the supply chains management in a dynamic environment.
- achieve an efficient flow of materials and total costs reduction - reduced consumptions of time and resources, the agents are faster than humans, using the automated agents can save the transportation and communication costs that human contact may incur (Linlan, Haigang, Xueguang & Hong (2011))
- reduction of the *bullwhip* effect – reduces oscillations of user requirements and improves the forecast level of reserves and resources. Thus determines the above demand and reducing the total operating costs.
- inventory control is enabled (e.g., an agent who represents the warehouse can stock availability information to other agents in order to know at any time stock availability)
- provide answers to uncertain market, merger and division of competence risk.
- increase the security of the system in situations of failure of one of the agents.
- such networks, regardless of the state, are always active and ready to respond.

A significant advantage in applying multi-agent model is in that it can be constructed even if the legality of the behavior of the whole is unknown (entire system). Multi-agent simulation capabilities are higher compared to conventional simulation models, using them to express more complex dynamics and structure. Agents in multi-agent simulation models are heterogeneous and thus enable a more realistic view. Also, these models are generally easier to maintain, because all of the updates made to the level of individuals - agents. Elements of multi-agent simulations are relatively faithful copies of objects from the real domain, which considerably facilitates communication between policy simulations (programmers) and end-users (experts in the subject area).

4. CONCLUSION

The area of autonomous agents and multi-agent systems is very diverse and represents an area that is rapidly expanding. It is a combination of several scientific fields such as distributed processing, object-oriented systems, software engineering, artificial intelligence, economics, sociology, organizational science. The methodology of the program based on agents provides a range of effective tools and

techniques that have the potential to significantly improve the technique of software ranging from conceptual design through to actual implementation. During the past two decades a significant number of improvements is evident in design and implementation of autonomous agents and how they interact.

Multi-agent systems introduce a new approach to modeling, which is reflected in the specific relationship between global and local (and elements of the system). The modeling is reduced to explicitly defining the elements of the system, while the dynamics of the entire system arises spontaneously from the interactions of the components. This significantly facilitates the process of modeling, because the behavior of elements in most cases can be described precisely, whereas the behavior of the system is often so complex that it is impossible to express it in a formalized form.

Agent technology has offered a powerful repertoire of tools and techniques that have the potential to significantly improve the way people conceptualize and implement many types of software. Agent technology is gaining in importance and it is used to solve real problems, and commercial applications. Agents are used in a growing, wide variety of applications - from small comparative systems, such as personalized *e-mail* filters to large, complex systems such as *air-traffic control*. Natural and simple is that so many different applications can be represented by agents, and that is what best explains impressed researchers and developers to given approach potentials (Sabeti & Makatsoris (2008)).

Abstract: *The aim of this paper is to investigate the model of ranking students for admission to master studies at the Faculty of Organizational Sciences. The current candidate ranking criterion is a weighted sum of the average grade and points scored in the entrance exam. This model has some deficiencies, listed and explained in this paper. There are two major problems: the model does not underline essential knowledge necessary for the wanted program and the weighted sum is unable to model a connection between variables. The suggested solution is to model a new criterion function, which includes few factors and the usage of logical aggregation based on interpolative Boolean algebra. That function is called pseudo-logical function. The results of the model based on pseudo-logical aggregation simulation are significantly different from the current model results. This is due to the emphasis on specific factors. This paper may be of particular value to university departments involved in student enrollment and to everybody dealing with any form of student ranking.*

Keywords: *ranking students, weighted sum, fuzzy logic, interpolative Boolean algebra, logical aggregation, pseudo-logical function*

1. INTRODUCTION

Since 2007 Faculty of Organizational Sciences has been enrolling students to master studies. The criteria of enrollment are entrance exam output and average grade at undergraduate level. Considering the differences between the courses existing at master studies at FOS, this universal ranking model may not be completely appropriate. The student's average grade is taken as indicator of previously acquired knowledge. That grade, as it is, does not show candidate's specific knowledge. For example, knowledge and grades gained at management domain should be additionally scored for enrolling in management departments. In this way the advantage at the enrollment would be given to the candidates who showed special interests in certain domain.

The propositions of enrollment, the current ranking model and its deficiencies are explained at Section 2. The details are underlined by description of necessary criteria considering the specific module. In Section 3 there is the proposition considering the usage of changed weighted sum, which includes several factors. One of them, the one which underlines required specific knowledge, is aggregated by fuzzy logic. There is also a theoretical introduction to fuzzy logic. The subject of Section 4 is Interpolative Boolean algebra (IBA) and Logical aggregation (LA). IBA treats negation differently from fuzzy logic. There is also a suggestion of pseudo-logical function as criterion function. One of the criteria is aggregated using logical aggregation, which is based on IBA. In fifth section there is an example of classical student ranking and the ranking using the function suggested at previous section. In final section of the work we give our conclusions.

2. MASTER STUDIES AT FACULTY OF ORGANIZATIONAL SCIENCES

Considering the proposition for student's enrollment to master studies the school year of 2011/2012, eight different study programs are offered for enrollment. Every single program is divided to modules or study groups that candidate enrolls. There are thirty six modules, which are the forms of additional guidance. Students are ranked in one of six rang lists depending on chosen program.

2.1. Master module Operational Researches

Module Operational Researches is a part of study department Operational Researches and Computer Statistics. Thirty five students can be enrolled to this module, and twelve of them have full scholarship. The qualification exam itself consists of thirty test questions with five offered answers each, but only one correct. The questions consider operational researches, statistics, software design, database and informational

systems. This kind of qualification exam (the same test and the same literature) is used for two more study departments – Informational Systems and Technologies, as well as Software Engineering and Computer Sciences.

2.2. Current ranking model

According to previous, the conclusion is that weighted sum of criterion

$$w_1 * u + w_2 * k = p \quad (1)$$

is used as a student ranking criterion. It contains the following variables:

- u – average grade gained at undergraduate level in the interval [0, 100];
- k – number of points on the entrance exam for master studies in the interval [0, 100];
- p – candidate's total points in the interval [0, 100].

Values w_1 and w_2 are weights in this model, whose values are predefined at the enrolment proposition, so the criterion function has the following form:

$$0.4 * u + 0.6 * k = p \quad (2)$$

This function is modeled by weighted sum considering only the values of variables. This way, it is not possible to model their conditionality or connection between the variables using the logical operators.

The qualification exam to module Operational Researches consists of questions considering different domains: informational systems, computer sciences, operational researches, and statistics. All the questions are scored the same way. This is illogical – it is wanted to have knowledge considering all of these domains, but knowledge considering operational researches should be the most important.

Average grade shows the general picture about candidate's success at undergraduate level. However, the grades in subjects which are focused to operational researches, statistics, mathematics, and system theory should be more important if enrolling this module. Analogous to that, subjects focused on informational systems, programming, database and data structures etc. should be underlined if enrolling the study program Informational Systems and Technologies.

The flaw is also restriction of weighted sum itself – it cannot be used to model logical expressions.

2.4. New model based on weighted sum

The first two comments, that the data aggregated using arithmetic mean and that total score at qualification exam does not underline characteristic data important for the program of master studies, can be solved by modeling new weighted sum:

$$w_1 * u + w_2 * u_2 + w_3 * k + w_4 * k_2 = p \quad (3)$$

Two new components figure in this expression, and they are:

- u_2 – average grade at undergraduate level at subjects which are focused on operational researches, statistics, mathematics, and system theory in the interval [0, 100];
- k_2 – points gained at qualification exam to master studies, but specifically in questions considering operational researches and statistics, in the interval [0, 100];

Values w_1 , w_2 , w_3 and w_4 are weights in this model. Values of this factors are 0.3, 0.1, 0.5 and 0.1, respectively, so the criterion function has the following form:

$$0.3 * u + 0.1 * u_2 + 0.5 * k + 0.1 * k_2 = p \quad (4)$$

The significance of specific knowledge, important for the enrolling master studies, is underlined by new variables. However, the criterion function defined this way does not solve the problem, because the subject

of interests is qualification exam achievement and appropriate subjects accomplishment, and not these two variables separately.

3. RANKING USING FUZZY LOGIC

The reason for introducing logic into consideration is the need of modeling conditions like following: “Candidate’s ranking on the list should depend on number of points on the entrance exam for master studies obtained on matters related to operational researches and statistics and the average grade at undergraduate level at subjects that are focused on operational researches, statistics, mathematics, and systems theory”. This condition implies that predefined variables u_2 and k_2 should be connected by conjunction. Weighted sum considers variables separately and can’t model interaction between them, so it is not sufficient to model this problem. It is necessary to introduce logic and logical operators, which can provide more options for aggregation.

Figure 4: What can be modeled using weighted sum, representation using sets

Figure 2: What can be modeled using fuzzy logic, representation using sets

Classical logic deals with variables that are either true or false, that are either 0 or 1. Values in described problem are decimal, so it is not appropriate. That is the reason for introduction of fuzzy logic.

3.1. Fuzzy logic

Fuzzy logic is generalization of classical logic – it can process all values in interval from 0 to 1. Fuzzy logic is not fuzzy. Basically, fuzzy logic is a precise logic of imprecision and approximate reasoning (Zadeh, 2008). Fuzzy logic is developed on fuzzy sets theory. It is particularly suitable for working with linguistic variables like *hot*, *very good*, *around twenty*, *not that busy*. Compared with conventional approaches, fuzzy control utilizes more information from domain experts and relies less on mathematical modeling about a physical system.

Functions that qualify as fuzzy intersections and fuzzy unions are usually referred as t-norms and t-conorms (or s-norms), respectively. The standard fuzzy intersection is min operator, and it produces the smallest membership value of all the t-norms (Ross, 2010). On top of that, algebraic product is used often as fuzzy intersection. The standard fuzzy union is max operator, and it produces the smallest membership value of all the t-conorms. Probabilistic sum is another operator often used as s-norm.

Conventional fuzzy logic is based on principle of truth functionality. In the general, it doesn’t follow the law of excluded middle, one of the Boolean laws.

3.2. New model based on fuzzy logic

The modified weighted sum is used to rank students. The third element of weighted sum is changed, and it is defined as: “Conjunction of average grade at undergraduate level at subjects that are focused on operational researches, statistics, mathematics, and systems theory and number of points on the entrance exam for master studies obtained on matters related to operational researches and statistics”. In accordance to that, weighted sum is:

$$w_1 * u + w_2 * k + w_3 * 100 * (u_2 \wedge k_2) = p \quad (5)$$

Variables u_2 and k_2 are normalized in the interval $[0, 1]$. Weights w_1 , w_2 and w_3 have following values - 0.3, 0.5 and 0.2. Product is used as t-norm. The third element in weighted sum is multiplied by 100, so all elements would have the same order of magnitude. In accordance to that, weighted sum has the following form:

$$0.3 * u + 0.5 * k + 0.2 * 100 * u_2 * k_2 = p \quad (6)$$

4. RANKING USING PSEUDO-LOGICAL AGGREGATION

4.1. Interpolative Boolean algebra and Logical aggregation

Interpolative Boolean algebra is a consistent multi-valued realization of Boolean algebra in the sense that it preserves all the laws which Boolean algebra relies on. It has two levels – symbolic and valued. On symbolic level all laws of Boolean algebra are valued indifferent. IBA element represents the analyzed object. IBA element on symbolic level is treated independently of its realization. All elements consist of one or more atomic element. Expressions are calculated based on the principle of structural functionality: Structure of any IBA element can be directly calculated on the basis of structures of its components (*Radojević, 2006*). This principle treats negation differently and that allows preservation of the law of excluded middle.

IBA is technically based on generalized Boolean polynomials (GBP). GBP uniquely corresponds to any element of Boolean algebra and any Boolean function can be transformed into corresponding GBP. Operators allowed in GBP are plus, minus and generalized product. Generalized product (GP) is any function $\otimes: [0,1] \otimes [0,1] \rightarrow [0,1]$ that satisfied all four conditions of t-norms: Commutativity, Associativity, Monotonicity, Boundary condition and Non-negativity condition (*Radojević, 2008A*):

$$\sum_{x \in P(\Omega/S)} (-1)^{|x|} \otimes A_i(x) \geq 0, S \in P(\Omega), A_i(x) \in [0,1], A_i \in \Omega \quad (7)$$

On a valued level the IBA is value realized – elements take values from an interval $[0, 1]$ and suitable operator for GP is chosen.

Consistent and transparent procedure based on IBA for aggregating factors is called Logical aggregation. The task of LA is the fusion of primary attributes' values into one resulting globally representative value using logical tools (*Mirković, Hodolić & Radojević, 2006*). It has two steps:

1. Normalization of attributes' values and
2. Aggregation of normalized values of features into one resulting value by logical or pseudo-logical function as a LA operator (*Radojević, 2008B*).

Pseudo-logical function, called pseudo GBP, is a linear convex combination of generalized Boolean polynomials. In this paper it is the proposed approach for aggregation.

4.2. New model based on pseudo logical aggregation

Two different functions are proposed as pseudo-logical function for ranking. Both are similar to the weighted sum presented in Section 3.3: first two elements and weights in sum are the same (0.3, 0.5 and 0.2 respectively). The third element in sum is the difference.

Case 1: The third element of weighted sum is defined this way: "If candidate's average grade at undergraduate level at subjects that are focused on operational researches and statistics is well, we are interested only in it. If it is not well, we are interested in the average grade at undergraduate level at subjects that are focused on mathematics and systems theory and number of points at the entrance exam for master studies obtained on matters related to operational researches and statistics."

Pseudo-logical function for ranking with this condition has the following form:

$$w_1 * u + w_2 * k + w_3 * 100 * (a \vee (\neg a \wedge d \wedge x)) = p \quad (8)$$

The third element is transformed on symbolic level:

$$a \vee (\bar{a} \wedge d \wedge x) = a + d \otimes x - a \otimes d \otimes x \quad (9)$$

After that, expression can be calculated. The operator of generalized product \otimes is product ($\otimes := *$):

$$w_1 * u + w_2 * k + w_3 * 100 * (a + d * x - a * d * x) = p \quad (10)$$

Case 2: The third variable of weighted sum is defined like this: “If candidate’s average grade at undergraduate level at subjects that are focused on operational researches is well, we are interested in the average grade at undergraduate level at subjects that are focused on statistics, too. If it is not well, we are interested in the average grade at undergraduate level at subjects that are focused on mathematics and systems theory and number of points at the entrance exam for master studies obtained on matters related to operational researches and statistics.”

Pseudo-logical function for ranking with this condition has the following form:

$$w_1 * u + w_2 * k + w_3 * 100 * ((b \wedge c) \vee (\neg b \wedge d \wedge x)) = p \quad (11)$$

The third element is transformed on symbolic level:

$$(b \wedge c) \vee (\bar{b} \wedge d \wedge x) = b \otimes c + d \otimes x - b \otimes d \otimes x \quad (12)$$

After that, expression can be calculated. The operator of generalized products \otimes is product ($\otimes := *$):

$$w_1 * u + w_2 * k + w_3 * 100 * (b * c + d * x - b * d * x) = p \quad (13)$$

Variables in presented expressions are:

- u – average grade gained at undergraduate level in the interval $[0, 100]$;
- k – number of points at the entrance exam for master studies in the interval $[0, 100]$;
- a – average grade gained at undergraduate level at subjects that are focused on operational researches and statistics, normalized in the interval $[0, 1]$;
- b – average grade gained at undergraduate level at subjects that are focused on operational researches, normalized in the interval $[0, 1]$;
- c – average grade gained at undergraduate level at subjects that are focused on statistics, normalized in the interval $[0, 1]$;
- d – average grade gained at undergraduate level at subjects that are focused on mathematics and systems theory, normalized in the interval $[0, 1]$;
- x – number of points at the entrance exam for master studies obtained on matters related to operational researches and statistics, normalized in the interval $[0, 1]$;
- p – candidate’s total points in the interval $[0, 100]$.

The third element in weighted sum is multiplied by 100, so all elements would have the same order of magnitude.

5. ANALYSIS AND COMPARISON OF PROPOSED MODELS

In this section suggested models are simulated and compared. Fifteen students’ data are used for simulation. Data were collected via internet survey. Eleven students have scored maximum on their qualification exam. Data on the exact number of points at the entrance exam for master studies obtained on matters related to operational researches and statistics do not exist, because it is not important for current ranking model. Students were asked to write their hypothesis about scored points at that study fields.

Total scores using different models are shown in the following table for 8 students. These students are chosen because their ranking differs by using different models. Student B and G are the first and the last on every ranking list.

Table 5: Score of chosen students using different models

Student	Current model	Model based on weighted sum	Model based on fuzzy logic	Model 1 based on pseudo LA	Model 2 based on pseudo LA
A	99.44	99.58	99.58	99.58	99.58
B	100.00	100.00	100.00	100.00	100.00
C	99.60	99.10	98.50	99.62	99.54
D	96.00	95.00	93.00	96.10	91.00

E	95.60	95.47	94.23	96.36	94.56
F	89.60	88.53	84.97	89.86	85.34
G	78.80	79.60	76.60	81.56	77.92
H	86.20	87.40	86.00	88.61	86.81

Students' rankings in the list are shown in the following table for 8 students.

Table 2: Ranking of chosen students using different models

Student	Current model	Model based on weighted sum	Model based on fuzzy logic	Model 1 based on pseudo LA	Model 2 based on pseudo LA
A	3	2	2	3	2
B	1	1	1	1	1
C	2	3	3	2	3
D	4	5	5	5	5
E	5	4	4	4	4
F	6	6	7	6	7
G	8	8	8	8	8
H	7	7	6	7	6

Rankings given by different models differ. The first model is an initial model, which is applying in practice. The second and the third model are transitional. Last two models are the final proposed models. Differences in students' ranking are caused by emphasizing specific factors and different method of aggregation. Users can model their own pseudo-logical function in according to their needs.

6. CONCLUSION

The master programs at Faculty of Organizational Sciences specialize students for different occupations – managers, programmers, analytics, database specialists, etc. The advantage at ranking should be given to students who showed great results at subjects which are related to chosen domains. That can be achieved by using the suggested models based on LA. LA is a technique that gives the user the most options in modeling, and treats negation in a proper way. Ranking students with pseudo-logical function gives results similar to current, but different enough to introduce these proposals and test it practically.

Abstract: *This paper aims to determine whether system dynamics approach could be of potential use in the emerging field of research concerning the quality of postgraduate university studies. In our paper, significant weakness of the current postgraduate studies organization was determined and elaborated upon. We proposed a system dynamics approach, which proved to be a vital tool in the strategic decision-making process. Appropriate Causal Loop Diagrams were determined and thoroughly elaborated. Further, possible improvements of postgraduate studies organization were proposed and ideas for further research on this interesting issue were pointed out.*

Keywords: *system dynamics, decision making, higher education institutions (HEI), process improvement, causal loop diagram*

1. INTRODUCTION

System dynamics is a perspective and set of conceptual tools that enable us to understand the structure and dynamics of complex systems. System dynamics is also a rigorous modelling method that enables us to build formal computer simulations of complex systems and use them to design more effective policies and organizations (Sterman, 2010). Together, these tools allow us to create management flight simulators, micro worlds where space and time can be compressed and slowed so we can experience the long-term side effects of decisions, speed learning, develop our understanding of complex systems, and design structures and strategies for greater success (Sterman, 2010). The basis of the system dynamics method is to recognize that the overall structure of any system is just as important in determining its behaviour as the individual components themselves.

System dynamics could play in the “managerialization” of universities. System dynamics tools could allow academic decision makers to better keep under control the complex and dynamic university environment: in these terms, (Barnabe, 2004) suggests the use of modelling and simulation techniques in order to capture the complex and dynamic structure of the university system and to explore the consequences of the policies and decisions that academic managements are currently taking (Barnabe, 2004). Higher education organizations face today strong pressure from institutional environments to adopt renewed structures and management systems. The reason for the vast reform sweeping across European and non-European countries have to be found in a substantial lack of efficient and effective academic educational and research programmes and in a widespread financial crisis of the public sector. The global scenario is even worse because the number of students is decreasing due to demographic reasons (Barnabe, 2004).

Universities are increasingly large in size, with non-traditional students, inadequate student-teacher ratios, declining financial support from the state, increased competition for external funds and increased competition for limited student demand (Al Hallak et al., 2009). Managing university academic resources is a complex administrative problem. Typically, the admission capacity for a degree program is decided based on the availability of lecturers, total enrolled students, and the available facilities in the university. The common formula used is the lecturer to student ratio (Dahlan and Yahaya, 2010).

In this paper we use system dynamics approach in order to outline crucial components of educational system at Faculty of Organizational Sciences (University of Belgrade, Serbia). It is important to mention that Faculty of Organizational Sciences (FOS) provides degrees for the undergraduate and graduate (MSc and PhD). Competitive knowledge and skills, best practice experience from abroad, mobility and specialization abroad is basis for employment and advancement of Faculty's graduates. That is precisely the reason why Faculty attracts students from different faculties and universities, and it is getting more and more popular among students.

2. LITERATURE REVIEW

The process of deciding on the aims of the organization is at the heart of educational management. In some settings, aims are decided by the principal, often working in association with senior colleagues and perhaps a small group of lay stakeholders. In many schools, however, goal setting is a corporate activity undertaken by formal bodies or informal groups.

School aims are strongly influenced by pressures from the external environment. Many countries have a national curriculum and these often leave little scope for schools to decide their own educational aims. Institutions may be left with the residual task of interpreting external imperatives rather than determining aims on the basis of their own assessment of student need. The key issue here is the extent to which school managers are able to modify government policy and develop alternative approaches based on school-level values and vision (Bush, 2010).

A system dynamics perspective has a powerful logic that offers substantial improvements in dealing with issues in strategic management, whether one-off challenges or the continuous direction of enterprise strategy. First, successful strategic management of business and non-commercial organisations requires attention to how performance is changing through time. Since performance reflects the state of resources in any period, steering strategy requires policies and decisions that control the flow rates of those resources. Lastly, this is complicated by the additional dependence of these resource flows on the current state of existing and potential resources at each point in time - a dependence that gives rise to feedback. These principles can be organised into a rigorous approach to strategy that is grounded in solid evidence from the situation of concern. Important implications from this perspective include the unavoidable causal ambiguity caused by accumulating resources, and the value of explicit and quantitative examination of resource development prior to investigating feedback structures (Warren, 2005).

In research made by Mavroeidis (Mavroeidis et al., 2009) authors propose an accurate model of measuring business excellence by applying the theory of System Dynamics. This theory defines the interaction of system variables giving the opportunity of a reliable and fair score as well as objective decision-making with regard to the areas that are susceptible of continuous improvement (Mavroeidis et al., 2009).

System Dynamics is really important in today business and in order to compete in the global market, engineering organizations are under increasing pressure to design, develop, and deploy products in the market place as quickly as possible with first time quality. In order to achieve these objectives, it is necessary to streamline the design and development process, namely in an efficient and expedient manner. This, in turn, has led to the emergence of highly sophisticated simulation software applications that not only enable high-fidelity simulation of dynamic systems and related controls, but also automatic code generation for implementation in industrial controllers (Menghal and Laxmi, 2012).

Jay W. Forrester's original statement of the foundations of system dynamics emphasized four 'threads': computing technology, computer simulation, strategic decision making, and the role of feedback in complex systems. Subsequent work has expanded on these to expose the significance in the system dynamics approach of dynamic thinking, stock-and-flow thinking, operational thinking, and so on. But the foundation of systems thinking and system dynamics lies deeper than these and is often implicit or even ignored: it is the "endogenous point of view" (Richardson, 2011).

We have to focus on the challenges the field must face if it is to realize its potential. The first 50 years of system dynamics have established an introduction to the field. There is the great importance of achieving a better understanding of complex systems in nature and human affairs. Now, the field is on a plateau ready to launch the next great thrust forward. We can better understand the present status of system dynamics by comparison to professions that have developed earlier. We are now at about the same state of advancement that engineering was when MIT first opened its doors in 1865, or that medicine was in the late 1800s when the Johns Hopkins School of Medicine was established. We have as much to learn yet about high-order nonlinear feedback structures around us as those earlier professions have already learned about their fields in the last 150 years. Now is the time to plan how the next 50 years can start to close this huge knowledge gap. Like those early days in more mature professions, we do not yet have universities devoted to 4-year and 6-year programs in system dynamics. Like the older professions at their beginning, we do not yet have the equivalent of programs in science and biology in kindergarten through 12th grade education to prepare students for more advanced study at the university level. Nevertheless, there has been major progress in

system dynamics during the last 50 years just as there had been in those older professions before they became formalized in advanced educational programs and before they were publicly recognized (Forrester, 2007).

Higher education organizations face today strong pressure from institutional environments to adopt renewed structures and management systems (Oganisjana and Koke, 2012). The reason for the vast reform sweeping across European and non-European countries have to be found in a substantial lack of efficient and effective academic educational and research programmes and in a widespread financial crisis of the public sector (Gilpin and Kaganovich, 2012). The global scenario is even worse because the number of students is decreasing due to demographic reasons (Hallak et al., 2009).

There is interesting research made by (Liang et al., 2010) which is related to China's educational system. China education-economy system was analyzed by traditional region economic theory and complex social economic theory. The econometric equation of system elements interaction was built based on the Cobb-Douglas production function. The simulation model of China education-economy system was built by combining econometrics and system dynamics methods (Liang et al., 2010). Findings of (Fumasoli and Lepori, 2010) show that strategies of developing high education in Swiss are at the same time a matter of intentions and actions: first, they relate to current HEI's position within the national Higher education system—and to relevant normative models—as well as to the degree of institutional autonomy. Second, even within participatory governance structures, organizational strategies appear to be initiated by the academic administrators, then substantially shaped and subscribed by academics at different stages. In this perspective, the dynamic relation of formal and informal processes holds diverse functions from making academics accept a strategy, to controlling and coordinating decentralized organizational structures (Fumasoli and Lepori, 2010). In Serbia, there is the same situation. Ministers, policy-makers, politicians, institutional leaders or administrators, higher education researchers, members of the academic staff of universities and colleges and students are all professionally involved in higher education. It will include both mature and developing systems of higher education, covering public as well as private institutions (Meek et al., 2010).

The Interactive Network Platform is developed in the Support of a Dynamic Resource Repository of General Archives Education” on the basis of exploring general archives education — a new field. This Network Platform is able to solve many problems arising in the new field, which are difficult to tackle with traditional methods (Hu et al., 2011).

3. RESULTS

On Figure 5 we can see the most important elements of the high educational system in general, which are integrated through cause and effect relations. We identified various reinforcing and balancing loops which include number of internal and external elements.

Interest of students for elective courses depends on many factors, such as teacher's motivation, material complexity and quality of teaching. All these factors influence final average grade, which is one of the most important criteria for employment, and it is of crucial meaning for economic situation in general. Besides high average grade, employers are looking for practical skills and experience. It is really hard for students to have high average grade and extracurricular activities. For getting high grades, students have to study for hours, which don't allow them to have enough free time for social life and extracurricular activities. Students have to make decision how to make compromise solution. High average grade and extracurricular activities are crucial for employment, but they are in conflict. These three elements together with economic situation in country create negative feedback effect.

In the research made by (Thoms, 2011), author examine the design, construction, and implementation of a dynamic, easy to use, feedback mechanism for social software. The tool was integrated into an existing university's online learning community (OLC). The software was implemented at a US university in an introductory course on IS with the goal of fostering higher levels of learning and social interaction. A content analysis showed higher levels of system usage corresponded with higher course grades (Thoms, 2011). According to this research, we suggest implementation of software which could upgrade interaction of students and FOS.

Employment situation of college graduates is not optimistic, and it is a special problem related to high education. The main reason of producing the phenomenon lies in that practical ability of college graduates is not strong. The best way to solve this problem is to attract enterprises to participate in the many aspects of

higher education. But the enthusiasm of most enterprises participating in higher education is very low (Guo et al., 2011).

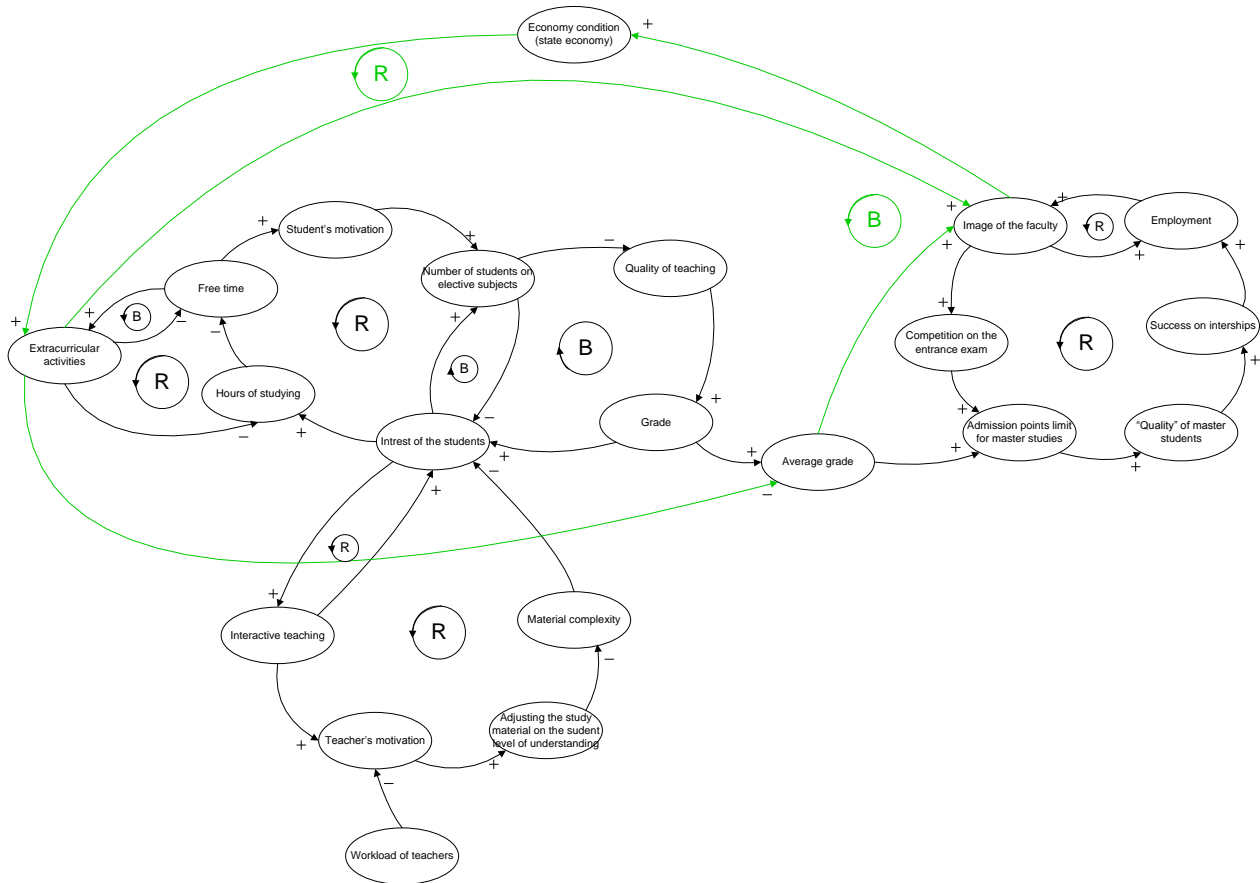

Figure 6 Figure 7: Higher educational system

Postgraduate master studies are important part of educational system and we would like to emphasize some facts about it. Positive image of FOS is created because of modern tools of learning, cooperation with prominent national and international companies and successes of its students at various competitions worldwide. Because of its positive image, many students from different faculties and universities are willing to attend FOS graduate master studies. Faculty has a problem to manage all students from different undergraduate studies, because they all have different prior knowledge. Postgraduate studies last only one year. Thus, there is not enough time to get complete knowledge related to that study topic. Because of this situation, quality of these students is not the same as quality of students who attended four years of undergraduate studies at Faculty of Organizational Sciences, which sometimes can have negative effect on image of Faculty.

Real systems are generally very complex and consist of many such feedback loops. The overall behaviour of the system is determined by the interaction of all these loops together. Solving these complicated interaction and determining the future behaviour of the system using pen and paper is neither feasible nor easy (Murthy et al., 2010).

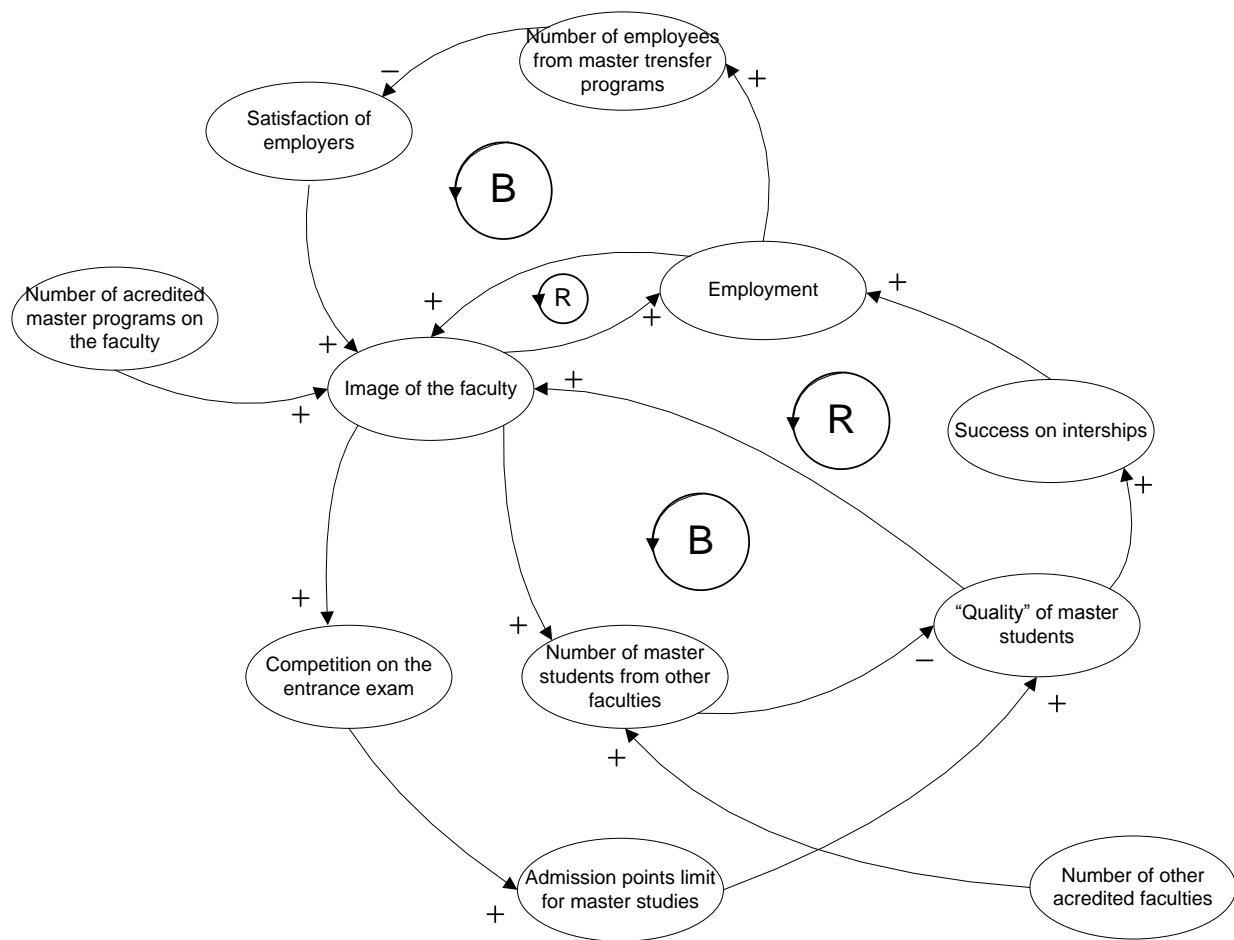

Figure 8: Master studies at FOS

On Figure 9 we identified reinforcing feedback loop that includes: image of the Faculty, competition on the entrance exam, admission points limit for master studies, “quality” of master students, success on internships and employment. This reinforcing feedback loop is being balanced by balancing feedback loop that include following elements: image of the Faculty, number of master students from other faculties and “quality” of master students. There are two external elements: number of accredited master programs at the faculty and accreditation of other faculties. We would like to point out another balancing feedback loop, which shows that number of employments of students who attended undergraduate studies at other faculties have negative effect on employer’s satisfaction. Since employers are not satisfied with students, that can cause negative image of Faculty.

An institution represents the ultimate knowledge organization. The rapid growth of data and technologies trigger the transformation of data to useful information known as ‘Knowledge’. To leverage knowledge, institutions need a knowledge sharing network that can meet the demands of changing knowledge. The knowledge sharing network is accomplished by sharing and capturing knowledge among faculty members and students (Rajalakshmi & Banu, 2012).

On Figure 3 we can see how these balancing loops influence the current image of the faculty. If the image is high the loops will strive to lower it down, and if the image is low the loops will strive to enhance it.

Figure 3: Image of the faculty through time

But we also cannot ignore the main reinforcing loop that will reinforce the change of the image in any case, either if it is lowering down or if it is growing up. So as a result of the impact of all these loops we can conclude that behaviour of the variable image trough time will be oscillatory (Figure 4).

Figure 4: Balancing loop (Image of the faculty)

The image will oscillate around its balance level and our goal is to rise that level as much as we can. We can do that by influencing on some of the entities from the balancing feedback loops. If we try to maximize satisfaction of the employer for example, the best way to do that is to have good transfer master programs adjusted to the transfer students so they can gain as much of practical knowledge as they can from the area of studies they have selected. This will also influence the second balancing loop on the Figure 2.

4. CONCLUSION

This paper wanted to assess that there is many opportunities to improve the postgraduate master programs at FOS, as well as in the whole Serbian high education system. Filling that gap would strongly influence the Serbian economy in long-term.

One of the solutions for improving the “quality” of master students is to make multidisciplinary master transfer programs. New knowledge and skills that students would gain trough that master, should be correlated with the area and knowledge from their undergraduate studies. Here we are faced with the two problems. The first one is that there is not enough resources for this kind of master programs yet in Serbia, and the second one is that there is not enough skilled and educated staff for performing the teaching process for these multidisciplinary master programs.

Also, beside ministers, policy-makers, politicians, institutional leaders or administrators, higher education researchers, members of the academic staff of universities and colleges and students, businessmen from various areas should be included in formulating postgraduate master studies. They should express their real needs in practice.

In Serbia there are many programs from social science areas which offer some kind of similar education, as at FOS, so the competition is high. The number of people with master diploma is growing, but the number of vacancies is growing slower. On the other side, in the technical field of research there is a lack of experts. University representatives should update the entering quotes, but here we are faced with the usual problem which is the lack of resources.

By using system dynamics we can see what would happen if a certain policy was changed, or how would we distribute existing resources into different parts of the system. System dynamics offers us a theoretical tool to analyze such a structure, and gain an understanding into the performance of the system.

AUTOMATION OF DATA PROCESSING IN DECISION MAKING IN RESOLVING CRISIS SITUATIONS

Danilo Obradović¹, Dragan Dragašević², Slavoljub Janićijević³

¹Serbian Armed Forces General Staff, danilo.obradovic@gmail.com

²Serbian Armed Forces General Staff, dragasd@sezampro.rs

³Serbian Armed Forces General Staff, slavoljub.janicijevic@vs.rs

Abstract: *Main characteristics of decision making in crisis situations are suddenness, uncertainty and time pressure (lack of time). These characteristics arise from the very nature of crisis situations, which usually develop rapidly and lead to various disturbances in the functioning of natural and social systems. Efficient and effective resolution of crisis situations depends on the speed of data collection, the quality of collected data, the speed and quality of data processing in obtaining information and the stability of the established integrated management system in emergency situations.*

Since time pressure is one of the key characteristics of crisis situations, from the aspect of this paper it is important to consider how the automation of data collection and processing reflects on the management efficiency in crisis situations. Frequent and rapid situation changes in the field certainly impose a need for flexible and adaptive situation assessment and decision making. What is significant is fast and reliable distribution of information, as well as monitoring decision implementation and effects.

Keywords: *crisis situation, data, information, automation, data processing, decision making*

INTRODUCTION

Crisis situations can be defined as incidents that occur quickly and include any kind of threat to a country, its territory, citizens, the armed forces, property, or vital interests. They can happen at local, regional, national or international level. Crisis situations can be caused by natural events or under man's influence. Some examples of emergencies encompass natural disasters (floods, fires, earthquakes, snowfalls, ...), terrorist attacks, industrial incidents, epidemics and pandemics, acts of external armed aggression, riots and protests of the population, etc.¹²

In resolving crisis situations decision makers are expected to know the standard operating procedures and they must do the following as soon as possible:

- have all current information from the field;
- process available data and information about the crisis situation in a qualitative way;
- bring qualitative decisions that will contribute to minimizing the negative impact of the crisis and contribute to the normalization of the situation.

The basic feature of decision making in emergency response is uncertainty and the lack of time. Efficient and effective emergency response depends on the speed of data collection, the quality of collected data, the speed and quality of data processing in the process of obtaining information and the stability of the established integrated management system in emergency situations.

In order to prevent or reduce the negative effects of the crisis in terms of the lack of time (time pressure), there is a need to work and make decisions very quickly. This increases the importance of prompt data collection, their automated processing and the appropriate use of information gathered in the decision making process.

1. DATA AND INFORMATION

Data and information are often used as synonyms in everyday life, as a result of misunderstanding of the essence of meaning of these two terms. Data is an objective category, whereas information is a subjective category that depends on how you interpret or use the data presented.

Data processing is an activity that enables understanding of the situation in the region and it creates basic conditions for the functioning of decision making process. For better understanding of the theory of data processing and automation capabilities, conceptual definition and main characteristics of data and information will be first explained.

1.1. Data

Data is simple, unprocessed and isolated fact that has some meaning. It is intangible and exists in people's minds, while describing the status of an object by defining: the meaning (name or description of meaning of certain properties), the value (measure or the amount of) and time (any form of appearance: astronomy, time ...). In short, everything that is raw data (fact), event or idea in a particular record (statement), we call data. This is a coded representation of some property, a concept, object, fact or event in the real system.

Data classification can be done according to a number of different criteria. At the highest level of the generality, it is important to consider the following two criteria:¹³

- A. **Who is the data user** in communication or among whom is data exchanged. There is a difference between these two forms:
 - 1) **semantic units of data and**
 - 2) **physical units of data.**

A-1): **Semantic units of data** are used in communication between people. They differ by their role in communication, its complexity, size and organization. In terms of hierarchy they can be structured as follows:

- **A sign is the smallest semantic unit of data**¹⁴ which includes besides alphanumeric characters, mathematical and logical operators, punctuation and other special characters.
- **The terms** represent a combination of physically adjacent characters.
- A **segment** is formally composed of groups of terms that can be united in the concept of a higher level of abstraction.
- A **record** consists of a group of logically related terms that refer to a particular object type and its properties.
- **The file** is usually the set of the same records related to all individuals of a certain type of object.
- A **database** is a set of files, each logically bound, related to a problem domain.
- A **data warehouse** is a special type of database customized to search extremely large amounts of data. The existing data are not changed, but updated.

A-2): **Physical data items** are a form of data which use computers and other electronic devices and systems in their work. Different physical forms are as follows:¹⁵

- **Bit** is the basic physical unit of data, and in information theory it represents the unit of measurement for the amount of information. It can have one out of two possible values which we denote "1" or "0".
- **Tetrada** is a greater physical unit of data consisting of combinations of four bits. Refers to the physical representation of semantic character hexadecimal number system.
- A **byte** is the next physical unit of data consisting of a combination of eight bits (or two tetrads). It is commonly used for the physical representation of the full set of semantic signs, establishing a relationship of one character - one byte.
- A **word** is the basic physical unit of data used by a computer at the central unit, or CPU. It is usually a combination of four bytes. Depending on the feature of the processor used, there are possible combinations of two bytes (half word), or a combination of eight bytes (double word).
- A **block** is a more complex physical unit of data that a computer uses to exchange data between central and peripheral units. It is formed as a combination of "N" bytes.¹⁶

¹³ http://www.efst.hr/nastava/27/7_PodaciInformacije.pdf , Poglavlje 7.1. Podaci.

¹⁴ Semantics comes from the greek semantikos - "significant meaning," derived from sema - sign. Semantics is a part of linguistics that is traditionally defined as the science of the meaning of words, phrases, sentences, and texts, the whole or any part (Wokabular).

¹⁵ http://grdelin.phy.hr/~ivo/Nastava/Numericke_metode/predavanja/02_pred.pdf (Vrste podataka)

The **file** can be viewed as a physical and semantic data unit. When treated as a physical unit of data, it means the amount of memory on which a larger semantic unit is deposited.

B. In comparison to data structuring, it can be distinguished:

- 1) **formatted and**
- 2) **unformatted.**

B-1: Formatted data structure is determined by the structure (position, data type and their length). Semantic meaning of formatted data can be established only if it the exact description of their structure is known. The use of formatted data dominates in information systems because it simplifies and accelerates data processing on a computer.

B-2: Unformatted data structure has no fixed structure and it occurs mostly in the form of media. Semantic meaning of these data is based on the very data. This is a great advantage from the position of a user, but data of this form are not suitable for automation of processing and application in business information systems.

1.2. Information

Information is created as a product of analysis and organization of data in a way that gives a higher level of knowledge about occurrence. The information consists of data that are given meaning by establishing mutual relational connections and organized in a manner that provides a better understanding of phenomena and processes. The meaning of information can be useful, but not necessarily.

1.3. Data processing

The concept of transforming data into information is given in Figure 1.

Figure 1: The concept of transforming data into information

Regardless of the perspective on the concept of information, its key feature is informational value. In this context all other properties of information are interpreted. It can be concluded that the more valuable information are those accurate and reliable, available at the right time and linked or related to the current problem.

The value of information is determined by the degree of reduction of uncertainty and ambiguity of a problem, based on the following criteria:

- timing and actuality,
- relevance and
- accuracy and reliability.

Timeliness and topicality are time dimensions of information. Timeliness means that information is available when needed, when it has the highest value. If the information is available with a delay, its value is significantly reduced. Figure 2 represents the change in value of information in comparison to event (at time T) to which it relates.¹⁷

¹⁶ The value of N - block size depends mainly on the performance of peripheral devices. What are these devices faster, carries large amounts of data.

¹⁷ http://www.efst.hr/nastava/27/7_PodaciInformacije.pdf , Poglavlje 7.1. Podaci.

Figure 2: Changing the value of information as a function of time

As you can see in the picture, the information has the greatest value if it provides a prediction of an event. Its value decreases continuously in the time interval after current events, and rapidly loses value in the period after an event, or in the period of obsolescence. We are talking about the period of time, not a moment of time because the event itself has certain pace and duration.

2. INFORMATION SYSTEMS

Information systems (IS) are an integrated set of the components for collecting, recording, storing, processing and transmitting of information. The development of information technology and management has resulted in business enterprises and other organizations and individuals in modern society to depend on information systems for managing its activities. Modern corporations are entirely dependent on computer information systems through which they control their operations and business transactions, and also carry out human and material resources management. Recently, various organs of executive power and government, are increasingly using information systems to perform a variety of services with residents. In addition, individuals use information systems to improve their knowledge, to purchase, manage bank accounts and transactions, as well as for communication and data exchange.

The rapid development and availability of new information technologies (IT) results in expansion of existing and emergence of new application possibilities. It can be concluded that information systems enable a variety of human activities which had an effect on society: acceleration of everyday activities performance, effect on the structure of organizations, changing the ways of supply and demands, and ways of working and understanding. Information and knowledge are today a vital economic resource.

2.1. Databases

The database can be defined as a well-structured collection of data organized for rapid search and access, which last relatively long and are used and maintained by multiple users or programs (applications)¹⁸. From the perspective of users, the data are in some way logically connected. They are aspects of the real world. Users access the database directly through queries. By using keywords and classification of commands you can quickly find, correct, group and select data and receive the necessary reports. Data are presented in a uniform way (eg. in a relational database data are organized in tables), which simplifies access and use by external programs. Thus, a variety of programs written in different programming languages can use one database.

Computer memory is used for storage and data processing. The main task of the first designers of IS was to develop a type of software that would enable locating specific data stored in secondary memory (stored permanently) and their effective load into working memory in order to be processed. The basic structure of an IS consists of sets of files that are permanently stored in a secondary storage device. The software that includes file management system supports the logical separation of files into records. Each record describes

¹⁸ Lazarević, B., Marjanović, Z., Ančić, N., Babarogić, S.: Baze podataka, Univerzitet u Beogradu, Fakultet organizacionih nauka, Beograd, 2008., str. 1.

a state consisting of a number of fields. Each field gives the value of a particular feature (attribute) to given units.

The negative experience of classic organization of data and attempts to reach an integrated information system by connecting applications led to defining a new approach for the implementation of integrated information systems. The new approach is based on the idea that we should integrate the data, not applications. The result of integrating files of different applications is called the "Database" (DB) and represent a new approach to data management.

Basic concepts of database settings are as follows:

- All data are integrated into one IS in a physical structure (large "file") or the database;
- The data are stored with minimal repetition - redundancy;
- All programs use data from the database, or update DB by using services of special software product - database management system (DBMS).

The relationship between database, database management system and user applications is presented in Figure 3.

Figure 3: The relationship between DB - DBMS - Applications

The disadvantages of conventional data processing were warrant for important technological changes in this area. Database belongs to a central place in the structure of information systems. Applications (IS subsystems) that perform specific tasks through its programs are connected on it.

2.2. Decision Support Systems

Decision support systems support all stages of decision-making process from problem formulation phase through the design phase, selection phase and all the way to implementation. Decision-making and resource management in resolving crises in modern conditions impose the need for processing large amounts of information, which includes the use of information technology (IT) in all stages of decision making. The basic idea of applying IT in the beginning, was associated to the need to increase the efficiency and effectiveness, and it was carried out through the implementation of information systems that are able to support current operation. Further development of IT, on one hand, and increasingly complex operational procedures on the other hand, led to the development of decision support systems – DSS (Decision Support System), whose main goal is to exploit all the potential that IT has to help the command/staff and provide timely and comprehensive information for decision-making process. Initially, the DSS focused on structured, periodic reports, and today are part of a complex concept called "business intelligence".¹⁹

Decision support systems (DSS), based on the data (Data-driven decision support systems), are today called by various names, such as: data warehousing, business intelligent systems, information systems aimed at executors, spatial GIS (geographic information system) and systems with multiple dimensional databases.

¹⁹ <http://www.scribd.com/doc/6815525/7-SISTEMI-ZA-PODRSKU-ODLUCIVANJU>

Construction and implementation of such systems is very expensive, but their effectiveness justifies their introduction in operational use. They are interactive computer systems that provide decision-makers with a relatively easy use of large databases.

There are four basic types of DSS based on the data, as follows:

1. *data warehouse*,
2. *OLAP (on-line analytical processing)* systems with the multiple dimensional databases,
3. information systems aimed at executors (*Executive Information Systems*), and
4. spatial (geographic) decision support systems (*Spatial DSS ili GIS*).

Systems for decision support promote and support a decision-maker in the decision making process by providing information needed for finding and troubleshooting. For this purpose it uses databases and quantitative models, but it does not replace decision-makers in judgement, insight and heuristic functions and they do not make decision-making process to be automatic (PK Hough). They use models and analytical techniques with providing an easy access to information and choice of their presentation.²⁰

Systems for decision support are particularly implemented in times of crisis when decision makers are overloaded with information. The growing number of available information leads to problems how to transform them into useful information for support decision-making and get the "right information at the right time."²¹

3. AUTOMATION OF DATA PROCESSING

The fundamental question regarding the automation of any of the process (management) is to define the goal of automation. In the process of setting goals it is necessary to answer the following questions:

- why manage (what we expect from automation)?
- what do we automate (what is the processing amount)?
- how to automate the process (define algorithm automation)?

In response to these questions, defining the objectives of process automation should ensure: the safety of work process, efficiency, compliance with standard operating procedures and defining the content of output files. During designing system to automate the process, it is necessary to analyze the process in order to determine which parts of the process makes sense to automate.

Depending on the level of automation there can be following levels of automation:

- *Off-line operation with a very low level of automation;*
- *On-line work in open loop with the high level of automation;*
- *On-line work in closed loop with a high level of automation.*

Off-line operation is characterized by the process personnel leading the operation without mutual coordination, so the work does not contribute to increasing the level of automation. A computer is used in individual configuration and it can perform certain segments of the process without a mutual exchange of information. Entering data into a computer and defining the output data is done in a manner typical of general-purpose computers.

On-line work in the open loop automation systems means that the process is also left to personnel, while a computer is used for monitoring the process. Information on the status of the process is transferred to a computer in real time, creating better conditions for high quality data-processing and document output.

In contrast to the off-line operation, process personnel receive better information about the current state of the process. When operating in open loop, control system largely depends on the experience and personnel's knowledge of operating procedures. Improving the quality of open loop can be achieved by improving the database installation of empirical knowledge and by developing expert systems (knowledge base).

²⁰ Balaban, N., Z. Ristić, J. Đurković: Principi informatike, Savremena administracija 1994.

²¹ Keenan, P.: "Using a GIS as a DSS Generator", http://www.ucd.ie/misys/staff/pkeen/gis_as_a_dss.html.

On-line closed-loop operation includes automatic entry of input data from separated sensors, automatic data processing by predefined application definition and output data. This mode requires high standards and it is not suitable for the optimization of decision making in response to crisis situations due to the high level of unpredictability. If the input data can be quantified, it is possible to apply the methods of operations research from heuristic approach. Moreover, the organization of the closed loop carries increased security risks considering the fact that the response of the system would be automated, so there could be sub-optimal use of resources and deliberate obstruction in the case of system compromise.

For automation of technical processes process values (variables) are of primary importance and they need to be managed. In technical processes we distinguish between three types of process variables:

- Continuous process variables (eg, data of geo-space, the demographic situation on the ground, communication lines, transportation infrastructure);
- Discrete process variables (information about the causes and manifestation of a crisis);
- Objects with oriented process variables, which join the individual objects (eg. resources that are available).

In accordance with this division of process variables, appropriate types of processes are defined:

- Continuous (dynamic) processes,
- Sequential processes (discrete event type processes),
- Management processes directed towards the object (object type discrete processes).

While managing the complex technical systems, be sure to apply the **principle of hierarchy** between the administrative and executive levels. Higher levels of management mainly perform tasks of decision making, direction and control, while the executive organs execute the decisions of higher level management. Also, at lower levels of hierarchy, in quantitative terms, the dominant source is (raw) data. At higher levels of management, the amount of data about the process is reduced without compromising quality. Higher levels of management handle information you have converted from the more specific information content.

The essential task of automation system is that a large number of functions are performed automatically, but in an acceptable manner in terms of safety and rational use of resources.

4. CONCLUSION

Crisis situations and crisis management preoccupy many theorists and practitioners involved in the process of crisis management. Whether the crisis is due to natural disasters or human activity, it can be concluded that there are some basic characteristics that define them as follows: suddenness, uncertainty and time pressure. These characteristics are primarily manifested negatively in the decision making process, which is a real skill. Decisions taken in these circumstances have far-reaching consequences.

Data processing creates basic conditions for successful decision-making process. Information is created as a product of successful data processing and give us a higher level of knowledge of data and provide an adequate understanding of a situation. It can be concluded that the information consists of data given meaning by establishing mutual relational connections. Organized data are arranged in a manner that provides a better understanding of phenomena and processes. The key feature of any information is its information value which is assessed by user, that is the fact whether the content recognised in some data can be used in a useful way.

From the point of time, the information important feature is its timing and actuality and that it is available when it is needed most. If the information is available with a delay, its value is significantly reduced. In terms of lack of time as the important characteristic of crisis situations, there is a need for a quick decision. This highlights the **importance of automated data processing**. Automation processing of data can significantly save time and simultaneously bring timely and rational decisions that can prevent or reduce the negative effects of crisis. By automating data processing in emergency situations there should be an aim to have as many functions performed automatically due to larger savings of time. These time savings at the expense of increased automation of data processing should not affect the accuracy and reliability of the information obtained because an inadequate decision due to misleading information in a crisis situation can have major negative consequences. Automation must also be controlled because of frequent changes of situational factors on the ground in the crisis. The "on-line operation in closed loop" can constitute an adequate solution since it takes into account the high pace of situational change.

EXTENDING GENERIC DECISION TREES WITH MULTIVARIATE SPLITS

Milan Vukicevic¹, Vera Stojanovic¹, Milija Suknovic¹

¹Faculty of Organizational Sciences, University of Belgrade, Belgrade, Serbia

Abstract: *Many decision tree algorithms have been proposed over the last few decades. A lack of publishing standards of decision tree algorithm software has produced a large time gap between algorithm proposals and their wider application in practice. Non-existence of a common repository for storing algorithms and their parts has led to a need for algorithm re-implementation from scratch when they have to be implemented on a different platform. This makes the comparison between algorithms and their partial improvements vague. In addition, combinations and interactions between different algorithm parts haven't been analyzed thoroughly. Reusable component design of decision tree algorithms has been recently suggested as a potential solution to these problems. In this paper we extend the reusable component based repository for the generic decision tree design with components for the creation of multivariate (oblique) splits. These components are implemented as a part of WhiBo environment and the evaluation is conducted in RapidMiner: an open-source system for data mining.*

Keywords: *algorithm; component; classification; decision tree; architecture; Rapid Miner*

1. INTRODUCTION

Decision trees (DTs) are among the most commonly used classification techniques since they have significant advantages (Tsipitis & Chorianopoulos 2009):

- They generate simple, straightforward, and understandable rules,
- They are fast and scalable and they can efficiently handle large number of records and predictors.
- They integrate a field of screening process which permits them to narrow the set of predictors by filtering out the irrelevant ones.
- They are not affected by the possible correlation between predictors and the presence of multicollinearity.

Several DT algorithms have been identified as most popular data mining algorithms (Wu et al., 2008), which have successful applications in many areas like medicine (Samanta et al., 2009) (Jovic & Bogunovic, 2010), bioinformatics (Emekci et al., 2007) (He et al., 2006), social network analysis (Hadjidj et al., 2009) (Jung, 2009), and finance (Sun & Li, 2008) (Chang et al., 2011).

Development of DT algorithms is based on two approaches (Zeileis et al., 2008). In the first approach an exhaustive search is performed over all possible splits in every recursive step. Attribute (predictor) that shows best split by some evaluation measure is selected for branching the tree. This procedure is recursively iterated, until a stop criterion is met. Well known algorithms from this class are ID3 (Quinlan, 1986), C4.5 (Quinlan, 1993), CART (Breiman et al., 1984), etc.

In the second approach, statistical tests serve as the basis for recursive partitioning. Selection of attributes for tree branching is based on testing the significance of association between input attributes (predictors) and the output attribute (class). Well known algorithms from this class are: CHAID (Kass, 1980), FACT (Loh & Vanichsetakul, 1988), QUEST (Loh & Shih, 1997), CRUISE (Kim & Loh, 2001), GUIDE (Loh, 2002), CTREE (Hothorn et al., 2006), etc. Most of these algorithms represent small incremental improvements over a seminal algorithm.

Suknovic et al. (2011) analyzed the aforementioned two groups of decision-tree development approaches and proposed a generic decision tree (GDT) algorithm that allows combining algorithmic reusable components (RCs) from the original algorithms into new algorithms. By assembling components users can either reconstruct original algorithms and/or design a myriad of new component-based DT algorithms. Delibasic et al. (2011) evaluated this idea and showed that combinations of reusable components (RCs) extracted from existing algorithms and their improvements can yield significantly more accurate algorithms compared to popular DT algorithms. Vukicevic et al. (2012) proposed an architecture for component based DT algorithm design with RC repository that allow easy extension and implementation of new RCs. Architecture is implemented as a part of WhiBo plug-in (www.whibo.fon.bg.ac.rs) for RapidMiner (Mierswa et al., 2006): an open-source system for data mining.

In this paper we extend an RC repository for design of generic DTs with RCs for creation of multivariate (oblique) DT splits. Also we evaluated performance of these RCs and compared with standard techniques.

Present architecture for building DTs with reusable components (RCs) proposed in Suknovic et al. (2011). The basic idea is to enable the reuse of components from existing algorithms and their improvements, and to allow collaborative.

The paper is structured as follows. Section 2 will present standard DT algorithm and GDT components. In Section 3 multivariate DTs are explained and RCs are identified. In Section 4 we evaluate performance of integrated RCs and Section 5 explains the directions for our future work.

2. GENERIC DECISION TREES

Suknovic et al. (2011) present that RCs for DT design were proposed (Table 1). Classification DT algorithms were analyzed and algorithmic parts with the same functionality (algorithm sub-problems) and algorithm components (RCs) used for resolving sub-problems were identified. This type of algorithm decomposition opens a way for “white-box” design and testing of DT algorithms. Every sub-problem has standardized I/O structure, and can be solved with one or more RCs (Table 1).

This enables interchange and combination of RCs originating from various algorithms.

Table 6: Sub-problems and RCs identified in Suknovic et al. (2011)

Sub-problem	Reusable component	Parameters	Input	Output
Remove insignificant attributes	CHI SQUARE / ANOVA F TEST	alpha (def. 0.05, min 0, max 1)	Dataset in current node	Dataset in current node (reduced)
Create split (Numerical)	BINARY		Dataset in current node	Split candidates
Create split (Categorical)	BINARY			
	MULTIWAY			
	SIGNIFICANT	merge alpha (def. 0.05, min 0, max 1)		
		split alpha (def. 0.05, min 0, max 1)		
Evaluate split	ALL		A split candidate	Evaluation of the split
	CHI SQUARE			
	INFORMATION GAIN			
	GAIN RATIO			
	GINI			
	DISTANCE MEASURE			
Stop criteria	TWOING		Current tree model	Signal for stopping tree growth in current node
	MAXIMAL TREE DEPTH	tree depth (def. 10, min 1, max 20)		
	MINIMAL NODE SIZE	node size (def. 30, min 1, max 1000)		
Prune tree	LEAF LABEL CONFIDENCE	confidence (def. 0.95, min 0, max 1)	Current tree model	Pruned tree model
	PESSIMISTIC ERROR PRUNING (PEP)	confidence (def. 0.25, min 0.1, max 0.5)		
	COST COMPLEXITY PRUNING (CCP)	use-1stdev (def. 0, min 0, max 1)		
	MINIMAL ERROR PRUNING (MEP)	mParameter (def. 2, min 0, max 1000)		
	REDUCED ERROR PRUNING (REP)			
	MINIMAL LEAF SIZE (MLS)	leaf size (def. 30, min 1 max 1000)		

Additionally, this approach allows better understanding and characterization of algorithms and their parts than traditional “black-box” algorithms. In component based (“white-box”) approach in DT design, algorithm flow is defined by a generic decision tree algorithm (GDT) (Figure 1). Sub-problems, corresponding RCs and the GDT algorithm for building hybrid DTs is presented in Figure 1.

To enable implementation of the component-based GDT algorithm one needs to define a common structure of sub-problems with standardized inputs and outputs (Table 1); we propose an architecture which will be described in the following sections. Here we offer a brief description of sub-problems and their possible solutions (RCs) that are currently integrated in GDT architecture.

3. MULTI ATTRIBUTE DECISION TREES

Here we extend RC-based analysis of decision trees to multivariate (oblique) decision trees. We explain the algorithms and the motivation for their integration with DTs and how can these algorithms be integrated in the GDT structure.

Gama (1997) proposed one way of enhancing DT models, where the author discusses the usage of multi-attribute (oblique) splits within each tree node (p.187-198). In each node, this algorithm, called LTree, can build new attributes based on linear combinations of the previous ones. Gama (1997) gives an example that illustrates a possible new oblique attribute (p.187-198).

$$\text{Linear_attribute_7} = -16.6 - 3.5 * \text{Sepal_length} - 5.5 * \text{Sepal_width} + 6.9 * \text{Petal_length} + 12.4 * \text{Petal_width} + 0.03 * \text{Linear_attribute_5} - 0.03 * \text{Linear_attribute_6}$$

If the “best” orthogonal axis involves one of the new attributes, then the decision surface is considered oblique. The new attributes are propagated throughout the tree branches, so the number of attributes considered in each node is variable. Since the tree searches for linear combinations of attributes, this strategy is applicable only to numerical attributes. The same author goes further in his next research (Gama, 1999), where he proposes extending this strategy beyond linear models. This extension includes quadratic discriminant and a logistic discriminant.

Additionally, there are more approaches in deriving new multi-attribute splits as tree nodes. Murthy et al. (1993) introduce an algorithm OC1 that creates hyper-planes which separate classes in each node, by applying search heuristics with additional randomization (p. 322–327). The authors contrast this with the former approach by Heath et al., (1993) that used simulated annealing for the search of the appropriate separating hyperplane. There are also more recent approaches of finding a good separating hyperplane, including evolutionary algorithms (Canti-Paz & Kamath, 2003).

Interestingly, all these strategies could be encapsulated and viewed as components for solving the “Create split (numerical)” sub-problem of our architecture. Since the other parts of the proposed oblique algorithms are quite typical for a decision tree algorithm (e.g. LTree uses GainRatio as a split evaluation measure), these new components could be included in the WhiBo framework, and used in conjunction with existing WhiBo components. In Table 2 we summarize new sub-problems and RCs identified from the analyzed algorithms.

Table 2. Sub-problems and RCs identified from analysis of oblique and hybrid decision trees

Sub-problem	RCs
Create split (numerical)	Linear discriminant, Quadratic discriminant, Logarithmic discriminant, OC1, Evolutionary Hyperplane, Sim. Annealing Hyperplane, Equal Width Interval Binning, 1R Discretizer
Enhanced leaves	Linear threshold Unit, Naive Bayes, Neural network
Stop criteria	Diversity, Linear separability
Evaluate split	Cross validation

4. Evaluation (Experimental setting)

In order to provide initial evaluation of usefulness of multivariate splits in RC based decision trees we implemented “Linear discriminant” RC as a part of WhiBo framework. Our main goal was to inspect if “Linear discriminant” splits are competitive with “Binary numerical” splits which are most often used in decision tree design. Additionally we evaluated if synergy of these two RCs can give competitive results when they are used in the same algorithm. For generalization of the results we used RC based design to build 150 (2x3x5x5) algorithms with different RCs from different sub-problems. Sub-problems and RCs used for generalization are showed in Table 3.

Table 3: Sub-problems and RCs used for building DT algorithms

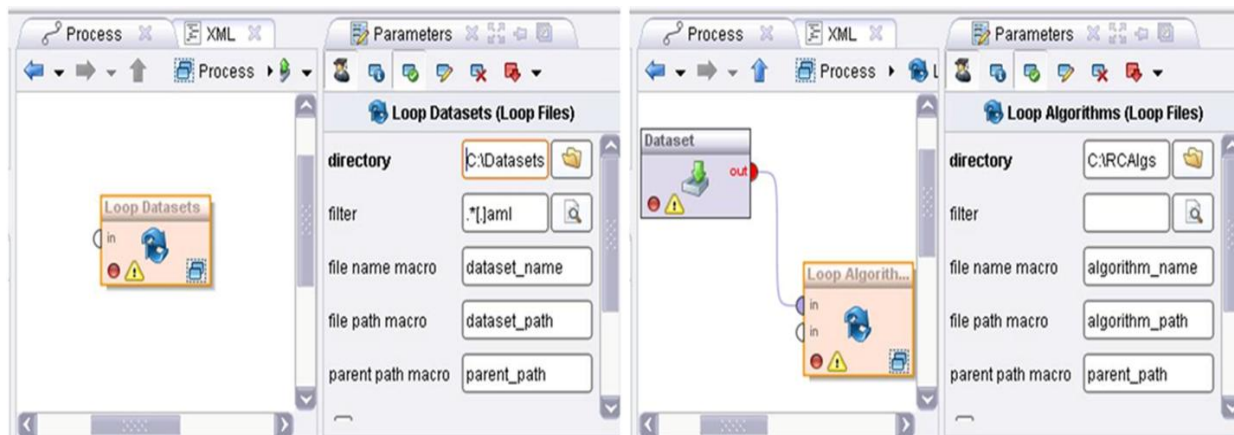

Sub-problem	RCs
Remove insignificant attributes	Yes, no
Create split numerical	Binary, Linear discriminant, All (Binary+Linear discriminant)
Evaluate split	Chi square, Distance measure, Gain ratio, Gini index, Information gain
Prune tree	Cost complexity, Minimal error, Pessimistic error, Reduced error, none

We evaluated all algorithms on 6 real world data from UCI repository. So we conducted 900 (150x6) experiments in total. Datasets and their basic characteristics are showed in Table 4.

Table 4: Datasets from UCI repository

Dataset	No. Of attributes	No. Of records
Breast cancer wisconsin (bcw)	10	699
Breast cancer (bre)	9	286
Hayes-Roth (har)	5	160
Hepatitis (hep)	19	155
SPECT Heart (spe)	22	267
Teaching assistant evaluation (tae)	5	151

Experiment is conducted in RapidMiner as its inner operator structure allows easy setting up of the experiment. The experimental process was organized in 3 levels. On the first level of the process we used an operator that loops through all datasets in a folder (Figure 1.a). On the second level we set up an inner operator for looping through all algorithms over every dataset defined on the first level (Figure 1.b).

Figure 10: (a) Iterating through datasets (b) Iterating through algorithms

On the third level (Figure 2) we measured classification accuracy of every algorithm which is evaluated through 10-fold cross validation. We used the operator "X-Validation with log" from WhiBo operator group because it enables logging of the results (average as well as detailed results for every fold) in a .csv format.

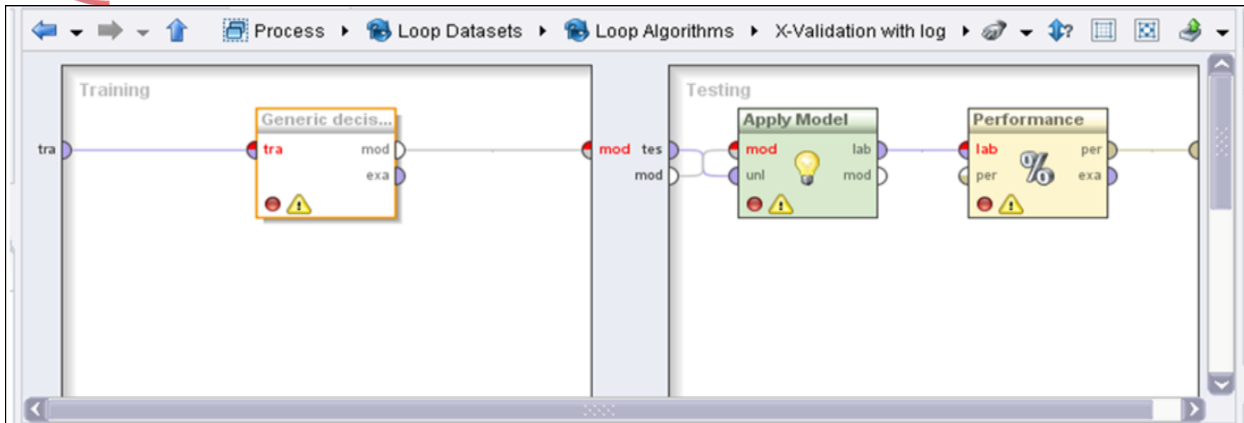

Figure 2: Inner operator structure of the “X-validation with log operator”

In each iteration, the GDT operator uses one of the predefined 960 algorithms on level 2 for training a DT model (left part of Figure 2). In the right part of Figure 2 standard RapidMiner operators for applying a generated model on a test set and measuring classification accuracy are used.

This experimental setting enables complete reproducibility of the results: all datasets are saved as .aml (i.e. RapidMiner dataset format) and algorithms with parameter settings are saved as .wba files and are available on www.whibo.fon.rs. Also, this setting allows logging of all results (in this case 150 algorithms x 6 datasets) in one execution.

It can be seen from Figure 3 that “LinearDiscriminant” RC didn’t give the best accuracy on any dataset. Still, on two datasets it showed better accuracy than “BinaryNumerical” and on 3 datasets the best accuracy is achieved with synergy of these two components (“AllNum” RC).

Figure 3: Inner operator structure of the “X-validation with log operator”

From the preliminary results showed on Figure 3 it can be concluded that “Linear discriminant” split is competitive with “Binary numerical” when used for building Generic DTs, and also that their synergy often can give best results.

Table 5 shows detailed accuracies of algorithms on every dataset for different “Create numerical split” RCs. Best accuracy for every dataset is marked in bold.

Table 5: Classification accuracies for different “Create numerical split” RCs on every dataset

Dataset	AllNumerical	BinaryNumerical	LinearDiscriminant
bcw	0.937	0.922	0.930
bre	0.688	0.716	0.677
har	0.771	0.689	0.739
hep	0.791	0.792	0.770
spe	0.923	0.929	0.924
tae	0.479	0.452	0.382

6. CONCLUSION AND FUTURE RESEARCH

In this paper we conducted a preliminary analysis about usefulness of oblique (multivariate) splits in design of generic RC based decision trees. “Linear discriminant” split is implemented as an RC for building generic DTs as a part of WhiBo environment. This RC is compared against most “Binary numerical” splits. Generic design of DTs also allowed to examine influence of synergy of these two RCs (“All numerical”). For generalization of the conclusions we designed 150 DT algorithms that contain aforementioned splitting RCs (“Linear discriminant”, “Binary numerical”, “All numerical”). Experimental results showed that there is no dominant RC and that synergy of RCs often allow design of well performing algorithms. Based on these results we plan to implement other oblique split RCs and to examine their influence on the performance on Generic DT algorithms on more datasets.

Abstract: *Employees in any organization can be a useful, continuous and inexpensive source of ideas needed to innovate. This paper explores the state of idea management in companies from Serbia as a developing country. First, the developing country with transitional economy context is analyzed. Next, the idea management basis and previous research in this area are discussed. A survey has been conducted, asking company managers about their beliefs and communication habits regarding idea sharing.*

Serbia is found to be a country whose companies have not surpassed many in its innovation efforts, where cultural specificities and a collectivist culture often inhibit employees' readiness to think about improvements and to share their ideas. Idea sharing communication among managers is found to be random and unorganized, with no structured idea management systems found in the observed sample. Ideas are preferably transferred orally, with little chance to be realized and often followed by inadequate feedback from managers. This research may serve as a basis to implement or improve different idea management systems in countries with a similar development context.

Keywords: *idea management; communication; innovation; developing country*

1. INTRODUCTION

Ever since Denny's shipyard in Dumbarton, Scotland, in 1871 (Brown et al., 2005), employees have been considered to be not only a source of work force, but a source of suggestions that could improve their company's business. The idea behind employee's involvement in improving the ways in which their company is doing its job is simple: they are the people "who get their hands dirty", which means they are the closest ones to the working processes that should be improved. Being the closest ones, they are most likely to notice what needs to be improved. Besides that, they don't cost as much as external consultants and they are here to stay, which means they have considerably more time to look for the small improvements. Methods used to harvest ideas not only from employees but also from companies' clients are various, starting with simple idea boxes and ending with high-priced network-based software idea systems.

Companies in countries that have changed their economies from government control to free market had the same challenge to harvest ideas successfully. But in addition, they became faced with sudden rush of competing foreign companies offering similar products. These companies also became faced with new ways to improve their business, showing unequal success and varying from great usage of their employees' ideas to a complete ignorance or neglect of employees' cognitive potentials.

This research, conducted in Serbia, aims to identify managers' views where cognitive potentials of one side should be used by the other one. A number of interesting questions related to idea management systems in transitional economies arise, with special accent on: (1) do these companies use idea management systems and if they do, how do they use them? (2) If these companies do not use idea management systems, why not and what are the potentials for implementation? An empirical exploratory research was conducted in order to gather relevant data to answer these questions.

There are few studies in literature which present relevant data from transition economies, and even then every transition economy has its own specificities. Serbian scenario portrayed in steps "totalitarian regime – civil war with foreign intervention – democratic government and open economy" could be, at least to some extent, applicable to other developing countries who had or will have similar history.

2. LITERATURE REVIEW

2.1 Transition economy and innovation background

Serbia's integration into global market was a slow and hard process knowing that the country's industries were partially destroyed or outdated during disintegration of Socialist Federative Republic of Yugoslavia and the civil wars 1991-1995 and NATO intervention in 1999. With political changes which followed soon, there were also economic changes, opening some of the country's markets to global companies in the year 2000. The consumers had begun looking for western goods which they were deprived of for decades, but the

process of transition also implied higher inflation, uncertainty and higher unemployment (Manrai and Manrai, 2001) which possibly made employees reluctant to participate in improving their organizations. This opening of markets and the introduction of global and multi-national companies changed the competitive landscape significantly. As well as in other countries where domestic industries got rapidly exposed to international competition which forced firms to rethink and reconfigure their models for manufacturing and management (Barnes et al., 2001), Serbian organizations had to evolve. While political and economic changes started happening fast, human resource aspects in these organizations evolved at slower rate, making a gap between companies' goals and possibilities.

Some South, Eastern and Central European countries, as well as others around the world, had transition changes over last 15 years. These countries moved, or are moving, from a state-planned economy to a social order based on a market economy. While some of them changed quite quickly, adapting to global market demands with little problems, others seem to progress at a slower pace. Eight of these transition countries have been integrated into the European Union, some others have the status of candidate countries, while others are still waiting for that status (Albania, Bosnia and Herzegovina, Macedonia and Serbia). Serbia is proven not to be a fully developed market economy (Linz and Semykina, 2010). According to the transition indicators published by the EBRD (2009), Serbia significantly lags in both large-scale and small-scale privatisation, which results in significant number of organizations being stuck in some stage of transition and managerial approach change. This context of unclear ownership structure and poorly defined management functions can lead to numerous obstacles in innovation processes.

Research in this area is scarce and often country specific. Furthermore, there is difference between innovation research in developing versus developed countries. Previous research from developing countries mention topics like "R&D management" and "technological change and development" which are not often present as research topics in developed countries, while developing countries lack research on topics like "technology strategy", "new product development" and "design innovation" (Cetindamar et al., 2009).

Political and economic changes in transition countries seem to have a significant impact on organizations capabilities and success in doing their business (Kubes and Benkovic, 1994). These changes from a centrally planned and government controlled economy to a open market driven economy were radical and resulted in the inability of organizations to simultaneously change internally and cope with external changes effectively. Past economic and political systems did leave a unique legacy in the transition economies by creating a peculiar cultural syndrome at the enterprise level with its distinct set of values, norms and standards based on the notation of the communist theoretical conception of collectivism (Leskovar-Spacapan and Bastic, 2007). This collectivism culture was shown to be less oriented to customers (Huff and Kelley, 2005), thus being inferior in 21st century global and dynamic environment. Furthermore, while in individualistic cultures speaking one's mind is a virtue, collectivist culture prefers harmony over sharing one's ideas (Carayannis and Sagi, 2001). There is a growing realization that the dominant orientation towards laissez faire enterprise privatization and macroeconomic stabilization has not affected economic growth in transition countries as was expected, and has instead threatened their economic integration (Svarc, 2006). The cumulative output decline index, which is an indicator of the harshness of the transition affecting resource allocation towards innovative activities, identifies Serbia as country which has not successfully surpassed the level of development that most developing countries achieved in last ten years (Krammer, 2009). Research findings from Serbia suggest that both the incompetence of HR managers and professionals, as well as a slow-moving transition, need to be carefully considered to explain the distinctiveness of human related aspects in transition economies organizations (Milikic et al., 2008), such as involving employees in improvement activities.

2.2 Idea management – basis and previous research

Innovation is commonly perceived as a key driver of industrial and firm competitiveness (Damanpour and Wischnevsky, 2006). It is one of main sources of achieving a sustainable competitive advantage, conversing ideas to useful applications (Afuah, 2003).

Innovation is broadly defined as "implementing new ideas that create value" (Linder et al, 2003.). Obviously, these new ideas serve as basis to innovate in different ways, such as product development, the deployment of new technologies, or utilizing new management practices (Zott, 2003). This research is interested in one of the sources of these ideas, analyzing organizations' employees patterns of behavior that lead them to share ideas, as well as organizations managers' underlying beliefs regarding usability of those ideas.

Employees' potentially useful ideas (as well as those of organizations' customers) can best be harvested, evaluated and implemented through some form of an organized idea system. Previous research confirms that idea management systems can be used to introduce and strengthen the innovation capability of an organization (Nilsson et al., 2002). Especially, the importance of forms of shop floor activation, which effectively mobilize the ideation and problem-solving behaviour of majority of the workforce is present in literature (Pfeffer and Veiga, 1999). In a neighbouring transition economy (Croatia) there is evidence that radical product innovation is related to implementing corporate changes, while incremental innovation is more related to implementing new organizational structures (Radas and Bozic, 2009).

Employee collaboration and common innovation infrastructure are thought to be the most important triggers of organizational innovation and creativity (Damanpour, 1991). However, there is a significant difference between an idea management process and an innovation process in an organization. Idea management system includes sub-processes of generation, collection, development, evaluation and selection of submitted ideas, whereas innovation infrastructure includes the processes for supporting research, as well as mechanisms in place for the cumulative 'stock' of technological knowledge and developing and commercialising new ideas (Brachos et al., 2009). Idea management can be observed as a sub-process of innovation management (Brem and Voigt, 2007). It is shown in recent research that in a developing country (Turkey) idea quality and idea generation are important determinants of (especially large-scaled) organizations' innovative capacities (Koc and Ceylan, 2007). In both phenomena, quality communication in organizations seems to be the prerequisite for effective usage of employees' ideation potential. A proper idea management system allows management to communicate effectively its' needs for good ideas, to motivate employees to engage in creative ideation behavior and it also harvests the resulting ideas in a way they can be used as basis for improvement and innovation. As a condition, idea management system as a part of continuous improvement must not be set as a binary state or a short-term activity, but as the evolution and aggregation of a set of key behavioural routines within the firm (Bessant et al., 2001). More extreme approach even sees idea management as a political strategy, where ideator has to sell his/hers idea (Bakker et al., 2006).

Process of idea generation is often found to be complex and delicate. Idea submitters need to bridge the gap between current situation and an ideal, employing their creative thinking to come up with a possible solution. Creative thinking seems difficult for ordering, which doesn't stop organizations trying to order creativity (Nov and Jones, 2006). Effective organizational communication should motivate employees to think about possible improvements. Organizational communication should also direct employees' creative thinking in a defined course and should motivate them to share resulting ideas with their organization. In other words, idea generation and therefore technological innovation can be represented as a complex net of communication paths linking the various stages of the innovation process (Rothwell and Robertson, 1973). Even the number of communication connections between employees is shown to result in a higher proportion of high quality ideas provided by individual employees: the possibility to interact with other employees (but individually, not in form of different groups) increases ideators' proportion of good ideas (Bjork and Magnusson, 2009). If the improvement or innovation task cannot be simply evaluated and requires interactions between idea creator and idea evaluator, high richness media channel would be preferred. Face-to-face meetings and video conference communication channels are preferred for these tasks that require creativity and immediate feedback. Similarly, low richness communication channels should be preferred where the ideation tasks are predominantly analyzable and have more predictable outcomes (Oke and Idiagbon-Oke, 2010). If group idea generation software is used in ideation processes meetings, it is identified that full benefits might not become evident until the number of participants has reached about six (Aiken and Wong, 2003).

Internal communication is found to be a critical point in idea and innovation management, because information timing is a crucial element to the cooperation between technology improvements and market (Brem and Voigt, 2009). It is shown that a well-designed, game-like system for generating and evaluating ideas can motivate evaluators to participate in constant ideation and idea evaluation activities (Bothos et al., 2008). However, it must be pointed out that centralised idea management systems discourage external partners like suppliers and customers to participate. These external sources of ideas tend not to work efficiently, as they lose ideas and delay their evaluation and implementation, implying that integrated idea management must be a system with a sophisticated and holistic approach (Brem and Voigt, 2007).

There are no relevant research results found in Serbia regarding idea management usage. Indirectly, a recent research has shown that earnings are positively related to employees internal locus of control and preference for challenge in Serbia (Linz and Semykina, 2010), where internal locus of control and preference for challenge can be seen as prerequisites for ideation and problem-solving behaviour.

3. RESEARCH METHODOLOGY AND SAMPLE

The data were gathered from six companies, during years 2009. and 2010., with intention to cover different ownership and management structures. The sample was constructed with explorative approach in mind, knowing that there was no similar research conducted in the country and trying to achieve diverse sample regarding bigger organizations. It must be pointed out that transitional economy context in Serbia seems to have made many organizations reluctant to take part in academic research: additional seven organizations which were contacted rejected to take part in this study, and another two organizations let their employees be surveyed, but the employees were not motivated to complete the questionnaire, mostly stating that their salary and work conditions were “not enough to cover their extra effort”.

The sample consisted of 66 employees identified as top level managers and mid-level managers, who were asked about their opinion on usefulness of employees' ideas. Also, they were asked about motivating employees to create and share ideas when they emerge. In this sample there were 17 female managers and 49 male managers, with 18 having high school diploma and 46 having their college degree.

Data used to investigate patterns of communication related to ideas for improvement were gathered using a survey instrument, and analyzed with descriptive statistics. The written questionnaire consisted of 9 general questions and 15 questions about idea usefulness and motivating styles. Only questions that derived most interesting conclusions were observed in further analysis. Since it was recorded that none of the observed companies had a formal idea management system, there was no method for obtaining objective data regarding number of shared ideas, their acceptance rate and implementation.

4. SURVEY FINDINGS

4.1 Managers view on employees' ideas

This section presents the overall findings from the managerial perspective.

The preferred method for majority of managers to receive ideas from employees is through direct conversation with submitters, as shown in table 1. After that, managers believe that ideas should be directly submitted to a potential idea officer, or at staff meetings. It is interesting to see that only 13% of top and mid level managers believe that written methods of sharing ideas via pen and paper or a software system would be the most effective. Additionally, 71% of surveyed managers reported that they predominantly receive ideas to resolve ongoing work-related difficulties and efficiency problems (question not shown in table form).

Table 1: Managers opinion on communication media effectiveness

Question: What means of communication do you think would be the most effective to gather employee's ideas?	
answer	frequency (percent)
in direct conversation with myself as a manager	27 (41%)
in direct conversation with a person whose job would be to manage ideas	16 (24%)
on a staff meeting	9 (14%)
talking to any of the top managers	5 (8%)
through a form put in a suggestion box	5 (7%)
via some software or internet	4 (6%)

Table 2 shows managers' opinions on potential idea evaluators. It is apparent that co-workers of the proposer are perceived as most effective in idea evaluation, while 47% managers do believe that top managers could effectively evaluate ideas. This finding shows a good sense for potential evaluators, but managers should be warned that top managers may not be effective evaluators considering their time available, as well as the fact that they are often not familiar with shop floor level activities.

Table 2: Managers opinion on valid idea evaluators

Question: Do you believe the following persons could effectively evaluate employees' ideas? (count for "yes")	
answer	frequency (percent)
co-workers from the same sector	46 (70%)
top managers	31 (47%)
external consulting experts	14 (21%)
all the interested employees, regardless of their job description	9 (14%)

Managers' initial reactions when faced with a new idea are shown in table 3. In most cases, managers ask for clarification, which is in fact a fairly common reaction in most conversations. The bad side of this approach may be that managers need to memorize proposers' explanation for further decision making process. Also, reaction of 29% of managers is not to ask for clarification, but to either immediately express their estimation of idea feasibility, with or without explanation, or not to answer at all.

Table 3: Managers' reaction to suggested ideas

Question: When you are presented with employee's new idea how do your most frequently answer?	
answer	frequency (percent)
I ask questions to clarify the idea	39 (59%)
I immediately give my opinion about the idea's feasibility	13 (20%)
I don't get any ideas	8 (12%)
I give a short answer without further explanation	3 (4.5%)
I don't answer for some reason	3 (4.5%)

According to table 4, majority of managers see giving feedback as an encouragement for further ideation. Smaller number of managers feel that the main purpose of their feedback is to improve employees' cognitive and ideation processes. A small number gives feedback mainly as a courteous reaction.

Table 4: Managers' motives to give feedback for suggested ideas

Question: What is the main reason to give feedback to employees when they share ideas?	
answer	frequency (percent)
to encourage further ideation	40 (61%)
so the employee should know if his way of thinking is good or not	16 (24%)
as a human gesture for his suggestion	8 (12%)
there is no reason to do so, feedback should not be given	1 (1.5%)
something else	1 (1.5%)

Table 5 shows managers perception of idea utilization. The alarming fact is that only 15% of respondents believe almost every good suggested idea will be realized, which implies that observed companies have problems converting ideas to innovations. There are no significant differences in answers to this question between companies. When asked if they follow accepted and realized ideas to learn how to further develop ideation and idea sharing, (only) 53% managers said that they do a follow-up of implemented ideas, which suggests that almost half of managers tend not to improve their idea harvesting and evaluation activities.

Table 5: Managers estimation of chances that good idea has to be realized

Question: When an employee gives a good idea, what chance does that idea have to be realized?	
answer	frequency (percent)
there is about half a chance	25 (38%)
unlikely	19 (29%)
almost every good idea	10 (15%)
answer to this question is highly variable across parts of organization, there is no unique answer	10 (15%)
there is no chance	2 (3%)

Table 6 shows what is managers' preferred method to encourage employees for further ideation. It can be observed that 50% of managers prefer income bonuses, 20% would give free days, 11% would prefer to motivate with other privileges, 11% with private praises and 8% public accolades. Other suggested possibilities were not chosen by any manager.

Table 6: Managers' reinforcement strategies for idea sharers

Question: How do you instigate and motivate workers to share their improvement related ideas?	
answer	frequency (percent)
bonus payments	33 (50%)
free days	13 (20%)
other privileges	7 (11%)
private praises	7 (11%)
public accolades	6 (8%)

Managers were also asked about readiness to engage one or more of their employees in idea management processes. As it can be seen from table 7, most of the managers from the sample believe one person should be enough to tackle this processes, without full time engagement. Less than one third of the managers believe one person with full time should be enough to manage the idea system, while only 14% believe more than one person should be trusted with these issues.

Table 7: Managers' readiness to conduct in-house idea management

Question: Would you be willing to engage an employee to organize idea management?	
answer	frequency (percent)
yes, one person with part-time employment	30 (45%)
yes, one person, full-time employment	19 (29%)
yes, two or more persons	9 (14%)
I would rather engage external expert to manage that	8 (12%)

5. DISCUSSION

The above results suggest general conclusion that idea management in observed Serbian companies is rather different than known systems in developed countries, but there are potentials to adopt such systems. First of all, no real "idea management" as a structured system was identified, and only simple oral idea sharing behaviours were found and analyzed. Managers in these companies lack good judgment regarding ways to harvest ideas, since they prefer to receive ideas orally. This method is suboptimal since it cannot receive more than a few ideas daily, and it requires from the idea recipient to remember all the ideas he has received. A significant number of these managers tend not to give a proper detailed feedback to suggested ideas, but they do have a good sense of why the feedback should be given. Nearly half of surveyed managers do not follow up accepted ideas, where that follow-up could serve as a good feedback to improve their own idea adoption decision making process.

On the other side, managers have a good perception of potential that ideas have. They have partial insight into who are good idea evaluators. Managers share belief that income stimulations should be the dominant method of encouraging employees for further ideation (which is in conjunction with previously mentioned research in part 2.2 that found positive correlation between earnings and internal locus of control and preference for challenge in Serbia), and that also free days and other privileges should be used to motivate sharing behaviours. Verbal appraisals are not among first choices for either side, which can be explained with the fact that relatively low average income and standard of living in Serbia impose other significant motivators, mainly material ones. This lack of verbal stimulation can be a serious issue since sustainable idea management should be based on intrinsic motivation, which is achieved through verbal communication, not through material rewards.

It is identified that observed companies have problems realizing ideas, and that if an idea is evaluated as a feasible and useful one, it still does not have big chances to be realized. Since none of these companies have an idea management system, most of ideas probably get lost in some managerial levels, especially since they are predominantly shared orally.

6. CONCLUSION

In this paper a developing country with transition economy context has been discussed. It was shown that this context may jeopardize companies' innovation efforts, and that collectivism culture and inefficient privatization place big challenges in using employees' creative thinking. With open market and harsh competition companies must stay innovative, using every good idea which they can find. Unfortunately, in most cases underdeveloped company strategies and Human resource departments have yet to learn how to effectively harvest their employees' creative thinking. Researches in this topic are scarce, and further research should provide more insight into employees patterns of behaviour and managerial strategies related to idea management.

The lack of idea management systems in Serbian companies presents another obstacle to utilize employees' knowledge and experience to the full extent. Ideas are randomly given and they are rarely written, so they have big chances to be forgotten, changed or misinterpreted when evaluated and realized. Previous research has shown that electronic idea management systems play a crucial role in the process of idea generation and selection within organizations (Bakker et al., 2006). Companies in Serbia should embrace these systems in order to more effectively utilize employees' ideas.

Current state of idea management communication in Serbian companies is predominantly unordered. Employees share their ideas orally and managers respond right away, without any objective evaluation process. Furthermore, one number of managers tends to immediately evaluate received ideas, without asking additional questions for clarification, which may additionally jeopardize ideas and employees' motivation. Communication habits of both sides need to be changed in order to ensure that every idea is securely transmitted, stored, evaluated, realized and to ensure an appropriate feedback. Employees should be asked not only to identify problems, but to suggest possible solutions. Feedback should provide them information on their idea's quality and feasibility. Suggestions for further ideation should be provided. Appropriate software solution should be implemented to maximize efficiency of idea sharing and evaluation activities, where employees should be strongly advised to use that software. Managers should be discouraged to receive ideas orally.

When implementing idea management systems, every company must pay attention to its organizational context and national culture. When implementing idea management systems in a developing country which struggles with transition changes, every company must also pay attention to its inherited frameset and legacies of the central planning system that suggest local adhocracy where no rules have been set. Culture specific communication behaviours of all participants should not be left unattended, as they are both tools for stimulating creative thinking and tools for sharing useful ideas.

7. LIMITATIONS AND FURTHER RESEARCH

The observed sample was predominantly conditioned by companies' willingness to participate in this research. The fact that half of the companies from the initial sample did not want their employees to be surveyed may demonstrate lack of intention to achieve improvement on scientific cooperation. Furthermore, this study only includes data obtained in Serbian companies, which should be taken into consideration when generalizing its results to other developing and transition countries.

Further research should determine how companies in developing countries could be more motivated to participate in research about their employees' potentials. Further research should also examine the conditions present to implement idea management software and specificities in targeted companies.

CONSUMER ETHNOCENTRISM RESEARCH: FIRST FINDINGS¹

Slobodan Miladinović

Faculty of Organizational Sciences, Belgrade, miladinovic@fon.rs

Abstract: *Consumer ethnocentrism is a tendency to favor the purchase of domestic-made products over imported ones. Ethnocentric consumers believe that in this way they promote the economic development of their country and thus contribute not only to the economic but also to the general social and political prosperity. This paper analyzes the survey data for the consumer ethnocentrism research conducted in 2011 on a sample of 425 respondents. Data were collected through the CET scale. The paper establishes total scale value - 60.51 and the mean value of the whole scale - 3.56. This is located within the limits of moderate ethnocentrism, which corresponds with the findings of earlier research in Serbia. We also performed factor analysis and there are four isolated factors: consumer patriotism, politically motivated consumer ethnocentrism, ethical ethnocentrism and radical ethnocentrism.*

Key words: *Consumer ethnocentrism, CETscale, consumer behaviour, market, domestic-made products*

1. INTRODUCTION

One in a series of sociological and psychological factors that influence customers' decisions in choosing which goods to purchase, when enter the marketplace, is consumer ethnocentrism. Ultimately, the ethnocentrism, generally, means the point at which their own national culture, lifestyle based on it and socio-cultural patterns are superior in regard to others. It is the value orientation aspect, syndrome of social attitudes which has a form of national attachment that characterizes national isolation and exclusion in the final sum (Schatz, Staub and Lavine 1999), putting their own ethnic group in the "world center" which produces a conviction of the superiority of their own ethnic group and not rarely express contempt for the others. This is especially true if there are grounds for the sense of national vulnerability. The presence of such attitudes lead to a selective approach in social interactions by the principle of us-them which means bias and lack of trust in relation to everything that comes from other ethnic groups and developing the need for "compacting ranks" which one's own ethnic group is seen as a reference framework for personal identification.

Marketing perspective, consumer ethnocentrism is the tendency to give priority in purchasing domestic products over imported. Ethnocentric consumers believe that in this way they promote the economic development of their country and thus contribute not only economic but also the general social and political prosperity. It is the tendency of the population of a society to purchase domestic products, and it shows what the consumer behaviour is morally acceptable in a given society (Shimpo Sharma, 1987: 100), or the reverse what behaviour is unpatriotic (Klein, 2002: 346). However, it should be noted that the moral attitudes are relative, that they make sense only when they are brought in a certain context.

Opening of a society means accepting external influence through various channels. Economic opening involves the penetration of market competition. The problem is that most of our companies are not yet ready to adapt to market conditions and the competitive struggle. Of course there are those small numbers, mostly new-formed companies that have already embarked on the competition. It is therefore understandable that there is public interest to recognize the limits of consumer ethnocentrism in our region because it is possible to prepare a long term strategy for market penetration based on these findings, not only for individual companies but entire national economy; it is also important for those who want to sold their own goods sold at our market.

There are many reasons why ethnocentrism effect on consumer behaviour. Conditions that affect the strength and intensity of its action can not be generalized. It is a large number of factors that may be the result of historical and cultural specificity but also the global economic situation, level of economic

¹ This paper has done under the project "Tradition, Modernization and National Identity in Serbia and in the Balkans in process of European integration (179074) which is implemented by the Centre for Sociological Research, Faculty of Philosophy in Niš, and funded by the Ministry of Education and Science of Republic of Serbia.

development and the current economic situation, the dominant value system, the degree of openness of society and individuals to external influences.

2. RESEARCH OF CONSUMER ETHNOCENTRISM

It is evident that different segments of the population differ in the expression of consumer ethnocentricity. Greater propensity to purchase domestic products show senior, those with lower education, pensioners, unemployed, less traveling (abroad), generally those with lower incomes. On the other hand are not ethnocentric those who are younger, better educated and with higher income and higher probability of being employed, who more travel abroad and have positive attitudes towards other nations. They are characterized by better assessing imported products than domestic, and that they are better informed about brands and their origin (Veljkovic, 2009: 100).

To think about consumer ethnocentrism, it should be noted that the concept of domestic consumers is extremely wide so that we included a narrow segment of the consumer body in the study, i.e. youth specifically urban population of students of management. This segment of the consumer bodies have chosen considering that they are future business leaders, people who will be available for several years in positions of business manager, i.e. those who will have to make important economic decisions. Hence, it is important to know what their position is in the determination of the domestic and imported products. The study included a sample of 425 respondents. We used the internationally recognized CETscale developed by Shimp and Sharma (Shimp Sharma, 1987). CET scale is based on seventeen allegations of different aspects of purchasing domestic versus foreign products. Compliance with the claims of the responses is recorded from 1-7 where 1 means complete rejection of ethnocentrism and 7 means its full acceptance. The values of consistent with a given scale are in the range of 17-119 with the result 17 what represents the theoretical minimum value of the absolute non-ethnocentric consumers and 119 what represents the theoretical maximum value of absolute ethnocentric consumers. It will be applied factor analysis in the paper to determine what dominant factors make consumer ethnocentrism in our sample.

Table 1: Item Statistics

	Mean	Std. Devia tion	N
1. Serbian people should always buy Serbian-made products instead of imports.	4,05	1,607	425
2. Only those products that are unavailable in Serbia should be imported.	4,68	1,731	425
3. Buy Serbian-made products. Keep Serbia working.	5,55	1,260	425
4. Serbian products, first, last, and foremost.	3,94	1,606	425
5. Purchasing foreign-made products is un-Serbian.	1,96	1,182	425
6. It is not right to purchase foreign products, because it puts the Serbian people out of jobs.	3,12	1,460	425
7. A real Serbian should always buy Serbian-made products.	2,69	1,472	425
8. We should purchase products manufactured in Serbia instead of letting other countries get rich off us.	4,19	1,618	425
9. It is always best to purchase Serbian products.	3,28	1,555	425
10. There should be very little trading or purchasing of goods from other countries unless out of necessity.	2,99	1,564	425
11. Serbian people should not buy foreign products, because this hurts Serbian business and causes unemployment.	3,19	1,362	425
12. Curbs should be put on all imports.	4,38	1,677	425
13. It may cost me in the long-run but I prefer to support Serbian products.	3,92	1,511	425
14. Foreigners should not be allowed to put their products on our markets.	2,34	1,271	425
15. Foreign products should be taxed heavily to reduce their entry into Serbia.	3,17	1,546	425
16. We should buy from foreign countries only those products that we cannot obtain within our own country.	4,55	1,632	425
17. Serbian consumers who purchase products made in other countries are responsible for putting their fellow Serbians out of work.	2,51	1,470	425

The total value of the scale is 60.51 and the mean value of the whole scale is 3.56. This result is within the limits of previous studies in which the recorded value of the scale was 62.6 (2005) and 57.0 (2008.)

(Veljković, 2009: 100). In a study from 2010, the value of the scale was 63.35 and the mean value of the scale was 3.72 (Marinković, Stanišić and Kostić, 2011: 53). The data shows that our respondents express moderate consumer ethnocentrism. There is an evident tendency of its slight increase, which can be explained by the economic crisis in recent years but it may be the result of campaigns to provide subsidized loans to purchase some local products. Viewed individually by variables from the scale, association of purchasing domestic product and employment expresses the highest acceptance of the variables. There is the claim "Buy Serbian-made products. Keep Serbia working" in the first place with the mean score of 5.55. This claim was also first-ranked in previous studies (Veljković, 2009: 100). This is the only claim in our sample with a high grade 5 and up, in the previous study it was the only claim with an average grade above 4.5. High grade mean above 4.5 have a claim "Only those products that are unavailable in Serbia should be imported" (4.68) and "We should buy from foreign countries only those products that we cannot obtain within our own country" (4.55). Similar trends were noticed in some previous studies, which expresses the belief that it is necessary to pursue the policy of import regulation to be based on regulation of quantities and types of imported products and generally to reduce imports and import of those products that we can not supply in our own country or at least not in sufficient quantity. Claims given for the opposition to the ban on the import or purchase foreign goods as well as attitudes about buying local products only are at the bottom of the list of acceptance. It is particularly rejected the claim "Purchasing foreign-made products is un-Serbian" (Mean 1.96) but the last ranking claim in previous research was the view that foreigners should be completely forbidden to sell their products on our markets (Lovreta, 2011).

Table 2: Rotated Component Matrix

	Component			
	1	2	3	4
1. Serbian people should always buy Serbian-made products instead of imports.	,737	,236	-,163	,053
2. Only those products that are unavailable in Serbia should be imported.	,664	-,052	,159	-,021
3. Buy Serbian-made products. Keep Serbia working.	,727	,016	,190	-,069
4. Serbian products, first, last, and foremost.	,653	,386	-,130	,066
5. Purchasing foreign-made products is un-Serbian.	,248	,738	,067	-,195
6. It is not right to purchase foreign products, because it puts the Serbian people out of jobs.	,282	,459	,567	-,135
7. A real Serbian should always buy Serbian-made products.	,426	,604	,091	-,091
8. We should purchase products manufactured in Serbia instead of letting other countries get rich off us.	,543	,367	,344	-,016
9. It is always best to purchase Serbian products.	,502	,378	,031	,142
10. There should be very little trading or purchasing of goods from other countries unless out of necessity.	,230	,138	,617	,280
11. Serbian people should not buy foreign products, because this hurts Serbian business and causes unemployment.	,158	,399	,691	,135
12. Curbs should be put on all imports.	,185	,065	,241	,702
13. It may cost me in the long-run but I prefer to support Serbian products.	,572	,234	-,073	,399
14. Foreigners should not be allowed to put their products on our markets.	,163	,640	,151	,381
15. Foreign products should be taxed heavily to reduce their entry into Serbia.	,201	,481	,018	,576
16. We should buy from foreign countries only those products that we cannot obtain within our own country.	,540	-,030	,369	,330
17. Serbian consumers who purchase products made in other countries are responsible for putting their fellow Serbians out of work.	,108	,703	,138	,203

Extraction Method: Principal Component Analysis.
Rotation Method: Quartimax with Kaiser Normalization.

We determine presence of four factors which the consumer ethnocentrism consists of by Factorial analysis (using Quartimax rotation) which cover 57.226% of variance.

Table 3: Factors

factor	% of Variance	Cumulative %
1. Consumer patriotism	34,954	34,954
2. Politically motivated consumer ethnocentrism	8,707	43,661
3. Ethics ethnocentrism	7,357	51,019
4. Radical ethnocentrism	6,208	57,226

The first factor is called consumer patriotism. It covers 34.954% of the total variance and it is a real and positive ethnocentrism. The essence of this factor lies in the fact that, whenever possible, we should buy local-made products in order to Serbian citizens were employed and the country prospered. This factor is defined by principal claims that it is good to buy local products. The claim "Serbian people should always buy Serbian-made products instead of imported" has the largest factorial saturation (0.737) and it was followed by the statement that "Buy Serbian-made products. Keep Serbia working "(0.727).

Another factor we have called a politically motivated consumer ethnocentrism. It is a negative sharper dimension of consumer ethnocentrism. The claim "Purchasing foreign-made products is un-Serbian" has the largest factorial saturation (0.738). It was followed by the statement that "Serbian consumers who purchase products made in other countries are responsible for putting their fellow Serbians out of work" (0.703). The rejection of buying foreign products because this is not the "national interest" is here an ideology based on consumer ethnocentrism.

The third factor we have called ethics ethnocentrism. It is a principled ethnocentrism, which is clear from the claim with the highest saturation factor "Serbian people should not buy foreign products, because this hurts Serbian business and causes unemployment" (0.691). The essence of this factor lies in the fact that imported products do not need to buy because it is harmful to our economy, and domestic products should be bought for the common good because it is the only possible way to maintain economic stability.

The last factor is called the radical ethnocentrism. This is an exclusive and xenophobic ethnocentrism which can lead to economic isolationism. Practically, it is the economic chauvinism as an extreme form of ethnocentrism if it is consistently poured into practice. It is known for its extreme refusing import products come to our market in general. The claim "Curbs should be put on all imports" has the largest factorial saturation (0.702) and it was followed by the statement "Foreign products should be taxed heavily to reduce their entry into Serbia" (0.576).

3. CONCLUSIONS

Previous studies of value orientations have found that authoritarianism, dogmatism, ethnocentrism, Machiavellianism and conservatism are interrelated phenomena (Schramm, 2006: 201; Eysenck, Wilson, 1978) and they build a receptive personality to political and other manipulation in their mutual interacting. The first point at which the manipulation sets is the insistence on the importance of national identity. Research has shown that national identity is just appearing as one of the most important drivers of consumer ethnocentrism. Translated to the sphere of economic relations this would mean that national identity is operationalized by "patriotic consumer behaviour", i.e. buying domestic products (Vida and Dmitrović, 2008: 336).

Consumer ethnocentrism is often highly correlated with the campaigns of national economic and political entities to buy domestic products in order to achieve economic and social stability i.e. to avoid reducing economic activity and employment. On the one hand, consumer ethnocentrism, from the standpoint of national economy, may be considered as desirable at the time of reduced economic activity, particularly in countries with low exports and high imports. In this context, emphasizing the ethnocentric behaviour makes sense considering that demand for domestic products enables maintaining economic activity. (Granzin and Olsen, 1998: 39). On the other hand, it is possible that imported products are better than domestic. In this case, viewed from the perspective of consumer, ethnocentrism is pointless considering that the consumer does not get the desired quality for the current price. In the case of a relatively stable economic relations

consumer ethnocentrism appears as a factor that suppresses effects of the market laws, which seeks to balance price and quality through the free competition.

Moderate ethnocentrism established in this study is generally positive phenomenon. On the one hand, domestic producers of consumer goods are protected and, on the other hand it, gives a positive signal to foreign producers that our market is open to imports and ready to compete. Capital and markets do not know borders in the global economy. The penetration of foreign capital and foreign goods on the domestic market may lead to healthy competition and encourage the fight for quality, low cost production and a competitive, low, price. Of course, the fear of uncertainty that brings new opposes this.

Long-term trends are announcing the victory of global over local. This means that we should not oppose the arrival trends of foreign capital and foreign goods, but that their arrival should be used to enhance the quality and market competitiveness of its products. Consumer ethnocentrism makes sense in periods of crisis and creating new market conditions. In stable times, it can have negative effects, especially if the centers of social and especially political power insist on it. Political campaigns for the purchase of domestic goods can cause resistance of foreign producers and their countries which may render the counter-measures on the basis of reciprocity. Of course, we should always keep in mind that the foreign companies and brands can become a national if in our region launch export-oriented production.

The issue of the extent and modalities of the consumer ethnocentrism acceptance is a thing of value positioning between conservatism and liberalism. Higher ethnocentrism involves higher conservatism and more isolation of the domestic market for the foreign products but also it means a higher closeness of foreign markets for our products. For a society like ours, which has not yet completed the transition process, turning to consumer ethnocentrism would mean a slowdown in economic, technical and technological modernization of society and the slowdown of connecting with the world and involvement in European integration. On the other hand, we should not allow our market is flooded with large quantities of goods that we produce too, because it would represent an attack on our production.

Given the research findings, it can be concluded that the tested population has a reasonable attitude towards consumer ethnocentrism and that viewed it largely in the context of preserving the functionality of domestic production rather than in the context of national isolation. This finding seems encouraging, considering that these are people who will in the near future enter into active social life and start as business leaders to take responsibility for economic decisions that should be a matter of rational choice rather than the emotional and value commitment.

Abstract: *The aim of this paper is to introduce and empirically validate the applicability of the concept of organizational justice, developed by Greenberg for the purpose of studying in organizational settings, in the domain of students' achievement. As organizational justice refers to the perception of fairness in a working context and has influence on other organizational aspects including work outcomes, it is reasonable to presume a relation between perceived justice and achievements at school, and later at university. Theoretical considerations of this paper included acknowledging particularities of the organizational justice construct, its multidimensionality and dependence on different situational and personality variables. Also, some results from previous research that linked justice theory with academic achievement were presented. Two main hypotheses were tested empirically using a modified Colquitt's four-dimensional scale (Colquitt, 2001) expanded with 30 items of actual unjust experiences in the school setting. The first hypothesis, referring to a positive correlation between all dimensions of justice and school achievement, is proven, while the second one, where a positive correlation between justice perception and university grades had been expected, was significantly correlated only with the distributive aspect of organizational/school justice. Two concurrent explanations for these findings were offered, one based on the postulates of equity theory and the specifics of educational settings, and the other focusing on a lack of correlation between university grades and procedural, interpersonal and informational justice that was assessed based on high school experiences. So, it was presumed that these experiences were more situational and therefore less transferable to a new context. Finally, some dilemmas concerning the construct were mentioned with the purpose of opening questions for further research that would clarify and enrich the topic.*

Keywords: *organizational justice, distributive justice, procedural justice, interpersonal justice, informational justice, academic achievement*

1. INTRODUCTION

In this paper there is an endeavor to apply concept of organizational justice, well known and mainly established in organizational settings, in new domain of interest. As a matter of fact, organizational justice, introduced by Greenberg (Greenberg, 1987), and originally created in domain of organizational behaviour could be seen in a new perspective as more complex and interdependent factor, as some contemporary researches imply (O'Neill, et al., 2011; Rupp, 2011). Even Colquitt (Colquitt, 2006), one of the scholars, the most engaged in not only in theoretical but also in empirical conceptualization of the phenomenon, has recently gave indices that the notion of organizational justice could be abridged by some personal variables applicable at non organizational environment.

Also, there is an ongoing debate of multidimensionality of construct, with the two, three or even four factor models of organizational justice (Cropanzano, 1997). Here, we adopt the four factor model of justice (Colquitt, 2001) and try to apply it and validate in a context of academic achievement.

In one word, organizational justice is a construct that explain an individual experience in an organizational setting in terms of fairness based on situational and personal factors (Colquitt, 2006) with evident consequences on employees behaviour (Cropanzano, 1997). Therefore, it is well established and valuable concept in lot of studies, sometimes as predictor of organizational outcomes (Zapata-Phelan, et. al, 2009), sometimes as a consequent variable of other organizational factors (Liao, Rupp, in press), but mainly as a moderator between concrete behaviour and more fundamental personality dimensions (O'Neill, et. al, 2011).

2. CONTENT AND MULTIDIMENSIONALITY OF ORGANIZATIONAL JUSTICE CONCEPT

Organizational justice is a term mainly used in researches in the domain of organizational behaviour where it is concerned with the ways in which employees perceive fairness of treatment at the workplace and its influence on other organizational aspects: work attitudes, satisfaction, work outcomes, perception of their supervisors (Moorman, 1991). Studies of organizational justice revealed that distinction should be made between, at least two, three, or even four dimensions of justice (Greenberg, 1987). Distributive justice refers to the perception of fairness of work outcomes an employee receives (Cronpanzano, 1997). Even when the outcome is perceived as fair, the way used to reach that result may be unfair. So, procedural justice assess the extent to which the system that determines work outcomes is accurate, consistent, correctable, unbiased, representative, based on prevailing ethical standards and open to employee input (elements of fairness) (Greenberg, 1987). Sometimes, this formal aspect is seen as independent from the perception of the way that employees are treated in concrete communication during the implementation of the procedure, so interactional justice is seen as one more dimension of organizational justice, describing the level of respect and dignity in employee's treatment by the authority figures (Zainalipour, 2010). Third organizational justice dimension is occupied with the fairness of interpersonal treatment received during the implementation of a procedure and emphasizes the importance of truthfulness, honesty, sensitivity, respect and justification as fairness criteria of interpersonal communication (Erdogan, 2002). In this facet of justice, researchers often see two distinct aspects, interpersonal that captures the sincerity and respectfulness of authority communication and informational justice that is concerned with the use of open and adequate explanations for decisions (Colquitt, 2001).

Multidimensionality of organizational justice construct is justified by the researches which show that, although all dimensions refer to the role of fairness, they have diverse impact and personal and organizational correlates (Zainalipour, 2010; Cohen-Charash, Spector, 2001). Briefly, distributive justice is proven to be related to the personal-referenced outcomes (pay satisfaction, promotion satisfaction, individual self-concept), while procedural justice was found to relate to system-references outcomes (organizational commitment, loyalty toward organization, cooperation, task, supervisor and co-worker satisfaction, trust in organization, willingness to exert effort on behalf of organization, lower absenteeism and turnover intentions and interactional justice was regularly linked with organizational citizenship behaviour and trust toward supervisor (DeConinck, 2010). Researches also suggest that employees evidently make a distinction between fairness of organizations and supervisors (Rupp, Cropanzano, 2002; Erdogan, 2002).

Theoretically and methodologically, organizational justice is commonly conceptualized as three dimensional construct, others combine interactional with procedural because of their high inter-correlations and similar consequences (Cronpanzano, 1997), while Greenberg (1987) and Colquitt, (2001) suggests four-factor structure due to the idea that the respect and sensitivity aspects might be viewed as interpersonal facets of distributive justice as they have a potential to alter reactions to decision outcomes and can compensate unfavorable outcome.

However, empirical studies gave inconsistent results regarding the dimensionality of organizational justice concept arguing that employees often consider fairness issues in a holistic manner. As a matter of fact, recent research indicated that overall justice predicts overall job satisfaction better than specific justice dimensions and influence some other organizational phenomena (Holtz, Harold, 2009). It is obvious that specific justice dimensions influence overall justice but the question remains is it useful to make a differentiation between them and to what extent every dimension participate in a general construct. Nevertheless, according to Johnson (2006), various theorists agreed that justice is anything from a single dimension to four dimensions.

3. PERSONAL AND ORGANIZATIONAL CORELLATES OF ORGANIZATIONAL JUSTICE

Greenberg (1987) identified organizational justice as a construct that has a potential to explain many organizational behavioural outcome variables. *Moorman (1991) says that organizational justice conceptualizes "ways in which employees determine if they have been treated fairly in their jobs, and the ways in which those determinations influence other work-related variables" (p.845).*

As previously has been said, organizational justice has been constantly related to organizational decision making (van den Bos, 2002), job and organizational satisfaction (Rezaiean, et al., 2010; Zainalipour, et. al, 2010; Johnson, et al. 2006), organizational citizenship behaviour (Rezaiean, et al, 2010), organizational commitment (Rezaiean, et al, 2010; Johnson, et al, 2006), trust (Johnson, Lord, 2010; DeConinck, 2010), job and task performance and work outcome (Liao, Rupp, in press; Zapata-Phelan, et. al, 2009), achievement (Peter, et al., 2012; Elovainio, et al., 2011), contra productive work behaviour (O'Neill, et. al, 2011; Johnson,

Lord, 2010), leader-member relations (DeConinck, 2010; Johnson, et al., 2006). Cohen-Charash and Spector (2001) also recognized the importance of differentiating forms of justice, since they are *related yet distinct constructs*.

Although organizational justice has been shown to have behavioural consequences, there remains a surprising amount of variation in how individuals react to fair and unfair treatment (Colquitt, 2006). Therefore, Rupp (2011) insists that understanding of justice phenomenon is not possible without concerning individual differences, affective, cognitive and social processes, as well as contextual influences and all that in the proper time perspective. Johnson and associates (2010; 2006) gave an empirical evidences that justice is inseparable from one's self-concept due to the fact that individuals perceive fairness based on specific aspects of self. He argued (et al, 2006) that "*justice concerns become salient when the self and some aspects of it is engaged*" (p. 176). He goes further and found that activation of self-identity mediated the effects of justice on trust and on cooperative, as well as on counterproductive behaviour (Johnson, Lord, 2010). Different studies take different personal variables into account with the idea to recognize the most influential dimension of personality (Colquitt, 2006), as well as the specific power of construct compared with other factors (O'Neill, 2011; Colquitt, 2006). For example, Colquitt (2006) analyse the effects of big five dimensions (conscientiousness, agreeableness, neuroticism, openness, extraversion), trust propensity, risk aversion, equity sensitivity and trait morality, while O'Neill (2011) add honesty-humility trait to big five dimensions.

Also, there is an endeavour to study effects of motivational factors in its mediating role between justice and task performance (Zapata-Phelan, et al., 2009). On the other hand, some scientists analyse the role of affects on perception of fairness in treatment (Barsky, Kaplan, 2007).

4. ORGANIZATIONAL JUSTICE AND ACADEMIC ACHIEVEMENT – EMPIRICAL APPROACH

The aim of this research is to test the idea that organizational justice could be applied in a context of academic achievement, along with questioning (reassessing) the narrow perception of potential cast of it, as some could infer from the previous field of research and theoretical frameworks, as well as from the existing instruments measuring the concept.

Although literature is full of researches of organizational justice in a work context, there are only few examples of implementing it in a school (Elovainio, et al., 2011; Zainalipour, et al, 2010; Horan, Myers, 2009) or academic environment (Berti, et al., 2010), especially concerning its relation with student achievements (Peter, et al, 2012).

In recent research of Peter and associates (2012), it was found that teachers' experience of organizational justice mediate students' achievement by promoting the atmosphere favorable for development of personality disposition variable of believing in a just world. Elovainio et al. (Elovainio, et al. 2011) used organizational justice as a dimension of the psychosocial work climate in school setting. They assumed that perceived justice among school personnel might be a potentially important predictor of overall school atmosphere that could have some impact on students' achievement, satisfaction, absenteeism and their well-being. Results prove that low level of relational justice among teachers was in correlation with poor academic performance and absenteeism, and frequency of psychosomatic and depressive symptoms as well.

The important findings for this research are results of several studies concerning schools and academic context that showed the importance of justice perception for some aspects of students' life. While distributive justice, defined as the allocation of educational outcomes affects learning motivation and well-being (Dalbert, Maes, 2002), procedural justice affects motivation, rule compliance and trust toward teachers (Chory-Assad, 2002). Since consistent with the researches in social justice, these results are sort of confirmation of idea that organizational justice is an applicable concept in other settings than organization.

Accordingly, the main goal was to bring the concept originally defined in organizational psychology and applied mainly in human resource management domain, in connection with academic performance. So, we tried to find if there is a correlation between perception of organizational justice in high school, and measures of high school and faculty achievements (grades).

Organizational justice is operationally defined by four subscales of distributive, procedural, interpersonal and informational justice (Colquitt, 2001). Variable of academic achievement is measured by the average grades at the end of the first semester at the faculty and then analyzed relative to the organizational justice assessments and high school achievement. We were interested in possible effects of organizational justice in high school on later academic achievements (at University). Although nature of that particular relation is not a subject of this paper, it is possible that experience from the high school could shape subsequent attitude toward other educational settings. Also, we should not forget the impact of broader dispositional

variables that could explain potential covariance of achievement and justice perception. In both cases link between school justice and academic achievement is expected.

In this particular study we hypothesized that:

Hyp.1. there is a positive correlation between high school achievement and all four dimensions of school justice; previous researches of organizational justice and achievements, especially in an educational context support this hypothesis (Elovainio, et al., 2011; Zainalipour, Fini, Mirkamali, 2010)

Hyp.2. there is a positive correlation between academic achievement and all four dimensions of school justice; although there are only few studies that analyze possible influence of justice on later achievement in other organization (Peter, et al., 2012), we believe that it might be useful to explore this possible relation.

5. METHOD

5.1 Participants and procedure

Participants were 253 first year students of Faculty of organizational sciences, drawn from different departments, who were taking psychology course during school year 2011/2012. Mean age of the sample was 19.2 years. 138 participants were woman and 115 men (54.5% woman). They received a course credit for participation in psychological research. Participants were guaranteed protection of their personal data and identity, so the answering sheets were coded (signed by number codes).

Students completed 50 items school justice scale (Kovacevic&Zunic, 2011) based on Colquitt organizational justice scale (Colquitt, 2001), and adapted for school setting. Participants also completed questionnaire regarding demographical data and their high school grades.

5.2 Measures of school justice

20 items were based on Colquitt organizational justice scale (Colquitt, 2001) grouped in four factors: procedural justice (7 items), distributive justice (4 items), interpersonal (4items) and informational justice (5items). These items were adapted for school context. There were 30 original, new items related to specific examples of unjust treatment in high school (measuring justice on its negative extreme for school context – perceived teachers misconduct). This subscale was based on results of preliminary research in which we obtained spontaneous reports from students based on their negative experience in school. After the content analysis, typical themes were transformed into a Likert type scales. Finally, we had a 50 five-level Likert type items scale, with five subscales, measuring school justice. Demographical questionnaire consisted of items regarding sex, age, previous school and school type, previous place of residence and high school accomplishment (grades). Average university grades after first semester were obtained from faculty database.

Table 1 provides reliability indicators of newly introduced school justice measure – school specific unjust events scale. Cronbach's Alpha and Guttmann's Lambda coefficients are presented.

Table 1: reliability of specific unjust events scale

	Number of cases	Number of items	Cronbach Alpha	Lambda 1	Lambda 2	Lambda 3	Lambda 4	Lambda 6	Lambda 7
Valid	252	30	0.863	0.801	0.870	0.863	0.863	0.851	0.887
Omitted	1								

Conclusively, reliability of newly introduced scale is good. It was actually somehow surprising to register that level of internal consistency, considering that specific items of the scale are not at all redundant and refer to very specific, different events or particular examples of unjust (unfair) teacher's conduct.

6. RESULTS

6.1 Descriptive statistics

Table 2 provides the means, standard deviations for all school justice scales. Interpersonal and distributive justice scales manifested significant deviations from normal distribution ($Z = 1.934$, $p < .01$, and $Z = 1.63$ $p < .01$ respectively, Kolmogorov–Smirnov test for normality of the distribution) so they were treated non-parametrically for subsequent analyses.

Table 2: The means and standard deviations for school justice scales

Scale	Mean	Standard deviation
Procedural justice	3.45	0.60
Distributive justice	3.68	0.75
Interpersonal justice	3.76	0.69
Informational justice	3.85	0.72
Specific unjust treatment	3.14	0.69

Table 3 provides the frequencies of school achievement categories. Selection effect of university admission criteria diminished variance of high school grades (result is absence of cases in fair and poor categories in our sample) and distribution was not assumed normal.

Table 3: Frequencies of school achievement categories

High school achievement	Frequency	Percentage
Exceptional (max. average marks)	54	21.3 %
Excellent	130	51.4 %
Very Good	65	25.7 %
Good	4	1.6 %
Fair	0	0 %
Poor	0	0 %
Total	253	100 %

Average students grade after first semester was **8.06** ($M=8.06$; $SD=0.997$). Kolmogorov–Smirnov test for normality of the distribution showed significant deviation $Z = 2.013$, $p < .01$ as a consequence of relative peak in number of failed or missed exams (which was actually expected considering short time spent on university - after one semester in the faculty).

Table 4 provides correlation matrix between high school achievement, average university grades and school justice scales. Because of the obtained results of normal distribution testing, only nonparametric Spearman's rank correlation is presented here (although, Pearson correlation coefficient gave similar figures)

Table 4: Organizational justice, high school and academic achievement correlations

		1.	2.	3.	4.	5.	6.	7.
Achievement	1.High school achievement		0.38 **	0.19**	0.43 **	0.14 *	0.19 **	0.15 *
	2.University achievement	0.38 **		0.10	0.30 **	0.07	-0.01	0.06
School justice	3.Procedural justice	0.19**	0.10		0.48**	0.58 **	0.60 **	0.55 **
	4.Distributive justice	0.43 **	0.30 **	0.48**		0.35 **	0.46**	0.42 **
	5.Interpersonal justice	0.14 *	0.07	0.58 **	0.35 **		0.48**	0.56**
	6.Informational justice	0.19 **	-0.01	0.60 **	0.46**	0.48**		0.53**
	7.Specific unjust events	0.15 *	0.06	0.55 **	0.42 **	0.56**	0.53**	

** Correlation is significant at the 0.01 level (2-tailed).

* Correlation is significant at the 0.05 level (2-tailed).

Significant correlations were found between high school achievement and all dimensions of school (organizational) justice: $\rho=0.19$; $p<0.01$, with procedural justice, $\rho=0.43$; $p<0.01$ with distributive justice, $\rho=0.14$; $p<0.05$ with interpersonal justice, $\rho=0.19$; $p<0.01$ with informational justice, $\rho=0.15$; $p<0.05$ with subscale of specific unjust events. On the other side, university achievement, that is in a significant

correlation with the high school achievement ($\rho=.38$; $p<.01$), is in correlation only with distributive justice ($\rho=.30$; $p<.01$). Obtained relation between academic achievements with only distributive justice may imply more stable character of phenomenon. This is interesting finding considering the fact that two different educational settings are in question. It seems that the perception of distributive justice created in the high school was somehow transferred to new academic environment. Although it seems to be in a collision with the results of previous researches where the more pervasive character of procedural justice was found, it is sound when we consider that those researches were conducted in the same organization. Here, achievement was measured in two completely different organizations in the moment of transition – at first semester.

7. DISCUSSION AND IDEAS FOR FUTHER RESEARCHES

The whole study was based on the idea that concept of organizational justice is applicable in education and relevant for assessment of the effects of justice perception on educational outcomes. As school justice was differentiated into four dimensions of justice: procedural, distributive, interpersonal and informational (Colquitt, 2001), we analyzed correlations between achievement and all four aspects. Also, we created one new subscale designed for measuring school injustice experience – consisting of specific examples of unjust treatment and teachers' misconduct.

In concordance with the previous research findings we postulated the existence of positive relation between justice measured in school context and educational achievement (Peter, et al., 2012; Elovainio, et al., 2011; Zainalipour, Fini, Mirkamali, 2010). Two hypotheses were specified: the positive correlation between school justice and school achievement (hyp.1.), and the positive correlation between school justice and university grades (hyp.2.).

First hypothesis is confirmed for all five subscales, with the highest correlation intensity between distributive justice and school achievement. This is not surprising if we understand the concept of distributive justice which is by definition directly related to work outcomes (grades in school context). Also, this is coherent with the previous research in academic context, where authors analyze distributive justice in the framework of learning motivation and well-being effects of educational results (Berti, et. al, 2010). The perception of justice in an educational context is mainly determined by the estimation of relative proportion between learning effort and result, as well as with some social referent (Cropanzano, 1997). For such a strong correlation among distributive justice and high school achievement, at least two different explanations impose. Unlike the organizational situation, where outcomes of referent to compare are not always transparent, in school surrounding performance and rewards of others are more visible and susceptible to reassessment. So, direct comparison and injustice awareness are easier. Other possibility is that students interpret fairness mainly according to their own outcomes. If they achieve more they tend to perceive situations as more just. Also, it is possible that low performers rationalize their position evoking the injustice. On the other hand, in some previous researches (Horan, Myers, 2009), interpersonal and informational justice, were seen as the most important determinants of fairness in the classroom context.

We found that correlation between school achievement and procedural justice could be explained by the motivation as a potential mediator (Zapata-Phelan, et al. 2009), where those who believe that teachers' practice is inconsistent, inaccurate, biased, unethical and closed to students' input are prone to be less motivated and consequently less successful. The possible impact of one's abilities cannot be ruled out, so this relation could be at least partly explained by mechanism of rationalization. Similar concurrent explanations are feasible for other two dimensions of school justice: interpersonal, that refers to the fair treatment in direct communication with school personnel and informational, that implies the use of adequate and prompt clarifications for school decisions and demands.

The second hypothesis is also confirmed but only for distributive justice. Academic achievement is found to be in a positive correlation with the perception of the distributive justice during previous educational period. This temporal stability of association between educational outcome and distributive justice factor across the different educational surroundings could be explained by the fact that other justice dimensions are situational specific and dependent on concrete interpersonal treatment, in contrast with the distributive justice which is always focused on outcomes (rewards and punishments). In school and university outcomes are very similar. So, transfer of experience among two settings is facilitated. One plausible explanation might include an existence of broader and more stable personal disposition that is connected with both phenomena.

More stable manifestation of procedural justice compared with distributive reported earlier by Saunders and Thornhill (2003) should be understood as an indicator of different study circumstances. Measures of procedural justice were compared in the same organization at different time points. Our assessment of procedural justice referring to the school experience was acquired retrospectively at the first semester of

university education. On the other hand, in our study, outcome measures represent the school and university achievement as well.

Procedural, interpersonal and informational justices are not in a significant relation with university achievement, as well as scale of specific unjust events. Absence of this relation might be against interpretation of direct and durable motivational effect of negative experience during the high school on later attitude toward subsequent education. Their too specific and situational character is likely responsible for the low levels or lack of correlation with outcomes. Nevertheless, this problem of situational or dispositional nature of organizational justice and its relationship with different organizational constructs is beyond the scope of this discussion but could be an object of further researches, especially because two measures of achievement, school and university grades are also significantly interrelated. It additionally emphasizes possible importance of dispositional variables impact on those phenomena.

Eventually, there are some ideas for further research. Dispositional measures derived from cognitive ability, as well as from the personality, especially those previously mentioned, should be included in analysis of organizational justice concept. The main idea is not to reduce this concept to more basic constructs but to clarify its relative impact on consequent variables in a comparison with those constructs. In the educational context there are inspirations to test the stability of measures at later periods of studies and to include other aspects of student behaviour (cooperation, cheating, dropping out), similar to the behaviours already studied in organizational context (organizational citizenship behaviour, counterproductive work behaviour, etc).

8. CONCLUSION

Using academic achievement as outcome variable, this research demonstrated viability and applicability of organizational justice construct in specific context of educational organization. However, peculiarities in organizational conditions gave rise to somehow different accent regarding components of organizational justice. Namely, strong focus on grades and more transparent, frequent and sharpened comparison with other pupils in school (than it is usual in working organization with co-workers), brings distributive aspect of justice in the forefront of school justice perception, relative to procedural, interpersonal and informational facets.

Also, interesting finding of the temporal stability of the phenomenon -persistency of association between distributive justice perception in school and later achievement, even after transfer to university, brings possible concurrent explanations in consideration. Whether there is exceptionally strong negative motivational effect of perceived unfair grading, or, which we find more plausible, some more fundamental dispositional variables (cognitive abilities and/or personality traits) can explain co-variation between later university achievement and school justice perception. Apart from dispositional measures, further research should include other behavioural outcome variables, relevant for educational context (student cooperation, cheating, dropping out, etc).

Dobrivoje Mihailović², PhD, Professor

²Faculty of Organizational Sciences, mihailovic.dobrivoje@fon.bg.ac.rs

Summary: *The aim of this paper is to analyze the influence of emotional intelligence (EI) on career and business in modern organizations. Education, or even work experience, frequently cannot provide employees with the most important skills that affect business success. This paper aims to present the relationship between emotional intelligence and business dedication, the impact of emotional intelligence on organizational leadership and the importance of emotional intelligence for high business performance. By analyzing the literature, we come to the conclusion about the impact of EI on successful business from the organizational and individual aspect. The growing importance of emotional intelligence in modern enterprises is a result of a growing need for teamwork, which requires employees to successfully control emotions, to be able to communicate effectively and collaborate with colleagues and superiors.*

Keywords: emotional intelligence, modern organizations, capabilities, leadership, teamwork, emotions.

1. INTRODUCTION

„Emotional intelligence matters twice as technical and analytic skills combined for star performances. And the higher people move up in the company, the more crucial emotional intelligence becomes.”

Daniel Goleman

As a new sort of intelligence, emotional intelligence (EI) has come a long way from scientific verification and adjudication. Although emotional intelligence is not completely accepted in the scientific circles, as equally important with the other types of intelligence, its success is obvious in the last two decades. Mayer, Caruso and Salovey, gave the unquestionable scientific contribution to the concept of emotional intelligence, developing the model that meets the requirements of the common types of intelligence. The concept of emotional intelligence starts with the importance of defining the meaning of emotions and their utilization as the foundation for understanding and solving the problems. We start from the fact that person with these abilities possesses a substantial advantage in comparison to the ones not having it, in relation to the emotional and social functioning.

2. THE CONCEPT OF EMOTIONAL INTELLIGENCE

“Emotional intelligence” construct emerged in the nineties of the 20th century and led to controversies in the psychology of that period, where emotions and intelligence were being observed as two completely different and incoherent terms. As a result of the ascending recognition of this concept in the scientific circles, the number of researches was increased, but only after publishing the book “Emotional intelligence” by Daniel Goleman in 1995, this term became popularized. Goleman demonstrated the important link between sense and expressing of emotions on one side, and special abilities of self-regulation of communication and social techniques on the other side.

Emotional intelligence refers to the ability of an individual to be aware of personal emotions as well as the emotions of others, to distinct them and use such information as a guideline for personal behaviour and thinking (Salovey & Mayer, 1990). Being the consultant in the organizations, Goleman (1998) concluded that the emotional intelligence matters twice as technical skills and intelligence quotient (IQ), when it comes to the professional success on all levels.

Most researchers agree on the fact that emotional intelligence is connected to other types of intelligence, but differs from the common concept of intelligence. Certain authors believe that emotional intelligence consists of various abilities in relation to the emotions such as perception, identification, understanding and controlling the emotions (Mayer, Caruso, Salovey, 2000). Others believe that emotional intelligence is connected to the key competencies essential for the effective social interaction such as empathy, time management, decision

making and team work (Ashkanasy, Daus, 2002). List of statements representing the integration of different views on emotional intelligence, i.e. resume of the know facts on emotional intelligence (Ashkanasy, Daus, 2002) is as follows:

- Emotional intelligence differs from other types of intelligence, but is connected with them.
- Emotional intelligence differs from person to person, where some of them are more gifted.
- Emotional intelligence develops during the life time of a person and it can be improved by training
- Emotional intelligence refers to the ability of an individual to identify with and recognize emotions within (oneself and the others), as well as possessing these abilities that allows the understanding and successful control of such emotions.

Models of emotional intelligence can be divided in two categories (Mayer, Caruso, Salovey, 2000): models of emotional intelligence as mental abilities and mixed models. Difference between these two groups of models is in the way of understanding the emotional intelligence, whether the emotions are being perceived through their connection with the cognitive aspect or with other characteristics of a personality, as well as motivation and mental abilities being included in the concept of EI. Three EI models are mostly present in the literature, with the two of them being the mixed ones by Bar-On and Golemana, where the model by Mayer and Salovey is a typical example of emotional intelligence perception as a mental ability separated from the characteristics of a personality and meeting the conditions of common intelligence. Whereas the model by Mayer and Salovey is focused not only on the relation between emotions and cognition, model by Goleman and Bar-On includes features such as trust, optimism and altruism.

Emotional intelligence can be measured by self assessment and performance. It is possible to use other people's assessment, but this technique is characterized by a large number of disadvantages, since such an assessment depends on the perception of the viewer. In case the viewer does not own developed emotional intelligence, he or she will not be able to assess the emotional intelligence of another. Assessments of the other people may be used solely as sources of interesting information considering other people's image of us, and other people's understanding of our abilities and skills, but in the scientific sense, they cannot be considered a justified instrument for measuring emotional intelligence.

Initially, in the process of investigation of emotional intelligence, self-assessment scales (based on the model by Mayer and Salovey) are being used, starting from the fact that people act in concordance with their way of thinking and opinions (Bandura, 1977). There are more than ten such scales. When it comes to the concept of emotional intelligence being a mixed model including motivation, features, social interaction, etc., apart from intelligence and emotions, self-assessment scales are commonly used for forecasting the business performance. Self-assessment scales are constructed for the purpose of assessing the believes and perceptions of an individual in relation to his or her competencies in particular fields. However, these scales are based on self-understanding and self-perception, where, in case of a low result, we have a low self-perception of an individual, and not the true level of emotional intelligence development.

Some authors accent the advantages of assessing the emotional intelligence as an ability using the tests where the subjects are demanded to solve a particular task. Examination of the emotional intelligence using tests, i.e. direct assessment of the emotional intelligence is being performed using psychological instruments constructed for the purpose of measuring the problem solving abilities of an individual, where the response of the subject is being assessed based on the set criteria. However, if we start with the fact that emotional intelligence should be considered as a dynamic, instead of a static category, it is necessary to take into account that it is actually contextual and dependable upon the circumstances (Gardner, Sough, 2002). Problem with current instruments for measuring the emotional intelligence is that those are based on the consumptions that emotional intelligence expression is invariable no matter the current situation. Current instruments do not consider the social habits, norms, power or the other relations being a part of most of the emotional reactions. The most important constraint in relation to the emotional intelligence tests is that these do not consider the differences between the personalities of subjects in question. The best solution of a particular life situation for a shy person is most certainly not the best solution for an aggressive individual. Also, the results of measuring the emotional intelligence in family relations may substantially differ from the results of emotional intelligence based on working relations. Therefore, people in family relations presented as emotional intelligent individuals may not necessarily be of same skills when it comes to working spaces and vice versa. Also, the tests of emotional intelligence do not measure the potential of a person, as much as the current skills of that person, that may develop during the life.

3. EMOTIONAL INTELLIGENCE AND COMMITMENT TO WORK

Series of researches found the universal forms of commitment to work: promotion of the work ethic, commitment to career, affective commitment to the company, continual commitment to the organization and taking part in the work. Concept of organizational commitment consists of three different constructs: affective, duration and normative commitment. Duration is defined as a measure of employees being committed to their organizations, based on the damage they believe will be caused in case of them abandoning the organization. Affective commitment to the organization is the positive feeling of identification and connection to the organization and work within that organization (Mayer, Alen, 1984). Normative commitment refers to commitment based on the feeling of obligation towards the organization. Employees with strong affective commitment remain in the organization because they want to, as opposed to the employees with strong normative commitment, who remain in the organization because they think it is the right thing to do.

Emotional intelligence may improve altruistic behaviour, since it permits employees to understand their colleagues, their emotions and react in a more successful way than people with lower level of emotional intelligence, due to their abilities to easily go from feeling bad to feeling good. Positive mood is crucial to altruism, since it permits the employees to keep the positive state of mind. People in a good mood are more socially interactive in comparison to people usually in a bad mood. The more satisfied people are with their work, the more motivated they will be for helping their colleagues

4. EMOTIONAL INTELLIGENCE AND EFFECTIVE LEADERSHIP

Aspects of emotional intelligence such as ability of assessment and expression of emotions, using the emotions for the purpose of improving the cognitive processing and decision making, knowledge of emotions and management of emotions, contribute to effective leadership (George, 2000). A vast number of researches gravitated towards pointing the connection between emotional intelligence and leadership, i.e. examination of emotional intelligence influencing leadership abilities of an individual. The leadership is a process with an individual influencing other, for the purpose of meeting a certain goal, as well as a form of managing the organization so that it becomes more coherent and compact. It is a process where an individual endeavors to influence others so that they do what he or she desires, and the influence that such an individual has on others is stronger in comparison to the formal authority. Leaders should be more mature, energetic, intelligent, motivated, competent, etc. It is not enough to solely possess the emotions, it is necessary to learn to recognize them, as well as to evaluate them. Such individuals have the ability to feel, understand and apply the power of emotions in an efficient manner.

There is a positive influence of emotional intelligence on an individual's work success. This is of particular importance if we believe that emotional intelligence can play a crucial part in creating the efficient leadership. Aspects of emotional intelligence such as ability of assessment and expression of emotions, using the emotions for the purpose of improving the cognitive processing and decision making, knowledge of emotions and management of emotions, contribute to effective leadership (George, 2000).

Emotional intelligence does not fit the scheme of typical historical leadership models, which are connected to important figures of history of army, being the charismatic or despotic personalities. However, people are now using the adjectives such as brave, courageous, with a strong sense of purpose, and decisive. This does not concur with the present needs and the reasons for that follow:

- Contemporary work force do not accept the autocratic style of leadership most commonly used in the past,
- Leadership is developed in direction understanding the sense of democracy and independence within work force.,
- Employees nowadays have more options and choices in comparison to the soldiers from the past back then.

Nowadays, leaders are in position to manage and lead the "reinforced" work force overcoming consultative, cooperative and democratic styles. These new conditions include:

- Consultation and engagement – however, leaders are still criticized for their lack of communication with the employees in relation to the overall vision and goals.

- Autonomy and freedom – leaders are still expected to take the complete responsibility in case the things go in the undesired way.
- Ability for growth, challenge and glory – however, leaders must be available to employees as their trainers and mentors, and motivate them to develop their potentials.
- Engagement and team spirit - but the employees still expect the individual recognition and acknowledgement.

Unfortunately, there is a lack of sufficiently talented individuals that can fulfil all the conditions above. Research conducted by the Center for creative leadership in 2003 showed that the high level of emotional intelligence is connected to the better performance in the following fields:

- participative management,
- calming the other employees,
- self-confidence,
- balance between personal life and work,
- honesty and composure,
- developing and improving the relations,
- preparedness to be completely engaged to work,
- decisiveness ,
- coping with problems,
- change management.

These results show that managers not feeling the responsibility towards others, are not able to efficiently function under the stress, are not aware of own emotions, lack the ability to understand others, easily break under the stress and lose their temper due to problems occurring during working with people.

Successful leaders possess the experience, as well as the strength to recognize themselves, abilities to harmonize the values, intuition and skills of creating the vision. In case the leader is able to share the power, influence and control, there is a possibility of creating one of the main skills and features of a successful leader – shared power, since it permits the fulfillment of main human needs for success and self-respect. Self-knowing is one of the important features of a leader, since it means knowing your own advantages and disadvantages. A successful leader must have the ability to present different, improved, new conditions, situations and ways, and it is of great importance for the leader to possess the vision in order to accomplish them. Intuition is also an ability that a good leader must have, since it means having the overall perception of the situation, forecasting the events, right decision making and accepting the responsibility for possible risks.

5. EMOTIONAL INTELLIGENCE AND BUSINESS PERFORMANCE

Ability to control the emotions and stress is crucial aspect of success, in relation to emotional intelligence. Emotional intelligence influences the time and manner of expressing the emotions and their control.

An interesting research was conducted by Barsade in 1998 on the Yale University. There was a group of volunteers with the task of playing the role of a managers that come together to the group to share the bonuses with their subordinate. In this group, there was an actor, and that information was not shared with the participants. Actor always spoke first. However, he had a role to show different behaviours in different groups: enthusiasm and good mood in the first group, warmth and calmness in the second group, depressive behaviour in the third group or hostile irritability in the forth group. The results showed that the actor “infected the group” with his emotions, where the positive feelings led to the improved cooperation, justice and overall performance of the group. It was also concluded that the happy groups distributed the money in a better and honest way, helping the organization (Barsade, 1998).

Goleman and Mayer, Salovey and Caruso (Mayer, Salovey, Caruso, 2000) believed that the emotional intelligence itself probably is not the strongest predictor in relation to the work performance. It mostly insures the foundation for the development of competencies. Goleman tried to present this idea by making the difference between emotional intelligence and emotional competency. Emotional competency refers to personal and social skills leading to superior business performances. These are connected and based on emotional intelligence, and a certain level of emotional intelligence is needed for obtaining the emotional competencies. For example, ability to precisely recognize the feelings of another, leads to developing special competencies such as influence. People with a better control of their emotions are more prone to developing competencies such as initiative or ambitiousness (Cherniss, Goleman, 2001). In order to adequately forecast the work performance, it is necessary to identify and measure precisely these social and emotional competencies.

6. CONCLUSION

The idea of EI was in shadow of researches directed towards cognitive intelligence, until the nineties of 20th century. Today, almost same importance is given to both types of intelligence. However, numerous authors believe that emotional intelligence is more important for coping with daily problems and stressful work situations. No matter the profession, emotional intelligence makes a difference between individuals successfully coping with stress, establishing satisfying relations with their colleagues and successfully work in a team. Within contemporary companies, team work is given a substantial importance. This team work demands for the employees to successfully control their emotions, successfully cooperate and communicate with their colleagues and superiors and successfully identify personal emotions. Although it is a fact that some of the questions considering emotional intelligence and its measuring will be solved in the future, emotional intelligence has positive implications towards leadership and team work.

Emotionally intelligent people are “optimistic”, they posses a feature that permits them to focus on the decision making more than on the thinking. Work in any modern organization presents problems that can lead to the feeling of frustration. Emotionally intelligent people would know that the organization is not responsible for every feeling of frustration, and are capable of positioning themselves in positive affective conditions, making the destructive consequences less important. This particularly stands for senior managers that must reconcile feelings of frustration and conflicts of interest groups within and outside the organization. This can be achieved solely in case the managers are able to put themselves in a positive state of mind. Apart from that, emotionally intelligent people will know how to avoid disfunctional emotions and use adaptive ways for reducing the feeling of frustration. Therefore, emotional intelligence is expected to enhance the level of affective commitment to organization

In relation to commitment to career, employees may face numerous obstacles for their career growth, which may lead to disfunctional emotions. Emotionally intelligent individual is expected to recognize, manage the emotions and use their emotions to eliminate such obstacles and improve the goals of the career, in a better way in comparison to the ones with lower emotional intelligence. It is defined when particular profession includes the high level of complexity. Highly complex management may be extremely demanding leading to higher levels of stress. Emotional intelligence permits people to control such stress and efficiently impede the negative effects on the attitude towards their profession

Work participation is a description of the current business and it refers to the believe an employee has in relation to the extent to which that work satisfies his or her needs. Employees do not relate to the work solely

based on the need to fulfil personal rational interests, but also based on some of their feelings. Commitment to work is commonly a consequence of emotional rather than rational needs. Manager work is frequently complex and dynamic. Senior managers with high emotional intelligence are often engaged in challenging situations. They stay longer on their work, after the end of working hours. This is due to their desire to overcome the complex tasks that provoke intensive emotional experiences.

Some of the discussions in relation to the concept of EI certainly have a scientific background. This refers to insufficient reliability of certain scales and inability of giving the right and wrong answer when the test is in a form that not include one correct answer. However, these deficiencies are often pointed out as advantages of the concept of emotional intelligence, since some of the authors believe that in this particular way the problems of common intelligence tests, that often do not consider the real life circumstances and situations that do not have one correct answer, are solved. It is completely realistic to expect that the concept of emotional intelligence will be theoretically shaped in the future, in concordance with the results of objective tests and evaluation of the present scales. In this way, EI will find its place in numerous theories of personality features and common intelligence.

EMOTIONAL LEADERSHIP

Ranko Lojić¹, Branko Ninković², Hajradin Radončić³
¹University of Defence in Belgrade, lojicr@ikomline.net
²SANI, branko@sani.co.rs
³University of Defence in Belgrade, radoncich@ptt.rs

Summary: *There is a common world-wide belief that leadership is a key to efficiency in organizations, sports, politics and other human activities. In recent years, both in theory and practice, there has been more insistence on the emotional intelligence of leaders, which is defined as the ability to understand and manage not only one's own emotions and feelings, but other people's emotions and feelings too. Emotionally intelligent leaders are resonant leaders and they will be more and more important in the future, because they put the emphasis on emotional, human aspects, rather than solely on success. Emotionally intelligent leaders are an important source of competitive advantage and success of an organization.*

The paper stressed the importance of emotional intelligence in leadership, pointed out its structure and presented one approach to the formation of resonant leaders.

Key words: *leadership, emotional intelligence, structure, resonance, self-determined learning.*

1. INTRODUCTION

The role of the leader is different from the role played by the classical manager who was not much different from the bureaucrat. Leadership is related to behaviour, or action, but not necessary to position. The essence of leadership is to win people to gather around a single idea, to direct their creative energies, knowledge and abilities in the direction of implementing the goals of organization. Organizations without effective leadership will have very limited chances for success and for the solving of claims and problems, that globalization of the world economy brings in the third millennium.

Leaders' jobs are full of challenges, conflict situations, disappointments, and excitement, and in these unpredictable situations it is necessary to make and implement decisions that are crucial for the realization of the goals of the organization. The complexity of the tasks and duties is a great challenge and a leader who is not ready for such challenges, can not manage successfully. Great leaders are those who are able to attract people with their ideas and vision, to awaken the passion, emotion, optimism and hope, and to direct the whole energy of the group towards a common goal. If emotions of the people are encouraged to grow in enthusiasm, performance can be extremely increased, and vice versa. One of the reasons why emotionally intelligent leaders attract high-quality co-workers is because the work in their presence is a pleasure. Optimistic mood enhances creativity, improves decision-making skills and provides better results in work. Therefore, it is necessary for them to have passion and skills of emotional impact on people and their activities.

The aim of this paper is to present more detailed concept of emotional leadership, makes the structure of emotional intelligence clearer and stress the importance and role of emotional leader in modern organizations. Because it turns out that the competitiveness of the organization to a large extent depends on the emotionally intelligent leader who can develop and are not born as such, there will be a need to sustain those claims by some research. The result of this work should be an understanding of emotional leadership and a presentation of one approach how one can become emotionally intelligent leader.

2. EMOTIONAL INTELLIGENCE IN LEADERSHIP

Emotions (anger, fear, love, shame, sadness, etc.) are vital for survival, they encourage and direct our energy and give meaning to our lives. For a man's success in life, school, work, family, marriage, relationship with friends, intelligence is not enough, it is emotional intelligence that is important, often crucial (Goleman, 1997). Developing emotional intelligence does not end in childhood, but develops and strengthens the whole life. Emotional intelligence includes more specific abilities such as (Goleman, Bojacis and Maki, 2006):

- the ability to understand oneself (self-observation and insight into self needs, affects, conflicts);
- the ability of emotional self-control (containment of affects, and braking ability to transform our emotions in line with the demands of reality and social norms);
- sensitivity to the problems and needs of others (helpfulness);

- self-confidence (self-esteem, optimism);
- the ability to understand other people's feelings (empathy);
- interpersonal conflict resolution skills;
- ability to establish harmonious friendly relations;
- leadership skills.

Comparison between the people in senior leadership positions who are very successful and those in low positions whose results were average, showed that about 85% of the difference between these two groups can be attributed to factors of emotional intelligence, and only 15% pure cognitive ability and expertise (Goleman, 1998).

David Makliland developed a "competency model" of leadership, which serves to identify, train and encourage those who might become extraordinary. As the benefits of highly successful leaders, four competencies of emotional intelligence were distinguished: striving to achieve success, the ability to take initiative, capacity for cooperation and teamwork, the ability to manage a team.

All leaders need appropriate intelligence of analytical and conceptual thinking, but the intellect itself does not make leaders. They have to motivate, guide, encourage, listen and persuade. Albert Einstein pointed out: "We must be careful that the intellect does not create a God. Intellect is certainly powerful, but it is impersonal. He can not lead, he can only serve." If the leader succeeds with his vision to convey optimism and enthusiasm to the group members, if he awakens in them the best skills and encourages the positive emotions, that means that he is a *resonant* leader. The word resonance comes from the word *resonare* which in Latin means echo. According to English Dictionary, the word resonance refers to the reinforcement or extension of the sound due to "refusal", or more precisely, "synchronized vibrate." Similarly, synchronized to the vibrations between people occurs when two people find themselves emotionally on the same wavelength, or when they feel "harmonized". Speaking frankly, in accordance with his own values, the leader establishes a resonance with the emotions of the attendant. Their passion, enthusiasm and energy resonate through the entire group. Group members feel secure, understanding, support, and are closely connected emotionally.

Dissonant leader draws in group only destructive, toxic emotions such as fear, worry, apathy, hate, and the group operates unadjusted and inefficient. The word dissonance in music and in human terms refers to the unpleasant and deafening sound, and the lack of harmony. Tactless criticism from superior causes emotional breakdowns that are transferred from work to family, and stress hormones are circulating through the body for hours later (Gottmann, 1993). Dissonant leaders produce despair in the workplace, but they do not realize how destructive they are or they just do not matter. A. Maslov, based on his research, claims that the successful leaders are more democratic, more compassionate, more willing to help and loyal, compared to less successful leaders. They are the parents-minded and have the ability to enjoy self-realization and development of others. But they are also able to endure to be unpopular, unloved, to see the objective requirements of the situation and respond to them.

The structure of emotional intelligence consists of four domains (areas), as follows: 1) self-consciousness, 2) social awareness, 3) self management, 4) management of others (Goleman, 2006). These domains are not innate talents, but skills that are taught and each individual contributes to a leader to be more resonant, and thus more efficient.

1) Self-consciousness is the basis of overall emotional intelligence and includes three characteristics: emotional self-awareness, accurate self-assessment and self-confidence. For successful leadership are necessary to understand own feelings, needs, opportunities, constraints, values and weaknesses. Self-aware leaders are honest with them and with others, understand their own goals and dreams and they are able to laugh their own shortcomings. They have a strong sense of urgency and intuitive decision-making, when it is necessary to make a fast decision based on lack of useful data. The results of the Hart's research (1999 and 2001) show that if a leader is more unsuccessful, then he more often overestimates his own leadership competencies. The higher position of manager is, the bigger self-deception and more drastic difference between the self-assessment and evaluation of leadership by his subordinates.

2) Social awareness includes empathy, which is a leader's ability to empathize with another man, and move others to action, or the ability to motivate other people, even for strenuous activity. Empathy is not a need for leaders to adopt other people's emotions, nor to please everyone, but to pay attention to the feelings of employees, and making smart decisions with due consideration for these feelings. The leader by his authentic feelings achieves harmony with the feelings of group members, thus reducing tension, anxiety and

motivate group members to constructive action. The main characteristics of social consciousness are: empathy, awareness of the organization and helpfulness.

3) The leaders' self-management does not allow them to be derailed and obstructed in clear thinking and proper decision making by harmful or disturbing emotions. If leader is not able to manage his own emotions, he is not able to manage the emotions of members of his group also. Leaders who somehow allow their disturbing emotions to cause chaos, are not able at the same time to create a positive atmosphere around in which is best to work. Those who control their emotions and impulses, create environment filled with trust, pleasantness and serenity. The basic characteristics of self-management are: transparency, emotional self-control and complaisance.

4) Relationship Management is the positive directing of people, regardless of whether it comes to marketing premise compliance strategy or enthusiasm to some new project. Inspirational leaders with their vision stimulate group members on a common mission and greater commitment to work. They establish a resonance with a wide circle of people that become activated when action is needed.

3. DEVELOPMENT OF RESONANT LEADERS

The subordinates often deprive leader with accurate information about matters of vital importance. They usually retain the bad information because of fear of his anger, especially if the leader's basic leadership style is based on the imposition of command and tempo. Whatever the motive, the leader remains deprived of the information about what is happening around him. Top leaders usually get the least reliable information about what they themselves were doing. The analysis of 177 separate studies that included more than 28,000 managers, found that feedback on the results become less consistent as a manager position was senior, or if his role was more complex (Goleman, 1997). Leaders' self-awareness and the ability to accurately understand their abilities, are important as well as feedback they receive from others. A survey was conducted on a sample of 787 persons in different organizations occupying positions ranging from low to high levels (Burckle, 2001). The results showed that high-ranking executives, compared with those in lower positions, were more likely to evaluate themselves more generous in relation to the twenty competencies of emotional intelligence than the others have evaluated them about these competencies. As they were at a higher position, they more exaggerated than it was thought about them in their surroundings. The difference between how managers see themselves and how others see them, was the highest among those at highest positions. Exact information about leader's abilities can be of great importance to his awareness of himself, and thus for his development and effectiveness.

Emotional intelligence has some genetic component, but education plays an important role also. People may differ in the initial stage of their abilities, but everyone can improve that abilities. Recent studies show that mastering the art of management is same as mastering other skills, such as playing basketball, learning to play the violin and so on. The research results of the European Institute for Education (EIE) show that over the life, people naturally tend to develop their emotional intelligence competencies. As they get older, they are becoming better and better are estimated by the others. For the development of resonant leader, it is very important to accurately determine the advantages and disadvantages of that person. It is known that any learning takes place in the brain, that is capable of producing new nerve tissue and new neural connections and pathways until the end of life. Only adult man takes more effort and energy to adopt new knowledge than in younger years when it was more easily and quickly adopted. It is necessary to remove harmful and adopt new habits. In all periods of life, neurological connections that are used constantly strengthened, while those that are not used, get weaker (Edelman, 1987).

4. SELF-DIRECTED LEARNING

An emotionally intelligent leader becomes by self-directed learning. *Self-directed* implies a systematic and planned development of certain abilities or skills in order to become such as what kind of person we want to be. Model of self-directed learning involves five discoveries, and was developed by Richard Bojacs².

²Richard Bojacs has worked for 3 decades as researcher on leadership skills development. This model describes process of involvement in programs for leaders education, and since 1990. in MBA program in Weatherhead Management School. Use of this model can be found in book: Cary Cherniss and Mitchel Adler, Promoting Emotional Intelligence in Organizations: Make Training in Emotional Intelligence Effective, Washington, 2000.

1) *Discovery of an ideal myself* (who I want to be?). The vision of the ideal self-image, is capable to awake a constructive energy, courage, hope and passion for change, which is neither easy nor certain. The most important thing is to discover your ideal yourself - what kind of person you want to be, including what you want in life and work. When you find an ideal image of your own personality, you are motivated to develop your leadership skills.

2) *Discovery of "no make up" me, the real me* (who am I and what are my strengths and weaknesses?). Since the routine causes the gradual changes that eventually prevailed, the reality of one's life is often very difficult to understand, and when you uncover the truth it can be painful. We realize that we have become exactly what we never wanted to become.

Emotionally intelligent leaders are breaking through the communication quarantine around them and ask directly for negative and positive feedback. The picture of the actual personality and leadership competencies provides a method called "360 degrees". Using this method in the evaluation of leaders involved different people - superiors, peers and subordinates. A variety of different opinions, for different situations by different people, is giving a more complete picture. Each group separately (superior, subordinates, colleagues) give different views of leadership abilities. One study found that the opinions of subordinates were most indicative in terms of actual leadership effectiveness (McEvory&Beaty, 1989). During long-term research in an organization, it appeared that the evaluations of subordinates was the closest to what the leaders managed to achieve two and four years later. Even after seven years, scores of subordinates were matched with what was accomplished by leader - much more accurate than from leaders' superiors.

By getting feedback, leaders should consider their advantages and disadvantages, taking into account the equal of both. Usually the benefits are neglected and disadvantages are exaggerated. Focusing exclusively on the disadvantages cause depression and demotivate.

3) *Creating my own learning plan* (so I can develop my own advantages and at the same time to diminish disadvantages?). For a radical change in management style and personality, a elaborate, detailed, practical and feasible plan is required, which is necessary to acquire new leadership skills, strengthen my good qualities and to release from destructive and harmful habits. The plans must be flexible and manageable. For the success of the plan, you need to feel "inside" that that it fits into your daily life and work and in what you want to learn. Best results are achieved when learning objectives relate to what motivates a man and encourages him in his abilities. Imposed targets reduce motivation because they cause anxiety and doubt about it if you can improve yourself, and therefore does not necessarily increase the quality of work (Locke & Latham, 1998). For rejection of acquired habits and adoption of new knowledge, a firm decision and a permanent reminder are needed.

4) The fourth discovery was *experimenting and practicing new behaviours, thoughts and feelings to perfection*. The radical changes in leadership style and way of life can be reached by persistent and long-term exercise of new patterns of behaviour, thoughts and feelings. Old, bad habits are changing very slowly and it takes to consistently practice the new ones. Large sportsmen spend much time training and a little time incompeting, as opposed to managers who do not devote the time to training. Professional musicians practice until they become able to play without thinking, just feeling. For leaders' training, courses or seminars are not enough to initiate the change process. To start the changes, they are needed to learn by doing other things, thus applying the strategy of "imperceptible teachings". Acquisition of essential leadership skills requires a radical transformation of personality, not only intellectual but also deep emotional sphere. Leadership skills can be significantly improved by using mental exercises. Studies have shown that by using mental exercises, one can increase the temperature of a body part, and to slow down breathing and heart rate. Through mental exercises leaders visualize their success, imagining the realization of an ideal situation and constantly focusing on that image. In this way the brain motivates us by a picture of what we aspire to.

5) *Developing social and emotional relationships* that will provide support and confidence and enable change is the fifth discovery. To acquire new skills and new emotional mental habits, others are needed and a positive and safe social environment also. Development of leadership can be exercised only within the relationship with other people, which confirm or deny the progress made and without which there can be no lasting change. The utmost importance for the leaders might be psychological safety for the acquisition of authentic knowledge. They often feel insecure because they are aware that they were viewed critically by others. The result is increased stress of uncertainty, which further hinders the practice of new behaviours. Because of this, the positive groups in which the relations are friendly and honest, enable people to change positively. For the development of leadership qualities, mentors or coaches can be recruited. The relationship between a leader and mentor (coach) must be based on honesty, trust and support.

5. CONCLUSION

In the old way of managing, the emphasis was put on functionality, and took no attention to the human dimension. The best leaders today avoid to manage on the basis of power only, but also foster relationships with people, establish cooperation and encourage innovation. The key to emotionally intelligent leadership is resonance. The most important competencies for a vibrant quality of leadership are offered by emotional intelligence. Intelligence is to some extent driving exceptional results in cognitive skills (width of thinking and the long-term vision) that are significant, but to achieve brilliant results of higher order critical role of emotional intelligence competencies is needed. Systematic and planned development of certain abilities or skills, or, self-directed learning can affect the development and creation of emotionally intelligent leaders. Emotionally intelligent leaders know how to manage emotions, they are flexible and think clearly under pressure. They are cooperative, less official, know how to listen to, honest, open, visionaries, and take account of the careers of his associates.

The conclusions and results that are derived from the research presented in this paper are important for both theory and practice of management. At the conceptual level, the study of emotional intelligence in leadership can significantly contribute to the development of the theory of emotional intelligence and leadership theory. On a practical level, this study has several important implications for management companies and other organizations. First, it emphasizes the importance of leadership as an important source of competitive advantage of organizations. Second, it confirms some studies, significant and successful leaders and organizations, if the leaders have developed emotional intelligence. Finally, the paper shows to leaders that by self-directed learning, one can improve certain abilities or skills. So, if organizations want to be successful and competitive, they should be led by emotionally intelligent leaders. Further research in this area should further analyze all relevant and useful interaction between emotionally intelligent leaders and successful organizations.

ANALYSIS OF STRESS IN THE HOTEL INDUSTRY DEPENDING ON THE WORK PLACE

Abstract: Nowadays, stress at work has become a ubiquitous and a complex phenomenon, which has been studied intensively for over twenty years. Stress at the workplace can be a particular problem in intensive labour industries because employees often face conflicting demands of the company, their immediate supervisors and clients, all of them creating dissonance. Research on the effects of stress on hotel employees is a topic which has not been fully studied so far, although it is an industry where there is fierce competition, where guests' expectations are more sophisticated and job uncertainty has become a regular occurrence for most employees. In this paper, we dealt with the specifics of stress among workers in the hospitality industry at various positions, its causes and consequences, and possibilities of its management.

Key words: stress, sources of stress, stress management, preventive strategies.

1. INTRODUCTION

The pressure created by time limits in the hotel industry is increasing continually. At one point several time zones are operated simultaneously, and there are more and more restaurants that serve both breakfast and lunch at the same time. The United States National Association for Mental Health States estimates that between 50% and 75% of patients ask for medical help because of stress (Faulkner B, Patiar A. 1997). Hotel industry is an industry that is oriented to people, and the staff in hotels and restaurants are in contact with the guests seven days a week, and for twenty four hours. If we add to this that the companies are under the continuing pressure to improve their own performance and to continually adapt to unpredictable changes in the global market, we can conclude that there are a great number of situations that can be stressful for a hotel employee.

The word stress comes from the English word "stress" and literally means a blow. In its original meaning, ie. as it was first defined by the Austrian Hans Selye, stress is explained as individual response to stressors in the environment and plays a positive role in the mobilization of the whole organism for the reaction and adaptive response " (Faulkner B, Patiar A). However, the most commonly used definition says that stress is " psychophysical condition in which a man finds himself when in difficult circumstances and situations " (Mihailović D, Borovnjak V. 1997).

In the hotel industry, there are four major stressful situations that anyone who deals with hotel management should take into account. First, direct contact with clients as well as the simultaneity of production and consumption of services, not only creates obligations for employees to react quickly but make them the subject of contradictory and conflicting demands and expectations of different sources. Second, if an employee is under stress and thus in a bad mood, this will be reflected in the quality of the service provided and his relationship with the guest. Third, high levels of stress tend to result in high staff turnover, which results in high costs of training and the problem of maintaining the quality of provided services. Finally, one can reasonably argue that hotel managers as employers have a moral obligation to take care of the well-being of their staff by adopting certain measures to reduce employees exposure to stressful situations.

American Institute of Stress (AIS) states that the price of the problems caused by stress at work, amounts to around 300 billion dollars, and the stress is associated with traumatic injuries, absenteeism, job abandonment, reduced productivity, costs paid by health insurance. The same source claims that stress is responsible for 19% of absenteeism, 40% of cases of leaving the job, 10% of costs for drugs, and therefore 40% of the cost of sick-leaves (<http://americaninstituteofstress.org/>)

2. SOURCES OF STRESS IN THE HOTEL INDUSTRY

Sources of stress are usually classified into those arising from the character of an employee and his susceptibility to stress reactions, and sources originating from the environment. Stressors arising from the environment and their combinations often lead to the occurrence of stress at work. This includes work in shifts, work pace, job security and the number of clients or customers with whom the members of the staff interact. Even the noise, which may involve other people talking or the sound of the phone, contributes to stress with no less than 54% (Dessler G. 1997).

Stress has consequences both for the employees and the organization wherein they work. The most common effects include anxiety, stress, depression, anger and various physical effects, such as cardiovascular disease, headaches or injuries at work. In some cases it can lead to the use of drugs, overeating or starvation and the passivity or apathy. Stress also has serious consequences for the company, including reduced quality and quantity of business performance, increased absenteeism and complaints. However, it does not mean that stress is always dysfunctional. Some people are more productive if there is a small dose of stress or when they have very close deadlines to fulfil their tasks.

By analyzing the various causes of stress in the hotel industry, several authors have identified four major ones, such as: conflict of roles at work, role ambiguity, as well as over commitment and the need to make a decision as soon as possible (decision-latitude) (Dov Zohar 1994).

Role conflict at work and role ambiguity are the limiting factors that prevent the employee to fulfil his obligations, and lead to increasing stress and sanctions in the work place. In the event of a conflict of roles, the employee may be subject to conflicting requirements, when the fulfillment of one task hinders the realization of another duty. Conflicting expectations may originate from one person (for example in the case when both the quality and speed in performing the tasks are required at the same time), from various persons, or from someone else with whom he disagrees for any reason. On the other hand, role ambiguity occurs when employees are not sure about their work responsibilities, and when the information they need is not available or is delayed.

Unlike the previous two stressors arising from interpersonal dynamics of relationships of different work roles carriers, the two other stressors are associated with the organizational structure of hotel companies. Studies have shown that even hotel managers who are not in direct contact with guests respond to these four stressors.

3. ANALYSIS OF STRESSFUL SITUATIONS AND REDUCE OF STRESS AT WORK

Each person has his own individual measure of workload that he can overcome successfully without harmful consequences. Therefore it is necessary, to the extent possible, to avoid stressful situations, to recognize the symptoms of stress and when they occur to minimize the negative effects.

Some of the most common symptoms of stress are: (Mihailović D, Borovnjak V.2008).

- Physical. Fatigue, headache, insomnia, stiffness and muscle pain, heart palpitations, chest pain, nausea, trembling, cold hands and feet, redness, sweating
- Mental. Impaired concentration and memory, indecisiveness, hasty or difficult thinking, confusion, loss of sense of humor
- Emotional. Anxiety, depression, anger, frustration, worry, fear, hot temper, impatience
- Behavioral. Accelerated progression, anxiety, nail biting, excessive eating, smoking, drinking, crying, blaming someone else, violence

There are a number of individuals who make unrealistic picture of themselves, ie. overestimate or underestimate their abilities. Anyone who overestimates his intellectual and physical abilities can find himself in an unpleasant situation if the tasks overcome his capability, if he fails to find the adequate solution and if he does not adjust to changes.

Realistic perception of his intellectual and physical potential with the assistance of psychologists and valid tests enables the employee to accept as much responsibility as his powers allow him to. And this is one of the important factors of success at work. In fact, when one is physically and mentally tired it is more difficult for him to remember and carry out his tasks. If he is scared, depressed, ill-disposed or of poor general health, quality of his work will be poorer.

Optimal conditions at each workplace are determined by factors related to lighting, temperature, humidity, air movement, noise, shift work, vibration and the like. Not only will a sense of comfort and pleasure at the workplace depend on them, but health, productivity and safety as well.

Analysis of the stressful situation means that you yourself should have an insight into the basic elements of the new situation and face with the facts. In her book "Stress and manager, Dr. Karl Albrecht suggests the following ways to reduce stress: (Dessler G. 1997).

- Form pleasant cooperative relationships with as many colleagues as possible
- Do not take more tasks than you can fulfil
- Negotiate with the superiors about the realistic deadlines by which to get the job done and be ready to propose your own terms rather than waiting for them to be imposed on you
- Always take time to relax
- Make a constructive "problem list" - write down the problems that bother you and beside each of them write what you plan to do about it
- Learn as much as possible about upcoming events and prepare for them as well as you possibly can

In recent years, major medical centres have been developing the method of autogenic training as well. This method is based on the suggestive influences, more precisely, autosuggestion. Suggestions do not affect directly mental content, such as fear, but the physical manifestation of the psychological content in the form of muscle tension, palpitations, breathing difficulty, etc. By relaxation, through removal of these bodily manifestations, psychological balance is achieved.

Another old-new concept which emerged in the mid 80's is the development of life skills in a variety of stressful situations or life skill education concept. The essence of this concept is to learn some basic life skills. Life skills are defined as: "the ability of adaptive behavior, which helps individuals to deal effectively with the challenges of everyday life" (Hayes, D.M. & Eddy, J.M. 1985). Some of the key skills relevant to this concept are: analysis and problem solving, decision making, development of critical thinking, development of creative thinking, communication, empathy, overcoming stress, mastering emotions, interpersonal skills, etc.

As for the stressful situation itself, experts insist on education which aims to enable the person to establish more effective control of stress, as well as of one's own effective response and behaviour.

Very often companies, in cooperation with their departments of human resources, can play a key role in reducing stress at work. Supervisor who monitors the performance of subordinates is responsible for identifying symptoms of stress and then he is obliged to inform employees on organizational solutions that are available to him. The role of experts in human resources is to conduct a survey of employees periodically in order to repeat the selection process if necessary, determine the adequacy of the workplace for the employee and provide career development so that the employee should occupy the position that suits best his abilities.

Management of a catering company should be aware of the difference between the sexes when it comes to stress. It is believed that women are socially-oriented in their behavior, while men have a task-oriented behavior, which would mean that women are more satisfied with their jobs if they cooperate well with others in the company, while men are content if others value their work. This difference is also reflected in their responses to stress, therefore women are much more actively and more directly confronted with problems, mostly by working longer and harder than men (B. Cheol P. Kim, Suzanne K. Murrmann, Gyumin Lee 2009).

Many studies indicate that women who make their career in a predominantly male work environment are usually exposed to chronic stress., ie. they have more health problems caused by stress than men. The reasons for this are the stressors that are more specific for women than men, such as harassment, and sexual harassment in particular. By reducing these stressor women are allowed to advance their career and eliminate the effect of "glass ceiling" that often occurs in higher positions.

4. THE RESULTS OF STUDIES OF STRESS AT DIFFERENT POSITIONS IN THE CATERING AND HOTEL BUSINESS

Analysis of work as a professional technical method has showed that some jobs are more subject to stress than others. For example, professions such as a doctor in the emergency room, nurse in the emergency department, police officer, firefighter, pilot and the others expose people who perform them to a high level of stress. Quieter jobs such as professors, janitors, librarians and the like do not produce such a big risk. The fact that some jobs are more stressful than others is confirmed by the results of a survey which included more than 130 different jobs. They showed that several jobs such as a doctor, shift commander in the militia, foreman, waiter, include very high levels of stress. Much lower levels of stress are included in the jobs of maids, artisans, farmers (Mihailović D, Borovnjak V. 2008).

The typical organizational form of large international hotel includes division into the supporting sectors and operational sectors. Operational sectors include accommodation, food and drink, and they are directly responsible for meeting the needs of guests, while the supporting sectors encompass the commercial service, service marketing, financial and accounting service as well as the department of human resources and they have no direct contact with the guests, but provide an efficient and effective functioning of the hotel.

From this we can conclude that the different departments in hotels generate different levels of stress. The role of employees in the department of hotel housekeeping is fundamental in creating the hotel product

and if they do not meet certain standards that will affect the guests' perceptions of other services offered at the hotel. However, despite this, the department has less valued status in the eyes of managers and other employees. This may seem rather demoralizing, especially if we consider the unpleasant nature of this business. Although maids generally have little interaction with the guests and do their work in isolation, a stressful situation can easily occur: for example, in the midst of performing their tasks the receptionist could call them to clean another room urgently. Stressful and unpleasant moment could also be a guest entering the room, and the efforts to comply with the timetable despite the lack of cleaning agents and lack of equipment. Another potentially stressful situation is introducing new standards of quality control, which requires minimal administrative tasks to be performed by the staff, which could also be a huge burden for them.

As for the staff at the reception, not only do they represent their own department, but also a reflection of the quality and standards of the hotel as a whole. In the course of their working day their job is to check in and check out guests, solve a number of situations that require empathy, patience and discretion, and meet the demands of the guests of different cultures and linguistic backgrounds, all of which can be a potential source of stress. Besides the above mentioned, there are two situations that can be particularly frustrating and stressful, the first is completely beyond their control, and that is when the hotel policy does not allow them to respond because it is not in their jurisdiction, and the second situation requires communication with other departments that takes place under the pressure of rapid response, when the chances of conflict is very high. Because of this, management needs to act preventively and to provide ongoing training so as to reduce worker absenteeism and high employee turnover.

5. CONCLUSION

Surveys conducted in the hotel industry have shown stress has harmful effects not only on productivity at work, the performance of employees who provide services to guests in real time and requires them to reach decisions on the spot, but it also reflects the increased costs of training of new workers for leaving work, the problem of quality, and the cost of health insurance. Four major stressors that are commonly mentioned in the literature dealing with these issues are: conflict of roles at work, role ambiguity, as well as work overload and the need to make a decision as soon as possible (decision-latitude)

Message for this industry is that while working with guests can be a challenging and difficult job, tensions and conflicts with colleagues do much more severe damage to health. Managers are generally more vulnerable to stress because their positions include much more responsibility and they have more working hours than employees at other positions. Therefore, considering the above mentioned, the obligation of every hotel manager is to protect the welfare of their workers, and so he will find, evaluate and acquire managerial experience to reduce workers exposure to stressors that are difficult to control, while at the same time they must provide an adequate standard of quality and performance.

MANAGERIAL STRESS IN AUDITING COMPANIES

MSc Marko Jovanović¹, MSc Milan Okanović², Aleksandra Stanković³

¹Faculty of Organizational Sciences, jovanovic.marko@fon.rs

²Faculty of Organizational Sciences, okanovic.milan@fon.rs

³Faculty of Hotel Management and Tourism, aleksandra.stankovic@kg.ac.rs

Abstract:

Stress management in auditing companies has become a primary strategic and operating concern for all big auditing houses because of the direct link between the very practice of auditing and the time auditors spend at work, as well as between good hiring practices and successful business. The term "stress" has been, in science and in everyday life, so widely used that it has acquired a great number of meanings and forms. The subject of our research was stress experienced by auditors working in big companies. The main goal of our research was to investigate whether and to what degree the auditors are exposed to stress and to what degree it influences their work and efficiency in business and control over financial reporting. In order to obtain more precise results in our research, we set up exact goals. We examined which period in the auditing year are the most stressful, whether specific positions in auditing influence the appearance and manifestation of stress, and whether it is possible to determine the influence of stress relief mechanisms on the frequency of stressful situations. Another goal of our research was to determine the interdependency between mechanisms that employees in auditing companies use to alleviate their own stress and the frequency of stressful periods over the years. In general, one half of the examinees alleviate stress at work through some sort of physical activity, whereas one quarter engages in different social activities. Based on the results obtained and processed, we came to the conclusion that stress greatly influences auditors and their work performance. We came to this conclusion since only 4 out of 50 auditors stated that stress has no influence on their work performance. As supposed, the most stressful period for the auditors is the process of control over financial reporting, and this stressful period equally affects male and female auditors.

Key words: Stress, auditing companies, stress causes, stress prevention, stress consequences

1. INTRODUCTION

Stress is a physical and psychological state that a person is in when confronted with difficult times and situations. It is problematic for experts to give the definition of stress since this phenomenon is highly subjective and difficult to measure and define. The notion of stress was introduced by Hans Selye in 1936, and he defined it as "the non-particular response of the human body to any need for alter"... Many scientific disciplines dealt with different aspects of stress, from biological sciences, such as physiology, biochemistry, and neurophysiology; through psychology and its disciplines: clinical psychology, mental hygiene, developmental psychology, social psychology, and other; to humanities such as anthropology and sociology. It is not surprising that the notion of stress was used with different meanings in these scientific disciplines, making thus its definition even more confusing. (Mihailović, D., (2009). *Psihologija u organizaciji*).

In the psychological literature, as well as in formal and informal communication between the experts, we can distinguish two approaches to understanding of stress, where in each of these two there are two versions of the definition. The first approach perceives stress as an external event, more precisely: (1) as an event that for most people represents a threat or a loss (or, rarely, a challenge); or (2) as an event that for the specific individual represents a threat or a loss (or a challenge). The second approach perceives stress as the reaction to the external event, more precisely: (1) as the activation of intense feelings (mostly unpleasant); and/or (2) as sum of the specific bodily reactions. (Macaulay D., (2010). *Successful Manager's Handbook*).

With the efficient stress management come direct obligations and responsibilities, with their own price. Auditing companies and their employees are much more required to invest their time, financial resources and skill in creating quality working time and environment and these requests can themselves be causes of stress. This makes recognizing the possibilities for the occurrence of physical and psychological stress absolutely necessary, as well as taking the necessary steps in the working place, occupation and business design towards the elimination of stress, or at least its minimization. If this is not possible, organizations and

their managers must be prepared to accept the fact that as the result they will have to face the problems of absenteeism, illness, injuries and job burnout.

The circumstances causing stress are also called stressors ("impactors"). The notion of stress in narrow sense signifies the physical reaction to the influence of the external stressor. When the "stress is loaded", man becomes ill: he/she can feel chronically tired or exhausted; may suffer from insomnia or increased need for sleep; may lose appetite and the ability to enjoy life; may feel depressed, anxious, experience crying and panic fits, obsessions and phobias. (Leplat, J. (2008). *The factors affecting workload*).

Starting from the developmental phase of stress and its consequences, as Selye did, we can distinguish three phases of stress. These phases are: the phase of alarming reaction (the beginning phase that doesn't last long and means preparing to face the stress), the phase of resistance (the organism enters the fight with stress and endeavors to cope with it), and the exhaustion phase (the organism subsides; its defensive strength is exhausted). According to Selye the development of stress is a long and exhausting fight of an organism and it can influence that through these three stages stress becomes illness. Stress illness is the consequence of the long term resistance to pressure.

Emotional reaction of a person in a stressful situation can be stretched between totally opposite meanings. These opposites are types of stress, eustress and distress. Eustress is a pleasant experience of self-fulfillment and joy, even though it is preceded by fight and exhaustion, whereas distress is an unpleasant emotional experience, negative and defeating, and a person wants to be relieved from it as soon as possible. A person going through distress is in agony and is suffering, feels great dissatisfaction and loss. In everyday speech the term stress is mostly used with the meaning of distress. (Leplat, J. (2008). *The factors affecting workload*)

2. CAUSES OF STRESS

2.1. WORKPLACE STRESS

Workplace stress creates possibilities for heart attacks and cerebral attacks, ruins mental health and shortens life. Ten years ago World Health Organization (WHO) pronounced workplace stress a global epidemic, and since then the workplace stress has increased even more because of the intensified global crisis and unemployment. Burnout syndrome denotes the state of complete emotional exhaustion due to excessive yet pointless putting of effort into work. Work burnout is similar to chronic fatigue syndrome, what makes them different is the changed attitude towards the work which is not characteristic for fatigue. Americans estimated that their companies lose around \$200 billion a year because of accidents caused by stress, decreased productivity, workplace absence (sick leaves) and medical insurance expenses. (Macaulay D, (2010). *Successful Manager's Handbook*).

Stress is a phenomenon that can be encountered wherever people live and work. Some professions are more exposed to stress, and some are less. The professions marked as highly stressful are: pilots, rescue service workers, journalists, actors, miners, construction workers, doctors and medical staff, especially those working in emergency room, flight controllers, prison officers, and other. Among the highly stressful professions managers and auditors in general are ranked pretty high. Stress and strain in these professions comes from almost every aspect of the job, especially from work operations: decision making, responsibility for the job completed, dealing with problematic situations, time pressures, striving to advance in business, to improve personal reputation, interpersonal relations, to find a new job, but social, economic and political environment also greatly influence the stressfulness of these professions. Managerial stress is the subcategory of stress that persons who are under great dose of responsibility, for companies as well as for its employees, are exposed to. Very often it is connected to deadlines, and making of difficult and responsible decisions under highly uncertain circumstances.

After all one of the main causes of workplace stress are interpersonal relations. Workplace stress that results from bad interpersonal relations is also described by the notion of mobbing, which denotes psychological terror that employees exert on their colleagues. Corner stone of this type of behavior is usually some disagreement, and then schemes, plots, humiliation and isolating ensue. For fear of loss of the workplace the "guilty party" can develop burnout syndrome and chronic health issues, and relief can be sought in leaving the workplace, or even suicide. And yet, every environment can cause stress, and some levels of stress are part of everyday life, and not just a consequence of workplace relations and circumstances. Interpersonal

relations of great quality, as well as those in the workplace, are never accidental; they are always the result of good interpersonal communication and appreciation. Good communication and work in a group give rise to new ideas and problem solutions due to sharing of experience and knowledge. It is of great importance that people learn to control their emotional reactions and avoid openly showing antipathy towards others. It is permanently employed that are most often exposed to stress – everyday or several times a week- whereas independent contractors and artists are least exposed to stress. As far as position is concerned, workers, experts and management are exposed to most intense stress, and they experience it every day, whereas apprentices and those at starting positions are under least stress.

Psychological symptoms also vary, and cover such states as anxiety, lack of concentration, frustration, agitation, aggression, insomnia, and in severe cases depression. Symptoms of the state of stress are not only unpleasant in their nature, but also restrain the person from his/her optimal performance at work causing thus more stress, and in that way the well-known enchanted circle is created.

2.2. PSYCHOLOGICAL REACTION AND CONSEQUENCES OF STRESS IN AUDIT COMPANIES

Audit is a systematic process of gathering and estimation of evidence that the management of a company provided about economic events and activities, in order to determine the degree of compatibility between those claims and determined criteria, and hand over the results to the customer. The goal of audit is handing over the results to the concerned customer (whether the financial reports paint “true and faithful” picture of the economic state). There are three basic types of audit: audit of financial reports that implies the examination of financial reports in order to determine whether they paint true and faithful picture or whether they present financial information truthfully according to the given criteria; operational audit that deals with the inspection of the operation of the specific organizational unit in order to evaluate its performance, and audit of compliance with rules and regulations whose goal is to check whether the organization follows certain procedures, rules and regulations prescribed by a higher instance.

Those working in audit have a lot of work and often work overtime. An auditor is responsible for forming and articulation of opinion about financial reports, whereas the management is responsible for its arrangement and presentation (audit does not diminish this responsibility of management). Main types of auditors are: independent auditors, who are usually authorized by some professional organization or by the government, internal auditors, who can be hired to do financial reports audit but the results of their work are then controlled by independent auditors, and governmental auditors, who can do the work of both independent and internal auditors. Although audit is mostly based on judgment, or in other words articulation of opinions (depending on the method used – statistic sample, audit risk, etc.) and that makes it faculty rather than science, the process of audit is still a systematic process. The audit process starts with the inquiry of a client, then an audit plan is made, the process of auditing takes place (examination of evidence) and finally an auditor forms his opinion. (Salas, E.M., Driskell, J.E., & Hughes, S. (2008). *Introduction: The study of stress and human performance*)

The four great audit companies influence the audit process in the world: Pricewaterhouse-Coopers (PWC), KPMG, Deloitte & Touche, Ernst & Young. Organizational form of these companies is partnership, and partners hire professional staff. Professional staff in these companies is comprised of: partners/executives (the owners of the company), managers (who follow and monitor audit), authorized auditors- supervisors (work on the field), younger auditors- auditor assistants (routine tasks). Each employee has his/her own tasks and stressful situations that follow them.

It seems that in many organizations there is a tendency to put people in the position that carries too much stress and is not appropriate. Many auditors make their problem even worse by their selection of delegated people for the creation of financial reports. These delegations are usually made in order to help the auditors that have too much work by sharing their responsibilities with their subordinates. However, delegating usually increases the auditor's stress. They usually delegate parts of their own work and more complex problems. The time that is in this way saved is later spent on worrying about problems that causes the most stress. By delegating, the personal stress portfolio of auditors is increased. In order to be more efficient it may happen that they delegate some of their most stressful tasks, such as audit of supply chain. Once the efficient delegation balanced the stress, next step to take is give priority to the tasks left to be done. By doing this auditors will in a more simple and easier way set up daily goals and set priorities. (Salas, E.M., Driskell, J.E., & Hughes, S. (2008). *Introduction: The study of stress and human performance*)

Examination and observation of psychological reactions of auditors working in great companies throughout one audit year made it possible to explain many questions related to stressful situations, psychological reactions and consequences. At the time of writing of financial reports, and when some important factor necessary for the completion of the report before deadline set by the client is missing, depression, general anxiety and post-traumatic stress disorder are observed. Relatively frequently observed symptoms are increased precaution, and fearful expectation of the next meeting with the client, hyperactivity, psychomotor restlessness and insomnia and nightmares. Since work in audit is very stressful and turbulent, terms of notice are quite common in all levels of management. Through examination and observation of the reactions of employees it was determined that it, almost infallibly, goes through the following stages:

1. Phase of impact (shock) - immediately after receiving terms of notice or unfavorable result of an auditor. It is characterized by the intense fear because of material endangerment and endangered reputation of the person in a company or society, and that is followed by corresponding problems (sweltering, breathing with difficulty, tachycardia...). Stupor and confusion, narrowed consciousness and attention, are also characteristic for this phase. These are all consequences of the strong effect of fear caused by the receiving terms of notice.
2. Consolidation phase: characterized by the mitigation of fear which makes it possible to more realistically look upon the situation and plan and execute organized activities in order to overcome the fact that one was fired and to concentrate on other open work positions in other competitive companies. This phase is characterized by great and devoted activity leading to irritability and exhaustion.
3. Phase of unjustified optimism: the phase in which after the abatement of the initial fear and tension, contentedness because of other possible positions in banking sectors and consulting becomes prominent. Auditors going into other branches have much more possibilities because of the comprehensiveness of their work. This leads to unjustified optimism in the consideration of possible future employments.
4. Phase of sobering down: characterized by the realistic perception of the present and future state of affairs, followed by depressive mood and anxiety, as well as with justified and unjustified disappointment in the new job, which never completely fulfills the expectations of an auditor. Hypersensitivity to actions of other employees, irritability, and envy for those who were luckier in the reorganization of work, are further characteristics of this phase.
5. Phase of reorganization: comes on scene when the hired auditors start anew to build their careers, and realize that their career depends solely on them. All the strength is used in that purpose. Possible mistakes and failures are followed by the bitter feelings, depression, anxiety, and loss of self-esteem, but the disposition to blame other colleagues, towards who negative feelings are developed, for one's own mistakes. (Lupien, S.J., Gillin, C.J., & Hauger, R.L. (2009). *Working memory is more sensitive than declarative memory to the acute effects of corticosteroids*)

3. STRESS AS AUDITORY ILLNESS

Despite the range of managerial occupations that exist, most auditors do some, or all, of the following activities: handling the financial reports, development and control of the subordinates, planning and organization, creation and maintenance of interpersonal relations in the team, communication with the clients, ensuring of joint and team efficacy, solving of problems and making decisions about the acceptance of audit. All these activities are highly quantitative and qualitative working norms for auditors, and they increase tension at work and decrease the very work on audit. Auditors have longer working hours than other workers. Also, a part of work, that is usually not paid, is done at home. That part makes about 40% of additional work. It is not surprising that working hours are source for conflicts on the work-home relation, especially for the executive auditors and partners. For most of the executive auditors it is a great problem to balance between work and life out of work. When faced with the problems on the relation work-home, they become more nervous, experience psychosomatic problems and suffer from depression on the workplace.

Roles of auditors are also characterized by high degree of responsibility and decision making. And, while certain degree of autonomy and freedom in making of the decisions has certain advantages, researches have shown that too much autonomy and freedom in decision making can be stressful and can endanger health. When certain level of autonomy is passed, work performance can deteriorate. (Wickens, C.D., Fadden, S., Merwin, D., & Ververs, P.M. (2008). *Cognitive factors in aviation displa design*)

As the consequence of all that we find the following consequences of stress in auditors. Psychological and emotional consequences, inability to concentrate during work on difficult tasks, loss of attention. Memory capacity decreases, both short-term and long-term, and they cannot perform their auditory duties devotedly. Problems that demand momentary and spontaneous reaction are solved in unpredictable ways. All the problems that demand mental activity are solved with many mistakes. Auditor is not able to estimate the momentary situation. The way of thinking does not follow logical and connected schemes, respects no order, and is unorganized. Difficulty with emotional and physical relaxation, tension. Increased impatience, intolerance, authoritativeness, lack of understanding for others. Moral and ethical principles that shape one's life are weakened. (Lupien, S.J., Gillin, C.J., & Hauger, R.L. (2009). *Working memory is more sensitive than declarative memory to the acute effects of corticosteroids*)

Managers are also faced with the unique causes of stress during maintenance of trust in the rightfulness of decisions on high levels. For example, employees usually feel betrayed in the cases of restructuring or decrease in the size of a company. Usually there is a long time span between the decision making of the managers and the results from the point of view of employees. An unfortunate side effect is that the influence of the decision made on the employees is of no interest to the managers. However, managers have already faced the weight of these decisions in past. Consequences for managers can be isolation and loneliness. Managerial isolation and loneliness may also be a consequence of the function they have in the hierarchy. Direct decisions can separate the managers and make them "different" from the rest of the employees and can be an obstacle for sincere and open communication.

Stress also has a great subjective element. What one perceives as advancement others may perceive as highly stressful. For some people some parts of work are more stressful than other. For example, some apprentice auditors see paperwork as a chance to be away from the pressures of audit department, while others are insulted by that work because it keeps them away from the audit department. (Wickens, C.D., Fadden, S., Merwin, D., & Ververs, P.M. (2008). *Cognitive factors in aviation displa design*)

3.1. STRESS PREVENTION IN AUDIT COMPANIES

There are a number of measures that a person or audit organization can use in order to diminish the causes and effects of stress. There are different guides that pay attention to good administration and management, to approaches to stress, training and resources for the completion of work and control of changes. Also, different techniques are suggested that should help one to control stress, such as: changing of the point of view, putting away problems in perspective, learning to feel joy of living, not worrying and working on the reduction of stress, thinking positively, and trying to slow down the pace of living. Stress control is the key to successful career. Some studies have shown that for success it is not enough to possess characteristics such as self-discipline and the ability for systematic work. Equally important is the ability to control negative feelings, such as fear and tension.

Many auditors are trying to diminish the effects of stress in a completely inappropriate and even harmful way. Nicotine, alcohol, caffeine, sedatives and narcotics are usually the means that auditors use to reduce the stress they feel. Substances that encourage action and increase performance at work or stimulants, work by encouraging excretion of neurotransmitters serotonin, noradrenalin and dopamine, but this causes great rises and falls in the energy and mood. In time, organism adjusts to them, and it is necessary to increase the dose of stimulant for the same result. Many take daily high doses of coffee, cigarettes, alcohol, chocolate, or all of them together. These do not reduce stress; they even create the addiction that breaks natural anti-stress mechanisms. (Diaz, D., Hancock, P.A., & Sims, V.K. (2011) *Ecological visual search under noise stress: Present & future research*)

Positive use of stress is important in prevention with auditors. Crises can influence everyone in an audit organization, or they can influence only certain individuals, however it is important for them not to allow desperation to overpower them. Actually, stress resulting from a crisis can be used in one's own advantage. Since stress increases their adrenaline level, they can use it for additional energy to solve the surprising

situation, if possible. (Williams, J.M., Tonymon, P., & Anderson, M.B. (2008) *Effects of life-event stress on anxiety a peripheral narrowing*)

Mental training has a great role in stress prevention with managers. Through methods of psychological or mental training, auditors can learn how to psychologically correctly overcome the stressful situation, and not how to avoid it, since in audit it is absolutely impossible to do that because of the very nature of the work. It is considered that all those who neglect the symptoms of stress, or, because of the nature of the work, expect the possibility of occurrence of stressful situations should in time go through professional treatment which would provide them with necessary knowledge and skills for the preservation of their psychological and physical health in the circumstances of everyday stress at workplace in audit companies.

Physical activity plays an important role in the prevention of stress. It encourages excretion of substances that act like natural antidepressants and anxiolytics – noradrenaline, endorphin and encephalin. Furthermore, regular exercise decreases level of estrogen and thus reduces the possibility of formation and growth of estrogen-induced tumors. Physical activity can greatly reduce stress and the intensity of reaction to stress. Particularly useful are aerobic exercises, such as hiking, running, swimming and riding a bike. Stretching is useful for muscle tension. Regular physical activity is a good strategy for coping with stress for auditors.

Communication between higher and lower auditors is of great importance. Through expressing and sharing of opinions with the members of the team auditors may come to better understanding of their own feelings; talk about what has been noticed in the reports, thinking and reaction on the stressors and deadline and client traumas is also very important.

Practicing of methods for stress control enables auditors to acquire mental, physical and emotional calmness on a wider plane. Knowing oneself increases the possibility for individual control, for the feeling that one has his/her life, problems, and difficulties in his/her hands.

4. RESEARCH (METHODOLOGICAL) APPROACH TO THE PROBLEM AND THE RESEARCH RESULTS

4.1. SUBJECT MATTER, AIMS, HYPOTHESIS AND DESCRIPTION OF THE RESEARCH

The subjects who work in the field of auditing participated in the research of the phenomenon of managerial stress. Sampling frame consisted of employees in the auditing companies operating in the international markets. Observation unit consisted of 49 participants from the auditing sector and consulting services of 75 employees in the sector. The sample comprised 36.7% of male population and 63.3% of female. The sample is representative for the reference sampling frame by sex ($X^2 = .225$, $p = .664$), because the difference between relation of male and female population was not determined.

Data obtained in this study were analyzed by using statistical software for data processing in the social sciences SPSS 17.0. Qualitative data were analyzed using descriptive statistics test for the analysis of variance (ANOVA) and Hi square test (Pearson Chi-Square) and determining the statistical significance of individual comparisons. Data collection was conducted through survey. Participants filled in electronically pre-prepared questionnaire, the survey was anonymous, i.e. the identification of respondents was not required. The survey consists of ten questions, claims related to auditors' perceptions of working conditions and control of financial reports. Encircling one of the answers, auditors participating in the survey marked to what extent they agree with the offered answers or to what extent these refer to them. The software package SPSS 11.5 was used for data processing. The responses were entered into SPSS spreadsheet program based on filled questionnaires. The frequency of responses expressed in percentages was calculated for each question in the questionnaire. Based on the results, which are presented in graphical and tabular form in order to be more clear, further analysis were carried out and conclusions were derived. The aims of the research and analysis are:

- The respondents' familiarity with the phenomenon and the influence of managerial stress in their daily business.
- Determining the period of most intense stress during an audit year
- Determining the impact of stress relief mechanisms on the frequency of stressful situations

4.2. RESULTS OF RESEARCHES

More than two-thirds of respondents (71%) believe that they know what stress is, while one-fifth does not think that they are completely familiar with the term. On the four-level scale for evaluating the effect of stress on business quality, medium grade is closer to the ultimate value and it is 2.71 (SD = .76376). The causes of stress in the form of hard and demanding work and causes that are not directly related to employment, i.e. that are concerned with personal ambitions, pressures of environment, etc. are found to be equally prevalent on the sample. Conflicts with colleagues and superiors are the causes that appear least in the respondents' choices. Increased nervousness with insomnia is the way in which stress is manifested in the cases of almost half respondents (38.8%) while the next most frequent case is lack of interest in 30.6% of cases. A fifth of respondents have health problems that include nausea, headache, stiffness, and other. What is specific for employees of audit companies is that more than half of respondents are under most intense stress before the deadlines for submission of final reports. At the level of the annual audit, the most stressful periods are almost equally present with the respondents. (Figure 1)

Figure 1. Most stressful periods during the annual audit work

One of the aims of the research is to determine the interdependence of the mechanisms employed in auditing firms use to reduce their own stress and frequency of stressful periods over the years. Generally, half of respondents reduce stress at work through some physical activity, while a quarter participates in various social activities. 18.4% of them have their own hobby as a mechanism for stress relief and 8% of respondents use the service of a professional psychologist. The assumption of the interdependence of ways of relieving stress and frequency of stressful situations during the business year is statistically proved. For this analysis we used analysis of variances (ANOVA) where the variable examining the mechanisms of stress relief was regarded as an independent variable and frequency of stressful situations was taken into account as a dependent variable. Table 1 shows the average frequencies and standard deviations of stressful situations during the business year for the group of respondents who use different ways to relieve stress.

Table 1. Average frequency of stress among the respondents

Mechanisms reducing stress	for	Average frequencies of stressful situations	N	Standard deviation
Hobby		2,11	9	1,054
Physical activity		2,54	24	,721
Social activities		2,75	12	,754
Psychological therapies		3,75	4	,500
Total		2,61	49	,862

Based on data obtained from the direct intergroup analysis of variance, it was determined that there was no violation of the assumption of homogeneity of variances. (Values of Levenov's test is 1167, $p = .333$). ANOVA test (Table 2) showed that there is a difference ($p = .011$) for the four groups of respondents

Table 2 Analysis of intergroup variance of the frequency of stressful situations for respondents

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	7,785	3	2,595	4,194	,011
Within Groups	27,847	45	,619		
Total	35,633	48			

Adequate post hoc test (Tukey HSD) determined that there is statistically significant difference of frequencies of stress among those respondents who use physical activity and psychological therapies as a stress relief mechanism (the difference in average is -1208, $p = .033$) as well as one's own hobby and psychological therapies (the difference in average is -1639, $p = .006$). The magnitude of the differences is expressed through the test η^2 . In our case, the magnitude of the differences is large and it is 218. This measure represents the proportion of variance in the dependent variable (frequency of stressful situations), which is explained by the independent variable (mechanisms for stress relief) and it is 21.8%. Therefore, the alternative hypothesis can be confirmed: The frequency of stressful situations in the future is determined by the mechanisms for stress relief.

Figure 2. The effect of mechanisms for stress relief on the frequency of stressful situations

5. CONCLUSION

Organizational change in auditing companies, the return issue from the nineties, has left consequences on organizational and on the individual level which are reflected in stress and trauma. The costs of stress on the financial, organizational and individual levels are very high. There is a wide range of stress in every auditing company regardless of business and management. Every business has its own stress print. Surveys have shown that persons have an important role in the stress process. (Čizmić, S., Bojanović, R., Štajberger, I., Petrovic, I., (2010). Psychology and Management)

Based on the obtained and analyzed results, we concluded that the auditors and their activities are greatly affected by stress. We reached this conclusion because we got only 4 auditors out of 50 respondents who stated that stress does not affect their business. As we assumed the most stressful period for auditors is the process of preparing the report, and the stressful period occurs equally with both female and male auditors. The frequency of occurrence of stress is manifested in the following way: in the case of a difficult business task, 40% of them are under stress, and 36.7% if they did not prepared pre-auditing. Stress tends to occur more frequently with women, no matter what kind of job it is. We got equal results for the causes of stress. 14 auditors stated the reasons which were not related to auditing work, of which the most common reason is related to the pressures of the environment, while the other 14 considered overweight and requirement of the auditing job as the basic cause of occurrence of stress, which makes 64.3% of women and 35.7% of men. Stress can be manifested in different ways, and it is most frequently manifested in the form of increased anxiety/nervousness. (36.7%).

Stress is defined individually. It varies depending on personality. What someone considers being extremely stressful, someone else could regard as very exciting and interesting. Everyone has a range of comfort within which he/she feels safe and secure. Stress occurs when an individual feels to be working outside that range. Individual differences are very important in determining the level at which the limits of the range comfort are abandoned. Although stress could make people move (and may mobilize some of them) creating possible positive reactions in their behavior, we must not forget the psychological impact of stress on a person. Headaches, tension in muscles, fatigue and high blood pressure are given as instances of consequences of stress. Stress is a complex issue. It is essentially connected to the perceptual system of every man and thus could be understood as a subjective phenomenon. However, it could also be understood as an objective phenomenon, especially in the cases of psychological assessments. Also, the stress should be regarded within the social context, which largely determines and defines the causes of the stress.

MOVING BEYOND MYTH OF CRITICAL SUCCESS FACTORS POWER OF ADVANCED SELF-MANAGEMENT SKILLS

Zorica Vukobradović¹, Vladimir Vasić²,

¹Faculty of Organizational Sciences, z.vukobradovic@gmail.com

²Faculty of Organizational Sciences, vasicmobile@gmail.com

Abstract: *What distinguishes very successful companies like Apple and Google from other companies which are far less successful, if they all started with a very limited budget? This research is dedicated to finding and presenting those critical success factors. Methods we used in order to gather information and experience were: personal conversation, lectures, workshops, training programs, memoirs, autobiographies, biographies, web sites, blogs, magazines and conferences. During the research, we found that there was a key success thinking pattern very similar in the majority of successful company leaders. That thinking pattern provided them with a crucial competitive advantage and therefore made them very successful. Based on success experiences we have developed a method which is practically applicable. If applied correctly, the method could give individuals and teams a competitive advantage and increase their probability of success. This paper could be of value to professionals who are interested in increasing their probability of success in business.*

Keywords: *success, factors, business, advanced self-management, skills.*

1. INTRODUCTION

How do they make it? There was a company which started with budget less than \$10,000.00 in a family garage, like hundreds of thousands other companies started. Four years after, they reached \$1 billion in annual sales. Majority of companies didn't. The name of that company is Apple. But companies successful like that are found in very small percentages. So, we asked ourselves, how do they make it? If they all start with a small budget, what are they doing better than everybody else to achieve that amazing success? This work is dedicated to finding and presenting those critical success factors. For two years we have been following successful companies, reading books, blogs and magazines about them, talking with their leaders, studying their business activities and investments. After the research was done we examined data and find out that there is more than just sum of a critical success factors - there is a key success thinking pattern which is common for majority of successful leaders. In the essence lies advanced self management skills concept. Then we have done another research with companies and leaders who were far less successful and concluded that majority of leaders didn't use that thinking pattern. That confirmed idea of key success thinking pattern which we are presenting in this work. (fundinguniverse.com)

Advanced self management concept consists of principles, methods and success stories. We are going to start with principles. Principles are conclusions that we have made during analysis and their understanding is crucial.

Hypothesis 1: Applying this concept is dramatically increasing probability of success in business.

Hypothesis 2: Business leaders in Serbia are paying too little attention to this concept, but those who do, are very successful in their industry.

2. PRINCIPLES

2.1. Power of thoughts

Quality of our lives tomorrow is equal to quality of our thoughts today. In business, quality of our business performance tomorrow is equal to a quality of our thoughts in terms of business today. Quality thoughts supported with action plan create quality activities, quality activities are delivering quality results. Supported with determination, quality daily activities are becoming quality monthly, yearly activities which are delivering quality results. If we create great thoughts and support them with action plan and determination we will achieve great business results. So, it is very important to invest in process of creating great thoughts, constantly.

Few years ago there was a man who organized a free conference which was attended only by 23 people, from which 21 were members of his family. Now he is organizing one of the most wanted conferences which lasts for two days and has a \$5.000,00 price tag per person. That man is Mr. Sharma, one of the most successful motivational speakers in the world. He realized the power of thoughts, he invested in them and that great achievement is his reward. (Lime light group), (theremarkableentrepreneur.com)

2.2 Master your craft and perform on world class level

Today's dynamic market and intense competition are placing a client in a position in which he can choose between huge numbers of companies. Purchasing decision is based on value/money ratio (the value client is receiving for the money he is investing). That ratio is very similar for 95% of all companies, but other 5% have noticeably better ratio because they are delivering some form of additional value to their clients. And usually those 5% are gaining more profit than other 95% together. And it is all based on a principle: master your craft and deliver unique additional value to your clients.

Apple iPhone is a product which has a same basic function as hundreds of other phones (calling, texting) but it is much more profitable product than others. It is much more profitable because the Apple is delivering unique value to their customers and that unique value is great user's experience which is a key to iPhone's success. (Internetnews.com)

Top management of one club in Serbia realized that his additional value could be based on: very pleasant staff, always enough amount of ice (which was a problem in that area during that period) and free VIP party invitations for key clients. The first value factor was achieved by investing in team building activities and specialized staff training. The second value factor was achieved by organizing the delivery of ice more times a day than other clubs in that area did and third was managed by developing customer relationship program, which was based on informational technologies and could show how profitable was each customer. That information was key element for process of making a decision which clients should enjoy VIP experience. Other club's management teams thought those investments were just a way to waste money but management of this club realized the power of world class service and master your craft principle. These three initiatives created a great client experience which no other club could achieve. The profit increased for 200% in the next five months was a result of that. (Vasic, 2012)

2.3. Disrupt the psychological boundaries

There are some boundaries that we have to overcome in order to set a good foundation for a future business results. The interesting thing is that majority of people is ignoring these principles and that is creating a huge obstacle for them. Those principles could be shown this way:

Face the fear. Fear is excellence killer. The comfort zone is the zone where people are comfortable with every aspect of activity they are doing (such as: type of activity, working time, team, space and dynamics). Read magazines you don't usually read. Talk to people who you don't usually speak to. Go to places you don't commonly visit. Disrupt your thinking. Great business results are available only to those brave individuals and teams who are getting out of their comfort zone, regularly. They are doing things others are afraid to and that is differentiating them from others, giving them a great competitive advantage. (Sharma, robinsharma.com)

"Eike Batista", Brazil's richest man faced a fear of failure and went into gold business. He raised US \$500.000,00 from investors and took a chance. After 15 months he gained a profit of \$6 million. (Addicder2success.com, 2012)

True form of leadership. The business life is advancing fast and it has created a need for a different type of leadership. The leader needs to be:

Charismatic in order to be able to inspire people to perform on the highest level. High performance is necessary since the competition is growing stronger and the client has much more power so companies need to deliver much higher level of value than ever before.

Liberal, because team of minds is much more powerful than one mind. So, participation is critical for good ideas on one hand and form strong motivation on the other. Job of the leader is to create more leaders, to delegate authority, to share information, experience and contacts in order to maintain team development which is crucial for success.

Authoritative, because he needs to set the frame of the business strategy, timeline and terms of participating. Sometimes, he needs that power to influence people even when others don't agree with him, in case he is the only one knowing all relevant information, which could be a business secret, for example.

Sir Richard Branson is the great example of a true form of leadership. He started as rabbit hunter, now he is a billionaire (Branson, Screw it, let's do it, 2010)

Power of idea. Don't doubt that small team of individuals with one strong idea can change the world, because it has been the only thing that was changing it during all this time. So, if you are going to dream, dream big! This is a great time for creative thinking, in last 100 years we have concord more natural forces than ever before. We have concord the air, so birds cannot compete with us; we have concord mountain tops and depts. So, no other living creature could compete with us. This was not imaginable 200 years before, and now it is all possible because people are thinking big. The only limits we have are in our minds. This is very important to understand in order to destroy psychological limits and unleash full potential of our minds.

Henry Ford was not educated man, he was not the smartest one also, but he was not afraid to dream big and we all are witnesses of success he achieved thanks to that. (Ford, lifehack.com)

Research showed to us that 41% of students are using existing ideas when they are doing projects or case study. Those 41% will need to change their attitude if they want to become successful. Copy-paste principle isn't creating real value for client. (Vukobradovic, 2012)

Built great relationships. It's very important to know that people are paying a great attention to a relationship when they are making a purchasing decision. So it's acceptable to fly 500 miles to have a half an hour meeting. Great relationship is only possible with human to human contact.

Mr. Robin Sharma, one of the best motivational speakers in the world, understood this principle well and now he is enjoying the results. (Sharma, 2009)

Enriching life and patience. There are only two types of value in business world:

Making someone's life easier

Making someone's life more interesting

Employees need to understand that and to focus on improving their clients' lives without expecting immediate monetary compensation.

Google is helping people find what they are looking for without expecting any type of direct compensation. They are making people's lives easier and more interesting and they are patient. Because of that, they are one of the most profitable companies in the world. (forbes.com)

Failures are essential part of success. Because we cannot predict future with the 100% accuracy it is clear that we are going to make mistakes and face some failures, but that is not necessarily a bad thing. Failures are a great way to learn something and to make us stronger and more determinant. So, they are necessary ingredient of learning process and learning is success key. So, failures are critical for success.

If a sales person has 1 successful phone call on 99 unsuccessful and if that one successful phone call is providing him 100 euro of profit, he should conclude that every phone call he makes is worth one euro, and that there are no failures, just a challenging way to a prize.

Tomas A. Edison has met failure 10,000 times before he succeeded. (Hill, 2010)

Think unique. Regarding the fact that competition is growing stronger, companies need to differentiate them from the competition. As we have mentioned, the only way to do that is to create a new value which could be only a product of unique thinking.

People from Apple have some clue about this principle – "Think different" is their motto. Now Apple is worth about \$500 billion. (marketwatch.com)

The last atom of magic. Majority of leaders is keeping that last atom of energy in reserve because they are afraid of spending it. But the last atom of energy which successful leaders are ready to burn is providing them with another area of competitive advantage which could mean difference between success and failure.

Daymond John started with \$40.00 and a ton of determination and will power, he had a dream and he wasn't afraid of burning the last atom of his energy in order to achieve his dream. Every effort has its

reward. Multimillion business is reward for his willing to spend that last atom of energy that 99,99% of people are keeping in reserve.(Addicted2success.com)

3. METHODS

Every human activity has a number of factors influencing it, both controllable and uncontrollable. Factors that are outside of human control should be observed, estimated and incorporated in plans. But there are controllable factors like inspiration, state of mind, energy and time. These four factors are the key pillars of every business activity. If they are left to case they become limits, but if they are managed they are becoming very strong differentiation point which could be used for creating additional value for client. That added value could be very strong competitive advantage and since very few people are managing these factors their effect is very hard to copy. So, managing inspiration, state of mind, energy and time is dramatically increasing probability of success. Our research has confirmed this conclusion and then we went deeper into research looking for experiences which help us develop a model to be used for managing those four pillars.

This model has a set of methods which are essential for:

- Creating purpose and setting goals
- Developing and maintaining inspiration and energy
- Goal oriented decision making based on probability principle
- Ultra efficient time management

These methods are developing advanced self management skills which would provide a great competitive advantage to every individual who is applying them. Our research showed that 63% of people are investing their time and energy in physical exercise at least once a week, but less than 5% of respondents are investing in advanced self management skills. Analyzing our research group we found out that only 63% of respondents thought that motivation has stronger impact on success than talent. As a matter of fact, the motivation is creating exceptional skills that some people may even regard as a talent. So, we expected that this number would be much higher. That is even more increasing probability of success for those who accept this methodology. It is very important to apply these tools like they are described here because they have very strong synergy and psychology effect which could not be understood fully only by reading. (Vukobradovic, Online research, 2012), (Business schools students, 2012)

3.1. Dominant desire

In order to transform wish of great reality into a great reality we need to burn the bridges behind, create great state of mind, support it with strong emotional impulse, concrete action plan and unbelievable determination. Impulse will transform our wish into dominant desire with power and energy to achieve desired reality. Next seven steps will give a frame for that.

1. Define what you want to achieve. Be precise, it isn't good enough to say I want to be successful, define success.
2. Specify what are you going to do in order to achieve that goal, there isn't a free diner.
3. Set precise date. When are you going to achieve your goal.
4. Create accurate action strategy, define how exactly you are going to achieve desired reality with resources you have. Start realizing it now! The journey of one thousand miles starts with the single step. (Tzu, (604 BC - 531 BC))
5. Write down defined goals, specify what you are going to do in order to achieve them, write down the precise date, explain detailed strategy which would lead you to those goals.
6. Read your statement every morning after you get up and every night before you go to sleep. While reading, imagine, hear, feel and experience desired reality as it is already happening. By doing it regularly, experience will become stronger and stronger and it would develop a great state of mind which will trigger strong emotional impulse and drive necessary for achieving desired reality.
7. Invest 30 minutes every day in quiet thinking about previous achievements and future plans. See yourself as a successful and capable businessman who is enjoying desired reality. And you will become one.

Research data: About 15% of students are using techniques similar to this for goal oriented behaviour. But those 15%, who are using it, are far more successful than others in our research group. (Vukobradovic, Online research, 2012)

3. 2. Mastermind concept

With applying dominant desire method we are creating a vision and internal energy for realizing it, but we could also manage external sources of power and raise our competitiveness on entirely new level. Power is crucial in process of achieving our goals. We need power to transform our dominant desire into reality. Nowadays, more than ever, we could define power as an organized and intelligent knowledge focused on fulfilling precisely defined goals. Since we have described the tool for goal setting, we are going to present how we can acquire power-intelligent knowledge. Intelligent knowledge consists of:

- Imagination or fantasy which is the great source of new ideas
- Collected experience could be found in books, magazines, videos, online storage and so on
- Research and development for everything which could not be found in collected experience we should look in this field
- Capability of making intelligent conclusions is available only to a human brain which has enough information and experience about the entity and mixes that with the imagination and unique thinking

It is very difficult to acquire and apply enough intelligent knowledge to achieve success if individual is relying only on his capabilities. But there is a solution and it's called MASTERMIND concept. We can define mastermind team as coordination of intelligent knowledge and effort between two or more people in order to achieve ultimate goal. Concept has 2 key components:

1. Logical - Battery is providing us electrical power just like mind is providing us with thinking power. Like a group of batteries will provide us with more electrical power than just one battery, a group of minds will provide us with more thinking power than just one mind. So, we can do more complicated tasks which require more thinking power if we work in a group.
2. Synergetic - If group of people is coordinating their efforts they will become a team capable of producing synergy effect. Thinking energy produced by a coordinated team is much higher than energy produced by team members working separately.

We can conclude that power necessary for achieving goals produced by master mind team is much higher than power produced by any individual. That added power is a great source of competitive advantage which is crucial for success. So, get together a team of elite performers, brave dreamers and help each other achieve extraordinary results that wouldn't be possible to achieve alone.

This is great example of key competitive advantage created by mastermind concept. Ross Perot was the best salesman in IBM which he left because of his vision to start his own company. Few years after, IBM and EDS were competing for the best contracts in IT industry. IBM had much bigger budget and more experienced professionals and it seemed like they had the advantage but EDS had better coordination and managed to produce powerful synergy effect by using mastermind concept. Competitive advantage of EDS which was based on MASTERMMIND concept wasn't noticed by anyone outside of the company but it was powerful enough to win them a great contract and defeat more powerful IBM. (Hill, 2010)

3.3. Probability based decision making tool

Hypothetical situation:

You want to play game in which you have 1/10 chance win the price. Every time you play you are investing 1 euro. You can choose between options:

1. If you win, you'll get 9 euro
2. If you win, you'll get 10 euro
3. If you win, you'll get 11 euro
4. You can choose not to play

Notice: you can play as many times as you want.
What would you do and why? What would you expect in the end?

Probability based decision making tool explains: We should always chose option number three - which is offering us 11 euro if we win. We should choose that because we will almost certainly going to make profit if we play long enough (notice: you can play as many times as you want). That is principle of probability - on a huge number every tenth game will be our win. So, if we invest 1 euro per game and we win 11 euro every 10 games it means that there is a great probability that we would make 1 euro profit on every 10 games we play.

Option number one should not be selected because it is certain that we are going to make loss. Option number two should not be selected because we are not going to make any profit - just waste time. Even thou a lot of people would choose option number four because they think it is not calculated risk we should not choose this option because this game is calculated risk and the option number three has a great probability of providing us with profit.

This decision is based on relevant information and probability theory, so we know exactly what we are going to chose, why and what we could expect. It is called calculated risk planning and it is a key part in probability based decision making tool. This thinking pattern should always be used for decision making and all guess based on irrelevant information, fear or current state of mind should be eliminated. (Stankovic, 2012)

People usually don't analyze situation like this and they make decisions based on emotions, current temper or pure guess. This has inspired us to develop this tool which is going to exclude all obstructions and help us make decisions based on a relevant information and probability to achieve the ultimate goal. Sir Richard Branson, the owner of about 400 companies has a motto - "Always take risks, calculated ones". He says that this motto provided him opportunities that lead him to this position. (Branson, Screw it, let's do it, 2010)

3.4. Time management

Experiment:

If we take plastic jar and fill it up with bigger stones people would look it and say that it is full and that you cannot put anything more in it. Then we can insert small stones which would fill up the gaps between bigger stones. Then people would say "Now it's full, in the last iteration we were wrong". Then we could insert sand which would fill up even smaller gaps between small stones. Then people would say "In last two iterations we were wrong - now the jar is full". Then we could insert hot water which would saturate the sand. And then - people would be amazed. After fourth iteration jar is 3 times heavier than after first iteration when people were thinking it was full. (Vasic, Plastic jar experiment, 2012)

In this experiment plastic jar is representing one work shift of 8 hours. In jar we can place some stuff just like in 8 hour shift we can place some activities. Experiment has showed us that we could multiple the effects if we organize the space in optimal order. The same principle could be applied with activities in work shifts. If we analyze and plan our activities right we could dramatically increase efficiency. Usually, people are missing great results because they don't manage their time like they could. First we should accurately plan most important activities which acquire lot of time and energy and then we should fill the gap between these with less important activities which need less time and energy. After they have been planed, we should plan activities which are not critical for our business but could increase our competitive advantage and which could be started, stopped and continued in any time. Nowadays, managers could invest in tablet device and take their business wherever they go and use every free moment to do something useful (while they are in the train they could read emails, while they wait in the line they can analyze reports, while they are waiting for lunch in restaurant they could respond on emails) only this investment can increase their efficiency by 10% or more. Increasing efficiency by 10% is increasing competitiveness by 10%. Regarding the fact that the difference in competitiveness of 2% could mean difference between failure and success we can conclude that this is a great tool for maximizing efficiency and therefore probability of success.

Basic time management tool

This tool is providing basic time management frame which could be developed further and it is applicable to any type of business activity.

1. Apply Importance-urgency principle to your activities
2. Plan and create time management table

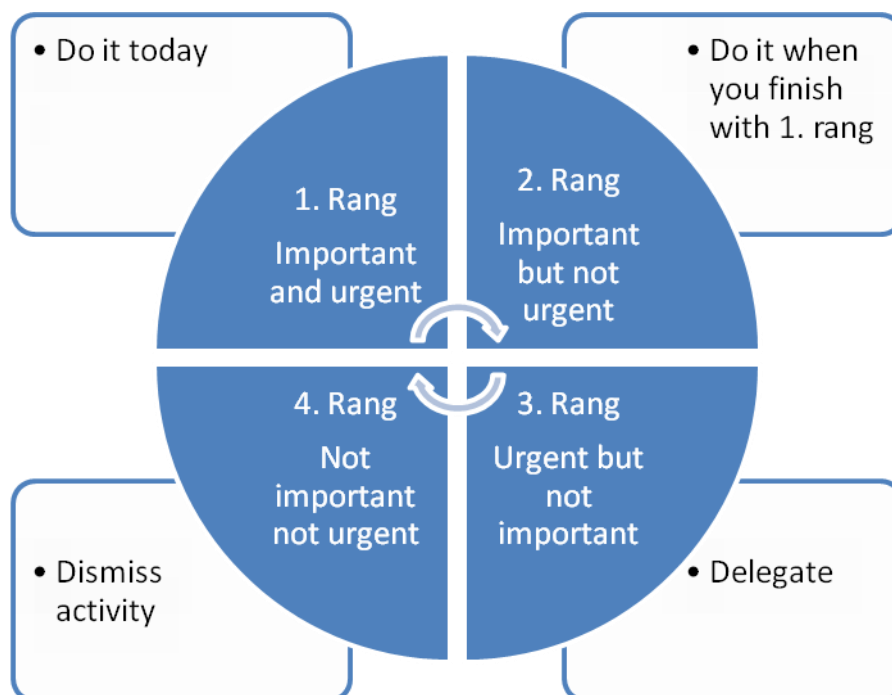

Figure 1: Importance-urgency matrix

Table 1: Time management table

No.	Activity name	Plan	Real	Initiative	Rang	%	Comment
1	Business meeting	20	20	Carlos Clooney	1	100	Successful
2	Activity no. 1	300	290	Eva Jolly	1	100	Successful
3	Activity no. 2	50	60	Everybody	2	90	Net enough time
4	Activity no. 3	50	0	Everybody	4	0	Dismiss activity

- No. Activity numeration
- Activity name Field for writing activity name
- Plan Planned time for activity
- Real Real (used) time for activity. This column is filled at the end of work shift
- Initiative- Name of the employee who is leading and who is responsible for the activity
- Rang From 1 to 4, using Importance-urgency matrix
- % Shows percentage of activity completeness
- Comment For the activity

Columns “Real”, “%” and “Comment” are filled in the end of the work shift. That information is necessary for effectiveness analysis. Looking at columns “%” and “Comment” we are briefly analyzing our effectiveness. If there is activity which wasn’t finished (less than 100 in column “%”) or if the comment isn’t “Successful” we should continue our analysis. If we compare columns “Plan” and “Real” we can control our time assessment. If the time we have estimated is too short or too long we will find a reason and solution for that and apply it to the time management table for the next iteration. Any activity which isn’t 100% done is moving to the table

for the next iteration in order to be finished. Using this principle we are eliminating the chance of forgetting some activities or letting them half done.

Research has shown us that constant rewriting the same activity is increasing the motivation for its realization. That is another psychological benefit. (Vasic, Concept tested in Auto Vasic d.o.o., 2012)

Future research directions: Research will be focused on startups in Serbian market and the concept will be developed further in order to increase probability of success in business.

4. CONCLUSION

Based on information and experiences that were collected in research we have developed a key success thinking pattern. Pattern consists of principles and tools. If applied correctly it will create room for competitive advantage based on advanced self management skills. Advanced self management skills are introducing us to unlimited potential which is waiting to be unleashed from our minds. Our thoughts are a trigger for that unlimited potential. Our thoughts are creating our daily plans which should be mixed with powerful desire and emotion for fulfilling the objectives. As the time passes daily activities are becoming monthly activities, monthly activities are becoming yearly activities and soon it's very clear that our thoughts today create our life tomorrow. Regarding that it's clear that best investment we could make is investing in positive state of mind, inspiration, energy and time management (Hypothesis 1: confirmed). By extending research in Republic of Serbia we have confirmed that understanding and applying described concept has a strong positive influence on success in business (Hypothesis 2: confirmed). The future of business belongs to brave dreamers who are stepping forward when everybody else is finding an excuse, to those who invest when everybody else is afraid to; to those who believe in ideas when everybody else thinks they are wasting time!

HUMAN RELIABILITY ASSESSMENT APPROACHES AND THEIR USE IN MINING

Biljana Panić¹, Mirko Vujošević², Aleksandar Milutinović³

¹ Faculty of Organizational Sciences, panic.biljana@fon.bg.ac.rs

² Faculty of Organizational Sciences, vujošević.mirko@fon.bg.ac.rs

³ Faculty of Geology and Mining, amilut@gmail.com

Abstract: *Statistics on and experience with accidents and failures of complex systems whose operations depend on human activities and behaviour show that human error is the most frequent and the most important cause. That is why reliability and risk analyses of complex systems need to include human reliability assessment. For that purpose, numerous models have been developed and used in practice and some of them are already established as recommendation or industry standards. This paper presents a review of human reliability approaches based on an insight into open literature. Emphasis is given to human reliability and risk in mining which is traditionally recognized as a very risky industry.*

Key words: *reliability, human error, risk, hazard, safety, mining*

1. INTRODUCTION

Human behaviour is considered to be one of the most important risk factors. Human reliability is not easily predictable since people perform several different functions in more different environments than any other component of a system. In addition, the possibility of a relationship between people and other elements of a system (including other people) is very vast. Therefore it is not possible to eliminate human errors; however, it is possible to evaluate to a certain degree the reliability of people involved in executing a task which they were appropriately trained for and propose change which could increase their reliability.

Human reliability is the probability of accomplishing a specified task successfully by humans at any required stage in system operation within a defined minimum time limit (if the time requirement is specified) (Dhillon, 2009). It is the probability that a person will accurately perform an activity required by the system within the demanded time (if time is a limiting factor) and will not perform unnecessary activities which could jeopardize the system (Swain&Guttman, 1983).

Human error is the failure to lead planned actions to desired events without the influence of unpredicted events (Reason, 1990). The same author uses the term "unsafe act" for describing errors and breaking rules by individuals which lead to hazardous events. Human error is the failure to perform a specified task (or the performance of a forbidden action) that could result in disruption of scheduled operations or damage to equipment and property (Dhillon, 2009).

Kletz (1976) points out that "To blame human error for accidents is as superficial and unhelpful as to blame gravity for falls". Therefore, the task is to identify the potentials for human error, and subsequently manage so as to prevent errors. In order to successfully manage errors, it is necessary to recognize and classify them.

2. HUMAN ERROR

Human errors can be viewed as a breakdown within an individual's mental activity and it can occur in attention, memory, retention, decision making, etc.

According to the level of cognition involved behaviour is divided into three categories (Rasmussen, 1982): skill-based, rule-based, and knowledge-based. Skill-based behaviours take place at an unconscious level and are often automated in nature. Rule-based behaviours deal with the application of learned rules, so errors occur when an individual uses the wrong rule or misapplies a good rule. Knowledge-based behaviours refer to novel instances where an individual must apply previous knowledge. These tasks require high mental activity which can cause problems in unusual emergency situations and errors occur due to a lack of training or information.

Human errors can be classified into two categories (*User's Manual*, 1983): situation-caused errors (SCEs) and human-caused errors (HCEs). SCEs are errors that are caused primarily by factors related to the design of the work situation. HCEs are errors with primary causes related to some human characteristic, such as sabotage or intentional errors.

Sater and Alexander (Sater&Alexander, 2000) categorized human error as errors of omission, commission, or substitution. Errors of omission occur when an individual fails to perform a required task. Errors of commission occur when the individual carries out an action in either the incorrect manner or at the incorrect time. Substitution errors arise when an individual carries out the incorrect actions.

One other classification is given in (McKenney&Roberts, 1997): omission - failure to perform an action, absence of response; wrong timing - action performed but not at, or within the proper time; extraneous act - unnecessary action not required by procedure or training; transposition - correct action but on wrong unit, system, or component; wrong selection - selecting the wrong item, control, action, etc; wrong sequence - performing the correct actions but in the wrong sequence; miscommunication - not communicating or receiving information correctly, or failing to communicate or receive at all; quantitative error - performing the task to excess, or insufficiently; qualitative errors - not performing the task to the quality required; other - anything else.

3. HUMAN ERROR TAXONOMIES

Human error models, taxonomies and classification systems have been developed in attempts to understand the causes of human error. These models include: the cognitive perspective, the ergonomic perspective, the behavioural perspective, the epidemiological perspective and the psychosocial perspective (Patterson, 2009). Newer models as *SHEL*, *ICAM*, *BeSafe*, *Wheel of Misfortune*, *SCM*, *HFACS*, tend to look at accidents as a result of a combination of causes that interact with each other, so they have moved from focusing on a single element of accident causation, to looking at the system as a whole and they represent a systems or organizational approach to accident investigation (Patterson, 2009).

Software Hardware Environment Liveware (SHEL) was developed to encompass human factors into system design (Patterson, 2009). The model describes human-machine interactions and identifies where areas of failure can occur. Failures are: software, hardware, environment conditions, and liveware. Software refers to the documents, policies, regulations, and standards; hardware is composed of the physical resources; environmental condition refers to the physical environment; liveware includes people who are involved with the system. Failures occur in the system when any one of the components or the connections between components fails.

Incident Cause Analysis Method (ICAM) is based on three main beliefs: 1) the root causes of all accidents can be linked to organizational deficiencies, 2) human error is inevitable and must be accepted, and 3) if an organization is serious about accident reduction then new approaches must be used, and one must learn from past mistakes (Patterson, 2009). ICAM includes establishing the facts, identifying contributing factors and latent conditions, reviewing the adequacies of existing controls and procedures, reporting the findings, recommending corrective actions, detecting organizational factors that can identify recurring problems, and establishing key learned facts that can be distributed across the company. It is very important to point out that the purpose of ICAM is not to measure the guilt and responsibility for errors, but to use errors to learn from them.

The Behavioural Safety (BeSafe) method is an example of an accident investigation technique that attempts to identify, through the use of ergonomics tools, the latent causes of accidents (Patterson, 2009). The goal is to identify areas where human error is possible before any errors occur.

Wheel of Misfortune is taxonomy with three concentric spheres representing the actions of the front line operators, local conditions, and organizational conditions (O'Hare, 2000). The central sphere represents local conditions and it is used to explain what happened. The next sphere shows organizational conditions, and the outer represents the interactions with the environment and these two spheres help define why an accident occurred.

In **Swiss-Cheese Model (SCM)** accidents result from a breakdown within the system which are a combination of active failures and latent conditions (Reason1990, 1997). Active failures are the unsafe acts of those directly in contact with the system and are most often associated with accidents. These failures can

be classified as errors or violations and intended or unintended actions. Unintended errors are classified as slips and lapses and they are associated with automatic actions and include result from memory or attention lapses. Intended errors are classified as mistakes which occur when an the individual fails to carry out the action as intended or carries the action out as intended, but the action was the incorrect response for the situation. Violations are intended actions that are carried out with wilful disregard to the established rules and regulations. Latent conditions of a system often go unnoticed until an adverse event occurs. These latent conditions take two forms, those that create error provoking conditions and those that create weaknesses in system defences. Reason reviewed this model several times, but each version defines the relation between active failures and latent conditions. The first version divides the system into five sections: the supreme decision makers, line management, preconditions for unsafe acts, production activities and defence. "Swiss cheese" occurs when "holes" appear in sections. The second version comprises three basic sections: organization, task/environment and individual, and the defence section expanded over these three basic sections. The third version of the section is presented by barriers, control, defence and protection of the system. An explanation of how "holes" occur is also added.

The Human Factors Analysis and Classification System (HFACS) was developed for use with the US Navy to define the latent and active failures that were identified in Reason's SCM (Patterson, 2009). Patterson was modified HFACS into Human Factors Analysis and Classification System - Mining Industry (*HFACS-MI*) with the input of end users to better correlate to the mining industry. *HFACS* classifications and *HFACS-MI* modification (in brackets) are given as follows:

1. unsafe acts
 - 1.1. error
 - 1.1.1.skill-based (routine disruption errors)
 - 1.1.2.decision
 - 1.1.3.perceptual
 - 1.2. violation
 - 1.2.1.routine
 - 1.2.2.exceptional
2. preconditions for unsafe acts
 - 2.1. environmental factors
 - 2.1.1.physical environment
 - 2.1.2.technological environment
 - 2.2. conditions of operator
 - 2.2.1.adverse mental state
 - 2.2.2.adverse physiological state
 - 2.2.3.physical/mental limitations
 - 2.3. personnel factors
 - 2.3.1.crew resource management (communication and coordination)
 - 2.3.2.personal readiness (fitness for duty)
3. unsafe supervision (unsafe leadership)
 - 3.1. inadequate supervision (inadequate leadership)
 - 3.2. planned inappropriate operations
 - 3.3. failed to correct problem
 - 3.4. supervisory violations (leadership violations)
4. organizational influences
 - 4.1. resource management
 - 4.2. organizational climate
 - 4.3. organizational process
5. (outside factors)
 - 5.1. (regulatory factors)
 - 5.2. (other factors)

4. HUMAN RELIABILITY ASSESSMENT

By analogy of general reliability calculation model, human reliability for simple tasks is calculated as (Dhillon, 2009):

$$P(Y) = \lim_{m \rightarrow \infty} \left(\frac{M}{m} \right) \quad (1)$$

where $P(Y)$ is the probability of occurrence of event Y , and M is the total number of times that Y occurs in the m repeated experiments.

When time to human error is described by statistical distributions such as normal, gamma, exponential, Weibull, and Rayleigh, for computing human reliability Dhillon (2009) suggests the use of the well-known general expression (2), irrespective of whether the human error rate is constant or not:

$$HR(t) = e^{-\int_0^t \lambda(t) dt} \quad (2)$$

where $HR(t)$ is the human reliability at time t and $\lambda(t)$ is the time-dependent error rate.

Human reliability assessment (HRA) deals with the impact of humans on system performance and can be used to evaluate human error influences on the system (ISO 31010, 2009). HRA can be used qualitatively to identify the potential for human error and its causes so the probability of error can be reduced, or quantitatively to provide data on human failures. Inputs to HRA include: information to define tasks that people should perform, experience of the types of error that occur in practice and potential for error, expertise on human error and its quantification. Outputs include: a list of errors that may occur and methods by which they can be reduced – preferably through redesign of the system, error modes, error types causes and consequences, a qualitative or quantitative assessment of the risk posed by the errors. The HRA process is as it is shown in the Figure 1:

Problem definition, what types of human involvements are to be investigated/assessed?

Task analysis, how will the task be performed and what type of aids will be needed to support performance?

Human error analysis, how can task performance fail: what errors can occur and how can they be recovered?

Representation, how can these errors or task performance failures be integrated with other hardware, software, and environmental events to enable overall system failure probabilities to be calculated?

Screening, are there any errors or tasks that do not require detailed quantification?

Quantification, how likely is individual errors and failures of tasks?

Impact assessment, which errors or tasks are most important, i.e. which ones have the highest contribution to reliability or risk?

Error reduction, how can higher human reliability be achieved?

Documentation, what details of the HRA need to be documented?

Health and Safety Executive in its research report for health and safety in laboratories gives the most detailed list of methods for human reliability assessment, followed by a brief overview of tools (methods) which are potentially useful. The majority of methods are developed to be applied in nuclear industry, and methods for general application are Human Error Assessment and Reduction Technique (HEART) and Absolute Probability Judgements (APJ) (Bell & Holroyd, 2009).

HEART is designed to be a quick and simple method for quantifying the risk of human error. It is a general method that is applicable to any situation or industry where human reliability is important. The method is based on premises (Bell & Holroyd, 2009):

- Basic human reliability is dependent upon the generic nature of the task to be performed
- In 'perfect' conditions, this level of reliability will tend to be achieved consistently with a given nominal likelihood within probabilistic limits

- Given that these perfect conditions do not exist in all circumstances, the human reliability predicted may degrade as a function of the extent to which identified Error Producing Conditions (EPCs) might apply.

There are nine Generic Task Types described in HEART, each with an associated nominal human error potential (HEP), and 38 Error Producing Conditions (EPCs) that may affect task reliability, each with a maximum amount by which the nominal HEP can be multiplied. The key elements of the HEART method are: classify the task for analysis into one of the nine Generic Task Types and assign the nominal HEP to the task, decide which EPCs may affect task reliability and then consider the assessed proportion of effect for each EPC, then calculate the task HEP.

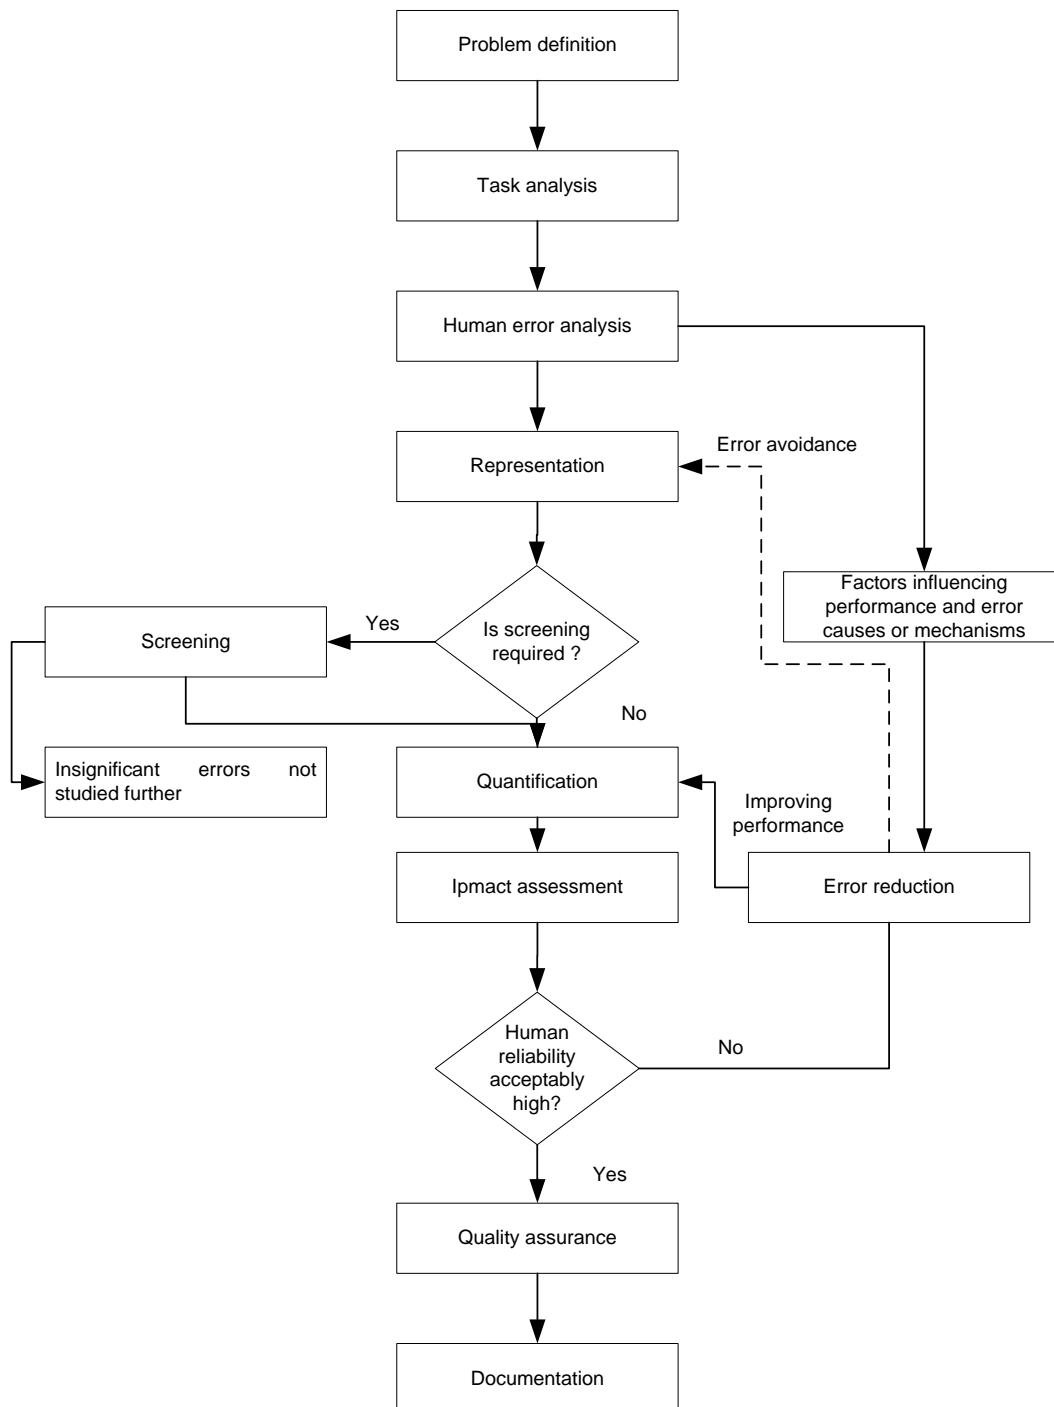

Figure 1 Human reliability assessment

APJ approach is conceptually the most straightforward human reliability quantification approach. It simply assumes that people can remember, or even, directly estimate the likelihood of an event, in this case, a human error (Bell & Holroyd, 2009). There are different APJ approaches that can be applied to determine human reliability: Aggregated individual method where individuals make their estimates individually and then a geometric mean of these estimates is calculated; Delphi method where individuals make their estimates independently of each other, but the assessments are then shared, allowing the experts to reassess their own estimates based on the new information; Nominal group technique where experts are given the opportunity to discuss their estimates and confidentially re-evaluate their assessment, Consensus-group method where experts meet and discuss their estimates, following which a consensus on an agreed estimate must be reached.

Steps to the APJ procedure are (Bell & Holroyd, 2009):

1. Select the subject-matter experts (SMEs). The SMEs should be familiar with the tasks being assessed and as many assessors as practically possible should be included. When discussions are required to reach a consensus the number of assessors would preferably be around 4-6 people.
2. Prepare the task statements. The clearer the task definitions the less they are open to individual interpretation.
3. Prepare the response booklets. The response booklets should include scale values that reflect the estimated range of the true probabilities of the tasks.
4. Develop instructions. The response booklet should include clear instructions for the SMEs.
5. Obtain judgements. SMEs are encouraged to work through the response booklets, starting with the tasks that they feel confident assessing.
6. Calculate inter-judge consistency. To determine the levels of consistency between SMEs an analysis of variance would be performed.
7. Aggregate the individual estimates. This is achieved by calculating the geometric mean.
8. Uncertainty-bound estimation. Uncertainty bounds may be calculated using a form of Seaver and Stillwell's (1983) formulae or alternatively SMEs can be asked to estimate the confidence intervals, the estimates being aggregated statistically.

5. HUMAN RELIABILITY ANALYSIS IN MINING

Safety issues in mining industry have been considered from ancient times. Henry Fayol, as a mine engineer, proposed safety function as an obligatory function within enterprise. For the purpose of providing high level of safety in mining industry there exist many standards and bills. Reliability issues have been considered more or less deeply. In manual (*User's Manual*, 1983) for human reliability analysis in mining, the following procedure was proposed:

1. Description of the system goals and functions in order to determine the position of humans in a system and their operational connections with other system elements, regardless of whether it is equipment or other people.
2. Description of the situational characteristics – comprises factors which influence the mode of executing a task. The factors can be categorized in three groups
 - 2.1. external factors - those outside the individual:
 - 2.1.1. situational characteristics – architectural features, quality of environment, working hours, availability/adequacy of special equipment, organizational structure, actions by supervisors, co-workers, union representatives and regulatory personnel, rewards, recognition, benefits
 - 2.1.2. Job and Task Instructions - procedures required, communication, cautions and warnings, work methods, plant policies
 - 2.1.3. Task and Equipment Characteristics, – perceptual requirements, motor requirements, control-display relationships, anticipatory requirements, Interpretation, decision making complexity, narrowness of task, frequency and repetitiveness, task criticality, long and short term memory, calculation requirements, feedback, continuity, team structure, man-machine Interface
 - 2.2. internal factors – certain skills, abilities, attitudes and other human attributes a person comes to the job with:
 - 2.2.1. physiological factors - previous training, state of current practice or skill, personality and intelligence variables, motivation and attitudes, knowledge of required performance, standards, physical condition, attitudes based on influence of family and other persons or agencies, group identification
 - 2.3. stressors:

- 2.3.1. psychological – suddenness of onset, duration of stress, task speed, task load, high jeopardy risk, threats, monotonous, degrading or meaningless work, conflicts of motives about job performance, reinforcement absent or negative sensory deprivation, distractions, inconsistent cueing
- 2.3.2. physiological – duration of stress, fatigue, pain or discomfort, hunger or thirst, temperature extremes, radiation, g-force extremes, atmospheric pressure extremes, oxygen insufficiency, vibration, movement constriction, lack of physical exercise
3. Description of the Characteristics of the Personnel comprises defining skills, fitness, experience and motivation of personnel, their abilities and limitations, which is compared with the requirements of the job position.
4. Description of the Jobs and Tasks that the Personnel Perform is a detailed analysis of tasks and jobs.
5. Analysis of the Jobs and Tasks to identify error likely situations and other problems
6. Suggesting of Changes to the System combines the results in order to analyze and give proposals for improvement.

McKensey and Roberts (McKensey&Roberts, 1997) suggested the method of Potential Human Error Identification as adaptation of *Hazardous Human Error Analysis*. This method is undertaken with a team, which should include people who can answer technical questions, who are familiar with the duties of people in relation to the machinery, and who are aware of the types of accident which people can have with plant and equipment. Typical applications include:

- identification of a single risky activity where there is potential for human error leading to serious consequences;
- identification of the potential for human error when studying the risks associated with mining equipment or machinery;
- identification of the potential for human error when studying the risks associated with a modification to a procedure or to equipment or machinery where there is potential for human error with serious consequences.

The study takes the following form:

1. The team is briefed on the equipment, and on the tasks undertaken by people around it.
2. A list is then compiled of the key tasks performed, each of which is then subdivided into sub-tasks and possibly into elements.
3. Each task element is then studied in turn by the team, using a checklist of possible types of human error, such as described in the previous chapter
4. Then the team discusses:
 - 4.1. *What are the possible root causes of such an error?*
 - 4.2. *What factors could increase or decrease the likelihood of the error occurring?*
 - 4.3. *What actions or factors could increase or decrease the consequences if the error occurs?*
 - 4.4. *What existing safeguards exist to prevent the error being made, or the adverse consequences resulting?*
 - 4.5. *What additional safeguards could be suggested to prevent the error being made, or the adverse consequences resulting?*
 - 4.6. *What actions are needed, in the light of the foregoing discussion?*

6. CONCLUDING REMARKS

The fact that inappropriate behaviour and errors of humans are the most important causes of system failures and accidents has influenced that great attention has been devoted to human reliability issues in research and practice work. As a result, numerous models and methods for human reliability analyses and assessment exist as well as manuals, recommendations and parts of reliability and risk standards. However, development of new models and methods remains a challenging theoretical task. An open issue is how organization and national culture influence human reliability models. Consequently, the issue is whether there is a general mathematical model for human behaviour which could be directly implemented in practice.

From the practical point of view, application and implementation of existing manuals and standards are of the most importance. In this context, the lack of a reliable statistical database of human errors and reliability is a very limiting factor.

Abstract: *Considering a large number of people of Serbian descent who live, work or study abroad, issues like their networking, institutional organization and joining forces and efforts in order to achieve mutual cooperation, the preservation of national identity and help in the economic and cultural development of the country of origin are very popular nowadays. The paper emphasizes the importance of formulating and implementing appropriate communication strategies within the diaspora, in order to improve internal connections and further strengthen the overall relations among the diaspora members.*

The main purpose of the research, which is an integral part of this paper, is to define the existing level of internal coherence and cooperation among members of the diaspora, through conducting an adequate kind of survey.

Key words: *internal communications, networking, diaspora*

1. INTRODUCTION

In the broadest sense diasporas are understood as self-identified cultural communities living outside the country of origin, but remains connected to their home countries (Fullilove, 2008). Simple and concise definition of diaspora would be: "The population scattered for any reason, in several places of residence" (Yossi, Aharon, 2003). According to Filipovic (2011) members of diaspora (diasporans) of a particular nation are "all those people of its descent and heritage living outside the country and territories where they are autochthonous population, irrespective of their citizenship, ability to speak the language, birthplace of their ancestors, the number of generations since emigration and who consider the state at issue as their Motherland, and remain committed to contribute to its prosperity through organized transnational endeavors". In recent literature, attention is especially paid on intellectual diasporas, defined as self-organized communities of expatriate scientists, engineers and professionals living in developed countries and working to impact development of their home country or region, mainly in science, technology and education (Barre et al., 2003). Features that distinguish diaspora are very strong connection among members of the same nationality outside the home country, a strong sense of nostalgia about the country, in pursuit, even irrational, to return to their country and desire to participate in the events which characterize the home country (Nielsen, Riddle, 2009).

From historical point of view, Serbia is one of the well known emigrational areas in the world, with one of the largest diasporas. As most of the diasporas of the world, the Serb diaspora was formed as a combination of voluntary and forced migrations, which occurred in several waves, four of them in the last hundred or so years. Serbian numerous communities of diasporans, dispersed around the world together with Serbs who live on territory of former Yugoslavia and countries in the region count almost four million people. Any individual who leaves the country of origin for it inevitably represent a loss, with the emphasis on experts in various fields, academics and many young people going to study or work abroad. There are more than six thousand and four hundred PhDs and doctorants among them, many of whom work at most famous research institutions (Filipovic, 2011), so it is certain that Serbia suffers from a chronic "brain drain". Although the state and its institutions work on development and implementation of strategies to motivate the return of expatriates in the country, it is evident that results do not meet the expectations. Taking into account poor economic situation in the country, high unemployment and low average wages, it is understandable why. The conversion of loss of the human capital into new possibilities and opportunities has become a topic of great interest in the world, including Serbia.

Diaspora can contribute to its motherland financially, socially and emotionally (Nielsen, Riddle, 2009). Kuznetsov (2008) states that: "Diaspora members can be useful to their home countries in two broadly defined modes of involvement: "discussions" and "transactions". "Discussions" include web sites, conferences, workshops, online communications and other activities helping diaspora members get to

know each other, connect with each other and define in which way they can contribute to the development of their home countries. "Transactions" involve actions usually requiring time commitment and sometimes, although not necessarily, or even desirably, monetary contributions" (p.275). Networking of members of the diaspora scattered around the world, their institutional organization and action towards realization of common goals is crucial for the matter. Only by increasing their internal connectivity, based on effective communication process, important goals can be reached, not only for individuals, organizations or associations in diaspora, but also for Republic of Serbia. Diaspora can be seen as the unrealized potential of the Serbian state and new, so far under-used channels of communication will help to mobilize this huge resource. Starting from publications and research papers conducted in recent years by state institutions, nongovernmental organizations and individuals in Serbia, this paper attempts to highlight the current situation in the area of internal connectivity among members of Serbian diaspora. Therefore, the overall objective of this study is finding adequate channels of communication with the target group of diaspora. Fazal and Tsagarousianou (2002) write: "With the spread of new technologies, diasporic communities have often developed virtual connections and a host of Information and Communication Technology - premised resources" (p.16). Internet and new technologies certainly help creation of new communication channels and improve relationships within the target group, enabling contacting and networking. Elaboration of strategies, activities and measures that will significantly contribute to the most optimal use of human resources in the diaspora should be directed in order to enhance and support development of Serbia. Diaspora networks are intended to improve and speed up communication and exchange of information and resources among members living dispersed from each other, as well as, among diasporans and their associates in the country of origin.

This so-called "network access", extensively used in the formation of diaspora networks in the past two decades, benefits the countries of origin, and brings many benefits for individuals in the diaspora. These networks are presented as a great help to migration process. Those who have already emigrated provide significant sources of data to those who intend to do the same. Those personal links can be used to avoid or reduce risks and costs of migration: legal and technical information on the procedures, financial aid, prospects for employment, administrative assistance, physical accompaniment, emotional solidarity and so on. The impact of these networks on migration flows is also one of their roles, as immigrants are a "bridge" for newly arrived immigrants - both in geographical terms (receiving country) - and in terms of fields of work (employment conditions) and housing (Grecic, 2010). Networks of this type around the world have arisen spontaneously and independently from each other, they are all different and heterogeneous. They differ in size, range, objectives, structure and activities.

2. CHANNELS OF COMMUNICATION

Internal communication has very important role in networking of diaspora community members around the world. These activities are usually carried out by the various organizations, whether at the level of individual countries, whether at the global level. In order to pursue planned strategies and activities of public relations it is necessary that, first of all, each of these organizations and associations determine target group of the public. Diaspora, by itself, covers a large human capital, so, every organizational subject must define the criteria to perform segmentation of target groups. For organizations that are limited exclusively to the territory of certain countries or continents, geographic segmentation is relevant, if their potential membership does not require certain profile and they want to address only to the target public on a particular territory. Demographic segmentation is the key determinant if the segmentation is based on age, gender, or, for example, the time of immigration. In addition, psychographic segmentation is also an essential element and shows common characteristics of groups based on education, membership of social class, occupation. The main task of any institutional form is to detect communication habits of its target group and reconsider the possibilities of restoration of communication link or improvement of existing relationships (Filipovic, Kostic-Stankovic, 2011).

Tsagarousianou (1999) states that medias in diaspora: "might be a valuable cultural and political resource available to minority groups, by instituting public spaces of representation and participation and creating an opportunity structure for cultural and political expression, dialogue and self-definition by members of ethnic communities"(p.57). Research about medias in diaspora, conducted in 2007 by Serbian Ministry of diaspora, shows that most respondent's access media content via the Internet. This category includes Internet radio and television, websites, blogs, magazines, newspapers that have on-line form, social networks. One-third of diaspora members cited that print media also have an important place. Furthermore, results show that younger members of the diaspora more often use the Internet for the purpose of informing than the elderly. This research has also shown that the most important mission of all

media in diaspora is "identity preservation". About 70 percent of media representatives marked this response. There are no differences depending on type of media: print, electronic and "new" media alike emphasize the mission of "preserving identity." In second place there is "information on events in the community" (50 percent of all media), and the third refers to "preserving and strengthening the Orthodox faith." The most frequent topics of Serbian diaspora newspapers are current happenings in Serbia, topics related to local Serbian community or country in which Serbian minority lives. In another study that was conducted same year by the "Strategic Marketing" agency, diaspora representatives cited: television, Internet and press as three most common source of information about political events, events in the economy, culture and sport.

Results of previous researches suggest that it is necessary that diaspora organizations form their own web sites, which will provide potential members and other parts of interest with accurate information about their own activities, goals and plans, and any other information of relevance. Sites must be regularly updated and there must be people in charge to communicate with all stakeholders. Communication with members must be regular, conducted by telephone, e-mail or personal contact, to ensure their commitment to joint tasks. In addition, by using modern technologies, organizations can create content of mass communication and reach a much wider audience with a significantly lower cost than by using of traditional media. Organizations can communicate with target audiences through email, online forums and other interactive media. Interaction, as the way of presenting information from various perspectives, builds a sense of community among users, in the same way people share their life stories and experiences. Opportunities that social media provide to an organization are: careful listening to their target group, objective insight into its reputation, understanding the target audience, identifying PR opportunities, direct communication with individuals, getting positive feedback and immediate identification of crisis situations, the use of e-learning activities. For all these reasons social media are very important communication tool among members of diaspora network who are spatially far apart. This method of disseminating information enables the influx of new ideas, dialogues and discussions among themselves and among them and their counterparts in the homeland.

Preferably, organizations should issue internal sheets, brochures or leaflets, available to all interested parties. Newspapers (newsgroup or newsletter) should be published in paper and / or electronic form, as tool of improvement of internal communication among network members and updating project plans and the latest developments in the country of origin, as well as publishing results of current researches.

Organizing special events, such as various conferences, seminars, workshops, celebrations and mass gatherings of the similar type is also a significant aspect of development and improvement of direct communication among members, sharing ideas, planning and finding ways to improve cooperation. These events are organized once or several times a year by the individual organizations and require preparation of several months, planning agenda, and all other elements (making a list of guests, making a call, informing the media, providing space, materials preparation, etc.). Many diaspora organizations choose to organize such events in Motherland, which allows gathering of diaspora members with relevant interlocutors in the country and their compatriots from other states. Events of this type bring together from 500 to 2000 people and usually take place during the period of summertime - June and July, when representatives of diaspora most often visit their home country, and during winter period around Christmas and New Year holidays. Organization of these special events is conducted by individuals within a specific network, in charge of these tasks, and rarely, by specialized agencies. Objectives of such special events are following: improvement of the image of exact network, getting in contact among certain groups of people, making the public familiar with activities of an organization, engaging participants in special in some projects, creating a positive echo in the media etc.

3.METHODOLOGY AND RESEARCH OBJECTIVES

The survey was conducted in attempt to determine the level of existing internal connection within Serbian diaspora, by polling a representative sample during the period June-September, year 2011. It was conducted in two stages. The first included personal contact with respondents at two special events of diaspora, Assembly of Serbs in diaspora and region and the Conference of Young Leaders in the Diaspora. 56 respondents were interviewed this way. The second stage included sending electronic versions of the questionnaire on e-mail addresses of respondents. 68 members of the diaspora were interviewed in this stage. The questionnaire contained questions relevant to the field of internal communication and the results of this study portray the current state of internal coherence and level of interaction from the perspective of respondents and correlation of key concepts and variables.

The main aim of the research was to examine the level of integration and communication methods of intellectual diaspora, while specific objectives of the research were to:

- Analyse demographic profile of the sample
- Determine the frequency and modes of communication of diaspora
- Establish a possible correlation among different variables
- Determine the percentage to which respondents belong to various organizations and associations
- Find out whether there is a developed cooperation with the home country and its institutions
- Show out the attitude of respondents regarding the future cooperation with the motherland

3.1. Sample description

The sample includes 124 participants - members of Serbian intellectual diaspora. The sample was gender-unequal: 37 respondents (29.8%) were female and 87 respondents (70.2%) were male. Subjects were classified into four categories according to age, as follows: 50 respondents (40.3%) were younger than 30; 40 respondents (32.3%) were aged 30 to 40; 18 respondents (14.5%) were aged 40 to 50 and 16 respondents (12.5%) had more than 50. The highest percentage of women in the sample (38%) is under the age of 30, while the majority of men (82.5%) aged between 30 and 40. Subjects were classified into four categories by level of education: students - 11 respondents (8.9%); with a university degree - 60 subjects (48.4%); with the title of Master - 36 respondents (29%); with the title of PhD - 17 respondents (13.7%).

For easier data processing, respondents were categorized by regions in the following way: European countries (36.3%); countries in the region (Slovenia and autochthonous population -13.7%); United States, (17.7%); Australia (21%); Canada (8.9%) ; Africa (1.6%); Asia (0.8% of the sample).

Based on the length of living abroad, most of respondents answered "more than 15 years" - 45, 2%, while the remaining three categories are relatively uniform: 21% answered "10 to 15 years"; 17.7% "from 5 to 10 years" and 16.1% "less than 5 years".

3.2. Results and discussion

Results of the survey showed that most women and men were connected with more than 50 people of Serbian descent who also live abroad. The results also show that the majority of respondents, regardless the age, were in contact with more than 50 people of Serbian origin in a country where they live and work. By comparing the education level of respondents and the number of people of Serbian origin with whom they were in regular contact following results were obtained: students were mostly in contact with 20 to 50 people (63.6%); respondents with a university degree were mostly in touch with more than 50 people (66.7%); the majority of respondents who have completed a master's degree (47.2%), and the vast majority of those with a doctorate (88.2%) maintained contact with more than 50 people. It can be concluded that people of Serbian origin who live somewhere abroad try to connect and make contact with as many Serbs as possible. It supports the idea of building large and solid diaspora networks.

Both, men and women, stated using all communication means offered in the questionnaire Internet, telephone and direct "face to face" communication. As an alternative means of communication and making connections respondents cited meetings, conferences, seminars and parties arranged by organizations and associations in diaspora. The combination of all these channels of communication is characteristic to respondents of all ages and levels of education.

As for the frequency of meeting the other Serbs in the countries they live, the majority of women, 40.5% quoted "once a month", while the largest number of men, 50.6%, rounded out the option "once a week" (Figure 1).

As for the relationship between age and frequency of meeting the other Serbs in the countries they live in, following results were obtained: half of those respondents who were younger than 30 rounded out "once a week"; the majority of respondents from the category between 30 to 40 (42.5% of them) also marked "once a week", as well as 56.25% of respondents older than 50. The majority of those who are between 40 and 50 (66.7%) reduced the frequency of seeing to once a month. Research had shown that the frequency of meeting with other people of the same origin differ by regions. The largest number of

respondents who live in European countries the frequency of seeing reduced to once a month (55.5%). Most Serbs living in the region rounded out "once a week" (59.2%). This applies also to the United States and Australia, despite the dispersion of those diaspora segments. In this way, answered 45.4% of respondents from the U.S. and up to 80% from Australia. Regarding Canada, the same number of respondents, 36.4% , voted for option seeing "once a week" and "once every few months". The respondents who come from Africa rarely arrange meetings with other Serbs, once every few months or even once a year. Respondent from Asia marked "once a week" (Figure 2).

Figure 1: The frequency of communication by gender of respondents

Figure 2: Frequency of communication by region

The survey results showed that male respondents in a much greater number joined up various organizations and associations of Serbs (77%) than female ones (23%). Most of respondents of all ages were members of at least one such organization or club - 64% younger than 30, 75% of respondents aged 30 to 40, 72.2% of respondents aged between 40 and 50, and 75% older than 50. Majority of respondents, regardless of the level of education, declared themselves as members of at least one Serbian diaspora association: 90.9% of students; 63.3% persons with a university degree, 61.1% with Master's degree, and all 100% of Ph.Ds. These findings are significant because previous researches of various authors had shown that only 12% of Serbs in diaspora were willing to join some expatriate network. 80% of

respondents living in one of the European countries were members of Serbian association or organization; and 64.7% of Serbs in the region; 54.5% in the U.S; 76.9% from Australia and 63.6% from Canada. None of the subjects from Africa were members of any organization. Respondent from Asia answered positively. As, all categories of respondents mostly identified themselves as network members, the results of this study clearly indicate high level of connectivity, networking and acting towards common goals.

Regarding business cooperation with other Serbs in diaspora as seen by education level, the results were following: 54.4% of those whose studying abroad was still in progress at the time of survey, so far had achieved business cooperation with fewer than 10 people; 56.7% of persons with university degrees cooperated with up to ten other Serbs, as well as 47.2% of those with MSc degrees. Finally, 64.7% of PhDs quoted business cooperation with more than 30 Serbs abroad. The fact that the respondents with the PhD were pointed out here could be explained by the fact they mutually associated and jointly engaged in the field of scientific and research work (Figure 3).

Figure 3: Relationship between education and business cooperation

The largest number, 72% of respondents younger than 30 years cooperate with fewer than 10 Serbs. No cooperation with any person of Serbian origin has 10% of this age group. 35% of respondents aged 30 to 40 do some business with more than 30 people of Serbian descent, while 10% do not cooperate at all. 59% of respondents aged 40 to 50, also do some business with more than 30 people of Serbian origin, while 16.6% do not cooperate at all. All respondents within age group over 50, pleaded business and cooperation with other Serbs, 56.25% of them even with more than 30 people of Serbian descent. It was shown that younger respondents, who were still students or just started their careers didn't have an extensive business network of cooperation with other Serbs, but the number of business contacts increases significantly with remaining three age groups. 64.5% of all subjects who participated in this survey work in an organization / institution that employed another Serbs (.Figure 4).

Regarding the collaboration with organisations and institutions in motherland, 56.5% of respondents answered positively, while the remaining 43.5% had not achieved that kind of cooperation. The fact that a large number of those who actively cooperate with the home country tells us that our expatriats are willing to help and contribute to its development. From the standpoint of educational level groups, 36.4% of students stated working with various organizations and institutions in home country, as well as 60% of university graduates, 44.4% of masters and 82.3% of doctors (Figure 5).

Looking from the perspective of years, 26% of those who are under 30 cooperate with organizations and institutions in the state. The percentage increases with remaining age groups from 30 to 40 (up to 77.5%), from 40 to 50 (77.7%) and over 50 (75%).

Figure 4: Relation between age groups and business cooperation

Figure 5: Relation between education and cooperation with institutions in Serbia

Respondents stated following institutions they most commonly cooperate with: Ministry of Religion and Diaspora, Ministry of Foreign Affairs, Ministry for Kosovo and Metohija, Serbian Chamber of Commerce, National Bank of Serbia, state agencies, local government authorities, youth and cultural organizations, Matica Srpska, the Serbian Orthodox Church, as well as different companies.

In terms of future cooperation with institutions and organizations in the Republic of Serbia, 71% responded positively, 27.9% negatively, and 1.6% did not declared. Even 90% of students from abroad intended to restore collaboration in the future with Serbian institutions, 65% of university-educated respondents, 69.4% of masters, and even 93.7% PhDs. The results are optimistic toward the possibilities of mobilisation of human resources from diaspora, which will certainly have a positive effect on the state of Serbia.

Types of cooperation which respondents pleaded to achieve with the motherland were following: economic cooperation (46.3%), cultural cooperation (54%), scientific collaboration (32.5%), investments (23%), humanitarian assistance and grants (6.4%), cooperation with educational institutions (21.6%), cooperation with political parties (16%), cooperation with sports clubs, youth associations and so.

4. CONCLUSION

Establishment and development of diaspora networks, as well as different types of organizations in all parts of the world where Serbian diaspora exists, should be strongly supported and helped. Understanding the basic forms, manners and processes of communication are keys to successful exchange of information among public in the internal diaspora organizations. Good internal communication is not just a reflection of successful policies and good interpersonal relationships, but is one of the conditions of well-functioning and on-going development of networks. Responsibility for establishing good communication flows lies on all members of diaspora organizations and associations, and therefore ability to act in the direction of defining the proper goals and improving internal relations.

The objectives of internal communication should be based on developing awareness of the importance of improving the effectiveness of communication for the overall business performance, precise and comprehensive definition of mission, vision and strategy of the network and continuous improvement incentives. The initial phase of this process is definition of the current state of the system, identifying obstacles, delays and strain point of the process of communication, combining existing or establishing new communication channels. It is vital that organizations regularly and promptly monitor and implement the latest technologies as important factor of efficiency and effectiveness of communication.

Results of the research work reflect the existence of a positive attitude among members of diaspora in terms of their networking, internal connecting and joining forces. Most of the respondents of both sexes, all ages and levels of education regularly contact and cooperate with their compatriots in diaspora, but also with many institutions and individuals in Serbia. It is necessary to use available resources in the best possible way, by uniting and gathering as many Serbs throughout the world, not only for financial aid programs, but also for establishing a wider range of cultural, educational and economic ties with the homeland.

Summary: *The role played by employees in corporate brand and reputation building is reflected in the delivery and increase of company values, and the creation of competitive advantage. This is why employees are one of the key stakeholders of each company and communication with them is a significant part of corporate communication activities and programs. This paper deals with internal communication, means and programs, which are the cornerstone for building and maintaining a corporate brand and reputation. By presenting the case of the Delta Holding company, the article shows the significance and scope of internal communication in good practices of corporate communication.*

Key words: *internal communication, corporate brand, corporate reputation*

1. INTRODUCTION

In the contemporary global competitive environment, corporate branding has become an important source of sustainable competitive advantage and a central element of corporate strategy (Balmer & Gray, 2003). It includes core values cherished by a company, its corporate culture, identity, business model, people (Cicvarić, 2006), and it can be described as “the visual, verbal and behavioral expression of corporate identity and business mode” (Balmer, 2001).

The corporate branding strategy determines the manner in which a company will fulfill its mission and vision, and realize value for its stakeholders (Järventie-Thesleff et al, 2011). It is most often expressed through the so-called “brand promise” which the company has to “live” and maintain in everyday business, to all stakeholders (Aaker, 2004). In delivering the value and brand promise, as well as in the application of each branding strategy, a strategic part is played by the company’s employees – from top management to those on lower-level positions, who cooperate daily with different stakeholders. The employees’ role becomes clear when considered in conjunction with the corporate branding strategy framework, which is not only the products and services it sells, but it also represents what the company does and actually is, i.e. a functionally and emotionally rounded unity. Due to intensive technological changes, the life cycle of products and services has a declining tendency, so corporate branding becomes the cornerstone for building and maintaining relations with stakeholders.

On the other hand, the corporate reputation definition, describing reputation “as a set of relatively long-term impressions, attitudes and emotions of individuals or groups in respect of an organization, established through experience or partially credible indirect information, in the context of personal and social expectations, which impacts intentions or behavior of individuals or groups in connection with that specific organization” (Vlastelica Bakić, 2012), helps to grasp the significance of employees in the establishment of beliefs and attitudes of the company’s other stakeholders.

The value of corporate branding and reputation yields benefits for the company which increase its financial performances and market value on the long run (Roberts & Dowling, 2002). They represent valuable resources which their competition cannot copy or imitate. Aside from reputation, being the organization’s intangible capital, another precious resource that is unique and attributable to one company only involves its employees, their knowledge, abilities and skills.

2. ROLE OF EMPLOYEES IN CORPORATE BRAND AND REPUTATION BUILDING

As corporate brand and reputation may be seen as a result of corporate governance and aggregate work of its employees (Cravens & Oliver, 2006), then their role in building reputation may be seen as having a decisive influence. The role is reflected in delivering and increasing the company's value and creation of a sustainable competitive advantage. Actually, employees are the starting point in reputation management, as it is impossible to create quality products and services without knowledge, abilities and efforts of employees. Furthermore, good reputation ensures good company performances. If employees work in a company that has good reputation, then their satisfaction is on a higher level and has positive effects on their attitudes and behavior which directly correlates with company performances (Riordan et al, 1997). As employees and reputation are the company's unique capital which no one can fully imitate, their synergy effect ensures a unique competitive advantage (Figure 1).

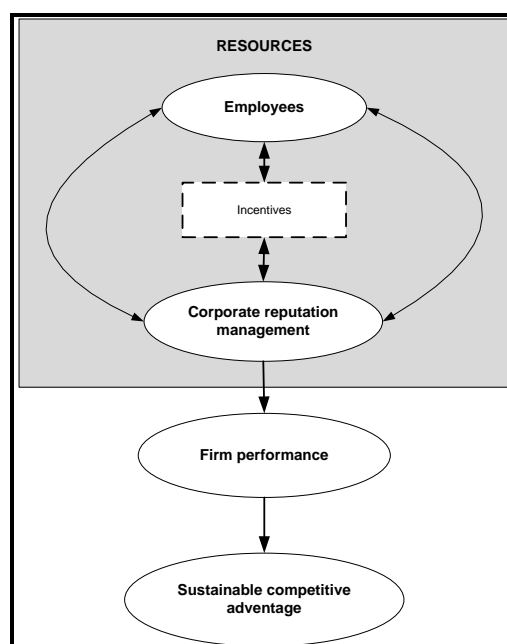

Figure 1. Synergy of employees and company reputation in the creation of competitive advantage (Cravens & Oliver, 2006)

The base for the image and corporate reputation building is the company's identity which is grounded in corporate culture and values. This is why reputation building requires that employees understand the core values of the company and its culture to be able to properly reflect the identity, positively impact image and, on the long run, the company's reputation. In understanding the corporate identity and its reflection in the desired image and reputation, the main part is played by corporate communications, i.e. internal communications inside them. The result of well designed and managed internal communications is the internal environment which understands the core values of the company and identifies with the company's vision which is stirred towards the creation and maintenance of the value of corporate brand and reputation.

The behavior of employees, especially in the sector of services, defines the manner in which customers, as well as other stakeholders, perceive the company. Employees are the company's interface with its stakeholders, so they are frequently called the "ambassadors" of the company. They deliver the company's value and its identity, and in that way they impact the formation of image and reputation. If employees identify with the values and aims of the company, they will behave accordingly and exert positive influence on other stakeholders. Otherwise, the correlation between employees' identification with the company and the company's reputation may be seen as mutually conditioned and symbiotic, since an employee working for the company with a strong reputation develops a sense of belonging to this company and emanates positive impression which further strengthens reputation (Morgan et al, 2004).

In bringing the culture, identity, brand and reputation of a company closer to its employees, an important role is played by managers on all company levels since their task is to communicate and work with

employees on a daily basis to build reputation. They observe, direct, estimate and reward employees contributing to the company's strength. And, in the final instance, top management and owners of the company must take reputation as one of priorities in business as that is the only way the reputation will integrate into corporate strategy. The strategy should include the activities of reputation management which should encourage, control and reward employees for their contribution in this respect. The major challenge here is how to measure individual contributions to reputation management. The part played by corporate communications in this field is implemented through internal communications which include communications between internal stakeholders. The goals of internal communications include (Welch & Jackson, 2007):

- Promoting employee commitment to the company;
- Creation of the sense of belonging to the company;
- Getting to know the environment and changes, as well as understanding corporate goals in the context of events taking place in the environment.

The final objective is to achieve employee satisfaction and enhance their business performances (White et al, 2010), which defines the role of internal communications in achieving business results.

Internal communications (Figure 2) encompass all formal and informal forms of communication which take place between the following parties (Welch, 2012):

- Between team peers and project peers;
- Between managers and employees.

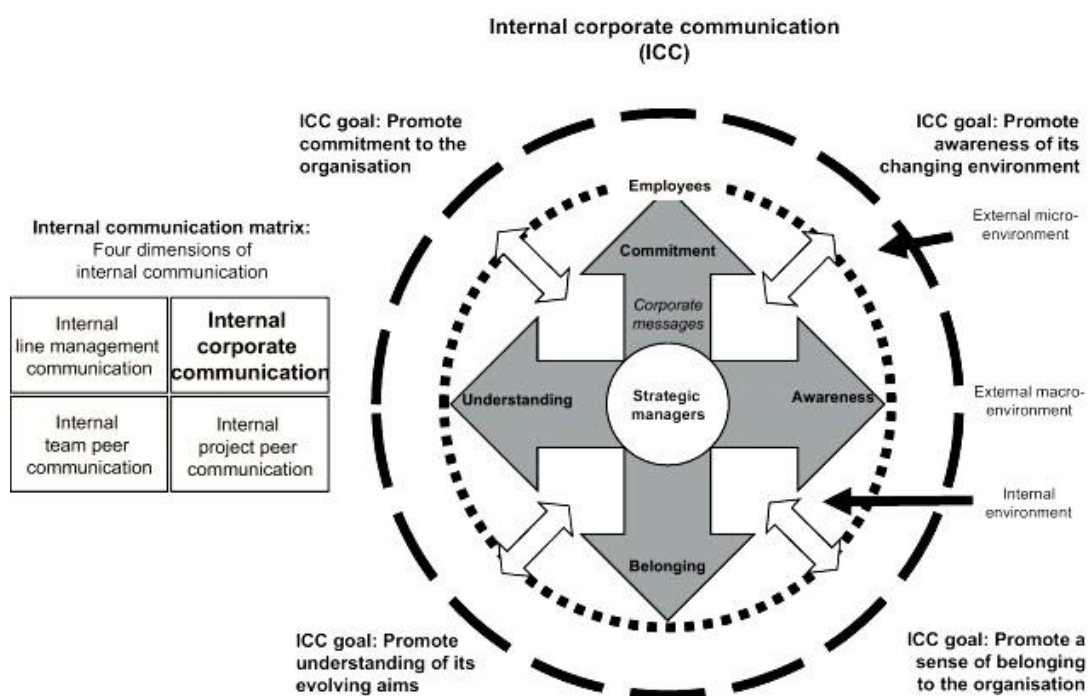

Figure 2. Internal corporate communications (Welch, 2012)

Therefore, by taking into account the organizational structure of the company, internal communications are performed: upwards, downwards and horizontally.

The task of internal communications is to achieve employee commitment and engagement reflected through positive work results, attitudes and behavior, motivation, ensuring productivity and better business performances (Gruman & Saks, 2011). Employee commitment represents the state determined by the dimensions such as levels of engagement, focus on work etc. and manifests in employee behavior, in being proactive, persistent, agile, adaptable etc. One of more famous models for analysis and tracking employee commitment is the JD-R (*Job Demands–Resources*) model which divides the work environment into demands and resources. Job demands relate to physical, psychological, social and organizational aspects of the job such as work conditions, microclimate, workload, clear work objectives, responsibilities,

reporting lines and the like. The resources of a job position include those physical, psychological, social, and organizational aspects of the job that are functional in achieving work objectives and stimulate personal growth, learning and development. Resources with positive influence on employee motivation may be:

- Organizational characteristics (wages, carrier development, work place safety), or
- Interpersonal relationships (support of superiors, team work),
- Work organization (clear role and level of participation in decision-making),
- Job description (skill diversity, autonomy).

The basic assumption of this model is that high demands adversely impact employee commitment, while resources are motivational drivers.

As all company employees participate in internal communications, the responsibility for its success falls on everybody. However, its initiation, steering and control are the responsibility of human resources and corporate communications departments. It is exactly the field of internal communications that represents the aggregation of impacts made by both sectors. Managing communications in a company requires, in the first place, determining employee satisfaction with their job, workload, deadlines, colleagues, their manager and other factors. This is mainly the responsibility of the human resource sector. The corporate communications sector should engage in the part related to planning communications with employees with a view to ensure effective and successful work performance, as well as the development of the employees sense of belonging towards the company and their commitment.

3. TOOLS OF INTERNAL COMMUNICATIONS

Internal communications are based on messages received by employees in the forms acceptable and understandable to them, as the manner in which they receive messages defines their evaluation of internal communications (White et al, 2010). The tools of internal communications may be observed through the forms or channels used to send a message, that can be print, electronic or direct, i.e. face-to-face communication.

Print tools include all forms of paper-based communication, enable making a large quantity of information available to employees over a longer period of time. These means may be distributed in visible places in the company so as to draw attention. The preparation of printed material for employees must take into account its profitability, time necessary for its preparation and effects it could have.

Print tools of internal communications encompass:

- Newsletter – intended for employees only and suitable for communicating topics such as the introduction of a new employee, changes in the company's policy and programs, presentation of activities and results achieved in the previous period and the like.
- Employee brochure – presenting to the employees company background information, its vision, mission, strategic goals, core values, rights and liabilities of employees and the like. An employee brochure may include ethical code, code of professional conduct and dress code, as well as other various manuals and guidelines.
- Collection of professional books and magazines – may help employees to familiarize themselves with some topics that are of consequence for the company's business.
- Notice boards – suitable for informing employees of significant events and their announcement, for communicating success achieved and the like. Boards are placed at busy places of a company.
- Suggestion box – a tool which enables employees to anonymously inform the company's management of their objections, suggestions and proposals connected to any segment of operations the adoption of which could help achieve higher satisfaction and enhance work. It often happens that ideas and suggestions are collected for some particular project, for instance "intranet portal improvement".
- Promotion material for employees – includes branded materials given to employees, such as mouse pads, personal organizers and the like. These items are used to communicate the visual identity of a company to employees.
- Congratulation letters for jubilees, promotions and the like – used to congratulate employees on their personal success.

Electronic tools relate to all forms of communication that rely on telephone, television, computer and internet, including, *inter alia*, the following:

- E-mail – a quick and cheap way of sending information. It is possible to group employees based on some criterion into certain mailing lists and send information as necessary.
- Intranet – entails a website allowing access to employees only (using a password), where folders with documents can be posted intended for all, news for employees, employee information etc.
- Share portals or folders – intended for e.g. sectors, enabling storage and using documents related to sector business, as well as exchange of materials, examples, business issues and the like.
- Video call and conference call – makes it possible for participants found on different geographical locations to meet. These require special equipment and are suitable for communication in small groups.
- Mobile telephone text messaging – suitable for rapid transfer of information and announcements.
- Social networking – if a company is connected to a social network, then it becomes a manner of communicating with employees who are also connected and follow network events.
- Plasma and LCD screens – as an up-to-date form of notice boards, enable the transfer of information, event announcement and the like. They are placed on visible and “busy” places in a company.
- Prize games and internal competitions – which are used to stimulate competitive spirit, motivate and reward employees for certain results achieved.
- Corporate video – presents core values of the company, its activity, mission and vision.

Direct communication or face-to-face communication is a form of two-way communication, which in addition to verbal elements, also includes transmission of messages and non-verbal communication. Among other things it also includes:

- Meetings – enables informing and active participation of employees in conversations and decision-making with regards to a certain matter. Meetings may also include employee training and advancement of their knowledge and competence, if organized as such.
- Individual meetings – represent a good way to make a conversation on delicate matters, especially when it is necessary to correct some mistake, conduct or problem of an employee.
- Conferences, forums, trainings – enable employee knowledge and experience on a certain topic, as well as advancement of knowledge and skills of participants.
- Conversations during breaks – lunch break can be used to have a conversation with an employee in a less formal atmosphere (popular term for this type of communication is a “brown bag lunch”).
- Employee recognition – represent an excellent tool for motivating employees. In respect of this tool it is necessary to determine causes for rewards, their frequency, content of such rewards and the like.
- Business trips – represent good framework for conversations among employees travelling together. These occasions usually give more time to talk and provide better atmosphere.
- Social events – represent a good way to develop and strengthen corporate culture and include various joint celebrations, lunches, visits to theatre, organized sports activities and the like.

Informal channels are not defined in the organizational structure, but they can be exceptionally strong as they are a result of a social network established by employees. These include rumors, hallway conversations, gratifies, funny materials and the like.

Many researchers have examined the forms of internal communications and tried to determine rules which channel is best applied on what occasion. Surely, it is impossible to determine universal rules given that the form of communication depends on the type of information conveyed, employee structure, positions among which communication is conducted and plenty other factors. The criteria applied to determine media to be used to send a message may include: availability of channels to a group of employees targeted by the message, characteristics of employee groups targeted by the message, message contents, speed at which the message should be sent to employees etc.

In one of most recent researches (Welch, 2012), it has been determined that employees prefer electronic media in internal communication, then combined electronic and print formats, and then only print formats. In choosing the channel of communication it may be dangerous to assume that all employees share the same preferences. Namely, it is necessary to identify internal stakeholders (important groups) and according to their preferences to select the channel of communication. For instance, internal stakeholders may be divided in the following way:

- Owner(s);
- Top management (executive manager and his board);
- Middle-level management (departmental directors);
- Work teams (departments);
- Project teams (of limited duration).

The tools or channels of internal communications are planned in reference to defined internal stakeholders and their preferences and expectations.

4. INTERNAL CAMPAIGNS AND PROGRAMS

Internal campaigns and programs are conducted for the purpose of keeping employees better informed, improvement of cooperation, gaining employees' support in the realization of short-term and long-term plans, projects and the like, strengthening the sense of belonging to the company etc.

The role of internal campaigns and programs is to present to employees projects of importance for business, to explain why they are important, as well as to describe the way in which projects will be realized, including the manner in which these will contribute to the realization of short-term and long-term goals. In addition, employees need to know the expectations from their engagement, within the meaning of tasks they need to perform, related deadlines, what are the expected results and the like. If the project and individual tasks are well understood and if objectives are clear, then employee commitment and support in the project realization can be achieved. Hence, if employees understand what they need to do and why, then the internal communication program is considered successful. Here again the significance of immediate superiors and managers is emphasized, as their commitment, involvement and attitude lead the attitudes and performances of team members and of all employees.

Internal campaign planning is a process comprised of stages specific for corporate communications campaigns:

- Company analysis and survey of employee opinions on and attitudes towards a certain matter.
- Defining the internal campaign goal.
- Identification and analysis of internal stakeholders to which the campaign relates.
- Formulation of key message(s).
- Choice and design of employee communication tools.
- Evaluation of internal campaign effects.

The starting point for internal campaign planning, regardless of its target, is to examine knowledge, opinions and attitudes of employees on the subject being the focus of campaign. A well defined starting situation sets the frame for further campaign planning and realization, and it may also prove instrumental as a starting value used to compare the campaign results. Some of the campaign and internal communications objectives are listed at the beginning. Depending on the campaign objective(s), the tools of internal communications are combines for each relevant group of employees.

The evaluation of certain campaigns, as well as internal communications in general, may be performed based on the following:

- Surveys of employees, their knowledge, opinions, attitudes.
- Analysis of proposals and suggestions received from employees.
- Level of employee intranet involvement.
- Level of participation in company events intended for employees, as well as many other criteria.

5. EXAMPLE OF GOOD PRACTICE: DELTA HOLDING INTERNAL COMMUNICATIONS

The company Delta Holding was established in 1991 in Belgrade. It was one of the first private companies started in Serbia, involved in agriculture, i.e. food production, distribution and real estate. The company Delta Holding aims towards continued development and enhancement of economic activities with a view to set new standards in the business practice of Serbia and of the region. By applying the principles of modern practice, it continuously works to establish a creative and innovative organization with an emphasis on the development of leadership, constant learning, motivation and team work for the purpose

of realizing quality company performances. This is why employees represent one of the most important stakeholders of the Company and internal communications are an essential part of activities and program of corporate communications.

Internal communications of Delta Holding are a shared responsibility of the Corporate Communications Department and Human Resources Department. The Company Code of Conduct delineates the rules of communications, graphic standards and codes in Delta Holding. The quality in all business domains is the main characteristic of all Holding members. Continuing progress and large investments, innovations and spreading and fortifying business activities are the capital tasks of all employees, as well as a significant motive for employees to prove themselves, improve and develop at work. The Company's summarized core values include quality, team work, respect and professionalism.

For the purpose of timely placement of information, there are various tools used to release information and most frequently used are:

- Mailing groups – for the needs of releasing information, different mailing groups are defined in line with the information being distributed. For the information that is of significance for the business system and for all employees, a mailed notice is sent to all employees. Special groups were formed for each separate member company.
- Internal portal – all information relevant to the system operation, rules, procedures, standards, new notices, contacts and the like is available to employees on the internal portal.
- Corporate communications SharePoint portal – in addition to standard portals, for all colleagues from communications department a portal was activated, covering all fields relative to marketing activities, public relations, corporate social responsibility and management of customer relationships. In addition to reporting on regular activities, creation of the calendar for all activities from the communications domain, the portal also encompasses the exchange of educational contents and examples of business practice, as well as idea exchange.

In addition to the abovementioned, the tools of internal communications used in Delta Holding also include:

- Internal newsletter – Delta Newsletter;
- Collection of professional books and journals – Library;
- Notice boards;
- Suggestion boxes;
- Prize games and internal competitions;
- Corporate video;
- Employee recognition.

All information concerning the system organization and work, as well as the promotions related to the Company's brands are regularly forwarded to employees.

In addition to informing and communicating to employees, internal programs and campaigns are also conducted in Delta Holding. Programs implemented for employees reflect through the organization of education, as well as team building for different employee levels. As an example of an internal campaign, the centralization of activities in the domain of marketing, public relations, corporate social responsibility and management of customer relationships realized in the course of 2011 can be mentioned. The centralization entails the preparation of complete necessary documentation, rules and procedures. The bylaws set out the rules and procedures in the segment of media relations, preparation and realization of marketing projects, media buying, event management, video production and corporate presentation, corporate social responsibility, customer relations management, relations with organizations with membership in the field of corporate communications, relations with educational institutions. To promote and realize the centralization, a joint SharePoint portal was established for all colleagues from the communications department. All colleagues have access to the portal and everybody enters data from his domain, so that now the Company has a calendar of all PR and marketing events, information on new products, companies and the like. In addition to Share Point portal of communications, joint e-mail addresses have been established to enable easier and speedier communication.

The communication with employees is achieved using the internal communication tools presented in the corporate communications theory. Internal communications are the responsibility of corporate communications and human resources departments. The example made by Delta Holding confirms the

applicability of instruments and significance of internal communications in the practice of corporate communications.

6. CONCLUSION

The grounds for corporate brand and reputation building are the company's identity which is based on corporate culture and values. The employees as the ambassadors of their company deliver the company's value and its identity thus impacting the creation of image and reputation. This is why reputation building requires that employees understand the core values of the company and its culture to be able to properly reflect the identity, positively impact image and, on the long run, the company's reputation. In understanding corporate identity and its reflection into wanted image and reputation, the main part is played by corporate communications, in particular the part relative to internal communications. The result of well designed and managed internal communications is the internal environment which understands the core values of the company and identifies with the company's vision which is stirred towards the creation and maintenance of the value of corporate brand and reputation. The task of internal communications is to achieve employee commitment and engagement reflected through positive work results, attitudes and behavior, motivation, and ensure productivity and better business performances.

²Public Relations Department, Ministry of Defence RS, zoran.bobar@mod.gov.rs

³Public Relations Department, Ministry of Defence RS, jovan.krivokapic@mod.gov.rs

Abstract: *Communication management within the modern defence structure has been greatly influenced by the introduction of new information technologies in the last couple of decades. Interactive, informative communication within an organisation serves a purpose, but virtual communication has enabled direct feedback, i.e. two-way communication among an unlimited number of users. This is clearly a necessity for organizations such as ministries of defence and military organizations that affect the general public.*

The highest increase in use amongst social media has been recorded in social networking. This article has analysed reasons for and objectives of the participation of the Serbian Ministry of Defence in these networks. Qualitative analysis of the content of a social network page has proved that the involvement of the Ministry of Defence was justified. This study case has identified a method of communication that is acceptable to the younger population, which is one of the main stakeholders. The article gives a positive example of the use of new technologies in communication management within a specific social subsystem such as the defence structure, whose main goal is to adjust itself to community expectations and improve mutual understanding of the military and its stakeholders.

Key words: communication management, information technology, public relations in defence structure, social media, social network

1. INTRODUCTION

Social, economic and technological conditions of the modern world have influenced the attitude of managers and/or executive directors – they have become aware of the fact that the success or survival of their organizations depends on the image they have in public and the level of public trust they have created. Communication management, commonly referred to public relations in Europe (more Van Ruler, Verčič, 2008), has increasingly become an important function of governance. It is well known that set out policies may be implemented easier with public consensus and understanding rather than facing the public opposition. Good communication with the public creates a positive relationship that can have important economic, cultural and political effects.

At the same time, management goes through various forms of transformation in today's digital era. Life in the digital era enables faster, cheaper and more convenient ways of sending messages alongside simpler document processing. The importance given to information technology (IT) and especially a global network improves management communication and assist in important functions such as decision making, coordination and control.

Communication management is the type of management where the impact of IT and information and communication technology (ICT) may have been the most profound comparing to other managerial functions. New media have reformed the ways of communication as the foundation of communication management. The organizations that have not engaged with or have not implemented this in the right way have become unsuccessful or marginalised.

All throughout the twentieth century defence and security have been treated as the government sector with the least public influence. It was considered that only political elite and military personnel with the knowledge of secret data had enough information and skills to make decisions in this area. Yet, the area of defence and security has become more and more transparent in the last couple of decades. This government sector has gained political support using political representation and public opinion to create an efficient system capable of quick action. The military and other organizations within the security sector have been developing relations with different public groups on a regular basis. In this regard, their communication management involves various techniques and tactics.

2. MODERN COMMUNICATION MANAGEMENT

Nowadays communication management has substantially changed the content and form of communication with a domestic or foreign public. This has been strongly influenced by information technology.

The most noticeable change has been the increased complexity of communication with employees and other internal liaison groups, but also with various groups of external stakeholders. Communication has become faster and more encompassing while at the same time it has been conducted more frequently without face to face meeting of participants involved.

The use of IT has led to a revolution in the work practices in most of manufacturing and customer oriented businesses. Various kinds of software and networks provide opportunity for multiple users to work on the same project simultaneously from different geographical locations. They also provide for the use of graphics or hyperlinks, while the supervising manager is enabled to edit the content or the final format of the document. IT allows what was once unthinkable practice and that is to work out of your workplace; telecommuting or combining the efforts of separated co-workers enables forming of virtual teams communicating via web conferences.

Working relationships and communication among the employees, participants or members of an organisation may be more important than the external ones when the organisation is trying to fulfil its objectives in order to survive (Cutlip, S, Center, A Broom, G, 2006,p. 249). In internal public relations, direct interaction is more achievable. Managers can choose from different communication channels the one that is best suited to their needs. The choice is selected by, above all, the amount of information that can be transferred through the channel. Face-to-face, verbal communication enables direct communication, (almost) synchronised reply and the presence of non-verbal communication. Besides meetings and 'walk and talk's, other forms of direct verbal communication include a teleconference or web conference. The other ways of communication with the internal groups, such as verbal communication in the form of electronic communication such as phone calls, internet chats or voice mails or written communication either personalised or general – e-mails, web-portals, bulletins - have been also improved by the use of new media and new communication channels. (Jones and George, 2011)

The most common interpretation of communication management is that it is a development, realisation, and upkeep of communication with the external stakeholders on which the organisation depends.

Every organisation can establish connections with numerous segments of the public. Two ways, symmetrical communication with an emphasis on the complete interaction of an organisation and its target public recipients is widely accepted as a standard model nowadays. Despite this, in practice, a communication management of any organisation focuses primarily on its own objectives and use of various methods, techniques and tools to convey its message. Traditional techniques such as a direct relationship with public (organisation of various events), or indirect ones such as issuing press release to mass media in order to publish them, have been enriched with additional interactive methods enabled by the internet and other forms of new media.

The internet has created a way of communication the cost of which is rather negligible. Sending information from multiple sources to multiple recipients almost concurrently with an event happening is a process that is multidimensional. Two important internet characteristics related to communication are: accessibility around the world and the fact that web content is practically impossible to control.

One of the biggest advantages of the internet as a public relation medium is reality and the possibility of direct and simultaneous access to specific target audiences. This also lessens the dependence of communication managers to traditional mass media. New methods of communication based on the internet have changed the media environment. On one hand the internet sends messages to a specifically targeted audience but on the other it creates the possibility for an organisation to receive feedback, which makes it very important in public relations.

The presentation of an organisation on the global network or even the set up of chat forums with registered potential participants still could not completely achieve the main public relation objective which is maximum organizational exposure to the public and increased interaction. The establishment of social media has considerably alleviated this issue.

3. PUBLIC RELATION REQUIREMENTS IN DEFENCE STRUCTURE

The purpose of public relations in the defence structure is to improve mutual understanding between an army and its stakeholders. Public relations has become one of the key functions of command within most military organizations. This change has been brought up not only by the democratisation of society and the transformation of armies themselves, but also the growth of free press and increased market competition. The application of information and communication technologies in military organizations has become unavoidable. The result of which is an opportunity for increased transparency, interaction with major stakeholders and new channels of communication.

Those who are responsible for public relations in military organizations communicate with all relevant internal and external stakeholders in order to coordinate the set out goals of a military organisation with a community expectation. The expectation is related, above all, to socially responsible behaviour in carrying out missions, of which some are of a military nature, such as the defence of country's freedom and independence. The other expectation may be related to a traditional, non-military role of the defence structure such as armed forces protecting national unity or being an institution that influences the younger generation by promoting desired values and helping them integrate with society.

The communication management of a military organisation strive to develop a communication strategy, coordinate the military organisation with the surrounding social environment, create an identity and a desired public image of that identity as well as increase acceptance of the military organisation in public. In addition, it also provides for better informed military personnel, facilitates better team work, supports marketing projects and improves forms and techniques of internal and external communication.

The defence structure must define all communication elements of its communication strategy for different scenarios – in regular, peaceful conditions, but also in crises such as extraordinary situations, immediate threats of war or being in a state of war.

Interaction between an army and the public is conducted through the information department of the Ministry of Defence and General Headquarters, commands of strategic and operational troops, State institutions for information (especially in a case of liaison with foreign journalists), public relations and marketing agencies, military public relations representatives – spokespeople and various military mass media.

The principal aim of communication programs and plans in relation to the members and employees is to form a certain identity and positive relationship between army personnel; encouraging motivation for more efficient work and the upstaging of a positive image of military forces and its leadership. Communication with the internal groups has been increasingly conducted through new media and the internet.

Typical external stakeholders, related to the defence structure, are the general public, journalists, the qualified public (researchers dealing with security, defence and army), army journalists, public activists, young people, members of parliament, politicians, state institutions (government, ministries, department for information and propaganda), but also business people, citizens organizations, ex service military personnel, military emissaries and foreign correspondents.

Military organizations disseminate their messages through mass media, some direct contact such as visits to military troops, exhibitions and similar, but more often nowadays by new media.

4. USE OF SOCIAL NETWORKS

The development of the information and communication technologies enabled development of the new media and adjustment of the existing ones to the new working conditions and habits of the consumers of the media products. But new media have also produced, up to then, unknown ways of social communication.

The biggest rise and popularity in the field of digital communications have achieved the social networks: MySpace, Facebook, Twitter, LinkedIn, which have considerably changed the way, not only the mass, but also the interpersonal and group communication. The social networks may be defined as internet services

designed for social internetworking of people who are connected with each other by certain mutual interests or mutual life experiences.

The popularity and development of social networks was conditioned by technology development. With appearance of Web 2.0 technology there was enabled bigger interactivity of site users, such as opening user's account, installation of photographs and video clips on sites, making comments etc. The concept of interactivity is the basic concept of social networks. The purpose of existence is certainly bigger socialization of the internet users, finding mutual interests, old and new friends, personal affirmation, but also expressing of users through various social activities, such as games, quizzes, blogs, participation in discussions. It is characteristically that the social networks have got the role which overcome meetings and personal affirmation. Social networks had, for example, big political role in the „Arabian Spring“ because they encouraged and gathered the demonstrators. The social networks, unlikely of the forums, on which is regularly expressed intolerance towards different views, gather people who have same or similar opinion with the creators of the opinions. Such a model of the social network is very functional for outburst, i.e. identification or confirmation of the opinion, but too little for real political debate where confrontation has to be made vs. the argument quality, and not in relation to personalization or closeness.(Colombo, 2010, p.5)

Social networks are products of the new media which have noted the biggest growth of users since 2008. They created a totally different understanding of PR in companies, as well as different views on target groups and communication with them through new channels. Penetration of the new media in all segments of the society imposed a serious theme for consideration to the defence structure. The fact is that defence structure passes through all social subsystems and it is in connection to the state system. In that sense the use of social networks opens a space for direct communication of the defence structure with the target groups and for direct placing of the key messages.

5. SOCIAL NETWORKS IN FOREIGN DEFENCE STRUCTURES

The defence structures in the world have been adjusted to the social networks as a social phenomenon with variable speed and diversely understanding the role of the social networks in the life and the work of the military organizations. Today the use of social networks is present virtually in many armies. In the surrounding countries it is related to administration of the profile on the social networks Facebook and Tweeter, without adequate legal regulations and precisely defined jurisdiction. Out of the Balkan region, specific proactive access to the new media has the French Ministry of Defence – in its Department for Public Relations there is a person that deals only with social networks. The Facebook pages of the French Ministry of Defence has 4.438 fans, [19] and on this social network officially are present the French armed forces as well as the army branches: the navy, the air force and the army. The French Ministry of Defence is present on the other social networks as well (Twitter, Dailymotion, the French version of the Youtube), The presence of French defence structure on social networks has been defined in the Strategy of Use of New Medias in the French Armed Forces. The main objective is to improve the communication with the youth in the country. So, the content of all the profiles of the social networks is adapted to the youth population.

The most systematic and most open use of the social networks in foreign armed forces is in the Ministry of Defence in the USA where there is a department dealing with new media and social networks. The social networks used in the USA Armed Forces are Facebook, Tweeter, YouTube, Flickr, Vimeo, Slideshare, Army Live Blog. All professionals of the USA Armed Forces are allowed to open profiles on the social networks presenting themselves with the official duty they have in the Army Forces or as a official profile of the organizational unit but strictly respecting clearly defined directives which are regulated by the Ministry of Defence. In 2010, the USA Ministry of Defence made an incorporated page of use of the social networks in the defence structure of USA.[15] There are contents for education and training in the field of use of social networks, regulated procedures, register of all sites and links to the pages, which incorporate the presence of the army branches on the social networks (Army, Navy, Air Forces, Marines, National Guard, Coast Guard).

In the new handbook on public relations in the NATO new media are described as „web based technologies which are used for social interaction of the users and for a process of transformation and expansion of media monologues in interactive, social dialogue“. [1] Interaction of users and the process of socialization represent the basis for consideration of new media in NATO, wherefore are called social media.

6. COMMUNICATION THROUGH SOCIAL NETWORKS IN THE MINISTRY OF DEFENCE AND THE SERBIAN ARMED FORCES

The feasibility study of the eDepartment in Republic of Serbia which is in compliance with contemporary tendencies of organization management says that management in state institutions should be based on general (standard) processes which can be classified in several scenarios i.e. business processes with mutual characteristics. One of the mutual functions of the state administrations is public relations for which assumed the following processes: [15]

- Audio and video conferences
- News and events
- Publication of information
- Media promotion

The Ministry of Defence of the Republic of Serbia (Serbian MoD) as part of state administration, has developed function of public relations which, besides the classic communication channels, realizes based on ICT and new media. The system is user friendly and gives support to all actors in internal and external information in the defence system. According to the competence, they can distribute information of multimedia content quickly and efficiently and get back related information necessary for analytical studies

Rapid growth of number of young users of the social networks during 2008, initiated the participation of the Serbian Ministry of Defence in the social networks (YouTube 02.09.2008 and Facebook 22.12.2009.). The basic intention was to reach the youth by direct two way communication. Young population, that can be further classified per age and goals of concrete communication, is very important target group for the Ministry of Defence and the Armed Forces of Serbia [14].

YouTube channel of the Ministry of Defence, was opened within the campaign „Be a Professional“ with aim of publicizing promotional spots (acceptance in professional army service, acceptance in the Military Academy, Military Secondary School, promotion of lieutenants...) and during 2009. publishing video news of the defence structure. There have been published 747 pictures and examined 606 video shots [19].

The analysis of the visits and the review of the recordings show that this media is the most suitable for promotional campaigns in the defence system, because the most visited recordings are the ones used in the campaign – professional Vuk Kostić 34896 views, professional “2008” 20892 views, professional “Arm Forces of Serbia” 18980 views... In comparison to this, video news do not reach more than thousand views, regardless of their content and the time of release.

Facebook profile of Serbian MoD & Serbian Armed Forces (SAF) is opened with the aim to become a source of information adapted to the target group which is user of this type of new media. The other goal was to secure reversing of the members of the social networks to the official web presentations of the Serbian defence structure. Besides that, the aim of opening a profile on Facebook was the need of two way communication with the members of the social network and neutralizing others to open the profile on behalf of Serbian MoD and SAF.

As there were no regulations which would regulate the participation in social networks at the time of opening the profile, the MoD and SAF Facebook profile was edited in accordance to the Terms for Communication Strategy of MoD and SAF and the document – Directive on Information of the Public about the Work of MoD and the activities of SAF. The Handbook for Public Relations in the MoD and SAF was adopted two years ago. It has confirmed the preference of the relevant Department for Public Relations for common appearance of MoD and SAF through one profile. All the public relations in using new technologies, as well as with classic communication channels, are realized in coordination with the Department.

If one organizational unit from the defence system estimates that can participate in maintenance of the Facebook profile or certain themes it can also be realized with agreement of the Department. In the previous period there were no parts of the Ministry and the Army Forces interested for maintaining the Facebook profile by themselves. On the other side, members of the Serbian Armed Forces cannot open their own profiles on Facebook nor can they show contents which are related to their professional work or engagement.

7. Case Analysis of the Use of Social Network

Facebook page of MoD and SAF was marked by 2507 visitors as *like*, with tendency of constant growth. Taken into consideration the number of friends of those visitors, one can get the number of 878607 persons as potential users of MoD and SAF posts. The number of users of Facebook who have seen some of the content of the page of MoD and SAF weekly is 9310 with rising tendency [21].

The analyse the sex and age structure of the visitors of MoD and SAF Facebook page shows that 54% of the users are male persons, and the rest are female persons. This ratio is favourable in the process of profesionalization of the SAF and realization of the campagne „Women in the Armed Forces“. It is possible to note that the age structure of the users of MoD and SAF page in more than 96% cases is within the range from 13 to 44 years of age (Figure 1). This confirms the estimation of the Department of Public Relations that Facebook should be used in promotional purposes and adjust the content to youth, potential candidates for entry in professional army service.

Figure 1. Age Distribution of the Users of Facebook of MO and VS

The qualitative analysis of the content of Facebook page of MoD and SAF shows that the decisive influence on the user is made by the type and choice of media where the information is published. Namely, the characteristics of the target group to which we address is that it expects a short, multimedia information. By analyzing the case of February 2012 one can realize the following

Figure 2. Number of Visitors and Users of the Bulletins on MoD and SAF page

From 02. to 08. February there were placed eleven bulletins of MoD and SAF, which arose interest of the users of the MoD and SAF page. The bulletins were observed by 18303 users, which represents distinct increase related to the average values of 5000 visits in 2012. (Figure 2). The type of bulletins indicates the fact that the visitors of Facebook page of MoD and SAF expect information on specific activities of the Armed Forces, followed by multimedia contents. In the observed period they are: Exercise “Meridien

2012", The Army helping the population in removal of snow, Serial "Military Academy" and Military Academy Cadets education in winter conditions.

8. CONCLUSION

Communication management in modern organizations has been influenced by new technologies in more than one way. Information and communication technologies have increased, enriched and speed up communication with the internal and external target groups. They enable direct and continuous interpersonal communication and in the case of liaisons with external stakeholders they increase interaction and improve the channels of communication.

Public relation has become one of the key functions of military organizations which need, as much as other social sub systems, improvement of mutual understanding with stakeholders. Military organizations provides for a continuous presence on the internet through web portals and organizational presentation, web services that is in the use of the defence system, electronic mail, blogs, forums and social networks.

The concept of interaction is the basis of social networks set up by military organizations. It is increasingly used for direct communication with stakeholders and immediate dissemination of key messages. Involvement of the Serbian Ministry of Defence in social networks has been conducted with the basic intention to reach the young population through direct, two-way communication. An analysis of web page use has shown that this medium is the most suitable for promotional campaigns in the defence structure and for short, multimedia information. More than 40% of web page visitors belong to the population group of 18 – 24 year olds. That demographic group is the one that has the most presence on the social networks, but they are also the key stakeholders group for the defence structure. The appeal and usefulness of information on the web page are two basic elements that promote users' involvement. These qualities also encourage the users to actively participate in creating a positive image related to social network announcements and to initiate feedback from them.

COMMUNICATION OF POLITICAL PARTIES ON TWITTER: COMPARISON OF POLITICAL PARTIES IN SERBIA, CROATIA, SLOVENIA AND BIH

Koruga Petra¹, Bača Miroslav¹

¹Faculty of Organization and Informatics, Varaždin
{petra.koruga, miroslav.baca}@foi.hr

Abstract: *In the past years, information and communication technologies have been affecting all aspects of our lives, including politics. Political parties use the Internet to communicate with their potential voters. This paper will give a short introduction to communication over Twitter, a description of the political parties in question, and the main part of the paper is the analysis and comparison of communication of Serbian, Croatian, Slovenian and BiH political parties on Twitter.*

Keywords: *Internet, communication, Twitter, Serbia, Croatia, Slovenia, BiH*

1. INTRODUCTION

A growing number of people use the Internet, thus it becomes a mass media whose advantages need to be used. For the past few years social networks, such as Twitter, Facebook or MySpace, have been recognized as a good medium for self promotion. Political parties have also discovered social networks and started using online campaigns to contact potential voters. One of the positive aspects is that potential voters can be informed and at the same time don't leave their homes. People can find information they are interested in with just a few clicks. It would be ideal that every political party publishes news about its work and program online, so people can now what is happening and be timely informed about newest developments.

Main advantage of using social networks for political parties is a great number of potential voters (mostly younger population) who use social networks. Political parties can in this way connect themselves better with younger population and present their programs. Also, promotion of political parties through social networks enables direct communication between voters and political parties, and thus makes a political party closer to its voters.

Some political parties have recognized advantages of social networks and see them as an excellent way of communication with potential voters. One of these social networks is Twitter which will be closely examined in this paper.

2. COMMUNICATION ON TWITTER

"Twitter is a very popular instant messaging system that lets a person send brief text messages up to 140 characters in length to a list of followers. Launched in 2006, Twitter was designed as a social network to keep friends and colleagues informed throughout the day. However, it became widely used for commercial and political purposes to keep customers, voters and fans up-to-date as well as to encourage feedback" (PC Magazine, 2012).

As in a lot of other things, Americans have first discovered social networks for communication with potential voters. Election of Barack Obama has been a milestone in effect of social networks on political campaigns. Twitter and other social networks have been used to collect funds, organize and implementation of campaign strategy, and most importantly, for gaining votes.

Twitter in numbers (Twitter blog, 2012):

- #tweets
 - 3 years, 2 months and 1 day. The time it took from the first Tweet to the billionth Tweet.
 - 1 week. The time it now takes for users to send a billion Tweets.
 - 50 million. The average number of Tweets people sent per day, one year ago.
 - 140 million. The average number of Tweets people sent per day, in the last month.
 - 177 million. Tweets sent on March 11, 2011.
 - 456. Tweets per second (TPS) when Michael Jackson died on June 25, 2009 (a record at that time).
 - 6,939. Current TPS record, set 4 seconds after midnight in Japan on New Year's Day.
- #accounts
 - 572,000. Number of new accounts created on March 12, 2011.

- 460,000. Average number of new accounts per day over the last month.
- 182%. Increase in number of mobile users over the past year.
- #employees
 - 8. 29. 130. 350. 400. Number of Twitter employees in Jan 2008, Jan 2009, Jan 2010, Jan 2011 and today.

3. POLITICAL PARTIES

First step in political party analysis is to define a political party. Downs (1964) says it is a coalition of men seeking to control the governing apparatus by legal means. Huckshorn (1984) defined political party as an autonomous group of citizens having the purpose of making nominations and contesting elections in hope of gaining control over governmental power through the capture of public offices and the organization of the government. Schlesinger (1991) defines a political party as a group organized to gain control of government in the name of the group by winning election to public office. Aldrich (1995) says that political parties can be seen as coalitions of elites to capture and use political office, but it is more than that. It is an institutionalized coalition, one that has adopted rules, norms and procedures.

3.1. Serbia

There is a great number of political parties in the Republic of Serbia (National Assembly of the Republic of Serbia, 2012): Serbian Radical Party (Srpska radikalna stranka), Democratic Party (Demokratska stranka), G17 PLUS (G17 PLUS), Democratic Party of Serbia (Demokratska stranka Srbije), Liberal Democratic Party (Liberalno demokratska partija), Socialist Party of Serbia (Socijalistička partija Srbije), New Serbia (Nova Srbija), League of Social Democrats of Vojvodina (Liga socijaldemokrata Vojvodine), Party of United Pensioners of Serbia (Partija ujedinjenih penzionera Srbije), Party of Democratic Action of Sanjak (Sandžačka demokratska partija), Alliance of Vojvodina Hungarians (Savez vojvođanskih Mađara), Serbian Renewal Movement (Srpski pokret obnove), United Serbia (Jedinstvena Srbija), Bosniac Democratic Party of Sanjak (Bošnjačka demokratska stranka Sandžaka), Democratic Left of the Roma (Demokratska levica Roma), Democratic League of Croats in Vojvodina (Demokratski savez Hrvata u Vojvodini), Party for Democratic Action (Partija za demokratsko delovanje) etc.

Political parties to be analysed are: Serbian Radical Party (Srpska radikalna stranka), Democratic Party (Demokratska stranka), G17 PLUS (G17 PLUS), Democratic Party of Serbia (Demokratska stranka Srbije), Liberal Democratic Party (Liberalno demokratska partija) as top five parties with the highest number of seats in National Assembly (National Assembly of the Republic of Serbia, 2012).

3.2. Croatia

In Croatia also, a great number of political parties exist: Croatian Democratic Union (Hrvatska demokratska zajednica), Social Democratic Party of Croatia (Socijaldemokratska partija Hrvatske), Croatian Peasant Party (Hrvatska seljačka stranka), Croatian People's Party-Liberal Democrats (Hrvatska narodna stranka – Liberalni Demokrati), Istrian Democratic Assembly (Istarski demokratski sabor), Croatian Democratic Alliance of Slavonia and Baranja (Hrvatski demokratski savez Slavonije i Baranje), Croatian Party of Pensioners (Hrvatska stranka umirovljenika), Croatian Party of Right (Hrvatska stranka prava), Croatian Labourists - Labour Party (Hrvatski laburisti - Stranka rada), Croatian Social Democrats (Hrvatski Socijaldemokrati), Croatian Demochristian Party (Hrvatska demokršćanska stranka), Croatian Labour Party (Hrvatska radnička stranka), Croatian Party of Rights 1861 (Hrvatska stranka prava 1861), Croatian Pure Party of Rights (Hrvatska čista stranka prava) etc.

Parties to be analysed are: Croatian Democratic Union (Hrvatska demokratska zajednica), Social Democratic Party of Croatia (Socijaldemokratska partija Hrvatske), Croatian People's Party-Liberal Democrats (Hrvatska narodna stranka – Liberalni Demokrati), Croatian Labourists - Labour Party (Hrvatski laburisti - Stranka rada) and Croatian Democratic Alliance of Slavonia and Baranja (Hrvatski demokratski savez Slavonije i Baranje) as top five parties with the highest number of seats in Parliament (Hrvatski sabor, 2012).

3.3. Slovenia

There is a large number of political parties in Slovenia: Positive Slovenia (Pozitivna Slovenija), Slovenian Democratic Party (Slovenska demokratska stranka), Social Democrats (Socialni demokrati), Gregor Virant's Civic List (Državlјanska lista Gregorja Viranta), Slovenian People's Party (Slovenska ljudska

stranka), Democratic Party of Pensioners of Slovenia (Demokratska stranka upokojencev Slovenije), New Slovenia – Christian People's Party (Nova Slovenija – kršćanska ljudska stranka), Slovenian National Party (Slovenska nacionalna stranka), Liberal Democracy of Slovenia (Liberalna demokracija Slovenije), Party for Sustainable Development of Slovenia (Stranka za trajnostni razvoj Slovenije), Youth Party - European Greens (Stranka mladih - Zeleni Evrope), Democratic Labour Party (Slovenia) (Demokratska stranka dela), Zares, Greens of Slovenia (Zeleni Slovenije), Movement for Slovenia (Gibanje za Slovenijo), Slovenian Party of Equal Opportunities (Stranka enakih možnosti Slovenije), Forward Slovenia (Naprej Slovenija, NPS) etc.

Parties to be analysed are: Positive Slovenia (Pozitivna Slovenija), Slovenian Democratic Party (Slovenska demokratska stranka), Social Democrats (Socialni demokrati), Gregor Virant's Civic List (Državlјanska lista Gregorja Viranta), Slovenian People's Party (Slovenska ljudska stranka), Democratic Party of Pensioners of Slovenia (Demokratska stranka upokojencev Slovenije) as top six (fifth and sixth party have the same number of seats) parties with the highest number of seats in Parliament (Republika Slovenija državni zbor, 2012).

3.4. BiH

Some of the political parties in Bosnia and Herzegovina are: Greens of Bosnia and Herzegovina (Zeleni Bosne i Hercegovine), Bosnian Party (Bosanska stranka), Citizens' Democratic Party (Građanska demokratska stranka), Liberal Democratic Party (Liberalna demokratska stranka), Pensioners' Party of Bosnia and Herzegovina (Stranka penzionera/umirovljenika BiH), Workers' Communist Party of Bosnia and Herzegovina (Radničko-komunistička partija Bosne i Hercegovine), Democratic youth movement (Demokratski omladinski pokret), Democratic Party of Bosnia and Herzegovina (Socijaldemokratska partija Bosne i Hercegovine), Our Party (Naša stranka), Union for a Better Future of BiH (Savez za bolju budućnost Bosne i Hercegovine), Party for Bosnia and Herzegovina (Stranka za Bosnu i Hercegovinu), Bosnian-Herzegovinian Patriotic Party-Sefer Halilović (Bosanskohercegovačka Patriotska Stranka-Sefer Halilović), Party of Democratic Action (Stranka Demokratske Akcije), Democratic People's Community (Demokratska Narodna Zajednica), Democratic Party of the Republika Srpska (Demokratska stranka Republike Srpske), Party of Democratic Progress (Partija demokratskog progresa RS), Democratic People's Alliance (Demokratski Narodni Savez), Serbian Democratic Party (Srpska demokratska stranka), Serbian People's Alliance of the Republika Srpska (Srpski narodni savez RS), Serbian Radical Party of the Republika Srpska (Srpska radikalna stranka RS), Socialist Party of the Republika Srpska (Socijalistička partija Republike Srpske), League of People's Rebirth (Savez narodnog preporoda), Christian Democrats (Demokršćani), Croatian Christian Democratic Union (Hrvatska kršćanska demokratska unija), Croatian Democratic Union of Bosnia and Herzegovina (Hrvatska demokratska zajednica), Croatian Democratic Union 1990 (Hrvatska demokratska zajednica 1990), Croatian Party of Rights (Hrvatska stranka prava), Croatian Peasant Party (Hrvatska seljačka stranka), Croatian Right Bloc (Hrvatski pravaški blok).

Parties to be analysed are: Social Democratic Party BiH (Socijaldemokratska partija BiH), Alliance of Independent Social Democrats (Savez nezavisnih socijaldemokrata), Party of Democratic Action (Stranka demokratske akcije), Serbian Democratic Party (Srpska demokratska stranka) and Croatian Democratic Union of Bosnia and Herzegovina (Hrvatska demokratska zajednica Bosne i Hercegovine) as top five parties with the highest number of seats in Parliament (Parliament assembly of Bosnia and Herzegovina, 2012).

4. ANALYSIS OF COMMUNICATION

Twitter, with its 190 million users, is the second largest social network in the world. Last couple of years number of twitter users is constantly increasing, and is expanding to former Yugoslavian countries. This chapter will give an overview of communication of the largest political parties in Serbia, Croatia, Slovenia and Bosnia and Herzegovina.

Twitter Grader tool has been used for analysis (Twitter Grader, 2012). Profiles are compared according to:

- Number of followers
- Number of updates
- Number of following profiles
- Rank
- Grade

Number of updates, followers and following profiles can be seen on every twitter profile. Rank and grade are calculated according to algorithm presented by Twitter grader. Following factors influence this algorithm (Grader blog, 2012):

- Number of Followers: More followers leads to a higher Twitter Grade
- Power of Followers: People with a high Twitter Grade following a profile, count more than those with a low Twitter Grade following a profile
- Updates: More updates generally lead to a higher grade
- Update Recency: Users that are more current generally get higher grades
- Follower/Following Ratio: The higher the ratio, the better
- Engagement: The more a given user's tweets are being retweeted, the more times the user is being referenced or cited, the higher the twitter grade

Those are the factors that go into the calculation of a score. The grade is calculated as the approximate percentage of other users that have an equal or lower score. Twitter Grade of 80 means that about 80% of the other users got a lower score. The absolute ranking says, based on all other users scored, what's the profiles "position" in that list. A ranking of 5,000 means that only 4,999 other people had a higher score than profile in question (Grader blog, 2012).

4.1. Serbia

Analysed political parties are: Serbian Radical Party (Srpska radikalna stranka), Democratic Party (Demokratska stranka), G17 PLUS (G17 PLUS), Democratic Party of Serbia (Demokratska stranka Srbije), Liberal Democratic Party (Liberalno demokratska partija). Those are top five parties with the highest number of seats in National Assembly.

All of the five mentioned parties have Twitter profiles (Table 1):

- Serbian Radical Party - @srpski_radikali
- Democratic Party - @demokrate
- G17 PLUS - @G17PLUSOfficial
- Democratic Party of Serbia - @DSSvesti
- Liberal Democratic Party - @LDP

Table 1: Twitter profiles and characteristics of Serbian political parties

Twitter account	Rank	Followers	Following	Updates	Account opened	Grade
srpski_radikali	972800	763	1208	837	28.3.2009	91
demokrate	139643	4988	1135	5336	31.7.2009	100
G17PLUSOfficial	506601	1361	604	719	16.12.2009	95,5
DSSvesti	1517903	297	4	230	15.3.2011	86
LDP	195464	3836	2078	1682	26.1.2009	100

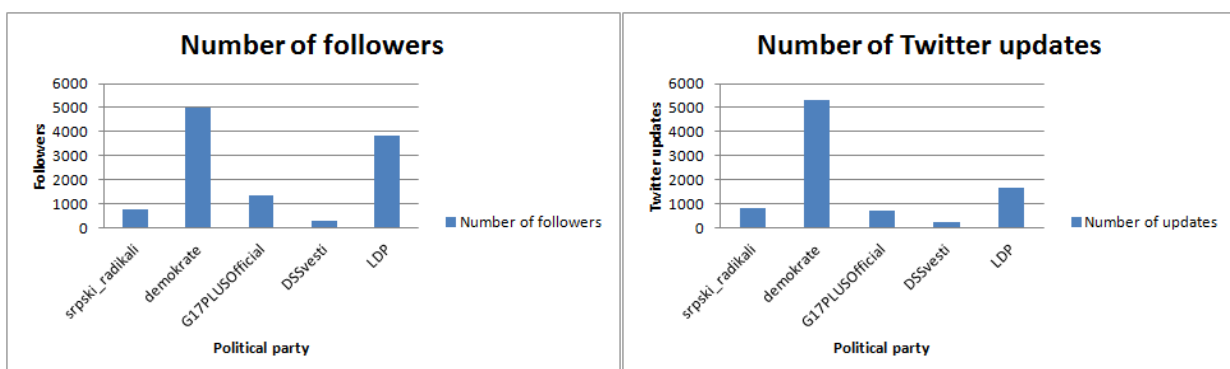

Figure 1: Twitter profiles by number of (a) followers and number of (b) updates

It can be seen (Fig. 1a) that Democratic party has the largest number of updates, and the largest number of followers (Fig. 1b). Through number of updates, number of followers and number of following profiles, twitter rank (Fig. 2a) and twitter grade (Fig. 2b) are calculated.

(a) (b)
Figure 2: Twitter profiles by (a) rank and (b) grade

4.2. Croatia

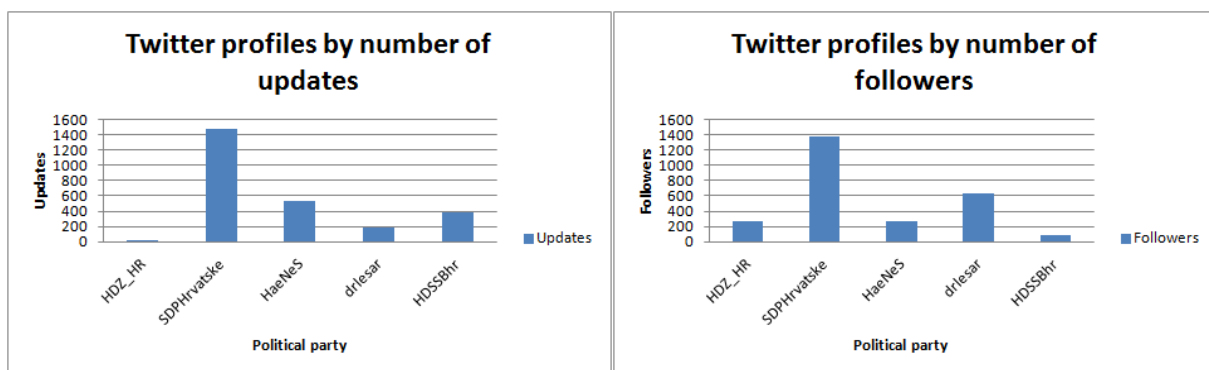

Analysed political parties are: Croatian Democratic Union (Hrvatska demokratska zajednica), Social Democratic Party of Croatia (Socijaldemokratska partija Hrvatske), Croatian People's Party-Liberal Democrats (Hrvatska narodna stranka – Liberalni Demokrati), Croatian Labourists - Labour Party (Hrvatski laburisti - Stranka rada) and Croatian Democratic Alliance of Slavonia and Baranja (Hrvatski demokratski savez Slavonije i Baranje).

All of the five mentioned parties have Twitter profiles (Table 2):

- Croatian Democratic Union - @HDZ_HR
- Social Democratic Party of Croatia - @SDPHrvatske
- Croatian People's Party-Liberal Democrats - @HaeNeS
- Croatian Labourists - Labour Party - @drlesar
- Croatian Democratic Alliance of Slavonia and Baranja - @HDSSBhr

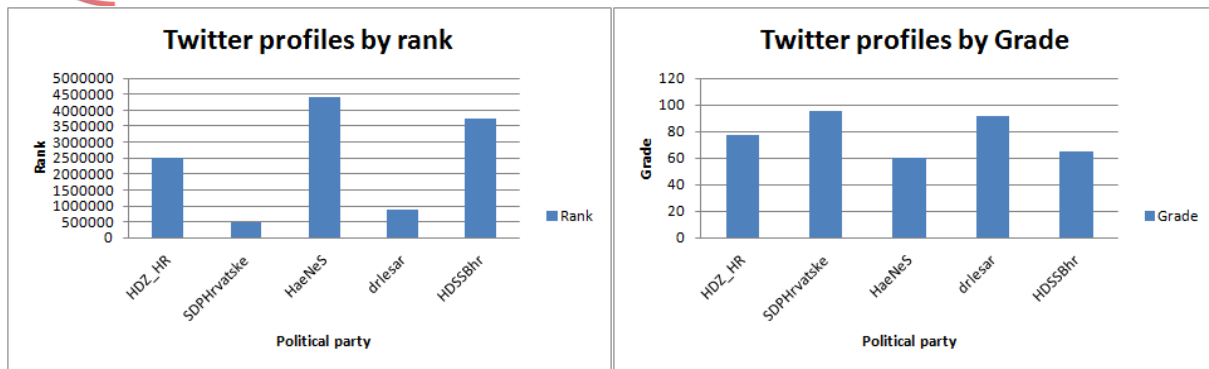

Table 2: Twitter profiles and characteristics of Croatian political parties

Twitter account	Rank	Followers	Following	Updates	Account opened	Grade
HDZ_HR	2521914	263	0	5	27.2.2009	77
SDPHrvatske	506601	1375	946	1470	15.9.2009	95,5
HaeNeS	4393131	272	136	532	23.5.2010	60
drlesar	901676	639	55	183	27.7.2011	92
HDSSBhr	3748941	89	142	384	21.3.2011	65

(a) (b)
Figure 3: Twitter profiles by number of (a) followers and number of (b) updates

It can be seen (Fig. 3a) that Social Democratic Party of Croatia has the largest number of updates, and the largest number of followers (Fig. 3b). Through number of updates, number of followers and number of following profiles, twitter rank (Fig. 4a) and twitter grade (Fig. 4b) are calculated.

(a) (b)
Figure 4: Twitter profiles by (a) rank and (b) grade

4.3. Slovenia

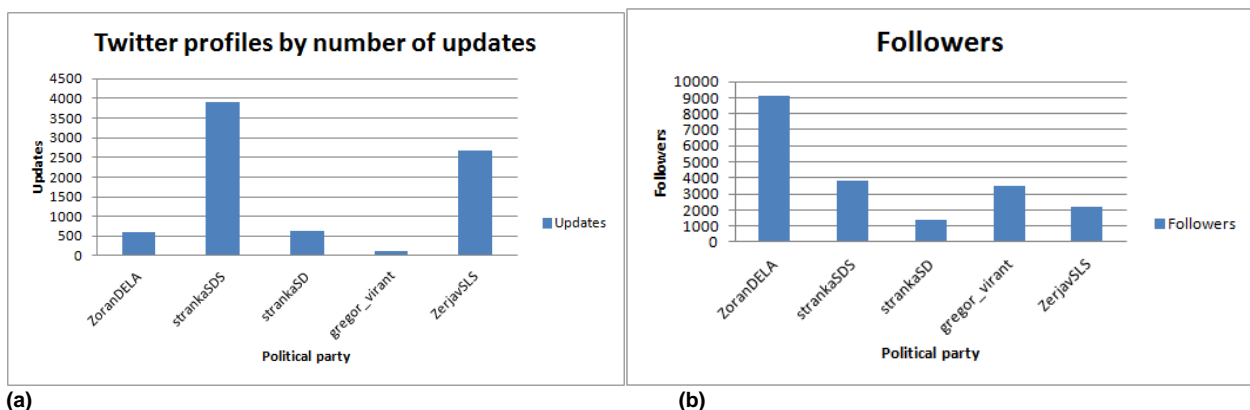

Analysis has been done on the following political parties: Positive Slovenia (Pozitivna Slovenija), Slovenian Democratic Party (Slovenska demokratska stranka), Social Democrats (Socialni demokrati), Gregor Virant's Civic List (Državljanska lista Gregorja Viranta), Slovenian People's Party (Slovenska ljudska stranka), Democratic Party of Pensioners of Slovenia (Demokratska stranka upokojencev Slovenije). Out of this six political parties, only one of them does not have a twitter profile - Democratic Party of Pensioners of Slovenia.

Other five mentioned parties have Twitter profiles (Table 3):

- Positive Slovenia - @ZoranDELA
- Slovenian Democratic Party - @strankaSDS
- Social Democrats - @strankaSD
- Gregor Virant's Civic List - @gregor_virant
- Slovenian People's Party - @ZerjavSLS

Table 3: Twitter profiles and characteristics of Croatian political parties

Twitter account	Rank	Followers	Following	Updates	Account opened	Grade
ZoranDELA	140885	9092	669	610	27.8.2010	100
strankaSDS	180203	3822	427	3891	25.2.2009	100
strankaSD	420557	1342	271	635	26.10.2011	96,4
gregor_virant	270132	3536	144	122	18.10.2011	97,3
ZerjavSLS	297809	2232	562	2670	21.4.2010	97,3

(a) (b)
Figure 5: Twitter profiles by number of (a) followers and number of (b) updates

It can be seen (Fig. 5a) that Slovenian Democratic Party has the largest number of updates, but Positive Slovenia has the largest number of followers (Fig. 5b). Through number of updates, number of followers and number of following profiles, twitter rank (Fig. 6a) and twitter grade (Fig. 6b) are calculated.

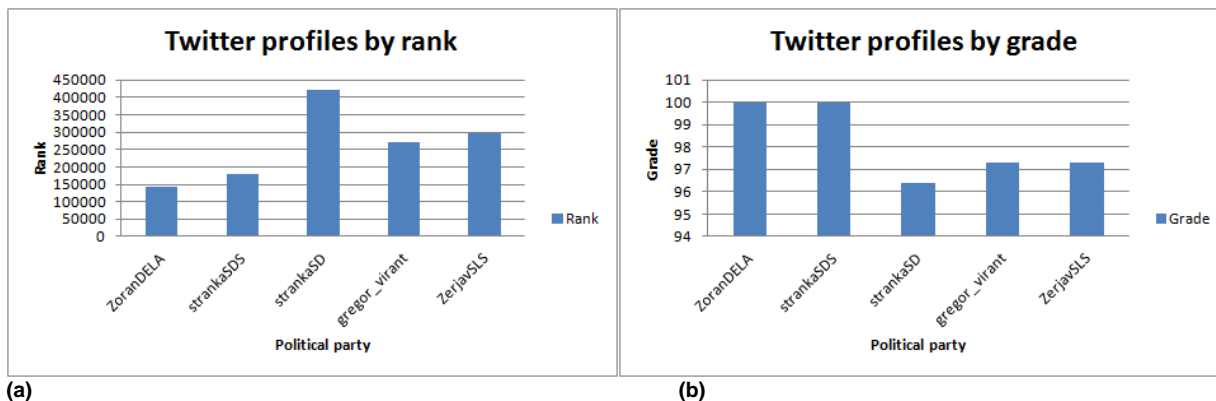

Figure 6: Twitter profiles by (a) rank and (b) grade

4.4. BiH

Analysed parties are: Social Democratic Party BiH (Socijaldemokratska partija BiH), Alliance of Independent Social Democrats (Savez nezavisnih socijaldemokrata), Party of Democratic Action (Stranka demokratske akcije), Serbian Democratic Party (Srpska demokratska stranka) and Croatian Democratic Union of Bosnia and Herzegovina (Hrvatska demokratska zajednica Bosne i Hercegovine). Out of this five political parties, only one of them does not have a twitter profile - Croatian Democratic Union of Bosnia and Herzegovina.

Other four mentioned parties have Twitter profiles (Table 4):

- Social Democratic Party BiH - @sdpbih
- Alliance of Independent Social Democrats - @srpskazauvijek
- Party of Democratic Action - @ASDAba
- Serbian Democratic Party - @sdrscom

Table 4: Twitter profiles and characteristics of Croatian political parties

Twitter account	Rank	Followers	Following	Updates	Account opened	Grade
sdpbih	2051739	171	23	937	10.9.2010	81
srpskazauvijek	1536590	257	22	1708	4.9.2010	86
ASDAba	9743944	1	0	2	13.4.2010	9
sdrscom	5421542	38	58	240	4.8.2011	50

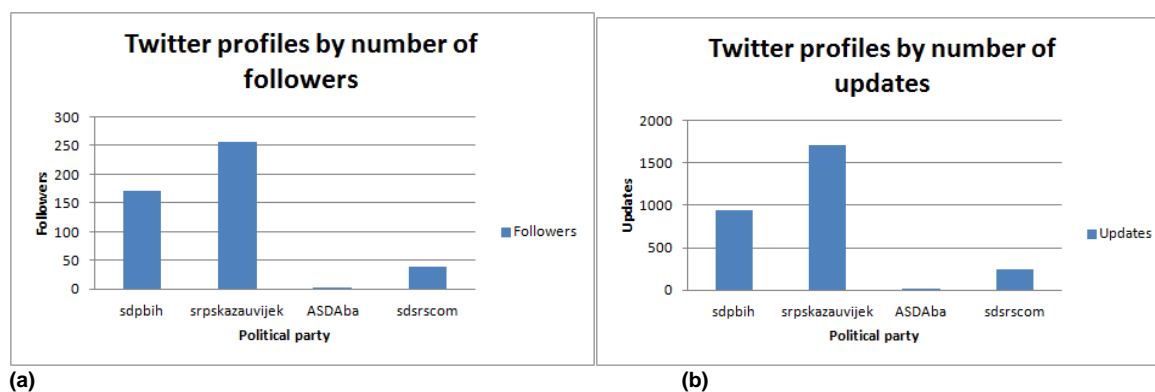

Figure 7: Twitter profiles by number of (a) followers and number of (b) updates

It can be seen (Fig. 7a) that Alliance of Independent Social Democrats has the largest number of updates, and the largest number of followers (Fig. 7b). Through number of updates, number of followers and number of following profiles, twitter rank (Fig. 8a) and twitter grade (Fig. 8b) are calculated.

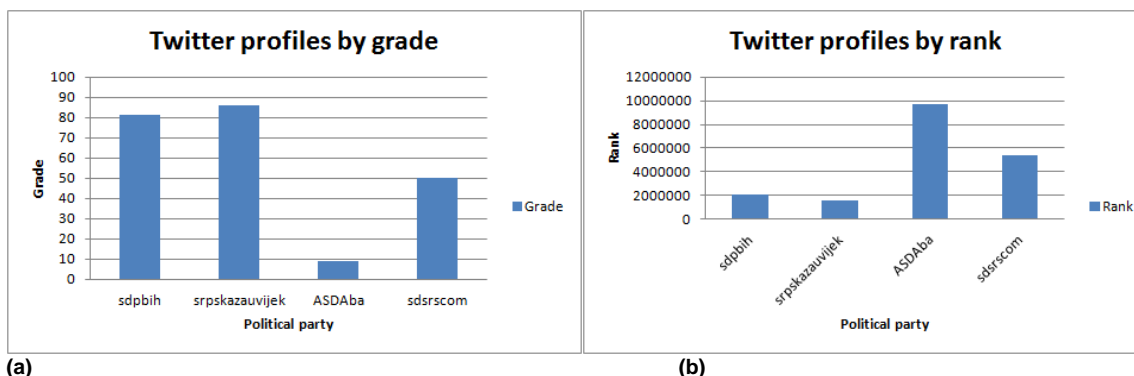

Figure 8: Twitter profiles by (a) rank and (b) grade

6. CONCLUSION

By this analysis of statistical information, and by reading numerous articles, it is concluded that Internet is used in politics in all analysed countries. Twitter social network is far from general popularity of Facebook, but its popularity is increasing every day. Twitter has great potential. This potential has been discovered by political parties but is yet to be exploited. Communication over Twitter unfortunately has many minuses. The main problem is unidirectional communication. There are no answers to users questions. There is also the problem of popularity of Twitter, inactive profiles etc. In most cases, politicians and political parties are active during election campaigns for state, local or presidential elections to win more votes. With election ending, Internet activity also mostly ends.

Figure 9: Twitter profiles of all political parties analysed by rank

According to ranking of profiles of all political parties analysed, Slovenian political parties have the highest ranking, Serbian political parties follow them, then Croatian, and Bosnia and Herzegovina at the end (Fig. 9). Future work will analyze political communication over Facebook in neighbour countries.

ACKNOWLEDGMENTS

Shown results come out from the scientific project Methodology of biometrics characteristics evaluation (016-01611992-1721) and technological project Multiple biometric authentication using smart card (2008-043) financed by the Ministry of Science, Education and Sport, Republic of Croatia.

Abstract: *This paper is based on the comparison between the 2008 research and the official data about social networks in 2011. The main topic is the relation between privacy and sharing information on social networks. The reason why this research was conducted is that the concept of privacy, which has existed for a very long time and is considered a fundamental human right, is slowly disappearing because of massive sharing of personal information via a wide range of Internet media. The research was conducted in 2008 on a group of students at all universities of Serbia using an electronic questionnaire. The data from 2011 was the official data on a particular social network. After comparisons, it is clear that privacy as we know it no longer exists and social networks are no more about fun and entertainment but much more about business.*

Keywords: *Privacy, policy, social, networks, research, comparison*

1. INTRODUCTION

Probably one of these days you got a call from at least one acquaintance to become his Facebook friend. Nothing unusual, considering that every day more and more Internet visitors uses currently the most up to date social networking application that crashes all previous boundaries. If you have already used one of similar communication applications, and if you have realized that you were tired of many self-imposed roles, you can relax and finally decide to present yourself to the virtual world exactly as you are, and accept with relief an invitation to join in the Facebook network. With unconcealed cinder you've started to compare your knowledge and taste in movies, music and pets with your new cyber friends, to selflessly send them hugs, kisses or your photos. You have discovered that you could easily reach long lost friends, colleagues and business partners. And you realized that, if you wanted them to find you, you must be open and leave as much information about yourself. In this way, you end a many years long tradition of concealment of identity and maintaining the confidentiality of various of information about yourself and about others.

What started to develop an interest for studying new patterns of behaviour on the Internet is a completely new phenomenon created by it. No communication media, until the Internet, did not manage to create a new, virtual space that has enabled its users to meet, learn and communicate between themselves. All previous methods of intermediary communications (letters, telegraph, telephone) were of transmission character, i.e. their role was to enable targeted remote communication. Introducing electronic mail service, the Internet joined to intermediary-targeted ways of communication, suppressing classic mail and, beside mobile phones, has become the dominant aspect of this type of communication. However, the particularity of the Internet is reflected in the fact that it has enabled a new type of mass social interaction. Whether it is the word of synchronized or unsynchronized communication¹, specificity is that its condition is no longer aimed at targeted or communication only with the ones we know, but it is getting closer, especially with synchronized communication, to face-to-face communication which takes place in a public place. However, chat-rooms and social networks on the Internet, do not only represent public places where many meet and pass by, but they may be more coherent occurrences that are thematically specific, with less and less limited number of integrated members. They start to regularly communicate, to develop their rules of communication² and build specific subculture through social patterns called virtual communities.

¹ Communication that is realized through the Internet (computer mediated communication) can be divided on synchronized (the one that takes place directly and in real time) and non-synchronized (indirect, the one that is not taking place in real time).

² One of the specifics of communication on the Internet is the language which is used. The adjustments or modifications of standard linguistic forms and rules, and on the other side is being enriched with the so-called emoticons (symbols that represent different moods) that have the function to imitate non-verbal aspects of communication in the real world. (Crystal, 2001.) represent different moods that have the function to imitate non-verbal aspects of communication in the real world. (Crystal, 2001.)

The Internet returned the topic of community in the centre of interest, through discussions on *cyber* space. Some recognized the possibility of returning to traditional strongly integrated community (Rheingold, 1993), other opted for possibility to create community free from nationalism, racial and gender prejudices, while the third rejected real possibility of forming community outside the physical space of the real world.

Leaving early Internet studies behind, it is essential to interpret new forms of social connectivity in a wider social context. If city represents projection of society in physical space, then virtual place is projection of society in *cyber* space. Only if we connect virtual society forms with the overall climate of individualization and network structures of macro and micro social relations, we can correctly interpret their manifestations and characteristics. But that does not mean that all social patterns on the Internet represent manifestations of networked individualism, but that they also represent projections of traditional patterns that may be based on religious, racial and other principles.

Starting from understanding that the Internet as a communications medium has dual nature, meaning that he is a intermediation channel for remote communication, but also virtual space for the establishment and maintenance of new social relations, we can extract two basic functions of the Internet: transmission and procreative (Carey, 1989). Transmission function indicates the Internet as a channel for technological intermediation of targeted communication between remote specific subjects of interaction. Through procreative function the Internet transcends the role of the mediation channel and converts into a social interaction space. This feature not only allows the individuals to develop through the existing remote connections, but also, in accordance with their needs, to build entirely new relations. Internet in this aspect became a social reservoir, and his virtual seats are just one click of the mouse away from us, wherever located.

2. RESEARCH IN 2008

2.1 Defining the sample

Because of this emerging phenomenon, during the month of February 2008 the research was conducted on use of social networks such as Facebook and MySpace among university students in Serbia. The sample included 1664 respondents, which makes about 1% of all students, proportionately taken in relation to the number of students per each university. All state universities in the Republic of Serbia were included (Belgrade, Novi Sad, Nis, Kragujevac, Novi Pazar, with the exception of Pristina University in Kosovska Mitrovica for objective reasons). The educational profiles structure of the respondents was as following: Natural-Mathematics 11.8%, Social-humanistic 47.3%, Medical 12.7%, Technical-Technological 24.3 and Artistic 3.9%. Males (49%) and females (51%) were almost equally represented. Considering the fact that they are all students, it is not surprising that 88.1% of respondents was at the age between 20 and 25. Half of the surveyed students are currently living with parents in the family homes, 8.2% lives in the student home, 11.3% of them live alone, and 30.5% live with someone.

In March and April this research was conducted on the Internet. A form of electronic questionnaire was posted on the Cyber Academic Forum site, belonging to student organization on Faculty of Organisational Sciences, and filled by 1022 visitors during these two months. Link to this questionnaire was forwarded to many groups in Facebook and MySpace community, as well as to individual student forums. The sample, therefore, becomes somewhat different. It included 86.5% of student population in Serbia, but also 9.8% of high school students and 3.7% of graduated students. The gender balance was preserved - 44% of female and 56% of male respondents. A large number of respondents fit in the age structure of offline sample - 82% are between 20 and 25 years, 10.4% are between 15 and 20 years, the rest consists of people from 25 years of age and not older than 35 years. Of course, those are the people who use the Internet intensively, and they are not accounted for in the results of this research, and will be subject to some special studies.

2.2 Formulating the questionnaire

The questionnaire consisted of 33 questions in three parts. The first set (7 questions) consisted of socio-demographic questions, as explained in the sample section. The second set of questions related to the availability of PC (where and when respondents use PC) and the degree of Internet using (whether and to which extent they are using it, to which purpose and in what way). Issues related to ways of communication on the Internet were featured, particularly for the use of certain chat-rooms, and for the

use of social networks. The third part (17 issues) was directed to users of Facebook and MySpace as the most frequently used social networks in these regions. Five grade Likert type scale was created for the purposes of this research, which goes from 1 for response *always* to 5 for *never*.

2.3 Analysis of collected data

The development of informational society in Serbia is notable in the past few years, as confirmed by the fact that 92.4% of students owns personal computer (compared to 55.1% according to research from 2003³). Of this number, 94.1% uses the Internet, which indicates its inevitable influence on the life of the young people. 50.4% of them uses Internet every day, half of which for more than 2 hours per day. Educational web sites are always visited by 30.3% of them, sometimes by 40.3%, but 19.4% of students never visits this type of sites. The percentage is higher when we talk about the news sites, always visited by 66.2% of them, sometimes by 25.3% and never by 8.5% of students. Leisure services are always visited by 34.4% of them, sometimes by 38%, and 27.6% of them never visits these sites.

Yet, one of the key reasons for the use of the Internet, as identified by students, is online communication, mostly by e-mail, then through various chat applications and finally through social networking. Numerous social researchers in the past decade tried to discover the causes of the ever more intensive need for communication in virtual space. When emerged, this type of communication took place behind the hidden identity of its participants. Until the phenomenon of social networking, users did not feel the need for disclosing of their identity, and used various pseudonyms. Easy way of involvement and disconnection, as well as possibility of identity changing, allowed for certain degree of relaxation and safety of individuals. The need to remain anonymous in this infinite world has widened the gap between online and offline personal life of ever increasing number of the Internet users. Short messages, introduction of new symbols such as a smile, allowed for arbitrary interpretation of the content and the opportunity to keep the distance. The introduction of visual identification with web cameras gradually changed the flow of communication and improved the individual's need to connect with others and to be recognized in the cyber world, even if only with the ones he knows.

Whether it was necessary for a certain period of time to pass in order to overcome the fear of the unknown, or for that generation of cyber kids to grow up with the Internet, it is still somewhat unclear. In any case, it becomes unsustainable, still somewhere present, this misapprehension that virtual groups consists solely of idle and lonely computer maniacs who want to escape from reality. Besides clearly measurable evolution of the Internet as well as social maturation of its users, explosive development of social networks becomes understandable. Final liberation and discovery that there are countless ways to connect with similar people if you leave enough data about yourself introduces us into a new era. Privacy loses its significance when compared with inevitable human need for socialization. In addition to that, the research results show that 45.1% of students uses some kind of existing social networks, mainly social networking application Facebook.

In 91.3% of the cases they communicate with closest friends. As for the communication with unknown people - in 25% of the cases this type of communication is rare, but 5.6% of respondents always communicate with strangers. This statistics is confirmed by the fact that 81.2% of students usually uses these applications for convergence with friends, 19.3% for finding "lost" friends, and for linking to people with similar interests in 15.1% of cases. For the purpose of achieving emotional connection 4.89% of students opted for the option - always, 23.51% - occasionally, 71.6% - never. It is interesting that, in all levels, more than twice higher number of male participants identified this option. Half of social networks users (50.6%), however, use this kind of communication for "killing time".

Maintaining contact with friends from the social network is being held, except through the Internet in 35.5% of cases, with mobile phone / sms 33.4% of them, through prone and personal contact in 28.5% of cases, while only 2.6% of students used exclusively personal contact for the development of communication, which indicates a very satisfactory role of the Internet in the social life of young people.

³ Research of Academic Cyber Forum "Using of personal computers by students", 2003.

Half of the respondents got to know personally at least one friend gained in the cyber community, but only 1.02% online relationships converts into deeper emotional contact, which indicates a certain degree of reservation and caution among members of virtual communities. The gap between online and offline gets relieved with mobile phone communication, especially through SMS contact, which in 13% of the cases serves as an additional form of communication. For those who dare to cross the line of real contact, in only 7.42% of the cases they continue to see each other intensively, 10.68% of them rarely, 16% continue to communicate by telephone, 6.25% through the Internet, while 4.45% of them cease all kind of communication. The number of „friends“ in these networks is mainly up to 80 (44.3% of users has up to 20 friends, 30.3% from 20 to 80).

Figure 2: Facebook account visibility in percentage

As a confirmation that this is real social network, transferred to the cyber space, indicates the fact that 56% of participants allows them to be "seen" by all users, 39% - just by friends. Only 5% of students hide their identity in this virtual community. Confirmation that the secrecy in the cyber space was exceeded gave 68.5% of students who, on the question what information about yourself you leave specified the name, surname and date of birth, while 57% leaves the photo on their profile. However, only 15.7% are ready to leave mail or contact phone number, and marital status (whether in relationship, married or single) 37% of them. Others identify themselves through different interests, education, academic community (Faculty) to which they belong, and through many other groups of all profiles.

Figure 2: Type of information shared on Facebook in percentage

It is interesting that 91% of respondents think that there is no possibility of abuse in these networks and that they are not interested in who can use their personal data. The only thing that bothered them, in 35%

of cases, was receipt of unwanted messages, which are, primarily, related to many applications uploaded by their friends. Identity theft was emphasized only by 4% of users.

2.4 Focus groups

Discussion in the focus group, consisting of 10 students from University of Belgrade, with different educational profiles and of both sexes, explained some of these results. All members of the group intensively used various means of communication on the Internet. For the exchange of important information, materials for learning, business communication, they use e-mail. Seven of them consider forums as major form of online communications. The amount of information, access speed, unlimited time of use, the possibility of active participation, these are characteristics and advantages that they delegate primarily to forums but, increasingly, also to social networks. For them, this new virtual communities are just another option and chance for something more. Internet, according to them, is not a window into the world, it *is the world*, the world in which there are no visas, where everyone who is in is just a single mouse click away from any point inside of this world. This is a network through which countless information flow, equally available to all, to students who seek scholarship to continue studies at a foreign university, to passengers who seek inexpensive transportation and lodging, to researchers seeking new scientific achievements, conferences, or even current literature. But it is also a place where you can establish contacts between those who otherwise would never have met.

2.5 Conclusion of research

The question is whether the development of the Internet and many social networking systems, which have confirmed people's striving desire toward more intensive communication and connectivity through different socialization processes, led to overcoming of our need for privacy. Whether we became so sure of our own choices and the possibility to even promote them online, or are we, in fact, so distant from each other that it became immaterial what do other people think and how do they represent themselves. Only time will give an answer to this question, and we will, in the meantime, find each other on one of the social networks.

3. COMPARISON OF YEAR 2008 AND 2011

It is 2012th year and concept of social networking on the Internet has drastically changed since the last research conducted in 2008th. You have all probably forgot the time when you were leaving only your name and surname, or even just a nickname in aim to make an account on the social network website. By introducing new features social networks initiated new demands for sharing more personal data in order to connect with others similar to you. In the very beginning people used to connect mostly with their everyday friends. As networks were getting bigger, users needs were growing, too. For an instance, if you would like to get in touch with some from your primary school, you must provide some more specific information such as name of the school, year you participated in etc. Also, emergence of companies on social networks has led to users leaving details of their employment, experience and interests.

Secondly, development in IT industry has established the new way people communicate among each other. Nowadays, users are spending more time using social networks not only for entertainment, but also for other activities such as business and education.

Those new trends in online social media communication has led us to this new research on privacy of users on Internet by comparing it to one from 2008th year.

3.1 Data in 2011

Internet users growth in past three years has led us to social network diversification. Therefore, today we have new networks specialized for certain type of communication among users.

For an instance, Twitter is social network based on short status updates with over 140 million users. LinkedIn is a network oriented to professional business people where they can communicate, make contacts and seek for new jobs by updating their working experience and expertise online. FourSquare is location-based service which provides users to notify location to others and also see other friends locations and recommendations for certain places. In the end, there are Facebook and Google who are trying to merge multiple services into one integrated platform.

Figure 3: Number of users (in millions)

Popularity growth⁴ of these social networks has resulted in fact that users are present on more than one network, which invokes sharing different types of content, which often includes personal data of the user.

Figure 4: Level of protection and types of information sharing

Figure above⁵ represents types of information, which are published, and level of privacy regarding to that can access them. Comparison is conducted through years from 2005 to 2010. Inner circle shows information that are visible by friends of certain user who published them. In second circle information are visible to user's friends of friends, while outer circle shows that published information are visible to all Facebook users. Each piece of circle indicates certain category of information, which is provided.

Figure clearly shows that from year to year users are providing bigger amount of information about themselves to wider audience on Facebook.

4. PRIVACY POLICY AND DATA COLLECTING

Even though social networks are diversified, Big Internet companies such as Google and Facebook are doing all they can to try and connect all those different services under their roof. There are numerous examples of new social networks and/or Internet services which got purchased by Google or Facebook (YouTube – Google, Instagram – Facebook). This is done because it is easier to create somebody's full profile if data about that person is gathered on a few platforms.

⁵<http://www.socialbakers.com/> Facebook statistics, 20 of April 2012

4.1 Google policy change

Example and a proof of this strategy is Google's latest policy change⁶. Before 1st of March, Google had 60 different policies for numerous of services that they offered (Google+, Gmail, YouTube, Calendar, etc.). Then, they packed all of those into one general Google policy. What does this new policy changes?

Google spokesperson - Alma Whitten, summarized the firm's new move with next words: *"Our new privacy policy makes it clear that if you're signed in, we may combine information you've provided from one service with information from other services. In short, we will treat you like a single user across all products, which will mean a simple, more intuitive Google experience."*

The point of this change, however, is that Google, in addition to merging their many privacy policies, is also merging their entire platform⁷. Meaning, all data collected on Gmail, You Tube and Google+ will be intertwined – thereby allowing for more targeted advertising. And yes, part of that data being collected is of the tracking variety – in other words, once you're logged-in to Google, they have the right to track your online activity within their network. And you can't opt-out.

This change is about the whole Internet basically becoming personalized. By tracking down all of users activities online, Google will be able to make a profile of the user and to be more intuitive about that users needs and interests. For example, if you search the Internet using Google, and type „Jaguar“, Google will know if you are looking for an animal or a car. If you use features such as Google calendar and Google maps, Google will be able to tell you if you're going to be late for a meeting, based on your calendar activities, your location and a local traffic conditions. It also allows Google to place better-targeted ads. By combining its data, Google will have much more precise data on its users. So for example if a user is searching Google for a holiday in Ibiza for June, they could be served advertisements from travel agents with an offer for Ibiza while they're watching videos on YouTube.

What does that mean practically? The more they know about you, the better they'll be able [to serve up targeted ads; and targeted ads lead to better sales.](#)

New Google policy explains what type of information they will collect. There are two collecting strategies.

- 1) *Information that user gives them.* Many of theirs services require from user to sign up for a Google Account. When they do, they will be asked for a personal information, such as name, Email address, telephone number, credit card. If a user wants to take a full advantage of the features that Google offers, he will be asked to create a publicly visible Google profile.
- 2) *Information they collect from use of their services.* In the policy itself says: *"We may collect information about the services that you use and how you use them, like when you visit a website that uses our advertising services or you view and interact with our ads and content."* This includes device information (such as hardware model, operating system, etc.), Log information (IP address, cookies, telephony log – duration o calls, SMS routing information, etc), Location information, Local storage.

4.2 Facebook Data mining

There is a great question about what Facebook does with all the information it collects from its users⁸. Most of us, who have a Facebook account, have noticed that there are more and more ads that are somehow related to us. That's because none of the data which users post on Facebook doesn't go unnoticed. The companies pay a great deal of money to get their hands on that data, so they can learn about those customers and what they do online so they can target them better.

Entities such as airlines, politicians, and even non-profits can use this data for finding new customers or targeting products to existing ones. Financial services companies such as banks and lenders are also

⁶<http://googleblog.blogspot.com/2012/01/updating-our-privacy-policies-and-terms.html> Google official blog. Updating privacy, 21 of April 2012

⁷<http://www.aaronkellylaw.com/internet-law/googles-new-online-privacy-policy-internet-lawyer-explains-in-plain-english/> Kelly / Warner internet lawyers. Google policy change explanation. 21 of April 2012

⁸<https://www.facebook.com/about/privacy/> Facebook privacy policy, 21 of April 2012

using the same data mining services for marketing purposes and to make lending decisions. For instance, certain types of credit products, which fit your personality, could be marketed specifically to you.

The Facebook policy says, „*We do not share any of your information with advertisers (unless, of course, you give us permission)*“. Over 40 million websites have installed the 'Like' button across the internet, so the infrastructure and technology is already there for Facebook to start capitalizing on its users' data away from the social networking site. When an advertiser creates an advert on Facebook, they are given the opportunity to choose their audience by location, demographics, likes, keywords and any other [information we receive](#) or can tell about you and other users. For example, an advertiser can choose to target 18 to 35 year-old women who live in Serbia and like basketball.

4.3 Conclusion

As a technology is constantly upgrading, so is our presence on the web. Internet giants are doing all they can to change the way we represent ourselves on-line. We watched the Internet users, starting the on-line road as an anonymous user, hidden behind some alias name, to become a full personality, like in the offline world.

Companies are doing everything they can to create a full individual, from all the information they can gather via social media. Somewhere in some database, there are folders with our names on them, describing our on-line habits. They tell who we are, what we like, which languages we speak, what food we eat, which books we read, which places we have been to.

If you ask yourself „Who gave those companies the right to know so many information about us, about who we really are?“, maybe you should also ask yourself – are WE the ones who gave them that power ?

The research shows that we shared so many information about ourselves, so that we could connect to the like-minded. Things drastically change from year 2008. to 2011. We, the users, care less and less about our privacy. The privacy policies are in most cases not even ridden. And even if every user does read them, what can we do about it as individuals?

The social networks are no more about fun, sharing photos and connecting with people. It became serious business with serious money involved and serious personal information data flowing around.

As the days go by, everyone is feeling like „The Big Brother“ is watching more intensively than the day before.

ENGAGING CUSTOMERS THROUGH SOCIAL MEDIA TOOLS

Miščević Tatjana¹, Dučić Minja², Milutinović Marija³

¹Faculty of Organizational Sciences, tatjana.miscevic@yahoo.com

²Faculty of Organizational Sciences, minja@agrif.bg.ac.rs

³Faculty of Organizational Sciences, milutinovicmarija@hotmail.com

Abstract:

The time that people devote to all forms of media consumption is higher nowadays, and so is the impact of media on society and the public. Specificity of social media requires a completely new way of thinking and engagement of experts in order to use them efficiently and achieve goals. This paper will research the possibilities that social media provide to organizations as well as ways to connect customers via social media tools. It examines the concept, features and advantages over traditional social media. Social media, satisfying the expectations of the new generation of consumers, fill gaps by creating new opportunities and establish themselves as an inevitable instrument of marketers in connecting with customers and market products. In accordance with that, the rules of marketing have also changed. While a number of marketers are still trying to achieve the desired results the old way, others explore and take advantage of social media, which bring new opportunities to connect with customers, but require a completely different way of thinking and acting. If used in a proper way, social media and networks can trigger a change of the entire marketing mix. The era of monomedia, where nations are bombarded daily with television commercials with the aim of building great brands is coming to an end. Marketing will be characterized by a radical new way to communicate with customers, where a digitally networked society has crucial influence on purchase intent and brand building.

Key words: Social media, social networks, communication, engaging customers, organizations, web tools

1. INTRODUCTION

Social media represents set of different new sources on web, that users, run, distribute and use in order to educate other customers about products, services, brands, individuals and challenges (Mangold & Faulds, 2009). Also, social media could be defined as a group of web applications based on ideological and technical basis Veba 2.0 that provides creation and exchange of content generated by users (Kaplan & Haenlein, 2010). It includes various media, such as blogs, chat rooms, e-mail, websites and consumer forums for ranking products and services, internet sites, discussion forums and social network websites.

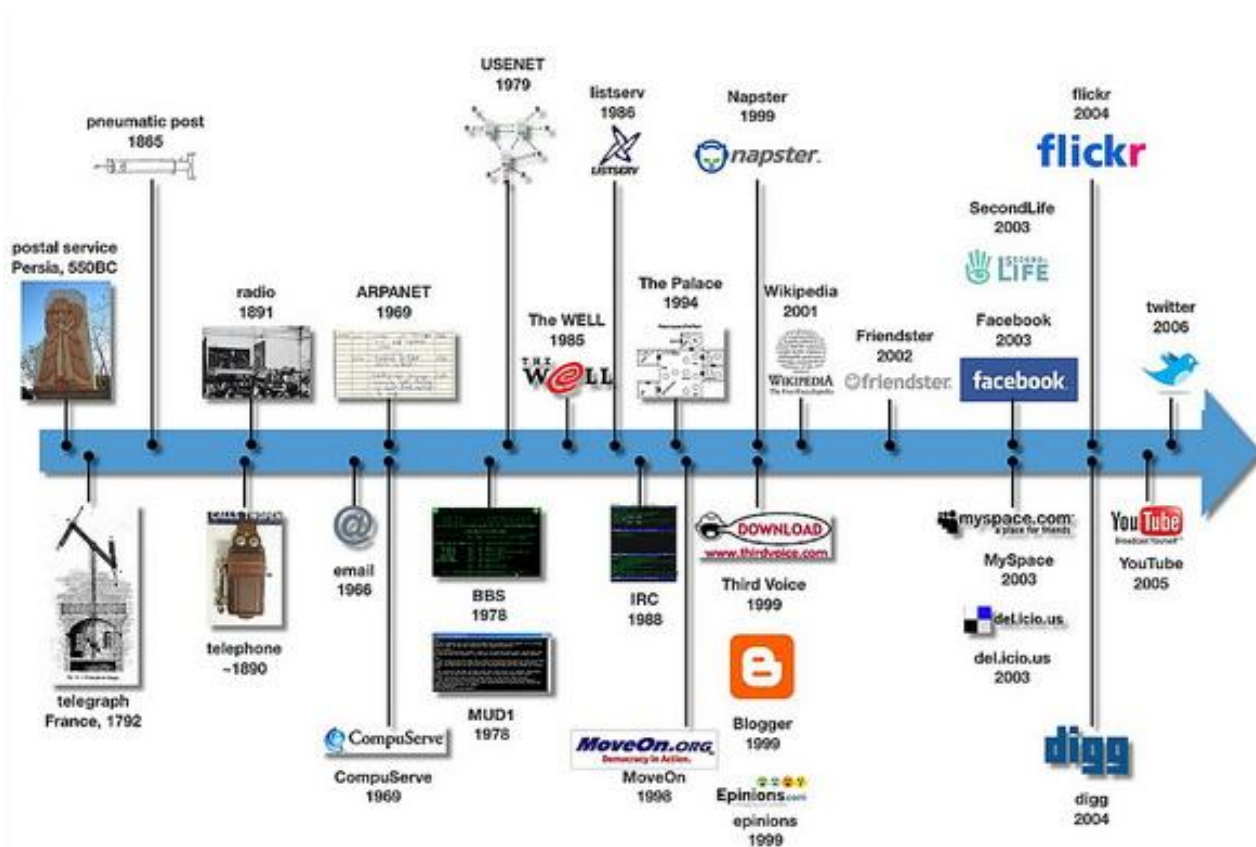

Social media is a gathering place of people with similar concerns and interests. In this way virtual communities of people, gathered around specific issues and informations on a particular website, of academic to the groups that are intended for leisure and various activities. Exchanging ideas and meeting people in such conceptualized space, beyond the limitations that exist in everyday human communication, such as ethnic, religious, gender and age restrictions.

By forming their own discussion groups and topics of the companies and monitoring of existing, effective way to market research is rapid translation of customers through the stages of the purchase process, strengthening the company's image and online business. Taking out your own and researching views and experiences, help in finding solutions to specific situations in the purchase and consumption. The concept of social media is nowadays top subjects of many business managers. Decision-makers, as well as advisors, trying to identify ways in which companies can make profitable use of applications such as Wikipedia, YouTube, Facebook, Second Life, and Twitter.

Today, social media is a new revolutionary trend and should be of interest to companies doing business online, but also for those companies that still do not. Companies are able to control the information available about them through strategically placed and through the publication of good governance and public relations. Because of its very wide distribution and expansion, social media are used for various purposes.

2. HISTORY OF SOCIAL MEDIA

Precursor of internet was the ARPANET, which was created in order to facilitate networking of universities. Some of the first applications Usenet, LISTSERV and BBS's had several characteristics in common with the current social networks. One of the first tools that appeared on web was service for sending and receiving e-mail. The development of the Internet environment was followed by real expansion of the various services that now make the history of the Internet. These services are shown in the middle of the line, and they are Napster, Usenet, The Well, BBC, IRC, until the advent of Wikipedia and the appearance of the first blog services in the late nineties. At the beginning of century, Internet environment is turning exclusively to users, and it is the users who have the opportunity to create content. There are new services that are very simple for use, and the emphasis is on multimedia and interactivity. More frequent user access to the Internet has led to the creation of social networking like MySpace, Facebook, Twitter, You Tube, Flickr, Delicious ... This contributed to the importance of social media that we now have. The latest glamorous groupings are called "virtual worlds" which are computer-based and simulated environments in which they live as three-dimensional avatars. The best-known virtual world is Linden Lab's Second Life. Proper use of a combination of these services and targeting the appropriate market can obtain effective marketing results.

Picture 1: The historical development of social media (Pajić B., 2010.)

Graphic representation shows the rise and progress of the media through the history of the period BC to the present. It starts with the appearance of postal in ancient Persia 550 BC, continues with the invention of the telegraph in France, and then the emergence of radio and television in 1890. created a real revolution in informing. Until the advent of the Internet in the seventies, there was no real media interactivity that connects a large number of users (Pajić, 2010).

3. DIFFERENCES BETWEEN TRADITIONAL AND NEW MEDIA

Unlike traditional media, which through unilateral, one-to-many communication, places informations in public, whose contents are created by professionals, more or less dependent on large and powerful stakeholders, the new concept of media offers bi-directional, many-to-many communication and public interactivity, which itself creates and fully independently selects and takes the necessary

information that are considered as relevant. While in era of monomedia others decided what information is important, in which moment will be placed, unlimited space of multimedia, besides the possibility for the public to choose which information, when and where will be assumed, offers the possibility of further research and finding new information (Fancher, 2009). While traditional media, perhaps too late, trying to adapt to the changes that have led them at a disadvantage (Gillmor, 2009) (introducing the online editions of daily newspapers and magazines; combining television, Internet and mobile communications into a single package, by creating blogs on the web pages of TV, radio stations and newspapers...) social media, meeting the expectations of new generations of consumers, fills gaps, create new opportunities and establish themselves as an indispensable instrument for marketers to connect with customers and product placement.

Accordingly, the rules of marketing have changed. While a certain number of marketers are still trying to come to the old way to the desired results, others explore and take advantage of social media, which bring new opportunities to connect with customers, but require a completely different way of thinking and acting. Used in proper way, social media and networks can trigger a change of the entire marketing mix. Era of monomedia, where nations are bombed by daily television commercials in order to build great brands, is coming to an end. Marketing will mark a radical new way to communicate with customers, where a crucial influence on purchase intent and brand building will have a digitally networked society (Meadows-Klue, 2008).

4. ANALYSIS AND CHARACTERISTICS OF SOCIAL MEDIA

Social media is a new world of free online media created by individuals and organizations. Various theoreticians emphasize different types of social media, and one of the main divisions are: (Zarrella, 2009)

- Social networks on web (Social networking services) - Internet communities that connect people around the world who share similar interests or activities. The most popular social networks are Facebook, LinkedIn, Myspace, Hi5, Friendster, Orkut, ResearchGate and Foursquare.
- Blogs – A blog represents a type of site that allows one or more authors to publish content (text, images, audio and video) in the form of articles (blog post) that are available to other users and are usually displayed in reverse chronological order.
- Microblogs - They allow users to exchange small elements of content, such as short sentences (up to 140 characters), hyperlinks, or individual images. The most popular services for microblogging are: Twitter, Tumblr, Plurk, and Jaiku.
- Media sharing sites - Allow users to create and place documents, images, presentations and audio and video recordings. The most popular sites of this type are: YouTube, Flickr, Scribd, SlideShare, Photobucket, Vimeo, Dailymotion, Livestream, Ustream, Pandora Radio, Spotify and Last.fm.
- Social bookmarking and voting sites - Enable users to tag websites which they find to contain useful or interesting content, and thus to create a list of useful resources. The most popular sites of this type are Delicious and Stumbleupon. A similar system for organization news use websites Digg and Reddit.
- Internet forums – Forum is a hierarchical structure that contains the topics that can be discussed, and each topic can have subtopics.
- Review sites - Sites where users or editors of the site can post their impressions of the products, services, companies and people. The most used sites of this type include Yelp and Epinions.com.
- Virtual worlds - Internet community, which is usually in the form of a computer simulation environment in which users choose a graphic look that will represent them (avatar) and where they can get in touch with each other and create and use objects. The most popular sites of this type are Second Life and SmallWorlds.
- Reputation aggregators - Provide services for ranking sites, usually the reputation of the site's content, which facilitates the customer to select the best products and services. The most popular search engines are Google, Yahoo and Bing. (Weber 2009)

5. CHARACTERISTICS OF SOCIAL MEDIA

The features of social media include participation, transparency, focus on communities, global connections, conversations and user capabilities. (Pajić, 2010)

- Participation: involvement and access to social media is widespread and broad. These media are, from the technological aspect, are complex, while from user's are very simple and designed to be

universally applicable. Using social media is free, registration and accessing accounts are very simple via e-mail address and password. Social media services are also designed to be very easy to use, and provide a full user comfort.

- **Transparency:** Social media are very transparent, as their entire content is public and accessible to all users. One can communicate with individuals and companies and monitor their performance and flows. An important advantage is free access to content, which is now available and transparent, while previously you had to pay for content that has often been filtered.
- **Focus on communities:** The primary focus is based on the creation of certain groups, targets specific groups of people with common interest with the ease of creating such communities. Very simple communication between group members allows free interaction.
- **User features:** User features are reflected in the fact that users can respond to content, or to express opinions and give feedback. It is a large number of portals where users have the option to vote, response and evaluate specific content whether it is video, image, text or other format.
- **Conversation:** In addition to good communication, it is possible to easily share content among users, so that some content can be easily spread and passed on to other users. The conversation is enabled through the messages in a large number of social media. These messages may be public so the other users and friends can see them and can be private, enclosed in a private conversation. The possibility of commenting is another important feature that encourages high-quality conversation. It is very useful to hear, and follow the comments of other users. Constructive criticism is good because they make us correct a mistake and encourage us to be even better. It is especially important not to filter the comments, unless they are spam.
- **Global connections:** The advantage of social media is that many people could see one's content in a short time. Connection can be carried out in two ways, by simply linking to other sites and shared among other sites. This creates a global connection among users around the world in a very quick and efficient manner.
- **Interoperability of social media:** Connectivity of social media allows information sharing through various platforms within social communities. Advertising in this environment is a good choice because it exceeds the limits of a social network. Connectivity of platforms allows users visibility of certain topics, products and services that can be found and connect to any social network.

Measuring the effects and costs of marketing activities using social media is a critical component of success, which causes a lot of interest. Although it seems tempting to measure the effects of social media, according to Chris Murdough, it's not impossible (Murdough, 2009). In this case, measurement would be a set of controlling experiences of customers and setting up checkpoints during activities to understand the reactions and predict future customer behavior. Social media are unique because they can be measured both qualitatively (through the topics under discussion, sentiment) and quantitatively (by measuring the range of reach, mentioning in chats). Three basic elements in measuring the effects of the reach of social media (which monitors the number of references and quality of author as some authors have more power than others on the basis of frequency of visits and comments, activities), discussions (need to understand the themes and sentiment of content) and outcomes (outcome monitoring behavior to assess the direct and indirect economic value as a result of engaging in social media).

6. DIVISION OF SOCIAL MEDIA TOOLS

The term social media refers to online tools and platforms that enable Internet users to collaborate, share experiences and make connections based on business arrangements or pleasure. Internet supports, and includes various methods such as social networking, user-sponsored blogs, multimedia sites, company-sponsored web sites, sites on based on cooperation, podcasts, etc. (Chung, 2010), or blogs, message boards, online video, social networking, podcasting and encyclopedias (Ganim, Mattson, Marušić, 2008).

According to (Lincoln, Rice 2009) the most important applications of the key social media are:

- | | |
|-------------------|-----------------------|
| ▪ Blogs | Chat rooms |
| ▪ Microblogs | Message boards |
| ▪ RSS | Podcasts |
| ▪ Vlogs | Sharing video content |
| ▪ Social networks | Sharing photos |

The division of social media tools (Pajić, 2010)

- | | |
|-------------------------|----------------------------------|
| ▪ Status | Sharing photos |
| ▪ Profile | Sharing documents |
| ▪ Group | Group of links |
| ▪ Fan page | Social bookmarking |
| ▪ Paid ad | Online journals - blog platforms |
| ▪ Event | Wiki platforms |
| ▪ Chat | RSS readers |
| ▪ Sharing video content | Promoting through forums |
| ▪ Sharing audio content | |

7. CHARACTERISTICS OF SOCIAL MEDIA TOOLS

Social media and networks tools are multifunctional and can contribute to:

- Join community
- Increase impact by presentation
- Assist the product development
- Receiving feedback
- Content creation
- Increase sales
- To create equal relationships among producers, consumers and clients
- Improve communication
- Increase confidence

Statuses on social networking sites can attract the attention of users, followers and potential customers. Regular update of pages on profile has a positive impact on increased traffic and increase the number of followers.

Subscribing to RSS using this tool, it is possible to monitor the content of popular sites, news, blogs by registered users. Sharing video and audio content is a useful audiovisual tool that can bring outstanding results combined with a well-defined strategy.

Online journals and forums with its open contents attract users with similar interests who can find in them useful information such as the experience of other users of a product, make comments, but can also actively participate in the creation of specific content.

8. WAYS OF INVOLVING CUSTOMERS THROUGH SOCIAL MEDIA

The amount of time that people devote to media consumption is increasing, and therefore the impact of media on society and the audience. The trend is particularly noticeable in countries with emerging economies, which are still evolving media market. The media, in fact, affect the simulation of reality and adoption of various forms - social, cultural, consumer, etc. (N. Perić, 2011).

Blogs can play a significant role in engaging customers through on going communication, which, in return, can help to greater brand loyalty.

Blogs tend to be time sensitive and driven by user-defined interactions, messages include customers and they are relevant through the customers. Customers use blogs to reflect their experience of the brand, both good and bad. Companies can offer customers the ability to get a role and be involved with a product or brand. This in return can contribute to build loyalty, giving them feeling of ownership of the brand (Nardini, 2005; Woffington, 2006).

Chart 1: Plan of social media

Listening	Planning	Strategy	Tools
Locate consumers Track consumers activities Focus on target audience	Set business objectives Consider how to increase the power of brand online	- How and where we can achieve increase the power of brand online - How can we change customer relations - Who will be responsible for action implementation	- Decision of what tools will be used - How will we follow activities and measure success

Source: Pajić B., 2010.

By listening, it is necessary to locate consumers, evaluate their social activities and focus on selected target group. When planning to determine the business tasks and assess how the strength of the brand could be extended to the Internet. Strategy defines how and where we act, how to change our relationship with customers and who will lead these efforts. Finally, to determine which tools will be used and how our activities will be monitored and how we will determine our success.

Chart 2: ACES Planning (A-audiences, C-capabilities, E-enablement, S-sustainability)

TARGET GROUP	POSSIBILITIES	ENABLED BY	SUSTAINABILITY

Good practice of maintaining the presence in social media

- Monitoring discussions on forums, discussions and comments on blogs and in general all references to brands on the web.
- Creation of communication tools on its website, encouraging conversation and support of all related companies.
- Monitoring and participating in any discussion on the web that talks about a product, even thanking customers for using their products. Through this creates a dose of personalization between consumers and products.
- Monitoring the popularity of products and overseeing the competition automatically over the Internet.
- Active monitoring and measurement of product sales with social media monitoring range.
- Updating the blog on a daily basis with the inclusion in discussions on other blogs.
- Demonstration of proficiency on own blog. This means that most of the articles are not only about their own product, but these articles give the value of the product later on.
- Building product ranges using interactive tools, affiliate program, where business partners are linking certain content (phrases) to our site.
- Rewarding good behavior in online communities on the web. Writing letters in person to the biggest fans. Calling those people who have relevant knowledge to write the blog VQS and thus are involved in creating content.

Using the system of social media, companies are involved in participation of a large online community. Companies need to be good community members to take advantage. The trend of consumers using social media is increasing. Consumers rely on various social media sites as much as the company's sites on a particular product or brand. As a result, companies that use social media and directly engage consumers are more likely not only to reach more customers, but also to increase the likelihood of making purchasing decision.

Ideas to attract customers attention through social media

- Competition for the best idea (slogan, music ...) and online voting .
- Survey on the particular product or service.
- Creating a database where the most frequent customers are noted and which will be displayed on the website as winners for loyalty.
- Updating profile page on regular basis and setting up of multimedia content, for example. wallpapers that will be implicitly inspired by product or service. This content can be published weekly or monthly.
- The possibility of a free download of this content is the main idea of linking our brand.

Therefore we influence the promotion and presence in your customer's mind.

According to studies on the involvement of customers, Engaging customers online worldwide Dei (2008) on attitudes towards the information they get from online brand representative, the likelihood that users will transfer the information to others, share their opinions and take buying action is of 57 to 67%. 62% more price information than ads. To obtain information about the company, brand or product, 70% of respondents visit social media sites, 68% of company Web sites, 57% of online news, Review of page 49% and 44% Wiki. Social media play an increasingly important role in marketing strategies of companies. One of the biggest benefits that social media sites have compared to company sites or news is that there is a greater probability that consumers who visit social networking sites will make purchases. Therefore, companies that integrate the elements of social media into their marketing mix will have a greater ability to influence the consumers for the purpose of buying as a final goal.

9. ADVANTAGES OF COMMUNICATION THROUGH SOCIAL MEDIA

By correct communication could be avoided and solved many problems and disagreements. On the other hand, a lack of communication or poor communication can significantly affect business and reputation. Media are able to put themselves in promoting trends, which, short and long term can be of positive or profoundly negative effects on society. Various organizations and groups use media in different ways, they fight for their "share of voice" and influence the public. (Perić 2011.)

Creating a reputation is a long process and could be lost in just a second. The main task of public relations and marketing is to create a positive image of the company or individual in public. Communication and education via a blog, social network accounts and etc are integral activities in creating and maintaining reputation. These two activities are closely related and the best way is to combine them. Social media are the platform for building confidence, and it requires not only a rational response, but also emotional. Technology without trust is just traffic and built without trust, the company will not be able to operate successfully.

One-way communication offered by traditional media such as television, radio, newspapers and magazines, is becoming obsolete and unacceptable (Vulić 2011), a new standard, thanks to technology platforms that have crisscrossed the people, organizations and society, becomes a "many to many" communication. One of the basic needs of every person is to make contact and to be a member of a group. Customers want to be connected, but the precondition that this relationship could work is that the company has to be honest and authentic.

10. CONCLUSION

Start of implementation of every new media was followed by skepticism, misunderstanding, inadequate methods of use, lack of understanding of real opportunities to fully. Since discovery of press, telegraph, television and radio, through internet to new social media, a content which those channels transmitted, in order to achieve marketing plans, varied and advanced. From the static, one-way communication, evolved in two-way, participatory, active, 'many-to-many mode of communication'. Number of users of social media tools is growing, and their advantages are more obvious, so the use of social media to achieve marketing activities becomes inevitable. Because of that the focus of marketing professionals is on detecting and tidying the problem of ways and opportunities for their adequate implementation. Specific features of social media require a whole new way of thinking and engagement of marketing experts, in order to efficiently and effectively used in achieving its goals. The methods used in traditional media will not give results. Cooperation, respect and understanding of both sides in communication and the desire to create strong, long-term relationships are the basic guidelines. The rules specific to social media activities include a holistic approach, listening to public opinion and desire and the realization of connection with customers. The main objective of engaging in social media is to achieve good relations and creating a strongly (evangelists) on the

other networks, which will be much more effective than paid advertising to achieve marketing objectives. Only the inclusion of users will be able to exploit the full potential of new media.

It is necessary to engage in conversation and start new ones. Contribute to communication on blogs and forums through comments and posts, and providing answers to questions. Companies can increase the impact of development by creating corporate blogs and groups on social networks that brings us to more visits and audience. In the existing communication or the creation of new one a special significance has maintaining transparency. In terms of maintaining presence on social media, social media campaign requires sustainability and continuity. The most effective way of winning over the attention of online audience is contribution and encouraging online communication. Marketing of social media and networking increase customer loyalty and enhance brand strength. To be successful, companies should be transparent in its efforts to achieve the goal of educating the public, selling a product or services. Further technology advancement will enable new ways and new channels of communication for the transmission of messages, and marketers on previous media example, must realize that in communication with the new generation's need to react fast, to adapt to changes and it is very important to understand opportunities and the essence of the new media, because without the proper use of all possibilities, the communication will not give the right results.

USAGE OF SOCIAL NETWORKS FOR EXTERNAL COMMUNICATION OF INTERNATIONAL ORGANIZATIONS

Vukasinovic Nevena ¹, Ilic Kristina ²

¹Academy of Diplomacy and Security, nevena.nbg@gmail.com

²Faculty of Political Sciences, kristina.ilic.dipl@gmail.com

Abstract: *Changes of communication on a global level has induced global actors to reconsider possibilities of communicating ideas. The paper is based on the supposition that new communication technologies can save the external dialog of international organizations by restoring dialogic and participatory communication in the public sphere, thus preserving a role of public relations as two-way communication rather than propaganda and spin. This study examines how new social networking media could be broadly used by organizations to advance their mission and programs. New roles of social networks have also been discussed, proposing a specific role: social networks as a peace instrument. The paper finally suggests and outlines further research efforts based on the existing literature and the evolving contexts.*

Keywords: *international organizations, communication, social media, Twitter, globalization, public relations, peace instrument, influence*

1. INTRODUCTION

Authors seek to examine possible solution on how international organizations can play their role in modern world affairs. There are two principal reasons for undertaking this task. First, it is obvious fact that international organizations have grown in numerous of various, powerful entities that represents an important part of the contemporary world. Second, technological revolution and evolution has led us through new perspectives linked with every single process that local and global systems have, thus new approaches are needed. And finally, a focus on international organizations, rather than nations and states, as units of analysis, provides a fresh perspective on the evolution of international relations and enables us to reconceptualize modern world landscape. For example, the phenomenon known as globalization might be better understood if the ways in which international organizations have been seeking for decades to establish transnational connections - politically, economically and culturally - has been examined. One important dimension of globalization is increasing integration and exchange of information among countries. Role of international organizations are crucial for such global approach, considering importance of combining two types of international organizations: intergovernmental organizations and international nongovernmental organizations. The former category consists of institutions that come into existence through formal agreements among nations and represent the respective governments. The United Nations is the best-known example, but several thousands of them exist today. Another one refers to associations that are established by private individuals and groups. According to the Economic Social Council of the United Nations, any international organization that is not established by any agreements among governments is an international nongovernmental organization (further: INGOs). There are lot of ways of their categorizations, but most common is Harold Jacobson's one - three broad types: those INGOs concerned with security and peace, those with trade and economic affairs and those with social welfare and human rights.

A fundamental assumption seems to underlie the study of international relations through an examination of diplomacy (social, political and economic) and war: international affairs are seen as a sum of activities of nations as they try to safeguard their interests and enhance their power positions in the world while engaging in negotiations and preparing possible clashes of interest (Berridge, 2005). These organizations could make a difference if one construes world affairs in a different way.

Marshall McLuhan theorized that *message is a medium*. If communicating ideas and missions is in the scope of the international organizations' work, then the way of communicating the message to the audience should be taken as crucial. Year of 1960 and slowly growth of international organization's sector is way behind us, so structures of the very beginnings of their policies have to be changed. Sharing the ideas, gathering people and movements seek for transparent, world-wide tool representing a most efficient way to connect third party with medium-message. Thus it is understandable why nowadays communication of international organization messages and exchange of the ideas should be more focused on external instead of internal communication. Public presence of the ideas and policies is

preferable way for gathering interested parties. It is important that wide presence could be assured and extended. Public (external) relations of international organizations are updating and rebuilding its roots by discovering and implementing more ways for transmitting goals of the organizations. Ewan has pointed out (1996) "In regard to a more democratic future, then, ways of enhancing the circulation of ideas—regardless of economic circumstance—need to be developed. We need to imagine what an active public life might look like in an electronic age. We need to discover ways to move beyond thinking of public relations as a function of compliance experts and learn to think of it as an ongoing and inclusive process of discussion". Process of discussion represents as highly important for nowadays international organizations' positioning. Discussion in two directions will make NGOs transparent and globally recognizable, while their ideas should be wide-visible. The fact of two-direction communication, based on discussion-sharing is main point for understanding present and future role of the INGOs. We are facing a return to participation in the public sphere, brought about by the computer, the Internet, the World Wide Web, and wireless digital communication. Through the web-participation most ideas, people, countries and regions around the world are inextricably linked. Yet, as cultural, political, and economic differences persist, international representatives and managers must be able to develop a global mindset in order to effectively adjust, adapt, and navigate the changing landscape of international movements through international organization's work.

2. INTERNATIONAL PUBLIC RELATIONS AND SOCIAL MEDIA ACTIVITY

Even though public relations has been studied as a social science and formalized only in the 20th century, evidence of its practice can be traced back to ancient civilizations in Egypt, Babylon, China, Greece, and Rome, in medieval India, where story tellers spread rulers' messages, serving common public relations function.

Public relations have long been looked at with suspicion given its use of persuasion to influence public opinion. That suspicion turns to fear when public relations are linked to propaganda. The 1963 Senate Foreign Relations Committee's investigation into the Foreign Agents Registration Act provides an opportunity to explore the fear of the public's susceptibility to propaganda and the perceived role of public relations in shaping public opinion. Public relations practitioners working for foreign clients were portrayed in the hearings as mercenaries who worked behind the scenes to influence foreign policy. Within international organization's framework role of public relations is shaping public opinion.

The fear of public relations that emerged in the hearings appears to stem from a belief that international organizations operated behind the scenes, that individuals were influenced by public relations tactics because they were unaware they were being targeted. Identification of the source, it was believed, was vital if individuals were going to be able to resist persuasion (Taylor-Kent, 2010). Unless public relations practitioners come to terms with the history of the field and how it has been perceived, the profession will remain maligned and misunderstood. International activity through social networks represents social media as a very good instrument capable of resolving the problem of transparency of INGOs work, but also to over jump problem of INGOs introvert behaviour.

Since the late 1980s, there has been a remarkable change in the scale and significance of INGOs as they move to centre-stage in international development work in areas such as poverty alleviation, sustainable development, human rights and women's emancipation. The ideological ascendancy of neo-liberalism and globalisation trends in the late 20th century has prompted a massive emergence of new social movements as local communities and marginalised groups around the world strive to create their own self-identity. These agencies have been able to perform this advocacy role because of their simultaneous attachment to places and local cultures on the one hand and their critical engagement with the global on the other.

One of the main defining characteristics of INGOs is that they operate simultaneously at different levels of the global system. In principle, therefore, INGOs are able to link micro-level experience with macro-level policy. (Madon, 1999) A more recent approach adopted by INGOs to increase the impact of development projects has been to improve learning by establishing closer linkages with partner organisations. Rather than working directly within the structures they intend to influence, INGOs are choosing to increase their impact by lobbying interested parties and other structures from outside. It seems like nowadays there is no better way then social media usage strategy to be incorporated eithin INGOs work.

The emergence and increasing popularity of social media have changed the practice of public relations. Social media offer numerous opportunities for public relations practitioners to interact with a wide range of

stakeholders. In their annual social media study, Wright and Hinson in 2010 found most public relations professionals felt social media tools were important in their organizations. Specifically, 77% of respondents felt social networks like Facebook and LinkedIn were important (14% felt they were unimportant), 65% felt micro-blogging sites like Twitter were important (23% felt they were unimportant), 65% felt video sharing like YouTube was important (22% felt it was unimportant), and 57% felt blogs were important (33% felt were unimportant). Because of the high importance organizations place on social media as well as its growing popularity among various publics, international organizations are becoming more involved and interested in trying to measure and manage social media. As more forms of social media emerge, international organizations must understand what tools to use, how to use them appropriately, and how to measure their effectiveness. Social media change the relationship between an organization and its employees, customers, competitors, suppliers, investors, the media, and essentially anyone who has an impact on or who can be impacted by an organization. .

To communicate effectively, organizations must go to where their stakeholders are. In fact, as one participant stated, the greatest risk is to ignore social media and to allow conversations to happen without awareness or participation (Pain, 2009) Social media was seen as a cost effective way to receive greater reach for research, communication and timely targeted dialogue.

Tredinnick (2006) defined social networking sites as those sites driven by user-participation and user-generated content. Social media provide a variety of ways for users to become involved with organizations. Waters (2009) found that nonprofit organizations use social media to streamline their management functions, interact with volunteers and donors, and educate others about their programs and services. Through interactions with stakeholders on Twitter, Facebook and other social media applications, organizations seek to develop relationships with important publics.

Kelleher (2006) encouraged practitioners to use the Internet and social networking sites to advocate for their organizations and causes; however, the practitioners should be transparent in their online communication activities. For full disclosure, organizations must make sure to provide a detailed description of the organization and its history, use hyperlinks to connect to the organization's Web site, provide logos and visual cues to establish the connection, and list the individuals who are responsible for maintaining the social networking site profile.

Taylor, Kent, and White (2001) pointed out that Web sites should be useful for gathering important stakeholders. The usefulness of social net-working site profiles often focuses on the information that is being distributed. The most common forms of message dissemination include posting links to external news items about the organization or its causes; posting photographs, video, or audio files from the organization and its supporters; and using the message board or discussion wall to post-announcements and answer questions Including press releases and campaign summaries on their social networking sites should also be encouraged to maximize the impact of their presence on social networking sites (Waters 2009).

Finally, interactivity plays an important role in developing relationships online with stakeholders. Jo and Kim (2003) found that interactivity was essential if organizations were to develop relationships with their stakeholders. Asking for e-mail addresses and ways to donate online can increase interactivity, but organizations should provide a calendar of events or listing volunteer opportunities to involve stakeholders offline as well.

Carrera (2008) predicted that social networking sites would force public relations practitioners to rethink how they approach relationship development with their stakeholders. Practitioners have been exploring the interactive elements of social networking and experiencing benefits for their organizations. This study found that although nonprofits are open and transparent with their Twitter and Facebook profiles, they are not using the sites to their full potential to inform others and get them involved with organizational activities.

2. INGO'S EXTERNAL COMMUNICATION IMPLEMENTED THROUGH TWITTER

Increased use of new media is a growing trend in public relations, and this is particularly relevant for transnational organizations. These media enable activists to mobilize citizens across the globe by efficiently transcending national boundaries at minimal costs. *Communicating ideas through social media increases the influence of those ideas*. The types of new media include websites, blogs, podcasts, video casts/vlogs, and wikis. By saying of communication officials from transnational organizations, there are

five main functions of new media that are highly important: promoting the image of their organization, fund-raising, engaging and interacting with the general public, forging and facilitating networking with other NGOs, and providing journalists with easy access to materials regarding the organization. The greatest communicative phenomenon that has developed on the Internet from 2006 is certainly a Twitter. With a growth above 1400%, in the period between April 2008 and April 2009, it has more than 40 million users, mostly in the United States and the north of Europe⁹

Twitter has become the largest nanoblogging (micro-blogging) site on the Internet. Nanoblogging is an Internet-based publishing platform that consists of sending short text messages with a maximum length of 140 characters through tools such as Twitter. Its purpose is to explain what one is doing at a given time, share information with other users or offer links to other web sites. About 19% of all Internet users use Twitter, and strategic communicators recognize its ability to reach a large number of stakeholders, making it the most used social media application in official public relations, advertising, and marketing campaigns. 36% of Twitter users say that they use it for strictly professional purposes. Cortés (2012) considers that the main activity of public relations carried out by companies via nanoblogging platforms with the purpose of building and maintaining a positive image is the use of “the corporate account as an accessory or alternative channel to existing ones to communicate with the press, clients or shareholders by means of the publication of company news and activities”. While it may seem difficult to communicate in a meaningful manner with 140 characters or less, Twitter users have found creative ways to get the most out of each Tweet by using different communication tools. Its text limitations, however, should not be an obstacle for disseminating links that lead to reflection and to the building of the public relations body of knowledge, basically through links to other information media and platforms (e.g. World Wide Web).

Organizations today can choose new ways to connect with their stakeholders through social media, by providing them with a current info about organizational practice and engage in conversations. According to the research paper by Lovejoy, Waters and Saxton (2012) that looks into how 73 nonprofit organizations use Twitter to engage stakeholders through their tweets, but also through other various communication methods. The sample was taken from the 2009 listing of the “Nonprofit Times 100,” the 100 largest non-university affiliated nonprofits in the United States based on revenue. Of these 100 organizations, 73 had Twitter accounts. Specifically it looks into the organizations utilization of tweet frequency, following behavior, hyperlinks, hashtags, public messages, retweets, and multimedia files. After analyzing 4655 tweets, the study found that the US nation's largest nonprofits are not using Twitter to maximize stakeholder involvement. Instead, they continue to use social media as a one-way communication channel as less than 20% of their total tweets demonstrate conversations and roughly 16% demonstrate indirect connections to specific users. Examining the relationship-building features of their Facebook pages these studies concluded that organizations were losing opportunities to engage with key supporters on Facebook.

While an organization's updates, or tweets, serve as the organization's principal communication tool on Twitter, there are other aspects specific to Twitter that can aid in stakeholder engagement and organizational research. Posting a tweet with the “@” symbol before the username of a Twitter user directs the message to that user. The organization would see that a user mentioned them and have the ability to respond to the inquiry. Through these public messages, a dialog is created between the organization and the user, but it is also viewable by anyone following the organization's or the individual's account. Sending public messages demonstrates responsiveness and establishes a dialog between users and the organization. Public messages also reduce the redundancy of answering the same questions repeatedly in direct, private messages. The number of tweets that are public messages has varied in studies from between 12.5% and 22%.

Another common feature used on Twitter is the retweet (RT), a function of the Twitter service that allows one user to repost a tweet from another user while giving acknowledgement of the user by adding “RT@[username]” to the beginning of the message. Retweets can be used to highlight involvement with another organization or to share information that the organization finds pertinent. The use of hashtags, represented by the pound sign (#), denotes that a message is relevant to a particular topic. Hashtags make searching for information easier. Hashtags works best when they have been established and agreed upon, which usually happens when an organization recommends a specific hashtag to be used by those interested in an event or conversation. After the 2010 Haitian earthquake, the American Red Cross

⁹ www.hubspot.com; www.compete.com.

encouraged individuals to use the #Haiti hashtag to ask questions and spread news about their relief efforts.

Third-party websites have been created to help users share information as hyperlinks on Twitter. Sharing informative links can get followers interested in the story with their tweets in the same way newspapers use headlines. Organizations encourage followers to read the whole story by following links to non-Twitter websites. Two of the more popular media storage sites are Twitpic.com, which allows users to link to photos, and TwitVid.com, which allows users to link to videos.

Of the 73 nonprofit organizations featured in the sample, 37% operate in the field of public/society benefit, 26% were healthcare organizations, 18% were human service (non-healthcare) organizations, 15% were from the arts and humanities sector, two organizations were non-university educational groups, and one organization was a religious group (Xifra, Grau 2010). The nonprofit organizations followed an average of 2842 users. To examine the friending practices of nonprofits, the researchers set up a Twitter account that followed all 73 sampled organizations. The researchers' Twitter account was followed by only 17 of these 73 organizations. Following users that follow an organization gives the impression that the organization wants to know what they are interested in, even if they never actually read the users' tweets. Conversely, an organization that does not follow anyone gives the impression that they do not want to engage in a dialog. The sampled nonprofits sent out a total of 4655 tweets over the one-month period. Range for monthly tweet totals from a low of 0 to a high of 289. But we should keep in mind that followers expect organizations to be more active than individual users. Of the 73 organizations, 80.8% organizations were classified as active.

The majority of the nonprofits' tweets included hyperlinks to external information. At 68% of the total, the usage of hyperlinks by the nonprofits is considerably greater than the average individual user on Twitter, which has been estimated to be between 13% and 25%. Twitpic.com was used to send 61 links to photos (1.3% of tweets) by 21 organizations, and only one used TwitVid.com to link to one video. Sampled nonprofits used public messages in greater proportion than previously found. Of the 4655 tweets made during the examined month, 16.2% of the total were public messages, characterized as any message that started with the "@" symbol. Nonprofits in the sample used the retweet function less often than Twitter users in general. Kim and Yang (2009) estimated that individuals use the function 27.8% of the time. The nonprofits in this sample had 755 (16.2%) tweets that shared other users' tweets.

Nearly 30% of the nonprofits' tweets included one or more hashtags. The use of hashtags by these organizations is likely a sign that the nonprofits have a better understanding of how searches occur on Twitter and focus more on search engine optimization than the others in the sample. The findings reflect similar studies in that one-way information dissemination (e.g., hyperlinks and retweeted messages) were the dominant communication tools used by the sampled nonprofits.

Although some organizations are using Twitter to create genuine dialog, most are using it as just another way to send out information such as that found in traditional newsletters, media kits, and annual reports. Although it may seem counterintuitive that real interactions can happen in 140 characters or less, Twitter can be used as a tool for stakeholder engagement—if practitioners use it proactively or to use it reactively for customer service.

There may be a more simplistic reason for the lack of interaction on organizations' social media accounts. Practitioners may neither understand nor believe that social media is the cure-all for organizational communication efforts. While Twitter is the leading social media outlet for organized campaign efforts, strategic communicators still remain puzzled over how to best use Twitter to connect with their external stakeholders on a daily basis (**Table 1**).

Additionally, the number of communication tools has changed since the data for this study were collected. Twitter now allows users to create lists of users, which could aid organizational communication to specific groups, and allows users to share their geographic location with their tweets, which organizations could use to attract audiences to specific events. However, perhaps one of the most beneficial studies would examine how shared links are being used. Are the hyperlinks shared on Twitter sending users to interactive spaces, such as blogs or Facebook, where online communities can form, or are they merely serving as a gateway to the organization's website, where the virtual brochure strategy continues to dominate? Exploring where these hyperlinks connect would reveal insights into how organizations view social media's role in organizational endeavours.

Table 1: Examples for increasing INGOs network¹⁰

Good practice	Bad practice
Defining the audience	Generic organizational announcements
Identifying the area of contribution	Public communication with your stakeholders
Clarifying main goal and strategy mapping	Lack of Twitter strategy
Highlighting most important information	
Communication strategy	

Two examples of good practices of external communication of international organizations on Twitter are:

1. **@Road to Rio+20** an international organization organized as an international support for United Nations conference that is going to be held this summer in Rio de Janeiro
2. **@Generations for peace**, an international organization for peace building promotion funded by HRH Prince of Jordan

Both are highly recognized on the social network by gathering people, institutions and stakeholders, constantly enhancing the dialog and interaction among their followers. More than 70 countries are involved in each of these international organization's online entities with more than 2600 followers from all over the globe. The transparency, open interaction and every-day possibility for contribution and involvement making these two examples appropriate, signifying notification for others how usage of social network can share the message and increase the presence world-wide.

6. CONCLUSION

It is important to stress out that most of the humanitarian organizations keep in secret their communication policies and results, because of the sensitivity of the public communication strategy that needs to present the organization in the positive light. There are also some unique challenges that humanitarian organizations faces, different than other non-profits. Example of UN humanitarian organizations briefly describes their communication strategy. The question that occurs is what are the most common challenges of using social media as a tool for external communication? The most common challenge for the organization is accepting the lack of control associated with social media and not knowing what people might say or do. Overall, they are all exposed to internal and external crises. Internally organizations must be concerned with issues such as intellectual property leakages, criticism of management or the company, and embarrassing employee behaviour that can damage a brand. Criticism, false information and activist groups were the biggest external concerns.

In almost every professional publication that you look at today, someone is making a claim about the power of social media communication technologies to improve public relations practice. The question today is not so much a question of "if" but "*how*" to use social media in external relations. The demand to use social media and new communication technology is also influencing public relations education. In only a decade, the role of technology in public relations has grown tremendously. Web sites are an omnipresent communication tool and e-mail has become the norm of internal and external organizational communication. The newest technology on the scene is social media allows one to obtain information from literally billions of sources. Obtaining and sharing information among billions represents a tremendous possibility for forwarding good and not so good ideas and practices. Remains on international organizations to assure that this possibility will develop in a positive, globally important way. Forwarding peace ideas and peaceful actions and campaigns seems as most important task that global society could archive. Twitter, for e.g. with its specific structure of *following* and *retweeting* could be an excellent peace instrument for a peace implementation among global population. For further research, authors suggesting *measuring organization's influence* at social network such Twitter is. Those measurement and specific

¹⁰ <http://bloodandmilk.org/2008/10/20/five-mistakes-international-organizations-make-when-using-twitter/>.

relations based on influence could be recognized as leading points for predicting the longitude of spreading peace through various societies by different communications and actions.

Authors strongly believe that international organizations worldwide will recognize the importance of active presence on social networks, but also the importance of developing their presence, concerning that social media represents probably the most efficient communication tool, but surely the most common tool of contemporary world.

IMPACT OF SOCIAL NETWORKING ON DAILY LIFE OF THE SERBIAN YOUTH IN A POSTCONFLICT ENVIRONMENT – A CASE STUDY

Aritonović Ivana¹, Lazarević Tatjana²

¹Faculty of Philosophy in Novi Sad, ivana.m.aritonovic@gmail.com

²Kosovska Mitrovica, Community Development Centre, tatjanalz@yahoo.com

Abstract: *The paper presents the results of empirical research with an aim to explore the intensiveness of the impact exerted by the most popular social networks (Facebook primarily) on daily lives of the Serbian youth population in Kosovo and Metohija. The province of Kosovo and Metohija is currently experiencing a post-socialist and a post-conflict transformation. The research starts from the presumption that the Kosovo and Metohija Serbian youth socialize in a rather different way than their fellow generation from other parts of Serbia. The advantages of the use of the Internet and social networks were supposed to be explored as a way of socialization, social promotion and, in particular, decreasing the feeling of isolation which the Serbian youth in Kosovo and Metohija have in comparison to the rest of Serbia and the world. On the basis of the earlier research “Daily Life of Young Serbs in Kosovo and Metohija”, the authors have carried out additional research using poll questionnaires, focus group discussions and observation with intervention (including communication via social networks). The interviewees were young Serbs – secondary school and university students, from the north of Kosovo and Metohija and isolated Serbian areas in the south of the province (also known as enclaves). The results of the research have indicated that the Kosovo and Metohija Serbian youth massively use the Internet and social networks as a way to escape from their gloomy reality. This gives them an impression that they do not live on the margins of the world. The compiled answers and the contemporary topic may guide the authors towards further and far more extensive and comprehensive research on the impact of social networks on the social lives of the Serbian youth in Kosovo and Metohija.*

Key words: social networks, Facebook, youth population, Serbs, daily life, Kosovo and Metohija.

1. INTRODUCTION

Social networks (primarily Facebook¹¹) are treasure of knowledge, information sharing and a way how to spend spare time. The invention of social networking in the late nineties¹² of the last century and in the first five years¹³ of the XXI century had an immense effect on the amplified Internet usage. The virtualization of people's lives in the spheres of society and labour has considerably occupied a larger portion of the physical area of society and work. The intensive usage of social networks by people of all ages, races, ethnic and social origins, confessions, and both genders, and their dominant influence on people's daily lives, society and culture, indicate a necessity for a continuous scientific research on such an impact. With regard to the popularity and influence of social networking, the global enlargement of Facebook is undoubtful. In spite of the fact that the former Harvard's student Mark Zuuckerberg's initial idea in 2004 was to create a social network which would connect the Harvard's students, it could soon connect more American universities, colleges and IT companies. Finally, in 2006, Facebook offered a free access worldwide. At the end of March 2012, 901 million monthly active users were registered. Approximately 80% of the Facebook's monthly active users are outside the U.S. and Canada. There are 526 million daily active users on average in March 2012. There are 488 million monthly active users who used Facebook mobile products in March 2012 and more than 500 million mobile monthly active users as of April 20, 2012. More than 125 billion friend connections were established on Facebook at the end of March 2012. On average, more than 300 million photos were uploaded to Facebook per day in the three months ended March 31, 2012. An average of 3.2 billion Likes and Comments were generated by

¹¹ The paper was written within Project 178028 – Material and Spiritual Culture of Kosovo and Metohija, financed by the Ministry of Education, Republic of Serbia.

¹² The first online network was *Six Degrees.com*, established in 1997, but it was closed in 2000. Still, the beginning of social networking could even get back in early nineties (*Geocities* in 1994, *The Globe.com* in 1995). Even back in 1971, when the first email was sent with the two computers sitting next to each other, one can count the beginning of social networking.

¹³ The largest number of social networks was created between 1997 and 2004, of which some are the most popular worldwide and regional as well: AOL *Instant Messenger*, *LiveJournal*, *AsianAvenue*, *MiGente*, *Tribe.net*, *BlackPlanet*, *Cyworld*, *LunarStorm*, *Ryze.com*, *Friendster*, *LinkedIn*, *MajSpejs*, *Orkut* and finally *Facebook*.

Facebook users per day during the first quarter of 2012. There were more than 42 million Pages with ten or more Likes at the end of March 2012¹⁴. Facebook is now available in more than 70 languages¹⁵. On their official web page¹⁶ is stated that their mission is to make the world more open and connected. People use Facebook to stay connected with friends and family, to discover what's going on in the world, and to share and express what matters to them". **According to statistics of Socialbakers¹⁷ for the last six months, Facebook penetration in Serbia is 42.00%** compared to the country's population and **75.11%**¹⁸ in relation to number of Internet users. The **total number of FB (Facebook) users in Serbia** is reaching **3084880**. The largest age group is currently **18 - 24** with total of 925 464 users, followed by the users in the age of **25 - 34**¹⁹. **These figures confirm the current major significance of social networks' impact on daily life of youth population but it may predict the continuous trend in future as well.**

2. ABOUT THE RESEARCH

After several years of observing the massive use of social network Facebook, we have decided to explore its influence on the youth population. The research was conducted in the north of Kosovo and Metohija – in the Serbian community. Twelve years after the arrival of international forces in the province, it is still undergoing through a post-conflict transformation process and low intensity conflict. In such a social and political framework, sustainable future of Kosovo Metohija Serbian youth population has become questionable. Starting from this presumption, and following our earlier major research, titled "Daily lives of the Serbian youth in the north of Kosovo and Metohija"²⁰, we did an extra research from January to May 2012, by using poll questionnaires, focus-group discussions and observation with intervention (including communication via social networking). The respondents were young Serbs – the secondary school and university students who originate from the north of the province and from isolated Serbian communities all over Kosovo and Metohija, known as *enclaves*. The *results* illustrated the immense use of Internet and social network (Facebook) by the Serbian youth in Kosovo and Metohija, primarily as a way to escape from their gloomy and insecure reality. The *results* clearly indicated poor quality of their daily life, a substantial lack of options for popular spending of free time among teenagers (in particular, it refers to the enclaves), and finally, the absence of optimistic vision to their future.

There have been four focus groups conducted in the field: the first and second one were age-homogeneous but place-mixed, composed of secondary school, i.e. university students each, from the north and south of the province, the third and fourth ones were age-mixed but place-homogenous, composed of secondary and university students who are studying in Kosovska Mitrovica but originate from the southern enclaves, i.e. originate from the north.²¹ They were divided in such an order as we wanted to explore and compare eventual differences in answers by Mixed and Homogeneous groups, by both criteria: age and place of origin. The results have shown instead that there are no significant differences in the students' answers; the interviewees' answers were rather uniformed. In addition to the obvious popularity of Internet and Facebook as global social networking phenomena, there was a specific value of them to the Serbian youth population in Kosovo and Metohija - the *immense use of Internet as a way out from physical, political and cultural ghettos, a way to escape from insecure and pessimistic reality*. The participants talked of their lives in a very open manner. Social networks make a very important segment of their lives.

¹⁴ <http://www.socialbakers.com/facebook-statistics/>

¹⁵ The data were taken at the official Facebook Page on 30 April 2012:

<http://newsroom.fb.com/content/default.aspx?NewsAreaId=22>

¹⁶ <http://newsroom.fb.com/content/default.aspx?NewsAreaId=22>

¹⁷ *Socialbakers* (<http://www.socialbakers.com>) is a global social media and digital analytics company with customers in 75 countries representing every continent. Socialbakers helps companies measure the effectiveness of their social marketing campaigns across all major networks, Twitter, Facebook, YouTube, LinkedIn and Google+.

¹⁸ According to source <http://www.internetworldstats.com/stats4.htm#european>, these figures are significantly less – 56% (4,107,000 out of 7,310,555) without Kosovo, while the Internet penetration for Kosovo, according to this source, is 20,7% (377,000 out of 1,825,632). As for the Facebook penetration, the statistics for Serbia is similar to the Socialbakers's data – 43,3% (3,173,440)

¹⁹ <http://www.socialbakers.com/facebook-statistics/serbia>

²⁰ Ivana Artonovic, Tatjana Lazarevic, "Daily Life of Young Serbs in Kosovo and Metohija ", "Baština, sv.32", 2012, currently in printing

²¹ The students were from the Gymnasium, both from the art and science, "Mihajlo Petrovic Alas" technical school, Economy-Trade school, Medical school, all from Kosovska Mitrovica and Secondary technical school from Zvečan. Focus groups were composed of students with the Medical, Pedagogy, Philosophy, Economy, Law and Sport faculties.

In this explorative research, sixty respondents were interviewed, and they were all equally represented on the basis of socio-demographic parameters.²² The most common research methodology was a focus-group discussion, as one of the most eligible methods in explorative researches, in such cases when the researching phenomenon is not well known. The reason why focus groups are used in early research stages may be also the structuring of hypothesis ensued from the results of the focus groups discussions²³. It facilitates easier the adoption of decisions on field research strategy that will come up in later research stages (Djuric, 2007). The reason to choose a focus group methodology as the principal one in this research is the development of a social interaction among group members. The aim is to identify the specific standpoints, opinions, beliefs, experiences and reactions of the group members which cannot be easily found by using other research methods. Those standpoints, opinions, beliefs are partially independent from the group or social environment, but the simplest way to discover them is through the members' gathering in their mutual interactions, as the basis on which focus group exists and stimulates.²⁴ We have directed the groups' dynamics towards our aim to receive sincere and open answers from the respondents. In particular, we strived for a stimulation of mutual cooperation among respondents, apropos the task of the moderator to reduce eventual tensions. Due to the pleasant and comfortable atmosphere that enables frank and open discussion (the emphasize of participants' standpoints), the success rate of the focus groups interviews and validity of the received data is of a very high score. According to Djuric (2007), "individual characteristics of participants shall affect on behavior of other participants, interaction quality, cohesion and compatibility of groups. This creates the ambient in which all participants will feel free or poky, motivated or indifferent, relaxed or afraid."(33).

Our focus group participants spoke sincerely of reasons for such an intensive use of social networks and Internet in an open and pleasant atmosphere. The spirit of sincerity during the discussion could be best seen while speaking of the side effects on their qualitative school attendance, preparation of classes and exams, communication with other people and finally, the literacy. Their answers got deeper into the sphere of virtual world, rather than describing a physical socializing in real world as the virtual life replaces more their physical surrounding.

3. SOCIAL NETWORKS AND THEIR INFLUENCE ON DAILY LIFE OF YOUTHS

While discussing "Social networks and their influence on daily life of youth population in Kosovo and Metohija", the participants have emphasized that they use Internet for several hours on daily basis (two to four hours is the average, although this varies as per age, season of the year, daily and school obligations, current emotional spirit of the youths etc.), and that they all have profiles on social networks²⁵, among which, Facebook is the most dominant and most popular. With new generations of Smart Phones and new applications (Google Android for instance), the access to Internet and social networks through cell phones²⁶ became common and more frequent. In fact, almost all interviewees have answered that they make their access to Internet and Facebook through their cell phones often per day, in spite of the fact that almost all of them possess their own PC. Cell phones have evolved to the level of mandatory personal equipment. It enabled more intensive and more often visits to the Internet and social networks.

²² The discussions are audio recorded, so the transcribed answers are fully original. The participants were have demonstrated high level of motivation for discussion on subjected matters. There were no negative verbal or nonverbal participants' reactions, nor rejections of giving answers. Moreover, we noted that the participants of all groups felt a need to openly talk of their lives and standpoints; there was a very intensive interaction within the groups.

²³ Besides explorative, the focus-groups interviews can be also used in a phenomenological (experiences) researches, which is characterized by the researchers' possession of basic knowledge about the interviewed subject. In such a research, the researcher's aim is to expend his/her knowledge and clarify eventual doubts. A phenomenological approach fulfills the objectives of triangulation and confirmation as well i.e. researcher is comparing derived data with results from previously used methods, and final data compares with own previous standing points and knowledge on researched phenomenon(see: Sladjana Djuric, ment. work, 2007, 33).

²⁴ For a researcher, it is more difficult to control a focus group than an individual interview, as the focus group participants may take over the initiative and be in control of the situation. Therefore, it is a must for a researcher to be in well knowledge about the research process. In combination with observing, a focus group enables the researcher to collect more information within a shorter time.

²⁵ Facebook and Twitter

²⁶ Similar findings were established in the earlier cited research „Daily Life of Young Serbs in Kosovo and Metohija." The uniformity in answers was obvious in both generations, among secondary school pupils and university students and in both geographical areas – north and south. Such equality in answers lead us to a conclusion on a continuous absence of creative and progressive opportunities to live daily life among the Serbian youth in the province, limited to all side effects of a post conflict society, of which one is the lack of freedom of movement. Social networks thus became a virtual space, dividing not anymore in 'us' and 'them', offering the Serbian youth in Kosovo and Metohija unlimitedly to exercise their freedom of speech and movement. This refers in specific for the enclaves.

The last generations of cell phones have enabled its users to personalize their access and visits to the world network, which is resulting in their greater dependence on Internet and virtual communications. Our respondents use Internet and social networks for several hours, many times a day. A vast majority connects to the network between 2 and 5 times, and spends 2-4 hours on it, mostly on Facebook, playing video games. It appears however, that the university students are somewhat more rational and spend their time much efficiently than the secondary school students. The latter mainly spend their Internet time by playing games, chatting with friends from their immediate physical environment, personalising their own profiles and visiting other Facebook profiles. Although the university students spend the same time on Facebook like secondary school students, unlike the teenagers, they are still able to set their priorities and go on sites relevant for their studies. They are seeking for useful information about various faculties, including the sites of their own faculties, study programs, but also political-informative sites and fun pages. On question "What do you mainly do on Facebook or other social network?" five participants from the place-mixed group of secondary school students, mainly play video games. Most of them currently played a few times day, or long evening hours the most popular game of "Puzzle". Those teenagers who originate from the southern enclaves communicate with their relatives in Serbia, or with their friends from Kosovska Mitrovica, when they stay in their homes. In general, most of interviewees from all four groups chatted with friends outside of their places of origin (a bit less than two thirds) and all of them check News Page. They also "spy" on other peoples' profiles, mainly of their sympathies, boys/girls or "competition", regardless age, gender or place of origin, but their emotional wellbeing and sphere of personal interest. On question: "What do you mainly do on Facebook or other social network?" all university students answered that they want to see what their friends do. Most of them use that network to chat with friends from other places. As above mentioned, this is in particular the case for the students from enclaves. Much of the Internet time which they spend in their homes in the south, they actually spend to communicate with their relatives and friends in Serbia, as the only way to stay connected with them. In contrast to the secondary school students from the north, who still have not expressed any need to contact with friends outside of Kosovska Mitrovica, the university students apparently need to stay in contact with friends through Facebook. The secondary school students are obviously "locally oriented" on Facebook, mainly communicate and visit profiles of their peers who they see and with who they meet on daily basis. The university students are also more active in Facebook networks/groups. In spite of the fact that the secondary school students are each registered within a few Facebook groups, they are rather passive members, who, by time, forget about these groups. They are considerably less active members of those groups, unlike the university students. The biggest similarity in answers from all groups is that most of them play games as already mentioned and are also aware of spending much time on Facebook. However, it seems that the university students are much more ready to take some measures in reducing time which they spend on Facebook. They are also aware of obligations they have on faculties. One student mentioned that he was "deceiving" himself for months sitting by the open books on the desk and with "online" presence on Facebook. Although he did not intend to stay long hours on his profile, he would anyhow end up online. His time waste was self-excused by his arguments of knowing all material from the book, until he realized that a deadline was approaching to take the exams. It was then when he deactivated his profile for more than a month. The results of that decision were obvious. He passed several important exams for a short time, and regained the concentration for learning. The university students also noted that they were aware of the Facebook addiction risks.

M.A. (pupil, KM): „I post songs on my wall and play video games.”

Lj.P. (pupil, KM): „I play games.”

V.S. (student, KM): „I play games and I check if there is something new with my friends. That is written on the first page, so I do not stay long on those pages...”

P.R. (student, Vitina): „I rarely go on Facebook as I have no permanent access to Internet, including my friends from the enclaves. I usually use weekend to chat with my friends and girlfriend, because she lives in the enclave and we can only communicate via Internet.”

Dj.R. (student, Vitina): „I disconnected my profile for a month and a half. It can be done as a temporary action, and I wanted to see if there will be any difference in the quality of my time and my success in studying for the exams. And there were. I passed more exams than earlier. I renewed my contacts with some other friends. It meant a lot to me. And then I reactivated my Facebook profile again as I cannot stay long without Face.

S.D. (student, Klina): „I stay connected with people who are not from here. We have created our own faculty group, so we stay in touch with our professor, who sends us some useful links. The negative side is that we use them too much, a positive side is that we have a plenty of them”.

B.V. (student, Gracanica): „I check messages and announcements. Sometimes, I play games. I keep in contact with my enclave friends, because they don't have telephone connection.

A.T. (student, Laplje Selo): I exclusively check my messages. I log in FB for even ten times, but I just check if there are some news and I log off.

On question: "Which are, according to your opinion, advantages for the youth to use of Internet and Facebook/other social networks?" their answers clearly showed that the Internet served paramountly as source of information and socializing: it keeps them in contact with people, provide them with faster and richer access to information. However, the participants have rather spoken of side effects of the Facebook's popularity. In their opinion, Facebook created a new addiction among new generations; when they are not online they feel like being cut off from the rest of the world, 'missing all that is important'. In addition, the addiction to Internet/Facebook is an irreversible process that influenced on people to get estranged from each other. They cited a few examples of the people who they know, who spend their time in caffe bars having coffee, but who are actually mentally all the time "online". These kinds of people, as they say, explicitly feel a need to expose their private lives to "the whole world" by announcing what are they doing and how are they feeling in "every moment". Interestingly, the students were more critical oriented instead of giving benefits. They talked more about disadvantages and dangers related to incautious use of social networks. Even more interestingly, among them were also the students from the southern enclaves who, shortly before giving the answer to the last question, had positively talked of Facebook as a tool that connects their physically isolated places with others. As the question was targeting the advantages of the use of Internet/Facebook, and all groups rather directed their answers towards negative consequences, we assume that young people either keep well in mind the information about the sideeffects or they experience about negative aspects of Facebook use.

S.D. (student, Klina): „Communication with other people, especially those that don't live in the same place.”

A.T. (student, Lapje Selo): „We are in contact with people.”

B.V. (student, Gracanica) „When I have no electricity and Internet, I feel like I'm not alive. I always think that something important is going on without me. Then, the power is on again and I see nothing big happened”

D.K. (student, KM): „When I log in and see a few requests, it is great, and then there is nothing more but the games invitations, I get *pissed off*, as too many friends are for nothing, no one writes messages, at least not on regular basis.”

I.S. (pupil, KM): We meet new people, we get new knowledge on technologies. But, there are dangers as well. There are always talks on TV about dangers of Facebook. I am always careful while accepting somebody's request, and I always double check if I know that person or not.”

On question: "Is there any advantage of using Facebook/other social networks for young Serbs in Kosovo and Metohija", many participants from both geographical areas – the enclaves and North Kosovo clearly stated that they use Facebook as a way to contact with the world outside – families and friends. In particular, this refers to the participants from the southern places while staying in their homes, as have no other communication option, due to the dismantlement of Serbian telecommunication system.

P.R. (student, Vitina): „Unfortunately, there are places without telephone, so Internet is the only connection. Our provider is an ethnic Albanian, he personally comes to our village and charges us for that...but we had to stay connected as had no other option to communicate. There are no Serbian mobile operators, so, apart from some private Internet providers, run by ethnic Albanians, most of the Serbian areas in the south use PTK²⁷ as an Internet provider.”

V.A. (student, KM): „Facebook itself is negative as we spend insufficient time socializing together. We used to know earlier where to find our mates, either in the playground, or in the street. The Facebook's advantage however is a fast circulation of information.”

Đ.P. (student, Vitina): „My parents found their school mates via Facebook.”

S.D. (she-student, Угљаре): „I have a sister who is living abroad. We communicate via Internet and Facebook. Otherwise, I would not afford to talk to her, or even make a phone call “

I.H. (she-student, KM): „This is our *window to the world*.”

J.P. (she-student, KM): „I found many seminars via Internet, which helped me to improve my skills. We learn a lot from Internet and social networking and can have better options to travel and meet new people.”

On questions; "Imagine that Facebook does not exist anymore, like any other social network? What would you do? How would you spend your free time?" we estimated that both university and secondary school students could not even imagine such a situation in real life. Many of them admitted that it would be very difficult to manage without it for the very first days but they would eventually get used to it in later time. The majority have connected it with the creation of a new network. The participants from all four groups have emphasized that the use of social networks is an irreversible process; there will be another network created in case Facebook disappears. Very few of them are of the opinion that there would be no major change, so they could easily manage their daily lives without social networking. Our impression was that the interviewees of all four groups have not really taken out the question seriously; it was only upon our

²⁷ The Post telecommunication Service of Kosovo

insistence that they should give an effort to imagine such a situation without Facebook, that we have got the cited answers. Those answers indicate that young people cannot really imagine their life without Internet and Facebook, as they play an active role in their daily life. Indeed, the facial expressions in non verbal communication of some of our interviewees who originate from the enclaves clearly showed a certain discomfort after being faced with the idea of life without Facebook. They have outlined for several times that Internet and Facebook are their only connection to the “world outside” i.e. their families and friends outside of their ghettos. Finally, Internet is also their source to stay informed about security and political situation in Kosovo and Metohija. Political situation namely has become ‘the culprit’ for the recent ‘explosion’ of Facebook groups; You tube posts, other blogs and news threads on Kosovo. All of them can be categorized in a social journalism genre. Vivid criticism against the former Serbian government and western international policy for Kosovo and Metohija are in common to this pages/news. Their major value is however, the speediness and right-on-spot image, audio and video recording by which the news can immediately reach its Internet consumers. In regard to the North Kosovo crises²⁸, other national agencies have lost this battle.

S.V. (students, KM): „People are addicted, it is impossible to shut down social networks. There is no way back.”

A.T. (student, Laplje Selo): „I have a friend whose whole life is on Facebook. He is all day long in caffe bar, with computer... his world would be demolished. But he is not the only one, there are many people identifying themselves with Face.”

D.K. (student, KM): „I know a person who spends 18 hours a day on the Internet. She has a lot of back pain. I use Facebook for half an hour to one hour per week. I don't need Facebook and I could imagine myself without that network.”

P.R. (student, Vitina): „If cell phones would still exist, we could be in contact. Somebody would create an alternative solution.”

J.K. (student, KM): „The dismantlement of social networks would not be pleasant but, we would have to get used to it. Anyway, we will open profiles on some other networks... I cannot even imagine that there are no social networks...”

D.K. (student, KM): „It is one way journey.”

M.K. (pupil, Klina): „I use Facebook in order to check information related to my faculty. When I am at home, I don't watch TV, nor use Internet.”

M.S. (pupil, Babin Most): „I use Facebook to find pages and interesting things. For the first few days I would be in a kind of crisis.”

M.B. (pupil, KM): „A new social network would be created.”

Lj.P. (pupil, KM): „Most people are addicted to Facebook. Some use profiles to find job, and some to keep in contact with family that live abroad. I would like if this is to be shutdown, we associated much more although we had less friends before this network.

Unlike the focus group discussions with the university students, who gave more concrete answers to all questions, the secondary school students in all focus groups developed long discussions on their Facebook activities – which pages they visit, which songs and what kind of photographs they post on their profiles, why there are more girls who post their photographs in half-naked and provocative poses, while boys post the photographs from gyms; finally, why Photo Shop is so much used and popular among teenagers. On question “Do you visit other people's profiles?” the affirmative answer was mainly given by the female secondary school students, but others said “Yes”, too. They mainly visit their partners', or sympathies' profiles, or eventual 'competitor's' profiles. Except from watching the photographs and statuses, they carefully check on all news and friends' lists. As for the boys, they mainly visit the profiles of those girls who are “popular” for their physical look, by watching their photographs.

I. H. (pupil, KM): „I check my sympathy's profile.

Lj.M. (pupil, KM): „There is a boy checking his girlfriend. They exchange passwords and then check profiles of each other. This is called “love” and “trust” today.

M.B. (student, KM): „They are also watching photographs a lot.”

J.P. (she student, KM): „If we don't know a person, we watch his/her photographs.”

Answering question: „What is your experience of using Facebook now in comparison to ‘Facebooking’ three years ago, the interviewees have said that their Facebook profiles were opened in 2009, emphasizing that the way they use their time nowadays, and life in general, has radically changed to the way they lived three years ago. In their opinion, it is primarily due to the enhanced role of Internet and Facebook in their life. Furthermore, they are currently experiencing Facebook as a regular daily activity. They find a tangible connection between a greater usage of Facebook and limited options for spending

²⁸ This is in particular after the outburst of the so called July crisis in the north of Kosovo on 26.07.2011. It was after the attempt of Pristina government to gain a control over North Kosovo, by first taking the administrative boundary lines towards central Serbia under its jurisdiction.

their free time. As they spend most of their time in indoor activities during the winter season, they all emphasized that they use Facebook far more in winter months than in summer season.

L.J.M. (student, KM): „If I don't log in Facebook for the whole day, I expect to find big news there, and then I see nobody has sent me anything and there are no such news.“

M.A. (student, KM): „If I am at the seaside, three days later, I need to find an Internet cafe and a video play shop.“

L.J.M. (student, KM): „It is no problem for me to be without FB for ten to fifteen days, but then it becomes bad.“

J.P. (she-student, KM): „I deactivated *Face* for fifteen days which was my most productive lifetime. I read fifteen books for then days. But I also cannot manage my life without FB as it is also way to be informed.“

M.C. (student, Клина): „I am addicted to *Face*, but when we went for a six day seminar trip to Plav, I had not thought for a single day of Facebook. My all days were completed there, so I felt no need for using Facebook.“

M.C. (student, Бабин Мост): „I am equally addicted to Facebook, both here and in Babin Most.“

L.J.P. (student, KM): „I spend most of my time outside and I don't need *Face*.“

The answers which indicated that the Facebook networking became a mandatory daily routine showed us a strong influence of the social networking phenomenon, as a result of Digital Era, on the reconstruction of the youths' lives. Within a post conflict framework, this influence is even more intensified due to the lack of other urban, social, cultural and civic options, common to all peacekeeping societies. One should not be surprised therefore by such an immense popularity of social networking among the Serbian youth population in Kosovo and Metohija. They speak of social networking in both categories –it is their *compulsory daily activity* and a *window to the world outside*.

4. INSTEAD OF CONCLUSION

Through the explorative research of daily life of young Serbs in Kosovo and Metohija, by the use of a poll questionnaire, focus group discussions and observation with intervention on Facebook (as the most frequently used social network), we identified specific features of daily lives of the Serbian youth in the province. At first sight, it does not differ much from daily routines of any young people in other parts of Serbia. Using the research techniques mentioned above, we compiled a relatively large number of data which indicates a conclusion for further and deeper academic researches in this and similar fields. They need to be conducted on a greater number of interviewees. It applies in particular, to a focus group discussion, as “a number of the acquired data, likewise a group dynamic, which motivate participants to give certain answers and which might not be given during individual interviews, still reflect its numerous advantages” (Aritonović, 2010). This research resulted in a common feature of all interviewees: the daily use of Internet, particularly Facebook network. Apart from the global popularity of the World Web and social networking, they have a specific value for our interviewees – it is their *way out from physical, political and cultural ghettos, a way to escape from insecure and pessimistic reality*. Young Serbs from the southern Kosovo and Metohija enclaves have no positive alternative for qualitative spending their free time, but the use of Internet and Facebook. As a consequence of the dismantlement of the Serbian mobile network in the south of Kosovo, they have no other communication tool to stay in contact with their families and friends but by Internet connection, provided by Kosovo Albanian private operators and PTK (Kosovo Telecommunication Service). As for the young Serbs in the north of the province, they are living in a specific cultural ghetto, encapsulated for twelve years in one and half square kilometer, with a high density of the predominant Serbian population, limited to spend their free time in a more qualitative way. In addition to the shortage of qualitative options for spending free time, they simply know that all of their friends are always *online*. The intensive use of Internet and social networks became thus their daily routine and an unquestionable category. In spite of such a fact, they are well aware of negative consequences of the *excessive* use of social networks – much hour consumption which affects their health, quality of studying and other daily activities. In particular, they are well aware of the negative impact of Facebook (wasting their personal time, supposed to be spent on studying or living a *healthier* life). Some participants stated that they had *frozen* their accounts for a while, after which they had scored excellent results in their schools and universities; they had time to read books and *truly* socialize with other people. They nevertheless, later reactivated their profiles with an excuse “Facebook is part of our lives. It is a strong information and communication tool”. Clearly, the participants could not give any definite answer to the question on the ceasure of social networking; they simply cannot imagine their life without virtual social networking. To them, it is an irreversible process - *one way road*. In spite of much criticism of Facebook and “web surfing”, Digital Era has made life easier to the Serbian youth population in Kosovo and Metohija. Internet has decreased their feeling of inferiority, which they have in comparison to the rest of the world; it is specifically in regard to their peers in central Serbia. Without Internet, they said – “*we would feel as if living at the end of the world.*” The research has also shown that the addiction to Internet and social networking create distance between young people and activities in real world. It

deepen apathy, sense of helplessness and negative emotions due to people's lives in a limited post-conflict environment. Hence the intensive initiatives of young Serbs to *change* their *grim* daily routine by spending several hours on the Internet and social networks, is their *window to a distant and better world*.

Abstract: *The competitiveness of a business system in today's global market requires increased effectiveness and efficiency of its processes and activities. Within management activities, the most widespread form of communication is the meeting. However, not all business meetings are purposeful. Some research confirmed that managers spent much more time in meetings than necessary, and also that more people than needed attended them. Meeting Management is defined as the application of appropriate management techniques for planning, organizing and leading, which will enable effectiveness and efficiency of meetings. Every management requires prior measurement and meetings should therefore become measurable, so that they could be managed. This paper aims to provide a methodological basis for measuring effectiveness and efficiency of meetings in a business system. The basis for collecting data is a pre-designed questionnaire covering relevant areas of research into meetings, as follows: basic information about the business system, the manager and perpetrator, effectiveness and efficiency of the meeting, and the attitudes of managers and perpetrators toward effectiveness and efficiency of meetings in the business system. The research should provide answers to the current meeting effectiveness and efficiency in business systems in Serbia, as well as guidelines for their improvement.*

Keywords: *methodology, research, meeting, manager*

1. INTRODUCTION

Business system that intends to be competitive in today's global marketplace must certainly take into account the effectiveness and efficiency of its processes or activities. In this context, a managerial activity of communication should be considered, which is one of four key elements of subjective support of management (communication, leadership, motivation and decision making). During the performance of managerial activities of communication, most common type is group work. The term group is defined as a group of people referred to the interaction in order to achieve a common task. In this regard, particularly in the functioning of groups of managers and the dissemination of information, an important management tool in working with people is a meeting (Bulat, V., 1997).

Since those business meetings are an important part of overall managers business, their importance is indisputable. However, not all meetings are meaningful, which is confirmed by some studies that suggest that managers on average spend 3.5 hours a week in meetings, an average of eight people attend meetings, including the presence of at least three of them that are not necessary, and so on (Portal o sastancima, 2007). Poor management of meetings by managers in the business system can negatively affect the decision making, time management, level of organization, human relations, as well as overall business results. It is clear therefore that the management of meetings comes to the fore. Management of meetings presupposes the adoption of appropriate techniques for planning, organizing and conducting meetings, which will enable them to become meaningful and effective and efficient, which will contribute to improving the overall business.

Each control includes pre-measurement. Therefore, management of meetings requires that meetings become measurable on several grounds. Only in this way the meetings will become manageable. This paper intends to provide theoretical background and methodological basis for measuring the effectiveness and efficiency of meetings in the business system. Future research should provide answers to the current state of effectiveness and efficiency of meetings in business systems in Serbia, as well as guidelines for its improvement. In this sense, hereinafter research model for assessing the effectiveness and efficiency in meetings in the business system is designed.

2. DESIGNED MODEL FOR EVALUATION OF EFFECTIVENESS AND EFFICIENCY OF BUSINESS MEETINGS

Model for assessing the effectiveness and efficiency of meetings in the business system includes research design (research subject, research aim, hypothesis and research method), the sample, questionnaire (identifying relevant factors and variables), the empirical work (data collection in the field), data processing and data analysis. The concept of the above research model is explained hereinafter.

THE RESEARCH DESIGN

The research subject is to evaluate the effectiveness and efficiency of meetings that are organized and carried out in the business system.

The research aim is to identify relevant factors that influence the effectiveness and efficiency of meetings in the business system.

The research hypothesis is that it is possible to measure the identified relevant factors, as well as the degree of their influence on the effectiveness and efficiency of the meeting.

For research method it is proposed a statistical method based on collecting data on a representative sample of respondents from business system. Collecting data is based on pre-designed questionnaire, which includes the relevant areas of research. Study respondents are managers and perpetrators from the same business system.

THE SAMPLE

The use of stratified random sampling is planned for the study (*Bojković, Krstić, Skorup, 2011*). The practice indicates that the sample is representative when the volume represents 10% of the population studied. Based on such sample conclusions can be derived with a high degree of probability and be valid for the whole examined population. For a population of 1,000 business systems it would be necessary for research to encompass approximately 100 respondents, that is managers (from different hierarchical levels) and perpetrators (who perform different tasks), and who working in tested business systems from different economic activities, as well as from different parts of Serbia.

THE QUESTIONNAIRE

Research is based on a questionnaire that includes relevant research areas, dimensions and variables. Relevant research areas are: basic information about the business system, a manager and perpetrator (Table 1), the effectiveness and efficiency of the meetings in the business system (Table 2), and the attitudes of managers and perpetrators about the effectiveness and efficiency of the meetings in the business system (Table 3).

Table 2: Relevant research domain: Basic information about the business system, a manager and perpetrator

Dimensions	Variables
business system in which manager and perpetrator work	the name of the business system (enterprise / institution), city, municipality, type of company, ownership status, industry, business, the total number of employees
chosen manager	managers name, name of the function in the business system, title, education, type of education, age, seniority, experience with another employer, career, hierarchical level of management, range of management, the total number of employees directly subordinated to manager
chosen perpetrator	perpetrators name, professional position, education, age, professional experience, qualifications and key skills

Table 3: Relevant research domain: Effectiveness and efficiency of the meetings in the business system

Dimensions	Variables		
	Manager		Perpetrator
	conducts a meeting	attends the meeting	attends the meeting
Quantification of the effectiveness and efficiency of the meetings in the business system	meetings function effectively (treat right things) (%)		
	meetings are effective (%)		
	average number of people attending meetings (number)		
	average duration of the meeting (hours)		
	average number of agenda items (number)		
	daily time spent in meetings in the business system		

Table 4: Relevant research domain: Perceptions regarding the effectiveness and efficiency of the meetings in the business system

Dimensions	Variables
	Manager / perpetrator
poor management of business meetings by the general manager	may have deleterious effects on overall business performance of organizations
	may adversely affect the management of time
	may adversely affect the level of organization within the company
	can negatively affect relationships
	may adversely affect business decision making
	have an impact on something else, what: _____
significance of the meeting	meetings are inevitable
	meeting is a place for information exchange
	meeting is a place for inventing the best solutions
	meeting is a place for creating ideas
	something else, what: _____
meeting as an opportunity	for the best troubleshooting
	for making group decisions
	to assist someone to make a decision
	for removal of discrepancies
	to address attitudes
	for planning
	for organizing
	for control
	for informing
	to create new ideas
	something else, what: _____
usefulness of the meeting	meetings are necessary
	meetings are a waste of time
	meetings last as much as needed
	meetings are attended by as many people as necessary
	meetings resolve key issues
	else, about the meeting
success of the meeting	chairman of the meeting has deadlines
	chairman of the meeting holds to the terms
	meeting starts at the scheduled time
	the chairman controls each agenda item
	selection of appropriate space for the meeting
	the appropriate time for the meeting is ensured
	the proper seating order of the participants is taken into account
	the proper way of conducting a meeting is ensured
	the equipment is provided (video projector, telephone, etc.).
	the debate is conducted only on the agenda
	limited time for participant to present its own attitude
	respect to others' opinions and attitudes

operationalization of the meeting	all meeting participants understand what was agreed at the meeting
	all participants understand which activities should be undertaken
	all participants understand the deadline
	all participants know who is responsible for every activity
improving the efficiency of the meeting	multimedia meeting
	forum (via Web)
	telephone meeting
	FAX meeting
	meeting at a distance
	corresponding meeting
The scale of variables measures: not at all, a little, quite, significantly, very significantly	

EMPIRICAL WORK

Realization of practical field data collection is planned to be through personal contact of interviewers with selected managers and selected perpetrators. The collected data would be entered on-site in specially designed patterns. After the interview, collected data would be transferred to the web questionnaire, which was created for this purpose in Google documents application (Figure 1), so data will directly flow into a common database of research, with the possibility of exporting it to Excel file.

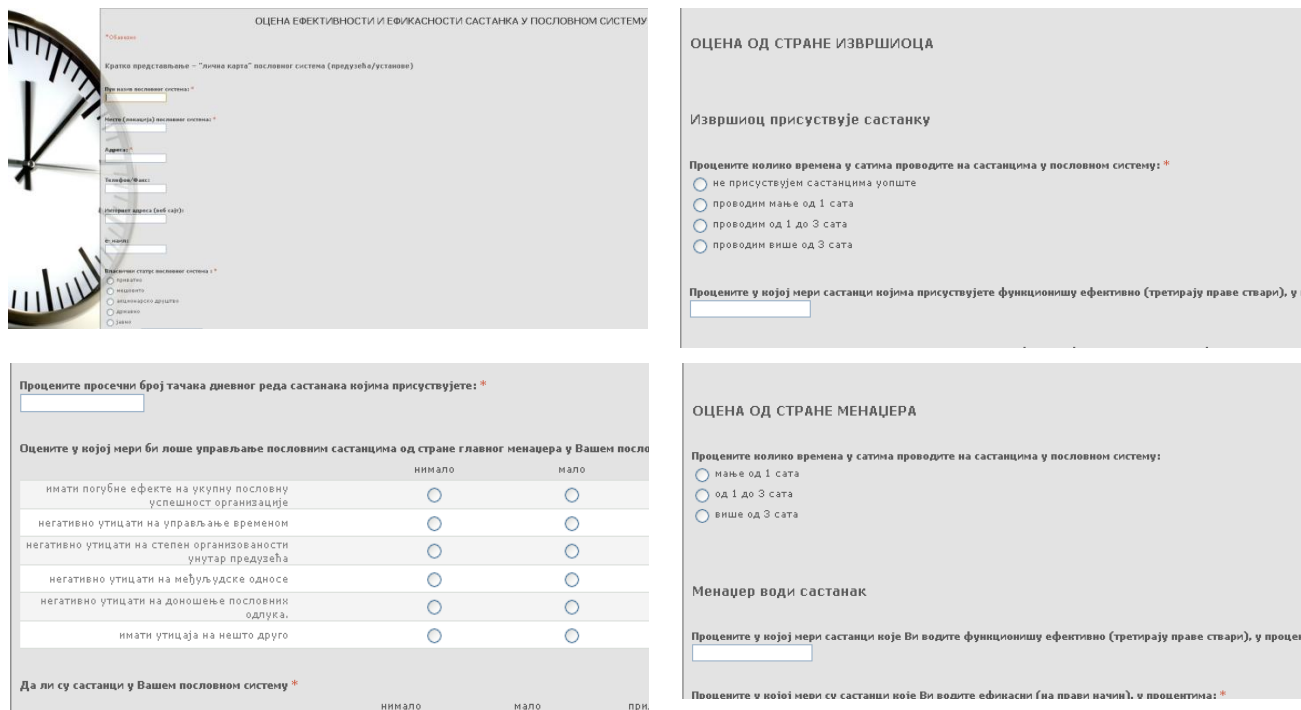

Figure 3: Inserts from the web questionnaire

DATA PROCESSING

It is planned that the processing of the collected data is based primarily on descriptive statistics, which includes the following tasks (Vuković, Živković, 2010):

- grouping and sorting of statistical data,
- presentation of statistical data, and
- determination of the basic indicators of statistical series.

For the presentation of research results the basic forms of statistical analysis of data will be applied, such as frequency distribution, relative frequency, valid percent and cumulative percentage, and the statistics will be displayed in tabular and graphical form. For graphic display of the results it is planned to use

histogram (for displaying of frequency distributions and distribution of relative frequencies), pie chart and polar (line) diagram.

Basic measures of statistical series, which will be used when displaying the results of research are:

- mean values or measures of central tendency (mean, mode, median),
- variation measures or measures of dispersion (standard deviation, range),
- measures of distribution shape (a measure of asymmetry, a measure of flattening).

DATA ANALYSIS

After conducting a statistical analysis, data analysis will be conducted, based on what will be said to what extent the research met its goal, and to confirm or refute the research hypotheses.

3. CONCLUSION

The study presents a model for assessing the effectiveness and efficiency of business meetings that contains all the necessary elements of research, such as research design, the research sample, designed questionnaire, empirical work planned and data processing.

The purpose of this paper is to provide a theoretical and methodological basis for future measurement of the effectiveness and efficiency of business meetings.

The next step for the research realization, based on the presented model, is the implementation of the empirical work, or the collection of field data in accordance with research design.

This research should first give an answer to the current state of effectiveness and efficiency of meetings in business systems in Serbia, and then based on that knowledge to breed clear and precise guidelines for improving the organization of meetings.

Presented research is ongoing, and the findings will be presented in subsequent papers.

ROLE OF INTERNAL COMMUNICATION AT THE FACULTY – STUDENTS' PERSPECTIVE

Petrović Nikola

Faculty of Organizational Sciences, nikolapetrovic89@gmail.com

Summary: *Internal communication, if properly organized and developed, can become one of the greatest strengths of an organization. Without good internal relations, an organization cannot establish good external relations either. All this speaks in favor of the great importance of internal communication. Internal communication at faculties is quite an interesting topic which has rarely been researched in our country and, in practice, a pro rata amount of attention is paid to it. It is the internal communication at faculties that is the topic of research presented in this paper, with the Faculty of Organizational Sciences as an example. The results show students' preference for the major part of this communication to happen via the Internet. This can be a significant guideline in future endeavors to advance and perfect this type of communication.*

Key words: *internal communication, communication at a faculty, students, the Faculty of Organizational Sciences*

1. INTRODUCTION

Public relations are defined as a strategic process of communicating between an organization and its targeted public for the sake of creating relations of mutual satisfaction (PRSA, 2012). Internal relations with the public are among the core activities in public relations. The public is every group of people that has an interest for the business management of an organization (Kotler, 2006) but an organization will find the most attractive targeted public and make efforts to create relations with them (Filipović & Kostić-Stanković, 2008). The most common targeted public are buyers, the media, suppliers, investors but also the staff of the organization when we are speaking about internal public relations. Internal public relations are, thus, focused on internal public which implies the staff of the organization but also all those with whom the organization communicates regularly through work on daily basis (Brkić, 2002). Internal communication is a base of internal public relations. As a prerequisite of good internal communication there are well organized informational-communicational currents in the organization. Internal communication i.e. internal public relations are developed with the aim of creating interest of the internal public for the identity, image and reputation of an organization (Filipović & Kostić-Stanković, 2008).

Three forms of internal communication can be distinguished. Descending internal communication, ascending internal communication and the horizontal internal communication (Black, 1997). However, with the creation of the new forms of organizational structures and with the development of informational technologies and especially the Internet arises a need for a new form of communication which in itself sublimates the traits of all three aforementioned forms.

Following the definition that the internal public of an organization are not only its employees but also all those with whom the organization communicates through work on daily basis (Brkić, 2002) we can conclude that the internal public of a faculty are not only employees but certainly students as well. Not only does the faculty communicate with them constantly through every day business but it is also of great importance for them, apart from the employees, to embrace the values nurtured by the faculty and also the corporate structure. Communication between students and the faculty takes place in the classroom and outside of it and it is very important to manage both in a proper way. With the development of the informational-communicational technologies the potential of development of internal communication increases but also the number of channels that can be used. In this paper we will present a research on the topic of internal communication at the Faculty of Organizational Sciences, with the focus on communication between students and the faculty. Based on this research a clear image of ways of internal communicating at faculties in general can be created and the most common forms of communication can be defined.

2. THEORETICAL BACKGROUND

Internal communication

The term 'communication' comes from the Latin verb *communicare* which means 'to make something common' and the noun *communicatio* which might be translated as a 'community'. If we define an organization as a community of the individuals, created in order to achieve mutual goals (Jaško, 2008), it is clear why the effective communication within an organization is a prerequisite of its functioning. The communication within an organization is sometimes called internal communication and it serves to transmit the information within an organization and create a high degree of corporate culture (Filipović & Kostić-Stanković, 2008). This implies the relation mechanisms for making contact within an organization, as well as means and methods for transmitting the information in order to affect people and improve the execution of the work and tasks of the employees, responsible for the organization's goals (Kavran, 1991).

We have to have in mind that an organization is made of individuals who are often divided into smaller groups. In certain situations, these groups can become smaller organizations which are still based on groups, but also show characteristics that clearly make them a group. Those are having mutual goals, the distribution of work, the coordination and the control of activities. This is how smaller organizations within a wider organization are created (Mihailović, 2008). So, within an organization, we can detect smaller organizations created from the groups which again represent the basic form of the social association of the individuals. Thus, the clear conclusion is that the internal communication in these circumstances is made between these four segments: the wider organization, the smaller, internal organizations, the groups and the individuals.

There are seven factors that determine the internal communication: the organization's industry, the mission, the organizational structure and its size, the competitors, the organization's tradition, its image and its employees (Filipović & Kostić-Stanković, 2008).

Forms of internal communication

Three forms of internal communication can be distinguished: descending internal communication, ascending internal communication and the horizontal internal communication. Descending internal communication implies that the source of communication is found on higher organizational level and that the message is passed to the lower organizational levels. With the ascending communication it is reverse, communication starts at the lower organizational levels and it moves to the higher ones. The horizontal internal communication takes place between the employees on the same hierarchical level (Black, 1997).

Internal communication can be divided to formal which is determined by the hierarchical structure of the organization and informal which is based on personal relations. As the most common forms of the written formal and informal internal communication there are letters, notifications, newsletters, internal newspapers, e-mail and suggestion boxes. Formal communication, which does not imply the written communication, is manifested through direct communication, meetings, gatherings of staff members, training and various festivities (Filipović & Kostić-Stanković, 2008).

Internal communication at the faculty

If we observe the faculty as an organization whose meaning we already defined, then every kind of communication between the faculty and the internal public might be seen as internal communication. Since the internal communication is made between the internal public, which includes not only the employees but rather everyone who the employees communicate with during their work (Brkic, 2002), then, beside the employees, this term also includes the students.

The importance of communicating at the faculty is immense and much should be done in order for it to be as simple and pleasant as possible for all students, because the uncomfortability and the fear of communication with certain students can affect their academic success (McCroskey & Andersen, 2006).

Involving the so-called shy students in communication is one of the seven goals which The American Society for High Education set for itself, in order to improve the educational system (Chickering & Andersen, 2006).

The communication between the students and the faculty is made both inside and outside the classroom, and the researchers have only recently recognized the latter as an important one, as well. It is interesting that among the factors affecting the communication success outside the classroom, the students' perception on teachers' empathy and their gender proved to be the prominent ones (Nadler & Nadler, 2010). The research also accentuates the relation between the communication between the students and the faculty outside the classroom and students' motivation (Jaasma & Koper, 2009), which clearly confirms the importance of this kind of communication and the validity of its further improvement. During the development of the successful internal communication at the faculty, and especially the communication between the students and the faculty outside the classroom, informational and communicational technologies are very important, given that more and more students are using the internet. For example, 51,6 % of Serbian homes in Belgrade had internet connection in 2011, whereas 42,2 % of Serbian population in general has used the internet in the last three months, mostly people with high or higher education (Serbian Bureau of Statistics, 2011).

3. METHODOLOGY

The study was based on primary data collection using online questionnaire as a research tool. The study was carried among students of Faculty of organizational sciences, where the total population was nearly 2500. The sample size was 205 examinees. They were selected randomly to ensure indicative and representative results. The response rate was 96,6% (198 examinees correctly fulfilled all the answers). The sample consisted of 130 women and 75 men. There was an equal participation on the part of students of all years and departments from the faculty.

The pilot test with 14 persons was conducted in order to insure questions readability. Thus prepared the final questionnaire was used for data collection. Data was captured by trained assistants and was entered and analyzed in the SPSS version 17.0. Quantitative data were analyzed with demographic statistics: percentages, means and standard deviation. Qualitative data were analyzed with Pattern analysis.

4. RESULTS

Doing research on the internal communication at the Faculty of organizational sciences, with the primary focus on the communication between the students and the faculty has shown which forms of communication students choose most frequently, in order to get information on mandatory and extra reading.

Table 1: Descriptive of various forms of internal communication

Frequency	N	Mean	Std. Deviation
Frequency of use students' internet forum	199	4,1784	,87449
Frequency of engagement older students	201	3,5647	1,20241
Frequency of use social network	199	3,6106	1,26345
Frequency of use students' society site	201	3,2910	1,13076
Frequency of use official site of Faculty	199	2,7990	1,16007
Frequency of use courses web page	197	3,3934	,99042
Frequency of engagement professor	200	2,6225	1,11240
Frequency of engagement teaching assistant	198	3,0505	1,03736

Most frequently, students use students' internet forum (Fonforum.org- the forum for the students at the Faculty of the organizational sciences) for getting the information on mandatory and extra reading, and the average value on 1-5 scale here equals 4,18 (SD=0,87). At the second place, there are social networks

with the average grade of 3,61 (SD=1,26), and at the third place there is communication with the older fellow students about the mandatory and extra reading, with the average value of 3,56 (SD=1,2).

Since the students use primarily the internet for getting the information on mandatory and extra reading (i.e. informal and horizontal communication), it is interesting to see how often they communicate with their teachers and teaching assistants outside the term period and the lectures, and how satisfied they are with this sort of communication. The students answered to these questions on the 1-5 scale.

Table 2: Descriptive statistics on communication with teachers and teaching assistants

	N	Mean	Std. Deviation
Examinee tells how often they communicate with teachers	205	2,07	,826
Examinee assesses the communication with teachers	203	3,21	,882
Examinee tells how often they communicate with teaching assistants	203	2,97	1,005
Examinee assesses the communication with teaching assistants	199	3,81	,806

Students communicate with teaching assistants more frequently, and the average value here equals 2,97 (SD=1,005), more than with teachers where the average value equals 2,07 (SD=0,826). As for their satisfaction with this, they are more satisfied with the communication with teaching assistants, with the average value of 3,81 (SD=0,81) whereas the average value is 3,21 (SD=0,88) when it comes to teachers.

Using pattern analysis, the most frequent way of students communicating with teachers is determined. The three most frequent patterns are 16, 18 and 17. So, students most frequent use the following behavioral patterns: communicating with teachers via e-mail and during consultation hours (Pattern 16), using only e-mail (Pattern 18) and only during consultation hour (Pattern 17).

Graph 1: The analysis on the patterns of communicating with teachers and frequency of the patterns

The pattern analysis has shown that, when it comes to communicating with teaching assistants, the following three patterns are the most frequent: communication via e-mail and during consultation hours (Pattern 18), via e-mail (Pattern 20) and there is the communication pattern via social networks and e-mail (Pattern 16) at the third place, which is not the case when it comes to communication with the teachers.

Graph 3: Analysis of the patterns of communicating with teaching assistants and frequency of the patterns

5. CONCLUSION

Based on the presented results it is obvious that students show the greatest inclination towards communicating via the Internet. Two of the most common ways to get the information about the exam literature are the Internet forum of the students from the faculty and social networks. It can be stated that students incline toward informal and horizontal communication which also encompasses the third most common way of getting data about the literature and that is communicating with older colleagues.

When it comes to formal communication of students with teachers and assistants in two of the most common patterns of communication as a form of communication there is electronic mail while in communication with assistants there is, as the third most common pattern, communication through electronic mail and social networks which is data that emphasizes the students' inclination towards the Internet communication. If we would relate the students' preference to mostly communicate via the Internet to the fact that they rarely communicate with teachers and assistants then the solution for increasing the frequency of this kind of communication and for creating steady and open channels of communication should be sought in the possibilities offered by the communication via the Internet.

Communication between the students and the faculty occurs in the classroom and outside of it and researches point to a connection between communicating outside of classroom and students' motivation (Jaasma & Koper, 2009). As it was already said discomfort and fear of communicating with some students can influence their academic results making them worse (McCroskey & Andersen, 2006). All these are clear reasons for faculties to work on establishing and maintaining efficient internal communication that suits the students by which a good information awareness and an equal participation on the part of all participants can be achieved.

MANAGEMENT OF LOBBYING STRATEGY – STAP MODEL

Mitrović Miroslav¹, Štrbac Katarina²

¹Strategic Research Institute, mitrovic_m_m@yahoo.com

²Strategic Research Institute, kstrbac@yahoo.com

Abstract: Lobbying is a communication phenomenon which emphasises the possibility of an organisational entity to achieve influence on decisions makers. The purpose of this activity is to provide appropriate decisions that have great importance for an organisation. Multidimensional forms of lobbying activities have created a demand for designing the projection and implementation of an appropriate project management methodology. The analysis of the literature (research and book publications), as well as practical experience, identifies the main approach of research methodology, which includes comparison and modelling as the main methods, as well as the usage of specific methodology approaches: description, context analysis, analysis-synthesis and induction-deduction. The research shows that lobbying is a complex activity that should be managed. In the following section, we offer STAP modelling for the management of lobbying operational strategies. With this model, through separate phases, we have developed a strategy for the implementation of lobbying activities, based on stakeholders' analysis, regulations and ethical limits, communication strategies and the evaluation of the ratio between achieved goals and used resources. This model for lobbying operation management can be of practical value to all kinds of organisations (commercial, public, institutional), which ought to have influence on decision makers with the purpose of achieving organisational benefits.

Keywords: management, lobbying, interest representation, influence, decision makers, STAP model.

1. INTRODUCTION

Lobby is an English word for corridor, hall, and has got roots from Latin word „labium“. In modern sense of business and political understanding, this word is recognized as preface of decision making process in law, administrative, political and business institutions. Lobbying is a process which develops and implements a strategic planning communication project, influencing the decision-makers to enhance the interest of a particular organization. Thus, lobbying is a communication process of formal and informal exchange of information between organization/stakeholders and authorities to influence the final decision, relating typically to the law and regulation bodies, state institutions, policy-makers and all the other authorities which raise the importance of its stakeholders interests. In other words, lobbying is communication form which purpose is to achieve influence on the law and regulation bodies, state institutions, policy makers and all the other authorities which are important to our interests.

As Cassidy (1999) points out, “lobbying is a healthy and necessary part of an open democratic society” (p.8). Thus, we may consider with certainty, that lobbying is a legally-based, legitimized activity in all democratic societies, with a developed role and impact of law, as well as anticorruption and accountability-based regulation.

Questions are: what is lobbying, who is lobbying and how lobbying could be the most effective and measurable activity?

2. PRACTICAL LOBBYING

Lobbying is an activity which main course is to influence on public policy, procurement, social issues, business success (or failures), environment, health and other wide areas of ordinary, day-to-day issues. Question is: are we in a position to have influence on our lives through lobbying activities?

Professionals report analysis, media stories and scholarly papers provide us an orientation through the knowledge-based process of lobbying. Of course, collecting of analytic dates from NGOs and specific agencies could also ensure that lobbying exists in modern democratic society as legitimized and (hopefully) legally based activity.

Examples of lobbying could be found in wide area of stakeholders activities: public policy development, area for new investments, as well as conditions of substitution for investments, capacities building of product base, technology and health standards for safe environment, etc.

Certainly, we can divide lobby groups (professional or *ad hoc*) into economy and political lobbies. Economy lobbying is mostly involved in realization of same business arrangement, either by representing client as “desirable”, “socially responsible” or loyal to the same higher interest. (Alzola, 2006; McWilliams et al. 2002; Rehbein & Schuler, 2006; Windsor, 2006b). We can consider public procurements (Kambrod, 2007), land usage (Nownes, 2006), new technology demands, new market opening (Kennedy, 2008) as possible forms of economy lobbying. Through lobbying activities, a lobbyist would introduce the capacities of his client, as well as the expected effect and efforts which should be achieved by the client engaging with the decision-makers. Task for lobbyist is to represent client as effective, reliable, time and schedule responsible as well as profit orientated. Most effective and productive is, if lobbyist will succeed to connect lobbying project efforts with wide public, as well as with expert's group opinions. The purpose is to make synergy of corporate profit orientation with health environment and clean technology, which are mostly desirable public messages that decision-makers wish to be connected to.

Political lobbying couldn't be clearly divided, because, finally, all decisions have profit based orientation, especially if we consider lobbying in political institution (Griffin & Mahon, 2006), or in campaigns. However, policy built lobbying as a part of political activities could consider as different form of lobbying. Anastasiadis (2006) points out that “policy outcome refers not only to the outcome in a narrow sense, but to any outcome in the political environment. To use a military analogy, this component refers to both ‘individual battles’ and the ‘war’ as a whole; the difference in the case of lobbying being that the political process never ends.” (p.17) If we have in mind that we can consider lobbying, regarding Cassidy (1999), as the “process of information to officials and legislators so that measures are better thought out in the hope of reducing the effect of the political law of ‘unintended consequences’” (p.9).

We can analyse lobbying from various points. For example, lobbying can be either ‘proactive’ or ‘reactive’ in sense that proactive lobbying is practiced by authorities, policy makers (e.g. European Commission), and by many pressure groups that encourage them to produce a proposal. For example, the single market policy of European Union was the result of proactive lobbying by businesses. Also, the wide range of environmental directives is a result of lobbying by environmental pressure groups. Reactive lobbying is necessary when the European Commission produces a “green paper” or a discussion document, or holds a public hearing. This frequently anticipates a future directive. These kinds of activities provide opportunity for interest and pressure groups to respond with reactions, ideas and suggestions. The increased use of green papers and discussion documents by the Commission needs vigilance to make sure that comments are submitted in sufficient time for the officials concerned to take them into account, before moving to the next stage which may be a draft directive. Reactive lobbying increasingly arises as a result of widened powers of the European Parliament over legislation, whereby the Parliament and the Council (of Ministers) jointly decide on legislation in ‘co-decision’ (Cassidy 1999). Of course, multidimensional sphere of lobbying depends of various actors, stakeholders as well as interest subjects (Coen & Richardson 2009).

Policy building as part of politics includes procedures which are deeply technical, bureaucratic, structural, organizational and publicly exposed (e.g. Bomberg 2005). The public carefully listens and watches current topics that consider their daily life burden (working conditions, social issues, foreign policy, laws and justice, medical care, education quality, environment protection, etc.). Sometimes the interest group will find a way to connect with the public opinion and win the public support, and sometimes it won't be the case. However, one thing is certain – the interest group will try to make a connection between political campaign, economic interest and public/social importance (Baumgartner [et al.] 2009). Successful lobbyist will find a way to connect their (client's) interest with socially acceptable, media well-covered and publicly desirable goals.

Some kinds of action, for example the process of involving new law or regulation at the national or institutional level, necessarily leads to engaging experts and implementing a project management approach. From this point of view, economic aspect again rises on stage, because engaging the experts or consultants, means necessity of budgeting and available money existence. Consideration of social benefits within the community is necessarily connected with public support processing, meaning: effects and results that community provides benefits are shown. By this means, effective psychological profiled communication, pointed to build awareness, develops public support. This is a future-oriented, pre-emptive activity, such could be involved in a future project preparation and political support for re-election

and opening doors for political campaigns for a new nomination (Nownes, 2006). At that spot, we can notice circling connectivity between economy, politics and public.

Questions could be raised about methods and means of lobbying instruments use, legislative regulation, codes of conduct, and ethical and moral norms of communication. For avoiding these legal and moral dilemmas, probably the most useful thing to do is developing of communication strategy which is based on project management theory.

2. BASIC CHARACTERISTICS OF LOBBYING

Most significant characteristics of lobbying are:

- The existence of more than one decision maker in process;
- Permanent presence of public (oversight and interest);
- Market activities in the sense that information are exchanged as goods;
- Compromise achievement through negotiation;
- Creation of coalition, based on common values and shared interest;
- Existence of procedures and more levels of decision making, which points out the necessity for organizational management support (Anastasiadis, 2006).

Interest representation is a multidimensional approach to achieve interest, or impact that has been made. If we analyse subject of lobbying, we can notice that different interests are focused at same spot. From our position, as a lobbyist, we can consider two types of interests: business interest of our own (achieved business goal leads to profit, positioning itself as successful and reliable partner for future clients, as well as experience and references collection), and interest of client (commercial and corporative interests regarding state institutions and state bodies). Companies regarding state institutions are represented in the frame of “package offer”, solutions for core systematic problems, improvement of efficiency and through projects of wider public interest (environment, social and health care, education etc.). State institutions represent themselves on behalf of corporative subjects through development and involvement of standards, promoting presenting and support of implementation of outside stakeholders programs and projects (EU, US AID, GTZ, and other projects in area of development and supporting of civil society, non-profitable organization and other NGO actions). Area of activities covers strategic society layers: energy, agriculture, entrepreneurship, public administration, health etc.

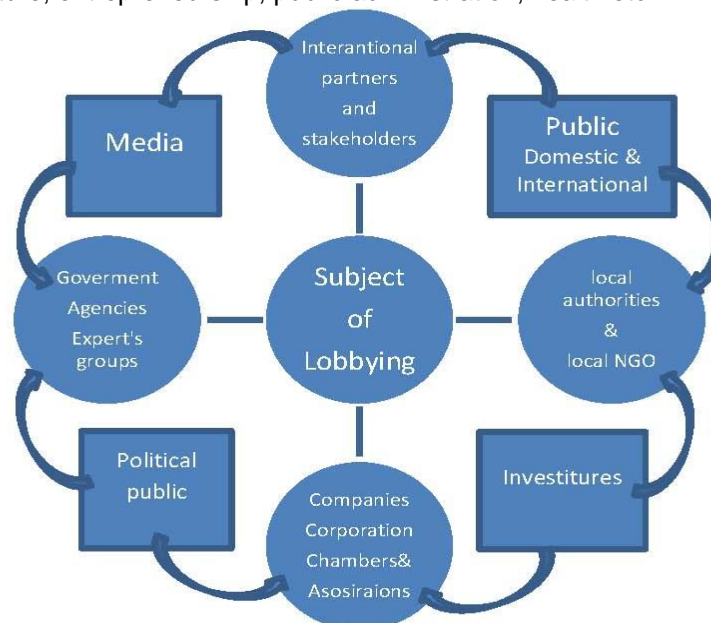

Figure 1: General overlay of multilateral characteristics of communications in processes of lobbying activities from lobbying subject perspective.

3. APPROACHING TO CREATING OF LOBBYING STRATEGY

The organizational approach of lobbying activities considers development of strategy which should tend to establish a balance between objective (level of achievement), costs (planned, not planned and hidden) and efficiency. A well-developed strategy is characterised by: continuity of action, putting resources in purpose of goals, understanding and forecasting political trends, taking the initiative and respecting time and schedule.

Regarding the goals, most efficient method is to define chain of more than few easy achievable goals. In this way, we can estimate successes in each phase of our project's implementation, as well building coalitions, self-awareness, and implementing eventual corrections. This means that intermediate goals should be: (1) designed within the wider context of possible future policy and market trends, (2) based on long-term goals, (3) sequentially relevant to bigger political or market goals, (4) reliable and with effective dynamics in their implementation.

Hidden goals could also be achieved as secondary results. They represent better image (of client) in public as "socially responsible" subject, network development (of client and us), and credibility building (mostly for us).

According to Bouwen (2002, 2004), information is one of the core elements and most valuable commodity in lobbying, providing "Access Goods". As exchange of information takes place through communication, further so lobbying is not possible without effective communication. Thus, lobbying is a communication process within a specific environment through which information has been exchanged with the specific aim of influencing the decision-maker.

However, without credibility and reputation, lobbying communication is like an empty shell. Hillman and Hitt (1999) point out that "the most important determinant of success in advocacy and public relations advertising was the credibility or reputation of the source" (p. 833). Moreover, this is un-avoiding substance in our efforts to be presumed as serious and reliable partner for talk's. Additionally, we concluded that reputation, or, in other words, credibility has direct influence on effects and results of lobbying (Hillman & Hitt 1999).

Following previous conclusions, information, communication and reputation are in core of lobbying process. Also, based on fact that Access Goods use communication canals to reach consumers "stakeholders", we can easily identify lobbying as Information Strategy (Hillman & Hitt's 1999). If we consider that the key elements of lobbying are information, intervention and argument (Hillman, 2003), only Implementation of Strategy means practical implementation of (above) stated elements.

Considering that Anastasiadis (2006) pointed out that "the nature of the information communicated in lobbying is surely a key to an organization's impact on society" (p. 32). Therefore, we should carefully consider the approach of targeting stakeholders as well as the wider public/society. Regarding Information, it is very important to be in possession of yet non-publicized information. Also, information should be based on expert's knowledge, to be reliable and future-oriented. If this information succeeds in fulfilling the needs of the stakeholder, the lobbyist would be considered as desirable partner, and doors to the stakeholder would open relatively easily. Intervention needs careful preparation based on analyses of power based connection and valuable orientation regarding subjects of lobbying. Intervention is based on communication strategy development and to practically implementation of chosen PR instruments.

Argumentation is part of communication contents with purpose to:

- build confidence,
- provide information,
- win hearts and minds,
- to convince.

Useful principles of success argumentation are: credibility positivism, use of exact facts and numbers, adapted decision, and innovative approach.

4. STAP model of managing of lobbying project

As key elements of lobbying are information, credibility, appropriate communication, ethics and legally-based relations, thus development of a model for implement offering a project management-based, sustainable and foreseeable lobbying process are considered in following section. Designing of STAP model has root from circling process model that has been illustrated in Figure 2.

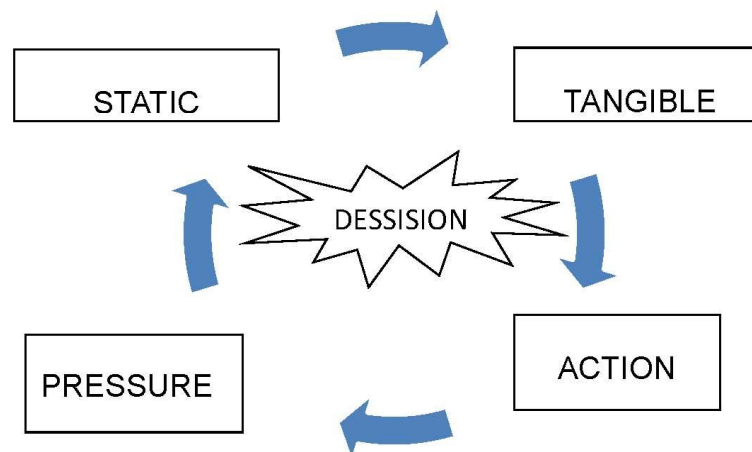

Figure 2:

The core structure consists of four main action phases: Static, Tangible, Action, and Pressure.

Static - the phase of the lobbying process phase, whose purpose is to analyze all so-called “given” parameters of all relevant political, business, cultural and marketing aspects of the environment in which our organization intends to have influence. At the very beginning of development of lobbying strategy, several important things should be borne in mind: laws, state and institutional strategies, organizational procedures, customs, ethics, tradition, cultural environment, good and bad practice, trends. All those external parameters should be analyzed thought our aims (organizational, strategic, business, etc.). Tendency is to build analytical approach for defining our goals and may to achieve them through the lobbying strategy.

Purpose of this phase is to connect all important stakeholders, having on mind stakeholder theory approach (Buchholz & Rosenthal, 2004; Driscoll & Starik, 2004; Freeman, 1994; Hendry, 2003; Mahon, 2002), and project environment with goals of our lobbying project. Most effective approach is to make detailed analyses of all stakeholders, and to try clarifying the interconnections, correlations and possible future trend in area that represent our interest arena. Key is to connect concert goal of our organization with important facts which have influence on our organizational success and to create connection between (our) organizational goals and goals of (our) lobbying campaign. This will be very important in evaluating phase, otherwise we can conclude (sadly, at the end of the process) that our strategy was wrongly directed, and that we wasted the resources (money and time). Final product of STATIC phase should clarify: stakeholders (number, influence strength, organizational form, etc.), goals (of lobbying campaign), social environment (laws, bureaucracy structure, procedures of communication, costumes, ethics, and cultural habits), and foreseeable future (policies, trends, strategies, analyses conclusions and forecast of future needs).

Tangible - tare that follows recognized and systematized stakeholders and their inter-relations. Putting all the stakeholders and static parameters in actual relational form, having dynamics and shape, putting “life” into the process and making all static variables tangible and alive, giving them a shape and interaction. Interaction is shown by the intensity, polarity and publicity dimensions. Intensity shows how strong relation is regarding our subject from the stake holder’s point of view. Polarity implies a positive or negative stakeholder’s altitude towards ours interest. Public exposures of lobbying processes declare how lobbying activities could be noticed by non-actors. Placing all these impact factors (intensity, polarity and publicity) in the same three-dimensional coordination system, we can design a “Power Map” (PM). This is a basic point for developing the communication strategy. The conclusions are reached by analyzing correlations, impacts, value orientations, as well as previous experience of public expressions on our target issues and are used to create an appropriate communication strategy. Bearing in mind that the final goal is to inform, influence, and to build alliances, the communication methods have to be considered carefully to avoid misunderstandings.

Action - up to this point of our process environment we have stakeholders, correlations among them, positions regarding subject of lobbying, cultural, law and policy environment, coalition potential and visibility level for non-actors. In the next phase we develop, design, and impellent communication strategy. As Anastasiadis (2006) pointed out “Communication is patiently essential in conveying information on preferences or positions. Lobbying simply cannot happen without it. Communication would thus appear to

be the process, or action, by which lobbying happens” (p.13). This phase is active based and means usage of communication instruments with purpose to inform, expose, negotiate, promote and marketing tools. Andrews (1996), arguing about connections of political lobbying and marketing notices that “Lobbying is ‘Machiavellian marketing... political lobbyists routinely utilize marketing concepts and techniques in pressing their case” (p.76). Also, for the same point of view (e.g. in Schendelen 2010) arguing, we can consider all lobbying activities as “Machiavellian” activity.

Depending on situation, stakeholder’s position and attitude regarding lobbying subject, we will choose some of communication instruments: one-to-one meeting, public hearing, public promotion, media covering story, publishing experts articles, using public debates, organized (or just take a part on) special events and all other wide range of PR tools to express our lobbying subject. In this phase, very important is the use of evaluating tools, to measure impact of our message in “heart and mind” of targeted audience, since expectable stakeholders reaction and changing or powering altitude. Feedback data can provide us evidence of any change in position on the PM, and can help in rationalizing our use of resources (time, money, organization capacities, etc.). If we notice some changes, it is useful for redirecting the message and influence beam, encouraging alliance and coalition efforts in same time.

Pressure - considers activities recognized in most lobbying projects as “grey” zone of communication. However, we have on mind pressure as influence and argumentation based activity, which purpose is to create pressure which result will be new quality “tectonic” plates, based on interest. Pressure doesn’t usage of personal disability, or social characteristic as instruments of trying to minimize the influence of same stakeholders. Also, it doesn’t consider corruption or use of some non-legal money contribution (for political campaigns), or expensive gifts (or paid holidays, for example). On the other hand, pressure is using of all legal and ethically approved communication tools to support stakeholders’ awareness about our lobbying subject. It means networking engagement, legal contributions, promoted social respond activities, building personal dignity based on ethical norms, following good practice and connections.

6. CONCLUSION

Lobbying is a complex activity built on interest-based communication. Considering results, we can analyze the “market” impact of our interest in terms of decisions made by stakeholders. Regarding the value of Information as Accesses Goods, we try, by using communication channels, formal and informal social groups, and PR instruments to inform decision makers about fact that it is useful for them either, to support and implement or suggest for future policy, laws, standards, etc. To make open doors, we have to be quality oriented and deterrent to constant development of reputation and personal ability. Complexity of Lobbying process involved necessity of project management based approach in designing and implementation of lobbying operation. STAP model in details allowed projecting of quality based programming of lobby process and including the use of various tools in each phase of the project. Depending on the sort of lobbying demands, and on the type of lobbying (economic, policy built, political, etc.) the relevant strategy, implementation tactics and tools should be developed. Development and practical putting into practice of STAP methodology will gradually improve the effectiveness of our lobbying efforts, in meaning of resources, time and money allocation.

Abstract: *This paper analyzes the influence of mobile operator competition on the prices of fixed-to-mobile calls. A model with multiple mobile operators and a single fixed operator is used. Mobile operators' market shares are similar. A situation where the mobile operators are not close substitute and their market shares are effectively fixed is considered. The results achieved in this research show that unregulated mobile termination charges will cause higher prices than monopoly call prices. The regulation of termination charges and prices may lower these rates. Direct mobile charging for termination can also lower the total fixed-to-mobile call price. It has been shown that profits of the fixed operator and each mobile operator decrease with an increase in interconnection costs under direct mobile charging. Also, with an increase in the number of mobile operators on the telecommunication market, the total price of fixed-to-mobile call increases.*

Keywords: *interconnection, mobile operator competition, termination charges, interconnection fees, price regulation*

1. INTRODUCTION

A terminating service involves the carriage of a call from a point of interconnection between two operators to the consumer who receives the call. The terminating operator directly bears connection costs from the point of interconnection to the receiving consumer while the originating operator bears the costs from the caller to the point of interconnection. Under the standard calling party pays principle of charging, however, the caller is charged for both the originating and terminating services. The originating operator collects the call charge and that operator and the terminating operator must, in turn, transact for the terminating service. In the absence of regulation, interconnection charges may be used by an incumbent operator either to prevent rival operators from becoming effective competitors (Armstrong, 1998), or to facilitate collusive outcomes under competition (Laffont, Rey & Tirole, 1998a, 1998b), (Armstrong, 1998), (Carter & Wright, 1999). Both possibilities suggest a role for the regulation of termination charges. Regulators, however, face a number of tensions when determining rules and charges for termination. If only the dominant operator's termination charges are regulated, entrant operators may have a competitive advantage and competition may be artificially biased in favour of new entrants. At the same time, if regulators limit the termination charges of non-dominant operators, this can affect an important source of revenue, thereby, making entry less attractive for new operators. With fixed-to-mobile pricing, the termination charges that are set independently by competing mobile operators influence the prices set by a noncompeting operator-the fixed operator. As termination charges influence the value to a mobile operator of attracting a customer, they play an important role in mobile competition. The competitive effects of mobile termination charges are influenced by *customer ignorance*. By convention, in many countries (an exception is the US for calls to mobiles) the caller pays for making a call. However, fixed-line customers often cannot identify the specific mobile operator that they are calling. They might wish to call a certain person or class of people who have mobile phone numbers, but they will often not be able to determine which mobile operator is associated with each person or number. Even if fixed line operators take differentials in mobile termination charges into account when setting fixed-to-mobile prices, the inability of fixed-line customers to identify mobile operators and, consequently, any price differentials in calls to them, means that fixed line customers are likely to base their fixed-to-mobile calling patterns on average prices. Alternatively, the fixed line operator will set its price for fixed-to-mobile calls on the basis of average termination charges. These averages depend on the observed market shares of mobile operators. As a result, an increase in one mobile operator's termination charges raises the average price of fixed-to-mobile calls and lowers demand for all of these calls. There is a horizontal externality imposed on the termination revenues of other mobile operators as well as a vertical externality imposed on the fixed line operators. Both of these externalities are potential sources of inefficient pricing. High mobile

termination charges will adversely affect fixed-line operator's profits. This may increase the incentive for vertical integration. By integrating with a mobile operator, the fixed-line operator can potentially internalise the vertical externality. High mobile termination charges will also raise regulatory concerns (Gans & King, 2000).

This paper is structured as follows. Section 2 describes the effects of changing termination charges. Section 3 presents the model, which is then analysed in the case of direct termination charging, in the case of operator identification and in the case where both direct termination charging and operator identification are used. Direct setting of termination charges, intervention for only a dominant operator and regulation by setting fixed-to-mobile price are also observed. Results obtained using the model are analyzed in Section 4. In the final part of the paper concluding remarks are given.

2. FIXED-TO-MOBILE TERMINATION AND CALL CHARGES

When mobile operators change their termination charges there are two types of effects. First, a higher termination charge will increase the fixed-to-mobile price and decrease the demand for fixed-to-mobile calls. This will generally change the profits from terminating fixed-to-mobile calls to each mobile customer. Second, any increase in termination profit per subscriber will make mobile customers more valuable, causing mobile operators to compete more aggressively to capture such customers. When the fixed-line operator can set differential fixed-to-mobile prices depending on which mobile operator calls terminate on, competition will lead mobile operators to set termination charges at the same level as would be set by a single monopoly mobile operator. A competing mobile operator, that can determine its termination profit per subscriber by changing its termination charge, will face an additional incentive. As termination profit per subscriber increases, it will increase the marginal profitability of attracting subscribers. This will make it compete more aggressively. Regardless of whether rival operators also compete more aggressively (operators compete in prices) or if this softens rival's reactions (operators compete in quantities), operators will generally benefit from increasing their own marginal profitability. Thus, each mobile operator will maximize its own marginal profitability by maximizing its termination profit per subscriber. The result is termination charges set at the monopoly level. When the fixed-line operator sets a uniform fixed-to-mobile price, competition will lead mobile operators to set even higher termination charges (Wright, 2002).

Unregulated mobile termination charges can result in fixed-to-mobile call prices above those that would arise under monopoly conditions. This outcome is a combination of consumer ignorance and horizontal and vertical separation. If the operators were not vertically integrated, with the mobile operator setting its termination charge independently then, when it can only set a uniform termination charge, it is likely to set that charge above its actual marginal termination cost. Otherwise it would not make a profit. The end result is double marginalization. The mobile operator will tend to raise the price of termination above marginal cost so as to increase its own profits. But this raises the cost of mobile call termination as seen by the fixed operator. To the extent that the fixed operator has any market power, it will tend to set its fixed to mobile call prices by marking up this price over cost. However, the cost observed by this fixed operator is not the true marginal cost of termination, but the higher termination price set by the mobile operator. As a result, termination charges tend to be marked up over cost twice – once by the mobile operator and once by the fixed operator. As the mobile operator raises the fixed operator's marginal cost of fixed to mobile calls, the price of those calls is higher. This result in lower consumption, reduced consumer surplus and also lower profits for both operators than would arise under vertical integration.

Horizontal separation of mobile operators combined with customer ignorance serves to exacerbate the double marginalisation effect; causing fixed to mobile prices to increase further. First, when consumers on the fixed operator cannot easily determine the precise price of the mobile operator they are calling, the fixed operator can do no better than set the same fixed to mobile call charge regardless of the operator being called. This price will be set on the average termination charges. Consequently, an increase in one mobile operator's termination charge will raise this average and raises fixed to mobile prices in general, rather than simply raising the price to the operator with the inflated termination charge. Put simply, the mobile operator that raises its termination charge gets all the benefit of that price increase (in terms of greater revenue from each fixed-to-mobile call it receives) but shares the economic cost of that price rise, as it only suffers a proportion of the fall in fixed-to-mobile calls. Thus, an increase in one operator's termination charge has a negative external effect on the termination profits that other mobile operators receive.

This effect is strengthened further when mobile operators recognize the influence of termination profits on their own competitive interactions. When competing against each other, mobile operators will recognize that attracting a customer not only gives them revenues from the calls made by that customer but also termination revenues from calls made to that customer. A mobile operator with a higher termination charge will, therefore, receive more profits from a given customer without any reduction in calls to that

customer; the calls to that customer are not influenced by the operator they subscribe to because the caller cannot identify this operator. So by having a higher termination charge, a mobile operator effectively receives greater benefits from attracting a given customer and hence, can afford to offer more attractive subscription terms to that customer. What this means is that in competing for a customer, an operator is going to be able to afford to offer better terms to a customer if its per customer termination profits exceed that of other operators. Because of customer ignorance, by increasing their own termination charge, a mobile operator will improve its competitive position to the detriment of other mobile operators. Competition will, therefore, drive termination charges upward. That is, termination charges may, in equilibrium, be so high that the fixed operator is unable to profitably offer a fixed to mobile service.

One response to this may be for the fixed operator to utilize its monopoly position to favor one mobile operator relative to another. Other non-favored operators may be required to pay higher termination charges for mobile-to-fixed calls made from their operators to the fixed operator. This would leave the non-favoured operators in a weakened competitive position and hence, price competition among the mobile operators would be weakened. This, in turn, would enable the favoured mobile operator to seize a greater market share and (as it then supplies a larger fraction of the fixed-to-mobile calls) would lead that favoured operator to reduce its mobile termination charges. In effect, a fixed and mobile operator would be getting together in a form of “quasi-integration” to eliminate the negative externalities associated with customer ignorance and vertical separation. This, of course, would have a detrimental effect on the degree of mobile operator competition and would potentially eliminate non-favoured mobile operators.

In the absence of any favouritism, vertical integration does not significantly improve the problem of market power and mobile termination charging. Integration will tend to reduce the average termination charge, as the integrated operator sets its implicit termination charge equal to marginal cost. But this will cause the non-integrated mobile operators to raise their termination charges. The end result is that the integrated operator will receive a lower level of profits than if it was vertically separated and integration without favouritism will not be advantageous. Only when integration leads to the ability to favour a single mobile operator and soften price competition will such integration be profitable. This will reduce fixed to mobile prices but at the expense of a softening of price competition in the mobile market and the conferral of market power on the integrated operator.

There are two drivers for regulation of termination charges for fixed-to-mobile calls: unregulated termination charges are set too high resulting in a loss of both consumer and producer surplus, the fixed line operator may utilize discriminatory call prices to exclude some mobile operators (Gans & King, 2003).

3. REGULATORY RESPONSE FOR FIXED-TO-MOBILE TERMINATION

Consider a model with n independent mobile operators and a single fixed operator. Mobile phone customers are exogenously distributed between mobile operators where s_i is the market share of mobile operator i . The marginal cost of terminating a call on a mobile operator is given by c_T^M while the marginal cost of originating a call on the fixed operator is c_O^F . The marginal cost of trunk services is given by c_1 so that the total marginal cost of a fixed-to-mobile call is given by

$$c_{FM} = c_O^F + c_1 + c_T^M \quad (1)$$

Let P_i be the price of a call from the fixed operator to mobile operator i . This price is either a price per call or a price per minute of the call. The fixed operator sets this price. The average price determines demand and is given by

$$P = \sum_i s_i P_i \quad (2)$$

The demand for fixed-to-mobile calls is given by $Q(P)$. It is often convenient to assume that this demand is linear so that

$$Q = \frac{1}{2b}(a - P) \quad (3)$$

The linear demand assumption allows us to explicitly calculate prices and charges and to compare these charges over different regimes. The fixed operator will set the price of fixed-to-mobile calls taking into account both the demand for such calls and the cost of those calls. If the fixed and mobile operators are owned by separate firms, then the marginal termination cost that will enter the fixed operator's pricing policy is not the true marginal cost of termination, c_T^M but rather the marginal termination charge set by the relevant mobile operator. The marginal termination charge is set by mobile operator i by T_i per call.

A useful benchmark price for this analysis is the uniform monopoly price for fixed-to-mobile calls. This is the profit maximising price that would be set by a single operator that owned both the fixed operator and

the only mobile operator. This price is $P^m = \frac{1}{2}(a + c_{FM})$ and the associated monopoly quantity is $Q = \frac{1}{4b}(a - c_{FM})$. Monopoly profits from the sale of fixed-to-mobile call services in this situation is denoted by

$$\Pi^m = \frac{1}{8b}(a - c_{FM})^2 \quad (4)$$

3.1. Direct mobile charging

The key problem of mobile termination is related to the clarity of information available to customers, the tendency to average prices over mobile operators and the tendency for double marginalisation. The most direct means of controlling anti-competitive pricing of termination services would be regulating those prices. There is clearly a range of regulatory rules that could be introduced by the authorities. A minimal regulatory rule could involve the mobile operators directly charging calling party for call termination. The fixed operator would only charge a customer the origination and trunk fee for a fixed-to-mobile call while the mobile operator would charge the customer the termination charge. To make such a rule feasible, the actual billing would have to be done by the fixed operator, possibly in return for a regulated billing fee (Gans & King, 2003).

Direct mobile charging does not alter customer ignorance. Customers still do not know which mobile operator is associated with a specific number until after they have been billed. But it does alter the strategic interaction between the fixed and the mobile operators. Direct charging also introduces regulatory clarity. Any manipulation of prices is clear and transparent.

Suppose that the fixed operator sets a price for origination and trunk carriage of O . The total price for a call from the fixed operator to the mobile operator is $P_i = O + T_i$. Under customer ignorance, with the shares of each mobile company given by s_i , the expected price that the customer pays for a fixed to mobile call is

$$P = O + \sum_i s_i T_i \quad (5)$$

First, if there is a single mobile operator, $O = \frac{1}{3}(a - c_T^M + 2c_O^F + 2c_1)$ and $T = \frac{1}{3}(a - c_O^F - c_1 + 2c_T^M)$. The total price of a fixed to mobile call is given by

$$P = \frac{1}{3}(2a + c_{FM}) \quad (6)$$

This price is below the standard double marginalisation price, as direct mobile charging has reduced the effect of vertical separation. At the same time, direct mobile charging introduces a new element of horizontal separation. The fixed and mobile components of the call are now complementary inputs from the consumer's perspective, but are provided by different operators. Thus, direct mobile charging still leads to a price above the integrated monopoly price.

Second, suppose that there are two mobile operators with potentially different market shares. In this situation, $O = \frac{1}{4}(a - c_T^M + 3c_O^F + 3c_1)$ and $T_i = \frac{1}{4s_i}[a - c_O^F - c_1 + c_T^M(3s_i - s_j)]$. The expected total price is

$$P = \frac{1}{4}(3a + c_{FM}) \quad (7)$$

The total price of a fixed to mobile call is independent of the actual shares of the mobile operators with linear demand. But the price is lower with direct mobile charging than with standard vertical separation. The specific termination charges set by each operator will depend on their market shares and, as in the case without regulation, these termination charges tend to rise for an operator as its market share falls.

Third, consider n symmetric mobile operators. The total price is

$$P = \frac{1}{n+2}[(n+1)a + c_{FM}] \quad (8)$$

The price of fixed to mobile calls rises as the number of mobile operators increases even with direct charging.

Overall, direct mobile charging, even in the presence of customer ignorance, tends to result in lower fixed to mobile prices than no regulation. But at the same time, it still leads to prices above the integrated monopoly level, and the price tends to rise as the number of mobile operators increases (Gans & King, 2000).

3.2. Operator identification

An alternative regulatory approach would involve operator identification. At a minimum, this would involve advertising which operators were associated with which numbers to reduce customer ignorance. Even so, this would only be a short-term solution. Operator identification could involve a customer being informed of the identity of the mobile operator that they are calling after they dial the number but before billing commenced.

If operator identification perfectly removes customer ignorance then each mobile operator is independent and there is no horizontal spillover between operators. If there is no call substitution then the fixed operator and each mobile operator are, in effect, a separate vertical pair. As a result, the behavior of the fixed operator and each mobile operator will be identical to a single mobile operator. In other words, for each mobile operator,

$$T = \frac{1}{2}(a - c_O^F - c_1 + c_T^M), P = \frac{1}{4}(3a + c_{FM}) > P^m, \quad (9)$$

Operator identification completely removes the effect of horizontal separation but it has no effect on vertical separation. Suppose that there is perfect substitution between calls to different mobile operators. The customer does not care which firm or person they call and will simply choose the firm or person associated with the cheapest fixed-to-mobile price. This leads to perfect competition between the mobile operators, and termination charges will be set at marginal cost. The fixed operator, however, retains all of their monopoly power and can set the price of fixed-to-mobile calls equal to the monopoly price.

3.3. Operator identification and direct mobile charging

If these regulatory options are both implemented, then the result for the fixed operator and each individual operator will be like the situation of direct mobile charging with only one mobile operator. In other words, for each mobile operator,

$$O = \frac{1}{3}(a - c_T^M + 2c_O^F + 2c_1), T = \quad (10)$$

The total price of a fixed to mobile call is given by

$$P = \frac{1}{3}(2a + c_{FM}) \quad (11)$$

This price is below the price established with just operator identification, but remains above the integrated monopoly price. As substitution between mobile operators increases, termination charges under direct mobile charging will decrease until, with perfect substitution, the charges equal marginal cost. The fixed operator retains its monopoly power so that the origination charge will be set at the monopoly level $O = P^m - c_T^M$.

3.4. Direct setting of termination charges

Suppose the regulator establishes a termination charge τ that must be set by all mobile operators. The fixed operator will then take this regulated charge as given and set the price of fixed to mobile calls to maximise profits. As the termination charges are now simply a cost to the fixed operator, and all strategic interaction is removed, the profit maximizing price of fixed to mobile calls will be

$$P = \frac{1}{2}(a + c_O^F + c_1 + \tau) \quad (12)$$

If this is compared with the integrated monopoly then $P - P^m = \frac{1}{2}(\tau - c_T^M)$. If the regulator sets the marginal termination charge equal to the marginal cost of termination, then the price will equal the integrated monopoly price.

If the regulator sets a termination charge above marginal cost then the fixed-to-mobile price rises, while if the regulator sets a termination charge below the marginal termination cost, then the fixed-to-mobile price falls below the monopoly price. The socially optimal price for fixed-to-mobile calls is given by the marginal cost of these calls, c_{FM} . The regulator would have to set the termination charge at $\tau^* = c_O^F + c_1 + 2c_T^M - a$, before profit maximization by the fixed operator was aligned with the social optimum.

For any higher termination charge, $t > \tau^*$, social welfare will be decreasing as the termination charge rises. In particular, note that it is not optimal for the regulator to set the termination charge equal to the marginal cost of termination. This only leads to integrated monopoly pricing and monopoly profits for the

fixed operator. Rather, to raise social welfare the regulator needs to set the termination charge below marginal cost. This creates a problem for the regulator and the mobile operators will make a loss on terminating calls.

One alternative for the regulator is to set termination charges at zero. Such termination charges will help offset the monopoly pricing by the fixed operator. If a is large relative to c_{FM} , then a zero termination charge can still exceed τ^* . But if a is relatively close to c_{FM} or c_T^M is relatively large, then zero termination charges may be below the socially optimal level. Zero termination charges have the advantage that they are easy to implement. The regulator simply does not allow mobile operators to charge for termination. At the same time, zero termination fees will result in the mobile operators making a loss from terminating fixed-to-mobile calls.

3.5. Intervention for only a dominant operator

If only a dominant operator's termination charges are regulated then call prices may be reduced, but that this reduction will be mitigated by an increase in the (unregulated) termination charges of other operators. Suppose that the termination charge of one operator, with the largest market share, is regulated while other termination charges remain unregulated. Then, all other things being equal, the regulated operator faces higher costs than the unregulated one. This is because the termination charges the regulated operator pays to other unregulated operators will tend to be higher than the charges the unregulated operators pay to both the regulated operator and to each other. With fixed market shares, lowering one operator's termination charges will flow through into the prices charged by other operators and average prices fall. But, at the same time, non-dominant operators have an incentive to partially undermine this flow through and seize some of the benefits for themselves by raising their termination charges. With uniform prices, reducing a dominant operator's termination prices tends to lower non-dominant firms' prices, as noted above, and this leads to a competitive response from the dominant operator. But this is partially offset by the reduction in the dominant operator's termination revenues. Operators use these revenues to compete more vigorously for subscribers, and reducing these for one operator reduces that operator's competitive position. Between two non-dominant operators, a regulated termination charge can increase competition and lead to lower prices because termination charges are set too high. Regulating non-dominant operator's termination charges will reduce their profits but only to the extent that they were earning monopoly rents. When the non-dominant operator has a sizeable market share, regulating its termination charge will put upward pressure on its call price but it will put downward pressure on the dominant operator's call prices. This may lower prices on average. In contrast, when the non-dominant operator is relatively small, the dominant operator may actually raise its call price in response to the higher price by the non-dominant operator (Gans & King, 2001).

An alternative to direct price setting for all mobile operator termination charges would be to just set the termination charge for a dominant operator. Suppose that there are n mobile operators, and they have asymmetric market shares. Let $s_j > s_i$ for all firms $i \neq j$ so that operator j is the dominant operator. The regulator directly sets operator j 's termination charge for fixed-to-mobile calls at τ . All other operators then simultaneously set their termination charges. Given these termination charges, the fixed operator sets the price for fixed-to-mobile calls. To simplify, assume that all non-dominant (and non-regulated) mobile operators are symmetric with market shares $s_i = \frac{1}{n-1}(1 - s_j)$. Then, for each non-regulated mobile operator,

$$T_i = (n-1) / n(1-s_j)(a - c_o^F - c_1 - s_j \tau + (1-s_j) / (n-1)c_T^M), \quad (13)$$

$$P = \frac{1}{2n} \left[(2n-1)a + c_o^F + c_1 - s_j \tau + (1-s_j)c_T^M \right] \quad (14)$$

$P > P^m$ even if $\tau = c_T^M$ so long as $n \geq 2$. Even if the regulator requires the dominant operator to set its termination price at marginal cost, the resultant fixed-to-mobile price will always exceed the integrated monopoly price whenever there is at least one other mobile operator. Regulation of one mobile operator leads to lower fixed-to-mobile prices than no regulation so long as the regulated price does not exceed the marginal termination cost by too much. The effect of dominant operator regulation in reducing the equilibrium fixed to mobile price is small compared to the effect of additional mobile operators in raising this price.

3.6. Regulation by setting the fixed-to-mobile price

An alternative solution to the problem of fixed-to-mobile charges might be the direct regulatory setting of the fixed-to-mobile call price. Setting the end price for fixed-to mobile calls avoids some of the problems with regulating mobile termination charges directly. In particular, it avoids issues of regulating operators that only have a relatively small market share. Once the final price is established, termination charges would then simply be a device used by the operators to divide any profit that exists under the regulation. While the setting of these charges could lead to considerable dispute, such a dispute is more about sharing profits than about raising prices to the detriment of final customers (Gans & King, 2000).

4. ANALYSIS OF THE RESULTS

Telecommunication market with n mobile operators and a single fixed operator is considered. Figure 1 presents profits of the fixed operator depending on interconnection costs by customer category and periods of traffic loads. It may be noted that profits of the fixed operator decrease with increasing of the interconnection costs, which is the most prominent for residential customers in the period of high traffic load. Business customers are less sensitive to changes of interconnection charges, especially in the period of low traffic load.

Figure 4: Profits of the fixed operator by customer category and traffic load

Profits of each mobile operator also decrease with increasing of the interconnection costs. That effect is also the most prominent for residential customers in the period of high traffic load, as shown on Figure 2.

Figure 5: Profits of each mobile operator by customer category and traffic load

Figure 3 presents the total prices of fixed-to-mobile calls for business customers depending on interconnection costs for the period of intensive traffic flow. It may be seen that changes of interconnection costs have slight effects on the total price of fixed-to-mobile call. With the increasing of number of mobile operators in the telecommunication market, the total price of fixed-to-mobile call increases.

Figure 6: Prices of fixed-to-mobile calls for business customers in the period of high traffic load

Figure 4 presents the total prices of fixed-to-mobile calls for residential customers depending on interconnection costs for the period of intensive traffic flow. Like in the case of business customers, changes of interconnection costs have slight effects on the total price of fixed-to-mobile call and the price also tends to rise as the number of mobile operators increase.

Figure 7: Prices of fixed-to-mobile calls for residential customers in the period of high traffic load

6. CONCLUSION

Direct mobile charging can lower prices of the fixed-to-mobile calls, but still remains above the integrated monopoly price. With increasing of the interconnection costs, profits of the fixed and each mobile operator are decreasing. The total price of the fixed to mobile call is independent of the actual shares of the mobile operators with linear demand and rises as the number of mobile operators increases. The most sensitive customers are residential customers, especially in the period of high traffic load. Also, the total price of the fixed-to-mobile call is nearly independent of the changes of interconnection costs for both business and residential customers.

Abstract: *Following an increased interest in the concept of the integrated supply chain management and its application, the related management issues are becoming clearer and more visible. One of them is about the issue of social responsibility, which emerges along with the economic benefits stemming from the supply chain integration. Many organizations exerting the strongest impact within their supply chain deal with this by creating rules of behavior that they impose on the other supply chain participants, which may be regarded as an approach to the management of the entire chain. Within the scope of the above-said lie the foundations of some key topics of this paper - i.e. what are the limits of responsibility of a particular organization regarding the behavior of other members of its supply chain, what are the directions of the dissemination of socially (ir)responsible behavior, as well as within which scope it is possible and useful to exert this impact and what are the obligations that emerge from this.*

Keywords: *social responsibility, supply chain, stakeholders, interested parties, management*

1. INTRODUCTION

In the world of modern business new areas are continuously revealed, which organizations try to reach in order to find the one in which they can exercise their competitive advantage. One of them is the integrated supply chain. As this subject become more and more present, so become clearer and more visible the problems of supply chain management. One of them relates to the questions of social responsibility which arise in parallel with the economic benefits stemming from the supply chain integration.

Many organizations which exercise the strongest impact within their supply chain, solve this issue by creating rules of behavior which they impose to the other supply chain participants – what may be regarded as an approach to the management of the entire chain. Within the scope of the above said lay the foundations of some of the key topics of this paper - i.e. what are the directions of the dissemination of the socially (ir)responsible behavior through the supply chain, as well as within which scope it is possible to usefully exercise this impact.

One of the questions which arise is about the responsibility boundaries of one particular organization regarding the behavior of the other members of its supply chain. Organizations increasingly accept the concept of business networking through integrated supply chains. Integrated supply chain represents a vertically coordinated network of organizations which are bounded by various activities connected with the production and distribution of products (goods and services) to the final users (Chopra & Meindl, 2001). This problem was once solved by a concept known as vertical integration, which was considerably simpler and which materialized so that each of the vertically integrated organizations performs its activities separately. However, recently, the significance of the outsourcing or external acquiring of services which are generally out of the scope of the core business, becomes more important, so it is necessary to take more care about organization and coordination of the flows of goods, documentation and, of course, money. In such a way, the participants in the supply chain now become more or less forced to start sharing a joint vision and values, to exchange information more intensively, which sometimes may be very “sensitive” in the business sense, even to start to directly connect inputs and outputs stemming from the processes, and all of this with an aim to achieve results which otherwise would not be possible and, ultimately, be more competitive than another, “rival” supply chain.

Such a behavior becomes necessary when taking into account factors such as globalization of the competition, increasing speed of changes and increased complexity of customers, development of information and communication technologies and attempts to establish standards within specific business activities. Integration of the supply chain leads towards decreasing costs of production as well as transactional costs, the product development is accelerated, and members of the chain have an easier access to the various types of resources, especially knowledge (Möller & Halinen, 1999). The cooperation

described herein can hardly evolve on its own – usually one of the organizations which are members of the supply chain, the most powerful and, as described by the standard ISO 26000, the widest “scope of influence”, has to play the main role.

On the other hand, besides the benefits, with this come the new commitments. Organizations with the widest scope of influence will experience further expansion of their obligations towards social responsibility of organizations within their supply chain. This trend, to some extent, also has a defensive character, as it represents a unique approach to the risk management. In addition to the benefits stemming from the integration of the supply chain management, managers often fear that such changes in relations may lead to the loss of management capacity and to the increase of vulnerability of the most influential organization in the chain, and such fears certainly have realistic foundations (Kolk & Tudder, 2002). Therefore, with an increasing proliferation of the supply chain management, the pressure of the organization on its partners to increase effectiveness and efficiency rises, whereas, simultaneously, exactly such practice exposes the majority of companies to an even higher risk.

Another dimension of the risk related to social responsibility of organizations within the supply chain is related to the extent upon which the reputation and general standing of an organization, which is a member of a supply chain, may be jeopardized by the activity of another member - by such an activity which may have a bad echo in the general public, which sometimes may include accusations related to illegal types of behavior. In a same way in which the members of the supply chain can share the benefit from something good, they can feel the consequences of bad behavior of others in the chain. Due to the above facts, the managers in the supply chain are increasingly focused to the problems related to achieving the trust of customers that goods and services are rendered without deterioration of ethical and environmental standards.

2. THE FUNDAMENTALS OF SUPPLY CHAIN MANAGEMENT AND ORGANIZATIONS' SOCIAL RESPONSIBILITY. LINK BETWEEN THE CONCEPTS

Supply chain represents a set of business processes which connect suppliers, producers, wholesalers, retailers and everyone who is involved in the processes of creation, sale and delivery of products to the final users. In such a way, the supply chain encompasses the flow of product, information and financial means between business partners, i.e. between organizations which are members of the supply chain (M.-Nikolic et al., 2004).

By the traditional approach, supply chains are linear systems in which the raw materials serve as an input and the final product in the hands of users, as an output. The members of the chain behave as closed, independent entities, with very little or even without direct information about the other participants. Organizations usually keep large stocks of supplies and secure excess capacities in order to protect themselves from changes and instability of demand. However, experience teaches us that such an approach, due to possible fast and big changes in the contemporary market, represents a big risk with potentially negative consequences.

Modern supply chains have to be dynamic, flexible and responsive networks, which operate by the principle of “feel and react”, contrary to the traditional approach “make and sell”. Fast response to the changes in demand requires efficient solutions in all elements of the chain: production, warehousing, supply, transport and distribution. This means that, in such competitive conditions, key factor of survival and development of organizations becomes the intelligent and efficient use of the available resources. The optimization of the use of the available resources has to be achieved through the adequate planning and management. The real processes in supply chains must take into account an extremely large number of interconnected variables. Their modeling requires an experience with mathematical methods and finding of optimal solutions requires the use of advanced software packages, the so called optimization software (Vujosevic & Vukmanovic, 2003).

Supply chain management encompasses flows of materials, products, services and information from the original supplier to the final user. It requires coordination between various participants such as producers, suppliers, distributors, freighters and retailers. The aim of this type of management is the delivery of the right product, in right time, under the right conditions and under the right price (Chopra & Meindl, 2001).

The social responsibility of an organization should be understood as a multistakeholder approach, whose basic methodology may be described through a process of identification of interested parties, recognition of

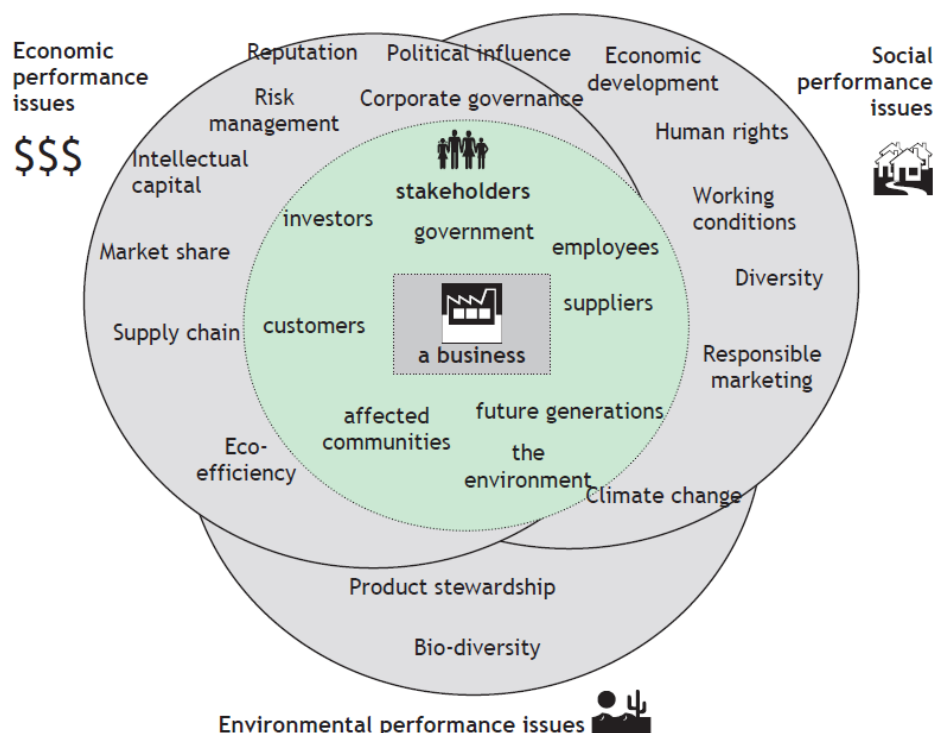

actual and anticipation of potential problems which may arise from establishing relations with them and the creation of adequate strategies, policies and processes for dealing with these issues. The use of the SR (Social Responsibility) concept should expand the horizons of social accountability of an organization, i.e. to elevate its level of awareness about financial, environmental and social implications of its behavior to the wider social community (Filipovic et al., 2008). Within this context, it is necessary to overview in high detail the relations between such influences and various stakeholders and interested parties of an organization.

However, before moving to this, it is necessary to clarify the difference between definitions of a stakeholder and an interested party.

Stakeholder of an organization is every individual, group, organization etc. which can be associated to at least one of the following three characteristics (Mitchell et al., 1997):

- Having an influence on the organization,
- Participation in any sort of legitimate relationships with an organization,
- Having priorities in requests towards the organization.

Interested party is a wider concept, which, besides stakeholders, encompasses all other parties which do not possess any of the above stated characteristics, but there is a possibility that they might acquire some of those characteristics through their operations and actions (Filipovic & Djuric, 2010).

Picture 1: Spheres of influence of an organization to its surroundings depicted through various stakeholders and interested parties (Source: Corporate Social Responsibility – Implications for Small and Medium Enterprises in Developing Countries, United Nations International Development Organization, 2002)

Picture 1 presents typical groups of stakeholders and interested parties of one organization, that are important for the application of the concept of social responsibility, that is, which are significant from the perspective of organization's economic, social and environmental impacts.

The most important interested party for this paper's topic are the suppliers. The suppliers are very interested in the economic impact, but they, in case of their own application of the social responsibility concept, as part of the supply chain, are also indirectly interested for social and environmental impact (Filipovic & Djuric, 2010). This particular problem of interrelatedness (now already clarified to a certain extent) of the concept of social responsibility and supply chain will be the subject of further considerations in this paper.

3. OVERVIEW OF STANDARDS ISO 26000 WITH REGARD TO THE SUPPLY CHAIN CONCEPT

Standard ISO 26000 entitled “Guidance on social responsibility”, was published in November 2010, and the official Serbian version in 2011. In this section we will pursue the examination and interpretation of the concepts from the mentioned standard, which are important for the relevant topic, in accordance with this international standard. Many terms which the standard defines explicitly are important for the relations between these two concepts. Among them, particularly stand out “social responsibility”, “sphere of influence” and “supply chain”. According to this standard, they are defined as follows.

The social responsibility represents “the responsibility of the organization for effects of its decisions and activities on society and environment, through open, public and ethical behavior that:

- contributes to sustainable development, including health and welfare of society,
- takes into account the expectations of stakeholders,
- is coordinated with relevant law and respects the international norms of behavior,
- is integrated across the entire organization and applies in relations with others.

With this definition there come a note that the “activities” include products, services and processes, and “relations with other” include the organization’s activities within its sphere of influence.

The supply chain is defined as “series of actions or sides (suppliers, foreign acquired workers, contractors etc.) that provide products or services of the organization”.

In standard ISO 26000 concept of “supply chain” is explicitly mentioned in two points. In paragraph 7.4.1 “Awareness raising and building of competency for social responsibility” it is said that the construction of competency for implementation of socially responsible behavior practices may include strengthening or development of skills in some activity fields, such as including of stakeholders and improving of knowledge and understanding in dealing with the key issues of social responsibility (as the key issues of social responsibility, the standard ISO 26000 recognizes the organization headship, human rights, work practices, environment, a fair business practices, customer problems, including and community development). Such efforts should include and use the existing knowledge and skills of people in the organization. Where appropriate, these efforts should include the competence building and training of managers and workers throughout the supply chain. For some problems, a special training can be very effective.

Thus, the standard in some way extends the concept of social responsibility on the whole supply chain, recommending to organizations to share their experiences with their business partners, that can lead to improvement of overall performance in some fields of social responsibility (we should note that usually it is not field in which organizations achieve the competitive advantage).

Next, in section 7.6.2 “Increasing of confidence in reports and statements related to social responsibility”, it is said that there are many ways to increase this confidence, and these ways include, among others, the taking of additional steps so that organization acts publicly and openly, providing information of some kind and in some form, that their accuracy can be easily verified by others. For example, instead of publishing reports with statistic data concerning the performance, the organization could also provides details about information sources and processes that are used to get these statistic data. In some cases, the organization can increase confidence in claims concerning its supply chain by providing a list of locations where these activities take place. In this way, the organization actually uses the socially responsible behavior of its suppliers (if it is really such) for the purpose of quality assurance. Thus, the standard induces and the specific situation from which the organization can benefit because it work properly throughout the supply chain, linking the organization with the social responsibility concept.

The sphere of influence is “range or width of the political, contractual, economic and other relationship through which the organization has the power to influence decisions or actions of individuals or organizations”.

It is noted that the power to make an impact, by itself, does not imply that the power is actually going to be used. Also, with this definition is note that wherever the standard uses this term, it should be understood in the context of guidelines from items that are named „Social responsibility and the sphere of organization influence“ (5.2.3) and „Application of Impact“ (7.3.3) which we will pay additional attention.

In paragraph 5.2.3 it is said that the organization is responsible for the effects of its decisions and activities over which it has formally and/or de facto control (de facto control includes situations where one organization has the power to conditional decisions or activities of another side, even when there is no formal or legal authority to do so). Such influence can be far-reaching. In addition to being responsible for its actions and decisions, in some situations the organization may have power to influence the behavior of other sides with which it has a certain relationship. In these situations, it is considered to be under the sphere of influence of the observed organization.

This sphere of influence includes relations within the supply chain of an organization, but sometimes even beyond. However, this does not mean that the entire supply chain in every situation fall within the sphere of influence of the organization. It can include formal and informal relations with all stakeholders, as well as other organizations and competitors.

The organization does not always have the responsibility to use its influence, just because it has the power to do so. For example, it can not be responsible for the effects of other organization action in respect of which has some influence, if these effects are not the result of its decision or action. However, there are situations where the organization is responsible for the manner in which it apply this influence. These situations are determined by the extent to which relationship with other organization contribute to the realization of negative effects.

There are also situations where, although the organization has no responsibility to implement its influence, it may be requested in addition, in any case to do so, on its own. The organization itself decides whether to enter into a relationship with another organization and, if so, how and to what extent. There are situations where an organization has a responsibility to signal and warn of the negative effects of decisions and activities of other organizations, and to take stapes to avoid or mitigate negative effects in terms of its relationships with such organizations (Spekman et al., 2005).

When evaluates its sphere of influence and when determines its responsibilities, the organization should proceed very carefully and conduct a detailed analysis of all the potentially critical factors – the so-called „due diligence“, to avoid getting into a situation that may contribute to the achievement of negative effects through its connections and relationships.

4. THE EXPANSION OF SOCIAL RESPONSIBILITY THROUGH THE SUPPLY CHAIN

Slowly, therefore, it becomes clear that the growing demands for the social responsibility of organizations extend to the activities that take place throughout the supply chain. This is one of the most important questions about the whole issue of social responsibility in supply chains – **should we consider the whole organization's supply chain as a part of this organization?**

If the answer to this question is positive, then we can bring into question whether some organization can, in this context, be in any degree independent from the other with which it cooperates, and from which is de facto legally independent. If it is negative, then the next issue is – is it appropriate to expect that an organization (usually the one that is the most powerful in the supply chain) takes responsibility for what happens beyond its legal responsibility, which can lead organization to situation where its socially responsibility actually extends to the entire supply chain.

Why an organization would be responsible for the way in which some other organization, legally independent from the first one, works? In this logic, we can say, for example, that customers are responsible for the mode in which some store, where they buy groceries, works or for anything related to it. This attribution of unlimited responsibility for supplier acting to organization, which is user of his products or services, certainly is not correct, because it would undermine the autonomy and independence of each organization. In most countries and their legal systems, the company is given a status of legal entity. It is usually considered, legally, that the organization is not responsible for some forms of socially responsible behavior of its employees or stockholders (Mamic, 2005).

Then, how to determine to what extend it is legitimate to expect from an organization to take responsibility for the behavior of others?

5. POSSIBLE IMPACTS WITHIN THE SUPPLY CHAIN

The organizations usually exercise the impact on the supply chain upstream, in terms of accepting the socially responsible behavior - this affects suppliers. It seems that the direction cannot be the opposite, even when seemingly true nature of the relationship shows that the one which is affected (though formally user), is supplier in some way. Considering the way in which this impact is realized, we can find some possible answers for this observation.

The ways in which an organization can spread its impact on others in the supply chain, in terms of their social responsibility, include:

1. standards and organizational rules of behavior that the organization imposes to others in the supply chain;
2. organizational culture;
3. taking role of stakeholders (e.g. of non-governmental organizations) which influence the development of social responsibility through public pressure on companies;
4. staff development.

Codes of conduct and standards of the organization-customer make it clear to the supplier which system of values is expected to follow. This kind of agreement can be reached by direct consultation with the current supplier or at the conclusion of the first contract with a new supplier, when the two organizations engage with each other for the first time (Amaeshi et al., 2008). Such consultation with each interested party is not possible if there is no real two-way communication. It is not uncommon for organizations to practice just formally some form of communication with their stakeholders, but this is actually one-way communication – it essentially does not allow the voice of interested parties to be heard, but it is a form of risk mitigation, development and protection of the organization reputation and creation of the competitive advantage.

Instead of this, communication should be characterized by true intentions, honest dialogue, connection, trust and fair relationship. Organizations which act in this way, have awareness that they can really add value through their relationship with stakeholders. They go into this relationship for reasons that go beyond calculating, wrongdoing and increasing profit. Such organizations often take responsibility to spread the culture (and practice) of socially responsible behavior throughout the supply chain (Crane & Livesey, 2003).

Also, the user organization has legitimacy to establish the process of periodic reports delivery about checks of the socially responsibility of its suppliers from them and, in some way, has duty to ensure that any form of quilt, discovered by the auditor or by the public, is going to be known. Sometimes, these things can lead to the termination of the contract. In the same logic, organizations can establish certain forms of rewarding suppliers which continually meet these standards and codes of conduct. This reward usually is not, nor it should be, of financial nature – may include sharing of good practice, establishment of joint training and the like.

Another possible way in which the most powerful organization in the supply chain affects the other members of the chain is to serve as **a model for others through its organizational culture** based on social responsibility. The customer cannot request from supplier the model of behavior which itself doesn't follow – in many situations, even, it must serve as an example. In this case, this example would be in terms of organizational culture, which is for an organization the same as the personality or character for a person, if we take this analogy. That diversity in the system of values, beliefs, work modes and relations make a major difference between the two organizations – as there are bad and good people, so there are both – bad and good organizations. However, the question is – why an organizational culture is good or bad. To simplify, the organizational culture could be considered good if it respects its stakeholders and interested parties in decision making, creating policies, processes and systems, therefore, the one that respects the principles of social responsibility at all levels, from the mission and vision statement to the ways in which organization carries out daily activities. With the development of such an organizational culture, an organization can become a model that the others in the supply chain wish to emulate. Some researches confirm that companies have a tendency towards imitating the most successful and powerful (Amaeshi et al., 2008).

Another option includes **changing the source of pressure on companies to behave socially responsible**. Sometimes, and in some situations, various non-governmental organizations were the ones who made the greatest pressure on companies to behave ethically, usually by bringing the public attention on what they do wrong. This change, in some way, changes the nature of the pressure, it no longer has to be

perceived as something threatening, but as an incentive - of course, if the strategy for this kind of impact on the supply chain is designed properly (Djuric & Filipovic, 2008).

Successful organizations can share their knowledge and good practice through the supply chain **by organizing trainings for employees of those on whom they want to influence**. Usually these trainings are designed to be common for employees of the organization and other members of the supply chain and include the identified needs of both. In this way, they contribute to solving the problem of individual behavior, often in conjunction with the appearance of corruption, unprofessional (sometimes very unethical) behavior and the like, that can not be fully reached by the organizational culture (Djuric & Filipovic, 2008).

6. THE ESTABLISHMENT OF SOCIALLY RESPONSIBLE RULES OF BEHAVIOR FOR PARTICIPANTS IN THE SUPPLY CHAIN – DIFFERENT APPROACHES

Even the most cautious organizations which apply the most effective suppliers monitoring practices and meet the conditions set by contract, may sometimes find themselves having their suppliers make the problem in the field of social responsibility. Of course that each serious organization attempts to influence the resolution of this problem (or, if it is not possible, they terminate the contracts with the supplier), but this kind of reaction to such situation, without any prior action, suggesting the absence of application of a systematic approach to the field of social responsibility and supply chain management.

Organization leaders in some industries, which have shown a willingness to overcome the existing legal norms and adopt sustainability as one of the fields of competition, were the catalysts of change and not only in their industries. For example, in the fashion industry it was “Levi Strauss & Co”, which was among the first to introduce a model of supply chain management, which many accepted (Emmelheinz & Adams, 1999). On the British market, known by its liberalism, company “B&Q” has launched several social and economic initiatives, particularly in terms of sustainability in forestry, and in cooperation with some non-governmental organizations and other members of the industry, developed a system for certification, known as “Forest Stewardship Council” (United Nations International Development Organization, 2002).

Let's see what can go wrong in this situation. Powerful organization will not hesitate at first to take an action, or to use certain amount of resources to help the other organization to solve observed discrepancies. If it fail, consequences are likely to be termination of the current contracts or cutting any thoughts of future contracts. This is the worst possible scenario. Simply, suppliers usually work under pressure and they are faced with certain political and cultural barriers, even when try to comply with what is proven to be the best practice. Ending the relationship with supplier as soon as some nonconformity is discovered can hardly contribute to the overall goals, such as ensuring human rights and labor rights, and environmental protection – if the organization that commits an violation has more users, it is difficult to be distracted from the bad practice because one of them left it (Amaeshi et al., 2008).

Sometimes this problem with the authority is the reason why organizations choose different approach – the responsibility for the behavior of partners in the supply chain can be transferred to the third side. There are organizations which deal with the development of generic codes of conduct for suppliers that can be applied across different supply chains. A certain number of international initiatives is focused on changes on the markets in certain sectors. For example, „The Fair Labour Association” has an impact on the U.S. apparel industry and in particular focus on college teams sports equipment, “The Ethical Trading Initiative” was launched by retailers in the UK, in collaboration with non-governmental organizations, standard SA8000 (Social Accountability 8000) has had widespread popularity among manufacturers of toys in China (United Nations International Development Organization, 2002). These emerging global standards aim to institutionalize and improve balance in specific industries, and above the limits of what individual organizations do.

However, beside the question of extend to which powerful organizations implement control over the activities carried out by their partners in the supply chain, it should be considered what this “big” organizations can do in return, without any excessive investment, for their “small” suppliers.

As a very common form of socially responsible behavior of a large organization, it allows small, less developed organizations' staff to attend training and events aimed at professional development, organized for employees of this large organization. Also, it is proven that the engagement of local suppliers and

tendency to employ members of the local community is a practice which is effective for creating a good reputation of the organization and for building good relations with the local community.

Some large organizations demonstrate their social responsibility by encouraging entrepreneurial initiatives in the territory where they belong. This is often manifested through the establishment of mentoring programs for initiating business ventures for individuals (so-called “start-up”) or by encouraging particular entrepreneur initiatives of already existing small and medium enterprises. Also, support for small organizations in the process of reporting about socially responsible activities, i.e. information about conducted activities, can be of great importance (Djuric & Filipovic, 2008).

7. CONCLUSION

As a main conclusion raises the fact that, since they have some benefit from disappearance of borders in the supply chain, organizations must be prepared to take care of risks related to the effects of the policies and actions of their partners, other members of the same supply chain, especially in the attitude towards eco and social environment. The concept of social responsibility can be a means by which organizations establish a balance between the benefits gained by “outsourcing” of their activities, for them especially specialized suppliers and the damage that can suffer through the loss of management activities that affect their business.

More and more organizations begin to understand the purpose of maintaining a balance between the advantages of supply chain integration and loss of control over certain activities outsourced to other organizations in the value chain. This understanding comes directly from the right approach to the field of social responsibility. Organizations which accept this responsibility usually do not hesitate to initiate the development of conduct rules that must be followed by their partners in the supply chain. However, responsibility for the behavior of partners in the supply chain can be transferred to the third side – there are organizations that deal with development of generic codes of conduct for suppliers that can be applied across different supply chains.

An important issue regarding this is – how much organizations may require from partners in the supply chain in terms of social responsibility. Overview of different codes of conduct for supply chain developed by both organizations from the chain themselves and from third side, indicating the existence of significant discrepancies. Differences in codes of conduct for partners in different supply chains open space for situations where for the same activities of organizations which belong to different supply chains is required more or less, and some of them in this way can come in a worse competitive position. In contrast, in some supply chains from the organizations is required too little, which leave the space for the loss of reputation or even a potential accusations.

SOCIAL RESPONSIBILITY AND ETHICS OF MARKETING AND CORPORATE COMMUNICATION

Vlastelica Bakić Tamara¹, Filipović Vinka² Kostić-Stanković Milica³
¹²³ University of Belgrade, Faculty of Organizational Sciences

Abstract: *Considering the definition of corporate social responsibility given by The International Organization for Standardization and the dimensions of social responsibility adopted by academics who study this topic, the authors of the paper defined the theoretical framework for the integration of CSR principles and philosophy with marketing and corporate communication, with special emphasis on ethics. The paper defines economic, legal, ethical and voluntary responsibility of marketing and corporate communication. The ethics of communication are discussed by reviewing two different schools of thought, and the authors have concluded that marketing and corporate communication is, by its nature, not an unethical process, but that it can be lead in an ethical or an unethical manner. Managerial implications of the paper include the systematization of ethical issues in marketing and corporate communication with practical examples.*

Keywords: *corporate social responsibility, ethics, marketing communication, corporate communication*

1. INTRODUCTION

In an analysis of academic definitions, among the first more comprehensive approaches to defining the term of corporate social responsibility (CSR), the author Jones (1980) stands out suggesting that corporate social responsibility implies that companies have an obligation towards all interest groups within a society, not only towards their shareholders, and that this obligation goes beyond what is prescribed by law or a union contract. A more modern definition offered by Marsden (2001) states that corporate social responsibility refers to the essential behavior of a company, as well as its taking responsibility for its overall impact on the society in which it operates. CSR is not an optional 'add-on' to business operations, nor is it a single act of philanthropy (a donation). A socially responsible company is one that leads a profitable business, taking into account the overall positive or negative effect that it has on society, the economy and the natural environment. McWilliam and Siegel (2001) define corporate social responsibility as actions that reflect positively onto society, which are above the company's interests and that which is required by law. Likewise, widely cited is the definition offered by Pinney (2001) that corporate social responsibility, or corporate citizenship, can be simply defined as a set of management techniques that allow a company to minimize the negative and maximize the positive impacts of its operations on society. Probably the most common definition in the academic literature in the last 30 years is the definition by the author Carroll, which reads that the social responsibility of a business includes the economic, legal, ethical and voluntary/philanthropic expectations of society, in relation to the organization during an observed period of time (Carroll, 1979; 1991). Dahlsrud (2008) has conducted one of the more comprehensive studies of CSR definitions, and has concluded that all of the relevant definitions include some, or all of the following dimensions:

- The social dimension – Contribution to the welfare of society, by improving the quality of life of the social community in which the organization operates;
- The natural environment dimension - Care for the consequences of the organization's operations on preservation of the natural environment, by reducing the negative impacts and increasing the positive;
- The economic dimension – Preservation of profitability, and contribution to economic development;
- The stakeholders dimension – Establishment of relationships with all stakeholders, and fulfillment of their expectations regarding business responsibility;
- The voluntary dimension - Decisions and activities that go beyond what is required by law, which are guided by ethical principles, and implemented on a voluntary basis.

The International Organization for Standardization (ISO 26000, 2010) has defined the term as: *"the responsibility of an organization for the effects of its decisions and activities on society and the environment, through transparent and ethical behavior, such that it contributes to sustainable development that includes the health and welfare of the society; takes into account the expectations of its stakeholders; is in accordance with applicable law and international norms of behavior; and which is integrated throughout the entire organization and applied in all of its relations."* The authors of this paper consider this to be the most

relevant CSR definition for the purpose of analyzing the social responsibility of marketing and corporate communication.

In accordance with the philosophy of conducting socially responsible business, a company needs to make marketing decisions by taking into account the desires and long-term interests of the consumers, the demands of the employees within the company itself, as well as the long-term interests of the social community in which it operates (Kotler et al, 2007). Therefore, the purpose of this paper is to define the theoretical framework for the integration of CSR principles and philosophy with marketing and corporate communications, with special emphasis on ethics.

2. THE SOCIALLY RESPONSIBLE DIMENSIONS OF MARKETING AND CORPORATE COMMUNICATIONS

In this paper, the socially responsible dimensions of marketing and corporate communications are analyzed through the theoretical framework of “the dimensions of social responsibility”, by the author Carroll (1999). The given model can be applied on marketing and corporate communications in the following manner (see Figure 1):

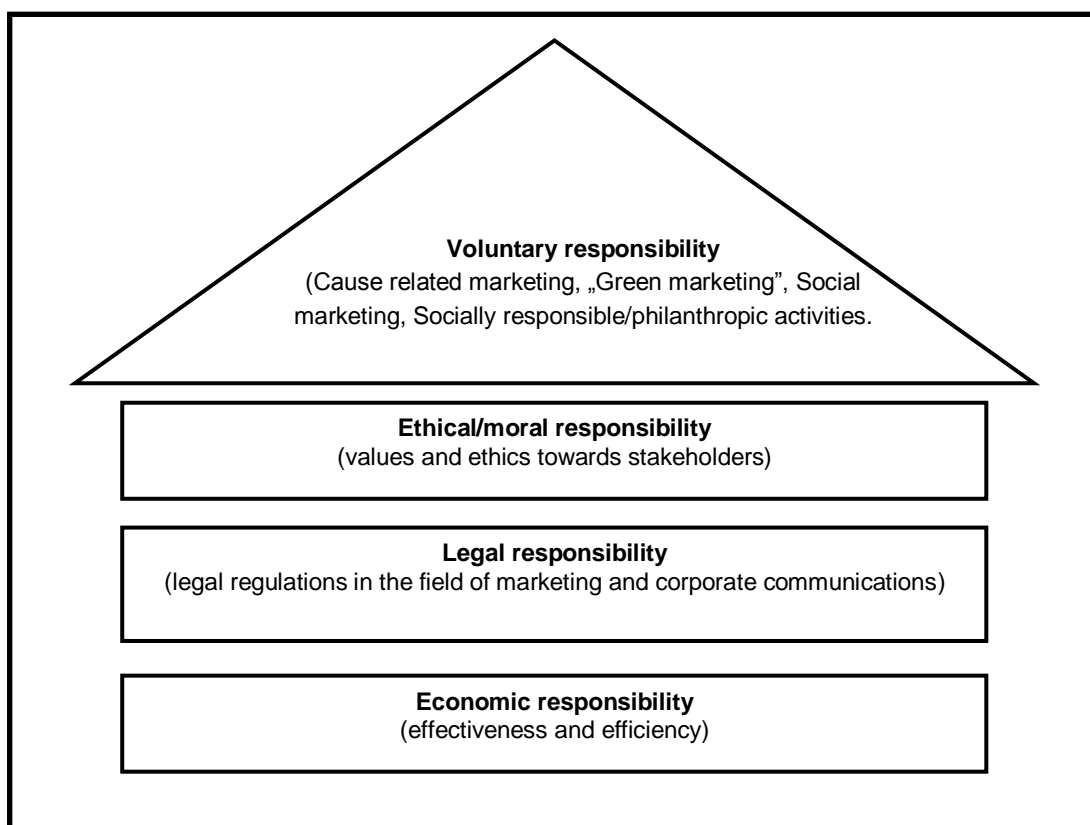

Figure 1. The hierarchy of the dimensions of social responsibility of marketing and corporate communications

Economic responsibility.

The first level of social responsibility in this domain implies that a marketing and corporate communication is planned and implemented in a way so that it fulfills its essential function within the organization (Filipović&Kostić-Stanković). This is most often an increase in sales and profits when it comes to marketing, while it is the improvement of reputation and relationships with stakeholders in the case of corporate communications. The main indicator of the economic responsibility of these two processes is the degree of effectiveness and efficiency, while the instrument of control involves the setting of measurable objectives and performance indicators (KPIs - *key performance indicators*), as well as evaluation, i.e. the objective measurement of satisfaction of the set objectives (Vlastelica, 2007).

Legal responsibility.

Compliance with legal regulations in the field of marketing and corporate communications represents the next dimension of social responsibility of these processes. In addition to legal regulation that directly relates to this field, such as the Law on Advertising, it is also necessary to know and respect the laws that regulate certain aspects of the communication process, such as the Law on Free Access to Information of Public Importance, the Consumer Protection Act, the Regulations on Marking and Labeling for Prepackaged Foods, the Law on Protection of Users of Financial Services, and others.

Ethical/moral responsibility.

Ethics in marketing and corporate communications is probably the most complex dimension of the given processes. The authors of the paper believe that marketing and corporate communications, by their nature, are not unethical processes, but that they can be lead in an ethical or unethical manner. Therefore, this paper provides a more detailed analysis of the ethical aspects of these processes.

Voluntary responsibility.

The process of integration of corporate social responsibility and marketing and corporate communications achieves the so-called "Voluntary responsibility". Namely, it refers to the overcoming of economic, legal and ethical expectations in terms of marketing and corporate communications, and the incorporation of social responsibility into the very heart of the processes. An example of this are the "hybrid" forms of marketing and corporate communications, such as:

- Cause related marketing
- „Green marketing"
- Social marketing
- Socially responsible/philanthropic activities.

3. THE ETHICAL ASPECTS OF COMMUNICATION

Ethics represent a set of moral principles and values that determine the behavior and decisions of individuals or groups (Berkowitz et al, 1997). According to the author Fill (2005), there are two basic schools of thought when it comes to ethics in communication, which focus on: the process, i.e. the activities, believing that certain actions are universally good or bad; while the second focuses on the consequences, and whose supporters believe that the evaluation of a certain activity as good or bad depends on the consequences of the particular activity's implementation. In this sense, there are also extreme views that any form of marketing and corporate communications are, by their very nature, unethical. In his article, the author Pollay (1986) presented an overview of the sociological literature on the subject of marketing communications, from which it is evident that the sociologists of the time considered this process to be a "powerful and intrusive means of communication and persuasion". The arguments for this view are most often the following:

- Marketing communications influence free will and the freedom of choice, by only emphasizing information that is of interest to those who are implementing the marketing communications, thus misleading the consumers (citizens, the recipients of the marketing messages);
- Marketing communications, according to their definition, promote materialism and consumerism, thus undermining traditional social values;
- Marketing communications influence the way in which individuals perceive others and themselves, they create artificial needs and affect social relations.

In the literature, it is also possible to find similar claims when it comes to ethics in corporate communications, primarily public relations and the media relations within them. The terms that are related to public relations among the public, such as "manipulating public opinion", "spin doctors" and such, indicate a wrong perception of the entire profession, which is the result of individual cases of unethical behavior by individuals, agencies or companies that are engaged in a particular field of business.

On the other hand, numerous authors state that it is precisely marketing and corporate communications that allow the public to "control" the operations of organizations that shape society, i.e. that they are a prerequisite for transparent business operations and greater public and consumer awareness, thereby limiting the power of the individuals holding the capital, and moving it towards the society.

As noted above, the authors of the paper believe that marketing and corporate communications are, by their nature, not unethical processes, but that they can be lead in an ethical or unethical manner.

The starting point of the analysis of the ethical issues in marketing and corporate communications is the choice of the theoretical framework. Namely, ethical problems can be analyzed from the perspective of:

- Values
- Stakeholders
- The process

The first approach involves an analysis of the basic values that are immanent in the process of communication, such as honesty, respecting of privacy, independence, transparency, etc. Most of the ethical codes adopted by professional associations start precisely from this perspective, and they prescribe the basic values that should be respected in communication. An example is the "Statement of Ethics" of the American Marketing Association (2012).

The ethical issues from the stakeholders' perspective are analyzed depending on whom the communication is referring to, i.e. which target group or target audience is under the influence of the communication activities. It may be consumers, competitors, as well as society as a whole. An example of an ethical code that is designed on the principle of stakeholders is the Code of Professional Ethics of the Public Relations Society of Serbia (www.pr.org.rs).

An analysis of ethics from the process perspective involves a review of the righteousness of certain activities within marketing and corporate communications, such as: public opinion and market research, the defining of prices, ways of promotion, etc.

Taking into account the given theoretical approaches to studying ethics, the authors of this paper distinguish the following areas of ethical and unethical marketing and corporate communications:

- **The ethical issues in public opinion and market research.**

Invasion of privacy is one of the main issues in the field of research. However, if a respondent is familiarized with all the relevant aspects of the research (the name of the client, the purpose of the data, how the data will be processed and in which manner it will be presented) and voluntarily agrees to participate in the study, this cannot be considered as an invasion of privacy, but a so-called informed decision of an individual. Furthermore, stereotyping, which is inherent to interpretation of research results through the analysis of demographic groups, is not in itself unethical, but stereotypes should not be used in communication "in a negative or dehumanizing way" (AMA, "Statement of Ethics", 2012). Protection of individuals' personal data, collected by the research, represents another ethical obligation within this process.

- **The ethical issues in "targeting" (the selection of a target group or target audience).**

The two basic occurring forms of unethical behavior in targeting are: selective marketing, in terms of deliberate exclusion of a certain group of consumers as undesirable, and the targeting of so-called vulnerable groups, which include children, the elderly, the poor, minorities and/or persons with special needs. The first form applies to, for example, deliberate exclusion of an offer to obese people, homosexuals, or members of certain minorities. On the other hand, common are examples of inadequate supply, place, and manner of promotion when it comes to children and the elderly. According to Kotler (2005) manufacturers of industrial crops are often criticized for the way in which they promote their products, which contain a low nutritional content and a large amount of sugar. Namely, the extremely strong appeals that are used in these campaigns, as well as the identifying personalities such as popular animated characters that kids love, overwhelm the rational defense and cognitive power of children, and lead to excessive consumption of these products. Similarly, certain companies take advantage of a lack of knowledge and a reduced ability to perceive all of the advantages and disadvantages of specific arrangements, such as various types of insurance or *time-sharing* arrangements, when promoting products and services to the elderly. The promotion of certain financial services, such as unaffordable loans to the poor with a conscious insight into their disadvantaged position within the arrangement, belongs to another form of abuse of the inferiority or vulnerability of a particular segment of the population, for the purpose of economic gain of the one communicating.

Kotler (2003), on the other hand, also states the example of communications directed towards children, which is not considered to be unethical. The Colgate Junior toothpaste for children, with specially customized content that allows for more frequent and longer brushing, represents a product whose promotion to children is justified, because of the immediate health benefits of its use.

▪ **The ethical issues in advertising.**

Advertising represents a marketing communications tool that is, in practice, the most susceptible to criticism regarding unethical behavior (Kostić-Stanković, 2011). The main areas, themes or dimensions within advertising, which are subject to ethical evaluation, are the following: truthfulness of an advertisement, completeness of information in an advertisement, the use of various techniques of persuasion, intimidation and manipulation, the content of the advertisement in terms of the use of illegal or inappropriate motives (sexuality, violence, etc.), the position of certain demographic groups in an advertisement, negative advertising, etc. Examples of manifestation of unethical advertising are shown in Table 1.

Table 1. Examples of manifestation of unethical advertising

Activity	Example
Concealing information regarding the total costs of a transaction	<ul style="list-style-type: none"> ▪ Advertising mobile phone services without stating the obligation of paying a certain sum in order to activate the service ▪ Advertising banking services without specifying the fees, interest rates, charges or other costs related to the activation and maintenance of these services ▪ Advertising airline ticket prices without specifying the airport taxes, whose payment is an unavoidable part of booking a flight
Use of vague terms	<ul style="list-style-type: none"> ▪ "Natural", "Organic", "Healthy", "Green", "Fresh", "Light", are only some of the terms used in advertising that can mislead the consumer. If situations in which it is allowed to use such terms are not regulated by law, their most common unethical application involves the use of these terms for promotion of a product, in which only one ingredient satisfies the given claim
Comparison	<ul style="list-style-type: none"> ▪ Using vague terms such as "better" or "best" in comparison with products from other manufacturers or "regular" products, without specifying in exactly which category or aspect the product is better, nor providing any evidence to support the given claim ▪ Using vague comparatives or superlatives, such as advertising in the film industry that promotes the "most charming movie of this fall"
Misleading consumers through the visual presentation of a product or service	<ul style="list-style-type: none"> ▪ Using photos or video that depict the product to be more than it actually is, or showing the product with accessories that are not included in the standard "package" that the customer receives for the price that it is communicated ▪ Promoting travel arrangements with a visual presentation of hotels or services (trips, massages) that are not included in the offer that is promoted
Fake testimonials	<ul style="list-style-type: none"> ▪ Presenting paid actors or models as scientists, doctors or experts, who guarantee that the product satisfies the function that is being communicated ▪ Testimonials of "fake" users of a product, in which they claim that they have solved a problem (obesity, insomnia, pains) by using the particular product ▪ Using celebrities and implying that part of their success comes from the use of a particular product or service

- **The ethical issues in sales promotion.**

The majority of complaints regarding unethical behavior in the field of sales promotion are related to the organization of prize games and sweepstakes. Promising of gifts “to every customer, user, reader”, after which it turns out that “supplies are limited” and that the claim that everyone wins is false, represents a typical example of deceptive communication. This also includes discount coupons that do not clearly state for how long they are valid, i.e. until when the customer can use them, or for which particular products the discount is applicable. Another example is the promotion of discounts for certain products, for which it turns out that they are out of stock, where the advertiser’s intention was to attract customers to the retail facility, so that they can purchase other products at a higher price than the one that was promoted.

- **The ethical issues in direct marketing.**

The basic ethical postulate of direct marketing, which is based on the existence of a target group/customer database, implies respect of the target group’s privacy. This primarily applies to junk mail (*spam*), whether physical or electronic, telephone marketing and sales, and the use of a client or potential client database for promotional purposes without obtaining prior consent from the clients, etc.

- **The ethical issues in public relations.**

Truthfulness, completeness and timeliness of information, represent the imperatives of ethical communication in public relations as well. Seeing as how the subject of communication in this field is much more complex, the ethical evaluation and ethical issues are also more complex. Namely, as opposed to marketing communications which are primarily focused on the very product/service, while the target groups are customers and consumers, the subjects of communication of public relations are most often corporate values, social issues and news concerning overall business operations, while the target audiences can be very heterogeneous: from the employees in an organization, through the media, public administration, non-governmental organizations, to society as a whole. Therefore, the first ethical obligation of public relations professionals is the introduction of ethical principles, values and codes of conduct at the corporate level. When initiating certain topics and raising public awareness on an issue, care should be taken to maintain objectivity, as well as a so-called *win-win* position between the interests of society and the interests of the organization on whose behalf the public relations are implemented. In practical terms and everyday activities, given that the media are the dominant target public through which public relations practitioners communicate with the broader public, the basic ethical dilemmas relate precisely to the various aspects of media relations. Namely, in the wish to improve the publicity of their client or organization, practitioners sometimes resort to unethical activities and instruments, such as: paying journalists to publish a report, paying for travel or other forms of compensation in order to be favored in the press coverage, disclosing information that views a particular topic or subject only from the company’s point of view, etc. It is obvious that the ethical issues in media relations are closely related to journalism ethics. Progress in this area from which both professions, corporate communications and journalism, will have long term benefits, implies a synergy of the basic missions of the representatives of both professions: on the one hand, reporting contributes to the greater awareness and well-being of society (when it comes to journalists), while on the other hand, it promotes the reputation of the companies it represents, providing truthful and timely information regarding their business operations (when it comes to the representatives of Corporate Communications).

4. CONCLUSION

After systematization of the field of application of ethics in marketing and corporate communications, it can be concluded that the ethics in marketing and corporate communications can be improved in one of the following three ways. Education of individuals who are engaged in this profession, on the conducting of ethical and unethical business. Legal regulation, in the case when the unethical behavior from a single incident becomes a pattern of behavior in a particular field. It is usually under public pressure that a given field is regulated by legal acts. Activities of professional associations, which on the principle of self-regulation serve to reduce unethical behavior in the field of their profession. This implies the adoption of a profession’s code of ethics, the promotion of ethical conduct, the monitoring and control of the ethical behavior of members and organizations, but also the punishment of unethical behavior within a profession through public condemnation, by dismissal of a membership, or misdemeanor/criminal charges. For example, in Great Britain there is the Advertising Standards Authority, which is an independent organization whose mission is to “ensure that all advertisements are legal, decent, honest and truthful”. This organization continuously monitors advertisements, direct sales and direct marketing in the UK, and undertakes actions to affect

changes, or cancel marketing content that is deceptive, harmful or offensive. At the time of writing of this paper, work is in progress on the first “National code of responsible advertising”, organized by the international branch of the International Advertisers Association (IAA) in Serbia.

Abstract: *The authors of the paper aim to contribute to the knowledge of morality in business activity, as well as the influence of ethics and integrity of board of directors and supervisory board members on decision-making within those bodies in companies in Serbia. The relationship between ethics and company success is taken into consideration in the same context. Ethics and success may not necessarily be in conflict. Opting for the topic in the title, we analyze the hypothesis that the personal integrity of board of directors and supervisory board members has an impact on decision making within the boards, and that the company itself is as moral as the people in it.*

Keywords: *duty of care, members of the board of directors, ethics, integrity, company.*

1. INTRODUCTION

Individuals who are at specific positions in a company's organizational structure arrive there with personal convictions, moral attitudes to actions which the company requires of them in the sense of identifying them as either good or evil.

This also refers to the holders of the offices of directors, members of the boards of directors, i.e. company supervisory boards. Their duties towards the company in terms of the obligation of observance (Art. 63 of the Law on business companies of the Republic of Serbia, in further text LBC), obligation of reporting businesses or actions involving personal interest (Art. 65, LBC) (or the interest of related persons in terms of Art. 62, LBC), obligation of avoiding conflict of interest, i.e. obligation of loyalty (Art. 69, LBC), obligation of the prohibition of competition (Art. 75, LBC) as well as the obligation to confidentiality in business activities (art. 72 LBC) differ, as it is well-known, from the jurisdiction of board of directors. It also differs from the responsibility of the company as a whole towards internal and external stakeholders, that is to say, society as a whole, although these categories are mutually intertwined. In this paper, we analyse, that the mentioned obligations of directors have an ethical dimension along with the legal.

2. DUTY OF CARE – WORKING IN COMPANY'S BEST INTEREST.

In our positive law, the duty of care that binds directors and supervisory board members is understood as the duty of conscientious decision-making, i.e. participation in that process, with the diligence of a good entrepreneur in sincere belief that this is in the best interests of the company. The conscientiousness of a good entrepreneur is an abstract standard and it has legal, economic and moral dimension. It implies the level of care with which a diligent person would act, if he or she possessed the knowledge, skills and experience needed to fulfill his or her duties in the company. If the good entrepreneur possesses the specific knowledge and experience, these will also be taken into account in the evaluation of the level of diligence.

When directors make decisions, the law requires them to do it in a reasonable conviction that they are acting in the best interests of the company. Bearing in mind the requirement for reasonable conviction, we are in presence of a cognitive principle accepted by the legislator, when establishing the ethics of a decision. A common procedure for determining whether the ignorance leading to a certain conviction is justified or not (whether it is reasonable not to know something), is analyzing if an average person with good intentions would put an effort in becoming acquainted with the given circumstances or consider the possibility of consequences in question. (De Džordž, 2003.:122) The justified or insuperable knowledge of something, such as something that is impossible for us to know, results in excluding or diminishing moral responsibility both for the decisions made and the legal accountability.

We are morally, just as we are legally, responsible for immediate and obvious consequences of our actions, but also for other reasonably predictable consequences in the future. It is considered that directors and supervisory board members can base their actions on the information and opinions of other persons competent for the relevant area, who they reasonably believe will act conscientiously in that case.

Therefore, in order for a director or member of supervisory board to be morally responsible for acting or, failing to act, the action itself or its absence, has to be performed both consciously and willingly (on purpose or through negligence). An action is taken consciously when its agent is aware or is obliged to be aware that it can lead to certain consequences. In case the ignorance is unjustified or was preventable, given other conditions, the liability for the decision (action), or its absence, is possible.

If we are in presence of free will, i.e. the will expressed without constraint, threat, delusion, or deceit, we say that an action is performed willingly. If there are conditions which eliminate or diminish the free will choice needed, we cannot speak of moral responsibility as moral responsibility. Namely, ethical responsibility does not exist without free will. The same holds in case a director or a member of supervisory board is in presence of conditions which prevent the possibility of undertaking or not undertaking necessary actions by which, otherwise freely formed will, would normally be realized. At the same time, the responsibility itself should be differentiated from liability in terms of the obligation of indemnification. (*De Džordž, 2003. :126*) Being capable of responsibility for morally wrongful actions means that a person can be indicted for damaging effects of their actions towards others. Then it is necessary to determine the existence of cause and effect relationship with the damage, as well as the existence of the damage itself.

In order for directors, i.e. the members of supervisory board, to be morally bound to render accounts to those who are affected by their actions, it is necessary that they themselves have the ability to judge the morality of an action, which is related to the set of values, feelings and moods for a certain action to be performed or evaded. This is called conscience and every rational being has it to the level to which the being itself is rational. (*De Džordž, 2003.:128*) Conscience, together with personal goals, personal norms, personal beliefs, is also equaled to subjective standards of moral activity. They are determined by culture, religious tradition, that is to say, heritage, as well as social and, particularly, economic situation. There are various theories which address the problem of conscience, beginning with the emphasis on the connection between conscience with the Divine (Thomas Aquinas, Martin Luther), over the conscience as a function of autonomous mind in Kant's view. According to Lock, conscience is a product of social and upbringing determination and in Froyd's view of conscience - it is a result of moral conflict.

As directors and members of supervisory board are required to make decisions in the best interests of the company, it is clear that we are in the presence of the accepted concept of consequential ethical theory. The utilitarian approach is based on the belief that we should choose the way of acting which provides the most good for the highest number of the involved, so that it is qualified as a moral action. Here we proceed into the stakeholder theory which is fundamentally a utilitarian theory. The stakeholder theory, as the interest stakeholder theory of corporate responsibility, places the moral responsibility of a corporation in the corporation itself. In our view, this means in the board of directors or supervisory board, i.e. their members, given their key roles in creating the company's will. Among interest stakeholders as interest and risk bearers, there are those who have the interest of the ownership (shareholders), interest of other rights that they demand (employees, suppliers...) and the ones that have wider or general interest for the company's activity (environmental protection organs, local and wider social community). (*Krkač, 2007.:326*)

Persons, who prove that they acted in accordance with the duty of care, are not responsible for the damages that can result from such action in the company. However, the burden of proving it is lies with them. The obligation of loyalty of directors, i.e. the members of supervisory board, necessitates their decision-making in such a way that they place their interests in the function of company's interests. At that, they must not misuse the company's business opportunity; abuse their position in the company, the company's information or assets for their own purpose. If they do, they risk finding themselves in the conflict of interest and they become liable for the consequences of such a situation. The company can take action for damages and transfer of benefits to the society which it gained as a consequence of the breach of duties (Art. 71, LBC). Some ethical cases which appear most frequently in the sphere of the conflict of interest are: raising personal earnings to the prejudice of the owner's profit; giving or receiving bribe with the intention to critically affect the decisions against the company's interests or overlooking them; appropriating parts of the company's assets for personal interest. (*Krkač, 2007.:226*) When directors, i.e. supervisory board members find themselves in a situation which is an ethical case, they should determine if there are any business reasons which lead to the possibility of making immoral decisions, whether there are legal restrictions under

which the given action could fall into if performed in a certain way, or if the company has an ethical code which includes certain types of actions. Furthermore, managers should ask themselves what the common way of acting in the given area of business is, and whether colleagues would support the chosen course of action; also, what is the relationship between this course of action and the manager's personal values and attitudes. The criteria for making decisions are often contained in ethical codes of companies and they rely on one of normative ethical theories. (Krkač, 2007.:227)

A company, as a whole, has responsibility in terms of „...care integrated on voluntary principle of social issues and protection of the environment in its business activities and relationships with stakeholders (owners, employees, customers, suppliers, government, media and general public)“. (Krkač, 2007.:328) Nonetheless, apart from corporate social responsibility, there are in literature corporate social capability of responsibility as well as corporate social performance by which emphasis is placed on the results of corporate social activity. The totality of the three aspects mentioned is encompassed by the term of corporate citizenship. (Krkač, 2007.:329)

What the damage is from an ethical point of view is quite another issue within corporate social responsibility. Namely, the question is how wide is the circle of subjects which might suffer damages for a company behaving in a socially irresponsible way to be held responsible for its actions. In other words, how wide should the circle of subjects and their interests protected by directors be, i.e. supervisory board members of a company, so that the company is not declared a socially irresponsible one?

Of course, it is highly unlikely that we can agree easily on everything that is necessary to create an optimal board of directors, i.e. supervisory board. It requires independent, well-informed, ethical, experienced, proactive directors as its members. (Broutans, 2004.:50) In order to perform successful monitoring of management and fulfill basic, fiduciary duties, the directors are required to be involved, i.e. loyal and available. If they are enthusiasts, they will, regardless of the required time, be completely prepared and knowledgeable enough about business and be able to accomplish their role of a member of the board of directors (supervisory board). Furthermore, directors have to be proactive (initiative – innovative), to ask questions and insist on answers; otherwise they should not be on the board. They should also be informed, especially for the purpose of maintaining financial literacy which is necessary for measuring the financial performance of the company as well as for the maintaining the level of business common sense, which enables them to contribute to formulating and developing a sound company strategy. This is where the essential basis for acquittal lies after taking decisions using bad business judgment (business judgment rule). Furthermore, the ability and courage to manage challenge require independence in the board of directors (supervisory board) as well as the creating the atmosphere of constructive scepticism. Companies will benefit from the independence of the board of directors and its restrictedness in terms of decision-making and better judgment of what is in the best interests of the company. The board of directors (supervisory board) is responsible for creating corporate culture which censors wastefulness, dishonesty and selfish interests, while praising ethical conduct, integrity. In literature there is an emphasis on the need to avoid „check-the box“ mentality as well as the necessity of the structure of the board in terms of members with complementary knowledge, experience and skills. (Broutans, 2004.:57)

Directors are faced with dilemmas in their actions on a daily basis (practical dilemmas), in terms of whether they themselves or the circle of subjects to which they delegated the authority, are competent enough to make adequate decisions, i.e. to participate in decision-making; whether the operations they suggest are feasible or not; whether they are profitable or not; whether they are successful enough or not. It is possible that they share the opinions about each of the questions separately, but it still does not have to be accepted within the decision of the board as a whole. In principle, the obligation of every member is to be informed on all the agendas and to study relevant documents, but they are not obliged to participate in discussions, save exceptionally if they participate in the preparation of a draft decision, so it is necessary, at other members' request, for them to clarify some issues; then, when a person is invited as an expert to an area which is the subject of decision-making, or when they are in the conflict of interest, when their exclusion, as well as the explanation related to the matter, is necessary. In addition, if a certain board member disagrees with the decision of the majority, it is necessary for him or her to clarify his disagreement, in order for the fact to be recorded in written documents and reasoned adequately. In accordance with Article 415 and 447 LBC, if the damage in the society caused by violating a provision of the law, statute or parliamentary decision, is the result of the decision of the board of directors or supervisory board, all directors who voted for the decision are responsible for the damages. A director who abstained from voting is considered to have voted for the decision in terms of the existence of the responsibility for damages. Moreover, if the director was neither present in the board's meeting in which the decision was made, nor voted for it in any way, it will be

considered that he or she voted for the decision in terms of responsibility for indemnification unless he or she objected in written form within eight days after learning about the decision making. Ultimately, at the disposal of the director there is the possibility of insisting on the revision of the decision, on the demand upon the assembly of shareholders to review such decision and question the responsibility of the board and, finally, there is the possibility of submitting a justified resignation. (*Vasiljevic, 2007*) It can be concluded that the law provides instruments of protection of the legal and moral integrity of supervisory board members, i.e. directors, and it is upon them to decide, in accordance with all aspects of their personal integrity, if and which of the mentioned mechanisms they will use.

3. ON INTEGRITY IN GENERAL

It is a fact that integrity cannot be explained in one word only, but we defer to the opinion of Arnold Polman, according to which a person that is unbribable and honest with himself or herself (ethical dimension), coherent and irreproachable (psychological dimension), that is to say, complete (social and philosophical dimension) we consider to be a person of integrity. (*Buche, 2009.:13*)

As reported by Polman, a person of integrity wants to behave in accordance with his or her system of values all the time. However, it is still said that a person who possesses personal integrity is open to reconsidering his or her basic beliefs and is ready to dismiss them. In that sense, the person has to accept a whole range of commitments and resist temptations, especially attempts at seduction and manipulation. The person also has to create the impression of personal consistency. A person of integrity has nothing to fear as there is no reason for them to be attacked. (*Buche, 2009.:18*) Being true to oneself means that a person lives in accordance with their personal will, led by their personal principles, and that we discover their personal values in their words.

Creating a picture of oneself belongs to the area of psychological perspective of integrity. These aspirations can be found in the following areas: making a moral decision between what is best for the person as an individual and what is best for the community; decisions related to commitments towards oneself, but in different areas; making a decision among various different options.

Fairness means that a person has respect towards others, that the person recognizes irreproachable behaviour and avoids illegal means of putting pressure on others, such as corruption. (*Buche, 2009.:20*) Moral integrity is a characteristic of a person who is uncontested, whose views and interests are not in collision with attitudes and moral values of the environment. Potentially, a problem can appear if moral standards of the environment, in disturbed social relationship and values, are lower than the standards of the person in question. Consistency refers to people who stay true to themselves regardless of internal or external pressure, who keep their integrity and moral coherence even when others put them to tests. The social and philosophical dimension of integrity emphasizes the completeness of the three aspects mentioned above. (*Buche, 2009.:28*) Integrity means that the behaviour of a person is in accordance with the accepted moral values, and that the person himself or herself is honest, ethical and trustworthy. Values have to be moral, whereas the behaviour of a person should be ethical.

Integrity in companies refers to the humane side, corporate as well as individual. Organizations reflect the sum of the integrities of their people. A significant indicator of integrity is the extent to which a person is truthful and honest. Another indicator of integrity is the extent to which promises are kept. In addition, trustworthiness is also an indicator of integrity, i.e. the extent to which a person can be trusted that information communicated in confidence will not be passed on to a third party in an unauthorized or careless way. Integrity also implies taking responsibility for personal decisions and actions. (*Yukl, 2002*) The culture of integrity can be developed in organizations so that even employees with relatively low level of integrity can also develop. (*Ficke, 2005*) Virtues, such as honesty, self-control and others are not static as they develop through activities in different situations in life. (*Kretzchmar, 2002.:365*) Thus, active steps should be taken towards their development. Personal factors play the key role in the development of integrity of a company and its employees. The strategy of integrity involves systematic embedment of ethics in corporate values as well as in strategic planning. This includes interpersonal communication related to ethics, so that ethical conduct can be made into the key indicator of performance. The advice given in literature is that companies should consider the need for confidential process of informing which would neutralize deceit and other risks. (*Dekker, 2002*) Education in the field of ethics, especially through the devised trainings for managers and employees, should contribute to clarification of ethical values and improvement of their ethical

consciousness. Hence, the implementation of a two-way system of communication between employees and management is of vital importance.

The primary driver of integrity is a moral compass within which are property and life in accordance with the key range of values and principles. Integrity reflects key values which are universally accepted: respect, sympathy, intentions and objectives, self-control, optimism and enthusiasm. Inner drivers are: personal motives and ideals which affect integrity, general needs which lend them as a sensitive test for integrity, selfish and self-seeking behaviour. The functions of integrity can be cognitive and affective. Cognitive functions are: moral intelligence which is the ability to differentiate between right and wrong; self-inspection, which reflects self-knowledge (presupposes knowing one's personal mental states, including beliefs, wishes and sensations) and self-reflection (ability of a person to perform introspection and readiness to learn more about one's fundamental nature, purpose, and essence). The affective functions of integrity are: conscience as well as a rational and positive sense of self (self-respect).

The developmental context of integrity is created by parental roles and roles of other role models; religious context, cultural context and education; disciplined upbringing and idiosyncratic (unusual) life experiences. The competences (knowledge and skills) of integrity are self-initiative and self-motivation; moral courage and self-confidence; honesty; dedication; diligence; self-discipline; responsibility, fairness.

4. BUILDING MORAL INTEGRITY OF A COMPANY

When discussing the concept of building integrity of companies, it is inevitable to encounter contradictions. Namely, how is it possible to talk about a set of values and norms related to corporations when a management that decides on its behalf has its own values and norms which are often not in accordance with the behaviour of the company itself? How can the unity and completeness of a company be achieved, as *differentia specifica* of integrity, when the company itself consists of individuals who can work against its will at a certain point, consciously or not, under the slogan of working in company's best interests? In order to differentiate integrity of the company from the integrity of the members of supervisory board, it is first necessary to view the company as a moral subject. Three positions can be differentiated in response to the question of moral responsibility of company's activities (Kapteijn & Wempe, 2002):

1. *Amoral model* – This concept does not recognize moral responsibility as a significant concept. Moral responsibility in a corporate context is connected with personal responsibility of the employees of company. Namely, moral responsibility cannot be attributed to the company or the people who perform certain functions in it. This school of thought is related to representatives of neoliberalism (Milton Friedman, Friedrich von Hayek, and John Kenneth Galbraith). Starting from the assumption of free society, the idea of immorality of a company is just a cover for mechanisms which function badly in it.

2. *Functional model* – This model also rejects attributing responsibility to a company or stakeholders. It emphasizes that organizational character of actions in organizational context results in responsibility. The integrity of a company views, through responsibility, decision-makers on one hand, and on the other, the responsibility of employees themselves (participants). (Velasquez, 1983)

3. *Autonomous model* – views a company as a separate entity, as a social subject. The responsibility of a company viewed from the social perspective is separate from the responsibility of individuals who decide in its name.

So, all three models are related to a great extent and the fact that the integrity of a company is related to the integrity of decision makers i.e. directors or board of directors, can be assigned to them as a common denominator.

The autonomous model can serve as a good basis for determining the concept of integrity of a company. In this context, a company is defined as a collective body consisting of persons who act as moral agents and for this reason it can be morally responsible. (Velasquez, 1983) But the moral awareness of a company actually depends on the extent to which moral judgment is integrated in the actions of its employees. If the behaviour of supervisory board members, i.e. management, was hypothetically considered to be an activity of an adult mature person deprived of rational judgment when making decisions, then moral blindness could not be an excuse from moral responsibility of a company. Hence, company integrity depends on moral values of its employees. (Werhane, 1985)

A big advantage of this school of thought is its tendency to differentiate between the responsibility of individuals who decide in the name of company and the responsibility of employees without the possibility of decision-making and, of course, the responsibility of the company in general. The objectives of stakeholders, management, managers, employees and external advisers can be treated as primary intentions but keeping in mind that not all intentions of board members are part of corporate intentions. Therefore, intentions of a company can be treated as secondary intentions. (Werhane, 1985) The board of directors' intention is in the company's interest only if it helps the company to accomplish its corporate ideas. However, regardless of it being in the company's interest or not, it is difficult, sometimes even impossible, to separate the company's activity in general from the actions taken by its management. As an example we can state a gender and minorities discrimination lawsuit which company AT&T was charged for. (French, 1984) Namely, a high number of women and members of minority groups were dismissed as collateral damage caused by economic crises, while the number of the members of these groups who had ever been appointed to any of the managerial functions is very small. Although perhaps none of the employees discriminated against them consciously in direct contact, the company was still guilty of structural discrimination and was publicly stigmatized as such.

Summing up, a conclusion imposes itself - the integrity of companies cannot be judged based on one specific situation. It is more expedient to follow its activities over a longer period of time. The intentions of a company and related behaviour, as well as the consequences of such behaviour can be seen in different ways so that it gives rise to dilemmas. All actions that a company takes speak of its integrity. The situations in which stakeholders' expectations are opposed are especially interesting. At that point, a dilemma appears in terms of which current and course the company should defer to and why the chosen direction is superior to its alternatives. It should emphasize that even when a company is not capable of responding to the requirements of every stakeholder, it can still be responsible. A company's integrity does not only lie in the choices it makes, but also in the manner in which the choices are made. Which values the members of the board of directors were led by when they were making decisions which affected significantly the course of action of the company and its identity, but also whether at the same time all rights and demands of all stakeholders were taken into consideration and valorised as such. A company's integrity does not only lie in the choices it makes, but also in the manner in which the choices are made. In addition, it is determined by the values which the members of the board of directors were led by when they were making decisions which affected significantly the course of action of the company and its identity. And finally, the integrity of a company also depends on whether all the rights and demands of all stakeholders were taken into consideration and valorised as such.

It is the company that provides a frame for activities for the people that represent it. That frame, in turn, stimulates them or distracts them while fulfilling their obligations. Consequently, a company is a social and legal subject which exists autonomously with its goals (structured and goal-oriented cooperation of individuals), with its tradition (cooperation which has a long-term character). (Kaptein & Wempe, 2002) A company can thus be seen as a moral subject that can be judged according to moral norms. Therefore, the integrity of a company is something that is continuously developed, improved and preserved as it is its influence on the surroundings that its essence lies in.

5. CONCLUSIONS

Based on the above mentioned, we conclude that, if a board member had a dilemma regarding legality or illegality of actions and opted for an illegal decision, solutions in terms of ethical consequences could open further questions. Thus, it is possible that not discharging certain obligations of a company (entering the sphere of illegality) enables preserving business as such. Nonetheless, we believe that the dilemma concerning the choice of legal or illegal actions does not actually exist as a procedure dilemma, as the laws are the ones that determine the extent of freedom with its imperative and dispositive norms (the latter especially in the sphere of business decision-making). Resolving any business, moral and ethical dilemmas make sense, that is, they can be expected to manifest, but only outside the legal sphere. The ethics of decisions of directors and members of supervisory board should be considered in that sense and context (ethical normative dilemma: morality or amorality). Managers incorporate their characteristics when making business decisions with the aim to fulfill their obligation. Additionally, they strive to create consequences which are in the interest of the company. In this manner, they can encounter ethical dilemmas in terms of whether to be led by their character, the duty which results from their position, or consequences which they perceive. In this typically ethical dilemma, they actually decide on the supremacy of one of the basic ethical theories, i.e. measures of moral correctness of their actions (theory of virtue, theory of duty or consequential theory). Furthermore, ethical dilemma, which he can potentially be concerned with, is whether to defer to

morally monistic or pluralistic concept, i.e. whether to be exclusively concerned with the interests of owners, i.e. shareholders, or to be also concerned with the interests of a wider group of risk bearers, the so-called interest (moral) shareholders, the so-called internal and external stakeholders. We suppose that if all board members are ethical, and view their interest as company interests, it is realistic that they manage the company in such a way that they balance interests of all stakeholders and make satisfying decisions in the long run, i.e. that they direct the company towards corporate social responsibility. In this manner, the company is also satisfied with them in the long term, which enables positive ripple effects (long-term better paid employment in the board of directors, i.e. supervisory board). If, while making a decision, a manager encounters a conflict of the courses of actions when applying the same principles (e.g. usefulness, equality, rights or fairness), or perhaps a conflict of different principles, then the manager can find himself in a moral dilemma. In addition, the manager can face a dilemma if he or she is in a conflict of an accepted principle and circumstances of a situation, or personal interest or individual situation.

If a concrete action or a moral or ethical attitude were discussed from the point of view of reality, rationality, objectivity, description and cognitivist as opposed to counter realism, irrationality, subjectivism, normativity, or emotivism, we would be talking about meta- ethical analysis, i.e. meta- ethical dilemma.

When making a decision, directors, i.e. members of supervisory board, should take into account one of the leading moral principles, the principle of fairness. Fairness can have different criteria: it can be based on the needs of those involved in creating a value, or their merits gained from creating the value. Justice consists of giving every person his or her due, treating equals equally and non-equals non-equally. The principle of rights, as the basic principle when moral decisions are made, is based on the respect of rights written in the fundamental and often the supreme legal acts of a state. The fundamental human rights cannot be suppressed by the principle of utility. If there are rights, there are also duties of those who have to respect those rights or create conditions so that they can be respected. Directors are certainly the people who are bearers of duties established by the law, which we have discussed. The principle of utility is based on the fact that moral activity is the one that increases the amount of good, and to this principle the principle of fairness is often added, too. A utilitarian analysis, measures both good and bad impacts of an activity on every person that is affected by it. Therefore, this analysis is established in the stakeholder approach to corporate management.

Rules can serve as a frame for creating public trust, for creating trust in corporate accountancy and creating a system of disclosure and indemnities. Nevertheless, for that trust to be actually incorporated in a corporation, the corporation has to be led by a proactive board of directors (supervisory board), who believe in corporate integrity and ethical behaviour, promote them, and in that way contribute to developing loyal employees, clients and other interest stakeholders.

CORPORATE SOCIAL RESPONSIBILITY – IMPERATIVE OF THE CONTEMPORARY BUSINESS

Jelena Premović¹, Slavoljub Vujović², Ljiljana Arsić³

The accelerating economic growth and inefficient use of natural resources, following intensive industrialization in the second half of the 20th century, has reinforced structural effects of the global crisis that is most strongly reflected in the field of ecology. Consumer lifestyles and environmentally destructive technologies have led to the intensification of the already existing environmental problems. Emerging problems of the entire human society can be solved by applying the concept of sustainable development and raising awareness regarding the necessity of implementation of basic environmental standards and social responsibility in business. Corporate Social Responsibility (CSR) is the responsibility of an organization for the impact of its decisions and activities on society, the environment and its own prosperity. It is a moral responsibility to the stakeholders that influence the activities of the organization by which organizations wish to harmonize their relations with all sorts of social actors who may have an impact on their business.

Following these facts, the authors analyse the social-economic environment and emphasise the importance of corporate social responsibility for contemporary business.

Keywords: economic growth, environment, pollution, ecology, sustainable development, CSR.

1. INTRODUCTION

Damage of the biosphere and the depletion of many raw materials, pollution and degradation of air, water and soil pollution, global climate change, endangering of the health and deterioration in quality of life, are the main manifestations forms of crisis that has gripped the planet at the end of the last century.

Technical and technological achievements were accompanied by demands for increased productivity and quality of products and services. On the other hand, these phenomena and processes in the global economy and society, have influenced the changes in the environmental sphere and to specific environmental problems are gradually gaining multiply growing, global dimension. Increase the physical volume of production in response to the growing needs of consumers and society, caused a disturbance of the environment by increasing pollution of the environment.

Therefore, in post-industrial society has developed the idea of the necessity of reducing the use of natural material resources for the benefit of increased use of non-material resources in the form of knowledge, information and new (green) technologies.

2. SUSTAINABLE DEVELOPMENT AND BUSINESS ENVIRONMENT

The accelerating economic growth and inefficient use of natural resources, following intensive industrialization in the second half of the XX century, reinforced structural effects of the global crisis that is most reflected in the field of ecology. Spending lifestyles and environmentally destructive technologies have led to the intensification of the already existing environmental problems. Taking into consideration today's development of science, it has been generally accepted that it is necessary to integrate ecological requirements and basic ecological standards into the concrete national developmental policies, as well as the global international developmental policy (Premović, Arsić & Boljević, 2012).

According to these global social and economic changes, at the beginning of the XXI century dominant role in national economy development has theory of sustainable development. The basis of the sustainability is the environment itself, and managing its capacities, in the function of further progress and development of people, but in such a way that the environment is not put in danger and completely destroyed. Having the basic meaning of the term in mind, sustainable development refers to enabling development during time.

Sustainable development has been defined in many different ways, but all definitions require systematic and holistic approaches which will allow us to understand the entire world as a complex system. The term

became an integral part of the vocabulary in the practice of developmental planning and political decision-making, after it had been used in the report "Our Common Future" the World Commission on Environment and Development in 1987. In this report, well known as the Brundtland's Report, sustainable development was defined as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs". It contains within it two key concepts:

- the concept of needs, in particular the essential needs of the world's poor, to which overriding priority should be given; and
- the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs" (WCED, 1987).

At the core of sustainable development is the need to consider "three pillars" together: society, the economy and the environment. No matter the context, the basic idea remains the same – people, habitats and economic systems are inter-related (Strange & Bayley, 2008, p. 27).

Sustainable development is a way of thinking about how we organize our lives and work so that we protect our most precious resource - Planet, a way to promote economic growth, rational utilization of resources, and environmental protection for the benefit of the quality of life. As a life philosophy, it is a complex and long-lasting process aiming to satisfy our today's needs, not destroying resources of the future generation! Defined like this as a responsibility toward environment, future generations and intensity of satisfying the needs, it can be applied as a national policy with different aspects: economic, demographic, social, cultural, urban planning, infrastructure, etc. (Sinadinovska-Shumar and Donev, 2010).

As Strange & Bayley conclude, sustainable development is about integration: developing in a way that benefits the widest possible range of sectors, across borders and even between generations. The concept of sustainable development has been used to articulate several essential shifts of perspective in how we relate to the world around us and, consequently, how we expect governments to make policies that support that world view. First, there is the realization that economic growth alone is not enough: the economic, social and environmental aspects of any action are interconnected... Next, the interconnected, or interdependent, nature of sustainable development also calls for going beyond borders – whether they are geographical or institutional – in order to co-ordinate strategies and make good decisions... Finally, thinking about human actions has had to undergo a temporal shift: put simply, we should consider the impact of a given choice beyond the short term (Strange & Bayley, 2008, pp. 24-26).

3. SOCIAL RESPONSIBLE BUSINESS

Contemporary corporations represent organizational systems with usually large number of interested parties in the results of their activities. Various parties have different interests and different objectives which might creates conflict in their realization. This is one of the most common problems that strategic management in contemporary corporations must face. The answer to this problem may lie in adequate implementation of stakeholder concept, which respects interests of all interested parties, but with their previously prioritization (Vujović, Stefanović & Vučurević, 2009, p. 273).

Companies that want to work successfully in contemporary business society must respect the presumption of sustainable development and environmental standards in planning their business activities and defining organizational goals. Therefore, in making many business decisions, modern managers need to analyze not only economic, but also the ecological and environmental dimension in the determination of cost-effectiveness of a particular job. In addition to responsibility for the successful operations of the company led by managers also have some social responsibility (Premović, Arsić & Milićević, 2011, p. 112).

Differences in business ethics can lead companies to take different views on what their responsibility is. The way each company makes and solves everyday business problems shows its attitude about its stance on social responsibility. In carrying out organizational activities managers must take into account the impact of internal stakeholder interests or insiders, but the external stakeholder's called outsiders.

Corporate Social Responsibility (CSR) is the responsibility of an organization for the impacts of its decisions and activities on society, the environment and its own prosperity, known as the "triple bottom line" of people, planet, and profit. Not only do responsible, sustainable and transparent approaches help build brand and reputation, they help strengthen the community and therefore the marketplace. A solid business plan,

embedded into the business culture, reflecting organizational values and objectives through strategic CSR application, will help to build a sustainable and profitable future for all (<http://www.mpiweb.org/About/CSR>).

Table 1. Forms of Socially Responsible Behavior (Gareth & Jennifer, 2008, p. 154).

Managers are being socially responsible and showing their support for their stakeholders when they:

- Provide severance payments to help laid-off workers make ends meet until they can find another job.
- Provide workers with opportunities to enhance their skills and acquire additional education so that they can remain productive and do not become obsolete because of changes in technology.
- Allow employees to take time off when they need to and provide health care and pension benefits for employees.
- Contribute to charities or support various civic-minded activities in the cities or towns in which they are located. (Target and Levi Strauss both contribute 5% of their profits to support schools, charities, the arts, and other good works.)
- Decide to keep open a factory whose closure would devastate the local community.
- Decide to keep a company's operations in the United States to protect the jobs of American workers rather than move abroad.
- Decide to spend money to improve a new factory so that it will not pollute the environment.
- Decline to invest in countries that have poor human rights records.
- Choose to help poor countries develop an economic base to improve living standards.

"The concept of sustainable development births a new concept - the concept of corporate social responsibility. CSR is assumed the involvement of the business entity in the social and community development programs in the field of health, environment, sports, culture, assisting vulnerable people, implementation of health (clean) technology, prudent use of resources, training employees on environmental protection, public reporting on success and its consequences, funding research projects of a wider social significance that are not strictly related to the activity of the company. Therefore, the socially responsible companies overcome once the primary target acquisition and distribution of profits by integrating into the process of solving social problems" (Boljević, 2008, p. 20).

Corporate social responsibility is the responsibility of enterprises for their impacts on society. Respect for applicable legislation, and for collective agreements between social partners, is a prerequisite for meeting that responsibility (European Commission, 2011, A renewed EU strategy 2011-14 for Corporate Social Responsibility, retrieved from http://ec.europa.eu/enterprise/policies/sustainable-business/corporate-social-responsibility/index_en.htm).

„Social responsibility refers to the task or duty manager to make decisions that respect, protect, strengthen and promote the welfare of the stakeholders of the organization and society as a whole. Corporate social responsibility is a moral responsibility to the stakeholders that influence the activities of the organization“ (Petrović & Vuković, 2009, p.184).

CSR is a process in which companies wish to harmonize their relations with all sorts of social actors who may have an impact on their business. According to Hitt et. al. „corporate social responsibility is concerned with the obligation corporations have to constituencies and the nature and extent of those obligations.

Companies have a wide variety of constituencies including current shareholders, customers, employees, specific communities, society at large, governments, and so on" (Hitt, Black, & Porter, 2009 p. 49).

„A company's stance on social responsibility is the way its managers and employees view their duty or obligation to make decisions that protect, enhance, and promote the welfare and well-being of stakeholders and society as a whole“ (Gareth & Jennifer, 2008, p. 153).

“CSR is about how companies manage the business processes to produce an overall positive impact on society” (Baker Mallen, CSR-What does it mean?).

Corporate Social Responsibility is a concept whereby companies integrate social and environmental concerns into their business operations and in their interaction with their stakeholders (employees, customers, shareholders, investors, local communities, government), on a voluntary basis...CSR is closely linked with the principles of sustainability, which argues that enterprises should make decisions based not only on financial factors such as profits or dividends, but also based on the immediate and long-term social and environmental consequences of their activities (www.industryplayer.com/corporate-social-responsibility.php)

Figure 1: Corporate social responsibility (www.industryplayer.com/corporate-social-responsibility.php)

Traditionally in the United States, CSR has been defined much more in terms of a philanthropic model. Companies make profits, unhindered except by fulfilling their duty to pay taxes. Then they donate a certain share of the profits to charitable causes. It is seen as tainting the act for the company to receive any benefit from the giving.

The European model is much more focused on operating the core business in a socially responsible way, complemented by investment in communities for solid business case reasons. This model is, according to Baker, more sustainable because:

1. Social responsibility becomes an integral part of the wealth creation process - which if managed properly should enhance the competitiveness of business and maximise the value of wealth creation to society.
2. When times get hard, there is the incentive to practice CSR more and better - if it is a philanthropic exercise which is peripheral to the main business, it will always be the first thing to go when push comes to shove (www.mallenbaker.net/scr/definition.php).

In October 2011 the European Commission published a new policy on corporate social responsibility. The new policy puts forward an action agenda for the period 2011-2014 covering 8 areas:

1. Enhancing the visibility of CSR and disseminating good practices: this includes the creation of a European award, and the establishment of sector-based platforms for enterprises and stakeholders to make commitments and jointly monitor progress.
2. Improving and tracking levels of trust in business: the Commission will launch a public debate on the role and potential of enterprises, and organize surveys on citizen trust in business.
3. Improving self- and co-regulation processes: the Commission proposes to develop a short protocol to guide the development of future self- and co-regulation initiatives.
4. Enhancing market reward for CSR: this means leveraging EU policies in the fields of consumption, investment and public procurement in order to promote market reward for responsible business conduct.
5. Improving company disclosure of social and environmental information: the new policy confirms the Commission's intention to bring forward a new legislative proposal on this issue.
6. Further integrating CSR into education, training and research: the Commission will provide further support for education and training in the field of CSR, and explore opportunities for funding more research.
7. Emphasizing the importance of national and sub-national CSR policies: the Commission invites EU Member States to present or update their own plans for the promotion of CSR by mid 2012.
8. Better aligning European and global approaches to CSR:
 - the Commission highlights the OECD Guidelines for Multinational Enterprises,
 - the 10 principles of the UN Global Compact,
 - the UN Guiding Principles on Business and Human Rights,
 - the ILO Tri-partite Declaration of Principles on Multinational Enterprises and Social Policy,
 - the ISO 26000 Guidance Standard on Social Responsibility.

A report on the implementation of this action agenda should be published in time for a review meeting scheduled for mid 2014 (European Commission, 2011, A renewed EU strategy 2011-14 for Corporate Social Responsibility).

4. APPROACHES TO SOCIAL RESPONSIBILITY

As is told, differences in organization structure, culture and ethics can lead companies and their managers to take different views on what their responsibility is towards their stakeholders and their environment, at whole. According to Gareth R. Jones and Jennifer M. George, there are four basic approaches to social responsibility. The strength of companies' commitment to social responsibility can range from low to high, which is illustrated in figure 1.

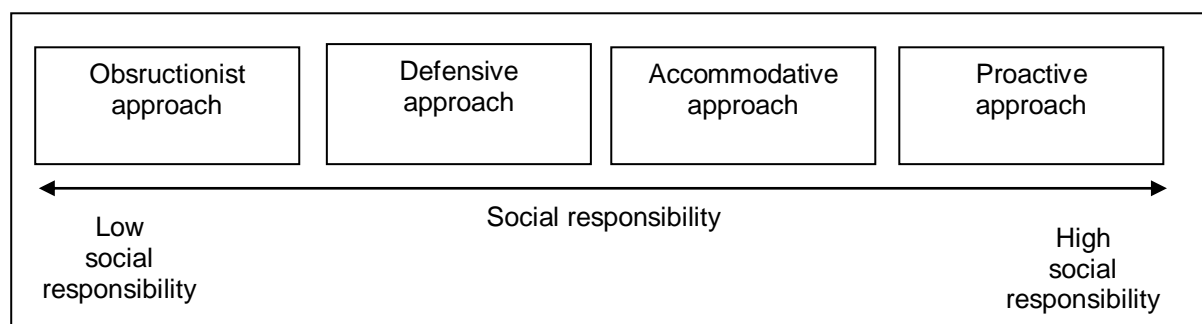

Figure 2. Four Approaches to Social Responsibility (Gareth & Jennifer, 2008, p. 155).

At the low end of the range is an obstructionist approach, in which companies and their managers choose not to behave in a socially responsible way. Instead of social responsibility behave, they choose to behave unethically and illegally.

A defensive approach indicates at least a commitment to ethical behavior. Defensive companies and their managers stay within the low and abide strictly with legal requirements but make not attempt to exercise social responsibility beyond what the low dictates - thus they can and often do act unethically.

An accommodative approach is an acknowledgment of the need to support social responsibility. Accommodative companies and their managers agree that organizational members ought to behave legally and ethically and they try to balance the interests of different stakeholders as the need arises. Companies and their managers taking a proactive approach actively embrace the need to behave in socially responsible ways. They go out of their way to learn about the needs of different stakeholders groups and are willing to utilize organizational resources to promote the interests of all stakeholders (Gareth & Jennifer, 2008, p. 156).

Strategic corporate social responsibility perspective

A more recent approach to corporate social responsibility is strategic corporate social responsibility perspective. Strategic corporate social responsibility perspective is a three-criterion model of CSR that can help managers focus on social areas where there is the highest possibility of creating shared value for the business and society. In other words, it argues that three fundamental criteria can guide managers. The first criterion takes an "inside out" approach. It means that managers can look inside the company at issues that are more rather than less important as a function of the company's strategy and business activities. The second criterion takes an "outside in" approach, by which it means that managers can look outside the company at issues that the company has an impact on. The third criterion takes an "outside out" approach which means that managers should look at social issues in general, in terms of the extent to which they are problematic. However, the strategic corporate social responsibility approach tries to address the balancing act managers have to engage in when it comes to responding to the concerns of all the firm's stakeholders. It does not advocate looking at all social issues but rather assessing those that come into focus as a function of the first two criteria (Hitt, Black & Porter, 2009, pp. 55-57).

„A strategic approach to CSR is increasingly important to the competitiveness of enterprises. It can bring benefits in terms of risk management, cost savings, access to capital, customer relationships, human resource management, and innovation capacity. By addressing their social responsibility enterprises can build long-term employee, consumer and citizen trust as a basis for sustainable business models. Higher levels of trust in turn help to create an environment in which enterprises can innovate and grow“ (European Commission, 2011, A renewed EU strategy 2011-14 for Corporate Social Responsibility).

6. CONCLUSION

Business activity affects all aspects of people's business and lives, so the way each company manages and solves everyday business problems shows its attitude about its stance on social responsibility. Ethical organizational cultures encourage organizational members to behave in a socially responsible way. Responsible business conduct is especially important when private sector operators provide public services. Helping to mitigate the social effects of the current economic crisis, including job losses, is part of the social responsibility of enterprises. Corporate social responsibility offers a set of values on which to build a more cohesive society and on which to base the transition to a sustainable economic system (European Commission, 2011, A renewed EU strategy 2011-14 for Corporate Social Responsibility). If companies and their managers behave in a socially responsible manner, then they can have several advantages. First, socially responsible manner, helps a company to build a good reputation that can enhance profitability and build stockholder wealth. A second major reason for companies to act socially responsibly toward employees, customers, and society is that in a capitalist system companies, as well as the government, have to bear the costs of protecting their stakeholders, providing health care and income, paying taxes, and so on. So if all companies in a society act socially responsibly, the quality of life as a whole increases (Gareth & Jennifer, 2008, pp. 156-157).

As a specific process of harmonizing relations between company and their stakeholders and society overall, CSR has the important role in the social and economic environment, more and more. It can be safely said that corporate social responsibility becomes a kind of imperative of the contemporary business.

Abstract: *This paper is an attempt to highlight the issues of constantly expanding and growing educational needs and their corresponding trends and changes, an attempt to emphasize the importance of management in education and the impact of education on socio-economic development of Serbia. Implementation of management principles in education is a fundamental prerequisite for internal and external efficiency of education system, with significant implications on the socio-economic development of Serbia, which is primarily determined by the general level of education. The desired outcome of implementing scientific research results to educational uses is the change in individuals, as well as the acquisition of practical skills and abilities. In the history of Serbia, education has always contributed to the inner rise of the Serbian people and was a strong factor in its overall development and spiritual liberation.*

Keywords: *education, science, socio-economic development, management*

1. INTRODUCTION

Research work, analysis and interpretation of the results of the research, as well as of other, similar research works, contributed to recognition, definition and understanding of the indisputable contribution of management in education to the development of science and education (educational programs' offer) and of their influence on the positive socio-economic changes and overall development of the Republic of Serbia.

Generally speaking, the entire world is changing, and science and education are the key factor of this change. New discoveries help discover new horizons and demands, new engagement in the implementation of change.

Successful socio-economic development is achieved through knowledge, and knowledge is acquired through education. Thus, numerous questions are opened that need to be answered in the process of development of education, and education thus acquires attributes of one of the main factors of social development.

Karavidic (2006) point out that "The education is a sound basis and safe foundation of each properly organized state and it is a measure of progress of individual societies" (p. 8).

Economic development rates are to a significant extent defined by the available offer of educated work force.

Answers to many challenges, time in which we are living, inevitably unavoidably comprises of dealing with the basic questions, such as the following:

- Possible contribution that the education may provide to the socio-economic changes and its assistance in development strengthening;
- Potential contribution of education, and especially of teaching and research, to the organization of modern society and their greater involvement in actions aimed at poverty reduction, strengthening of the basic principles of civil society and development of other levels and forms of education;
- Answer that the education can provide to the changes in the area of work and civil culture that on its part should to provide answers to the challenges (which implies strengthening of academic and professional qualifications, as well as of the civil and personal qualities).

The following can be concluded from the above questions: What is and what should be the role of education in the society today and in the society in the future?

2. MANAGEMENT IN EDUCATION AND SOCIO-ECONOMIC DEVELOPMENT

To dig into the ideas about education is to perceive origins of problems that are nowadays important issues in the development of education and its contribution to the socio-economic development.

We may despair, introduce savings measures by closing down smaller schools, think about changing the network of schools and continue to lose quality staff in education...

This would imply opening door for defeat by surrendering to despair, reducing competencies and scientific and educational potentials and their contribution to socio-economic development through reductions of expenditures, neglecting aspects in which we have traditionally proved to the best, surrendering quality and industrious experts to other countries...

Wouldn't it be better to increase investments in human resources and implementation of a new doctrine and management application in education? The aim for the educational institutions is to position themselves as responsible and organized institutions that follow modern trends and satisfy the needs of their users in a quality manner (the needs of pupils, students, and of the society in general, too), by creating the culture of learning and by enhancing the values of human resources' capital as an expression of a wish for the future.

It is necessary to leave the door wide open for science and education to bring innovations, new curricula and initiatives with clearly controlled criteria for quality through implementation of management in education. In addition to this, national interest in respect of education must be expressed and defined, along with the regional, local and other interests of the society, and awareness must be built about the interactive liaisons between the socio-economic development and education. It is due to the future development of Serbia that the education must be given a chance in its search for a new identity, which primarily pertains to the change of the fully developed parasitical and subordinate mentality of education (its dependence on politics, economics, etc.), and the change of its mentality of "second class traveller in the train for the future". The historic contribution of education in creation of national structure that was necessary for the functioning of Serbian economy and society, national culture and elite and as a channel of social mobility must not be forgotten at that. Regardless of the level of destruction that the educational system has suffered so far, it is still of far better quality than everything else that can be found in Serbia today.

Education is the "central nervous system" of each society – educational, cultural chain that vibrates incessantly. In this chain, an educated and skilful manager should make an important link, in addition to the educators, teachers, professors and others.

Managerial skills can be generated only through a combination of theory and practice. It is generally known that a manager is required to possess capacity for innovativeness and management in planning, organization, coordination and control of task implementation of educational institutions.

Positions and opinions in respect of the characteristics that essentially characterize a manager differ. Regardless of whether it is about approaches according to which the experience acquired lies at the core of management, or about the skills acquired, or about a scientifically based discipline, an additional qualification is always present in the background of all of these positions: a special spirit lies at the core of management in education, a specific philosophy that requires a certain state of mind, a system of values, i.e. a specific standpoint in relation to the key questions about the behaviour in the course of operations and in relation to the operations of educational institutions.

The basic question is: how to keep idiosyncrasy and peculiar characteristics of one's personality and at the same time fit in the existing environment and changed circumstances?

Since management is never an entirely finished process, this very fact presents a special challenge for managers who should learn more, grow and develop their skills to achieve goals that are set quite high. Basic principles in business are especially prominent, such as the flexibility, accessibility in

communication, energy investment, need for understanding and establishing communication lines, team work development, creation of good and positive atmosphere, well thought-out public presentation.

In order to achieve a goal in this course of ideas and in order to overcome potential obstructions and barriers, the so-called 'bridges' are set up (freedom of thought, expression and communication). In management of education, information conveyance is of utmost importance. Information is a notice, announcement, a piece of data, but it additionally involves the organization, choice and creation of a certain job.

Usefulness of management in education and achievement of educational development goals are reflected in abandoning of principles of traditional static-functional principle of business activities of educational institutions and their focus on changeable and flexible organization of education that assumes different shapes with the changing demands of the socio-economic development. Development that strides towards the present, which implies harmonization of economic and overall social growth and development on one hand, and the quality of life, i.e. of the acceptable standard of living, on the other. Development that does not jeopardize the potentials of the future generations for satisfying their needs, i.e. the survival of the future generations.

Development implies innovation as a process in which new technologies are to be generated, a new way to do business, etc., and from the aspect of sociology, it implies that the great social and structural changes will additionally be created in the process of institutional transformation as well.

Successful development requires adequate knowledge, innovativeness, accountability, initiative and innovation, and a great deal of work. In addition to this, the new market reality demands flexibility and fast changes in education in compliance with the developmental needs.

Education level of the general population is an indispensable indicator of the achieved level of social development in each society. Higher level of education implies a higher level of ability to perform complex tasks that involve responsibility in a society and it also exert influence on all the areas of social life – economy, politics, culture, health care culture and social security. Education provides for permanent development of values.

Economic crisis intensifies interest for the place and role of science and education that are a treasury of valuable experiences adaptable to the present stage of development in Serbia, through intensive research in different area of activities, generating of ideas, as well as through the development of methods and techniques for problem solving in practice, which under the present conditions implies speed, optimum costs and innovativeness.

The necessary changes are primarily related to the changes in people's attitudes (in their motivation levels, knowledge, criteria, individual behaviour and group behaviour, capabilities and other personal characteristics).

The basic criterion for progress must be founded in the accumulation of acquired knowledge and education. Ability-based selection makes a social system become more rational and economical, since it does not allow the less capable ones to waste our time. Goals in education must be clearly specified. Once the goals and tasks are specified, adequate methods must be found, too, together with forms, means and organization of education. This can be achieved through constant professional improvement, following and selection of new scientific achievements and knowledge and necessary changes, through implementation of management in education.

Modernization of society and state and focus on the modern economic and technological development imply innovations in global goals of science and education in Serbia.

In order to set the development of Serbian society in motion towards a learned society, in addition to the formal education it is necessary to also develop readiness and capacity for continuous professional improvement and lifetime learning as a whole. In addition to a well structured formal system of education, it is also necessary to have an adequate system of institutions, organizational forms and programs that are not included in the formal system of education, through which the capacity for continuous, lifetime learning will be realized and nurtured, based on the premise that:

The manifestation of lifetime learning is an integral part of holistic education;

- A corrective of the regular educational system;
- An innovative mechanism of the educational system;
- A strong factor of economic development;
- It increases professional mobility.

This is based on facts that the mental abilities must be maintained, enriched and strengthened through self-motivated learning and self-education.

Revealing ignorance is only a means for spreading knowledge. People learn about the world by using their common sense, and their common sense motivates people to reach the treasures of knowledge that will enrich their personalities and minds by means of correcting their own minds and education.

Modern developmental tendencies in the countries with market economy have shown that science and education are at the very top of priorities of the global national strategies and policies of socio-economic and technological development and progress. It is about such social organizations that are based on knowledge in which science and education have the status of basic instruments of the entire socio-economic development, finding solutions to the basic social problems and production of social, economic and technological changes.

The best abstract of research into the scientific and educational benefits for socio-economic development lies in the change in individuals (characteristics and forms of behaviour of individuals) and in the changes in society. These changes can produce far-reaching consequences for economy and society, and even for the course of history. By summarizing the main findings about the influence of education to the socio-economic development and to the society as a whole, it has been concluded that the education:

- Significantly improves the knowledge levels, intellectual tendencies, and the similar;
- Helps people in finding their own identities and in their individual choice of lifestyle;
- To a great extent, education increases people's practical competencies, flexibility and tolerance in their capacities of citizens, workers, family members and consumers, and influences their choice of leisure-time activities, their health and their general abilities for coping with the problems in life.

The main influence that the education exerts is on the practical abilities, skills and generally applicable characteristics, such as: the verbal skills, essential knowledge, rational approach to problems, intellectual tolerance, future orientation, adaptability, self-esteem, and so on.

Changes in individuals that came as the result of the influence of science and education are transferred to their children and to future generations.

It is indisputable that the educated people exert influence on their social environments (on the predominant interests, values, attitudes, behaviour, etc.).

These effects can be manifested in different areas, including creativity, family planning, care about children, quality of schools, appreciation for arts, culture and learning, health care services, political participation, understanding of social issues, acceptance of social changes, as well as the sense of shared culture and social solidarity.

Science and education additionally serve to preserve cultural heritage and they enhance civilization.

Despite the fact that a convincing argument about the role and contribution of science and education to the socio-economic development has been proposed in the economic texts, the reason why education makes people become more productive remains relative, as well as the alleged effect of "spilling over" of education that can indirectly contribute to development.

It is obvious that the development process is linked not only to the growing levels of education, but also that the link between education, political and economic development is dubious under extreme conditions (political instability, corruption, violence, etc.).

In essence, relations among science, education, population growth and economic development are complex, and especially when directed towards the socio-psychological research works through transformation of values and attitudes that have direct implications on development.

Science and education in socio-economic development contribute to the capacity to transform individual attitudes and values from the "traditional" ones towards the "contemporary" ones, and thus by strengthening the rate of structural modernism in a society, they increase the rates of socio-economic development.

Another contribution highlights the role of literacy and improvement of communication in development. Many researchers have claimed that the written tradition is of essential importance for the origins of "formal rational thinking" in every society. Others point out that if development depends on efficacious dissemination of new information, the role of science and education in complex social systems in particular lies in their influence on costs of such information dissemination processes. This is above all manifested in facilitation of communication processes that are of vital importance for socio-economic development.

Although the research in social sciences has provided a series of convincing hypothesis pertaining to the "intervening variables" that serve to explain the relationship between science, education and socio-economic development, direct political implications of these researches in Serbia are in no way obvious (preliminary results of research works are used selectively to justify the educational policy for quite different and often political reasons).

However, broader terms of institutional transformation that are linked to the development imply that both the scientific and educational institutions (both the formal and informal ones) have to undergo adequate transformations in their functions. The balance is tipped towards the use of educational institutions that act as agents in the selection and division of individuals and groups that play different economic roles and take up positions in social structure. Thus, education becomes an independent variable in the process of social changes and as the structural differentiations grow, it can facilitate or even obstruct the development process. Concrete problem of measuring the influence of improvement of educational input on the economic output must be looked at in a broader historical, socio-economic and sociological perspective that attempts to explore the problem of relationship between science, education and development in the broadest sense.

Basically, the interactive relationship between the economic and educational dimensions is being highlighted, since the opinion that the educational basis is the prerequisite for sustainable development is broadly accepted throughout the world (the developed countries suggest the threshold of 30 to 40 per cents).

Science and education are the basis of socio-economic development, and vice versa, socio-economic development is the basis and function of education, since the development of society is above all conditioned by the level of development of science and technology that are before all the result of education. Similarly, we have ventured in "an unforgivable age". Rules are constantly changing, and the economic and social environment is changing with them. Changes in reality are faster than the spontaneous, reflex thought.

The main problem lies in the question of whether there is a politically articulated, convincing alternative to something better compared to the existing state and whether there are socio-cultural and political subjects that are sufficiently strong to achieve it. This is even more so since all the paradoxes of our society result from the antagonism of the real and promised socio-economic development.

The conflict and confusion among different goals of changes and means of their realization is very prominent and at the same time burdened with excess expectations for reduction of inequalities under the present conditions of life and life chances of people (Karavidic, 2006).

There can be no socio-economic development or way out of the crisis without a road to economic freedoms (creation of new values, road to entrepreneurship, business, etc.) where science and education play a significant role.

Reforms are concessions to spontaneity of organic development, natural tendencies in economy, and in a broader sense – freedom of creation.

Huge costs of inaction over a long term have come as a result of many trends that are nowadays unsustainable, as well as of wrong choices and erroneous solutions in relation to production, technology, infrastructure, agriculture, use of natural resources of Serbia, etc.

Political elite and missionary intelligentsia that are used to loans approved under favourable conditions, donations, sponsorships, etc., and they use the international economic crisis for their excuses.

Aimlessness, lack of one's own road of socio-economic development, inability to bridge the transition and socio-economic crisis have all been transformed into "the only way", regardless of whether the road to the EU is called 'reformist' or somewhat else.

On that road, science and education could become a bridge between the "outer world" and the "inner world", between the world "that is somewhere over there" and the world "that is here exactly". In science and education, questions are as important as the answers themselves. It is the place where generalizations must give way to concrete actions.

The process of change in the area of science and education has, so far, however, been impoverished in its content, and the quality of changes has been made completely uncertain, because the changes have been treated as the ultimate goal, and not as a road and means to arrive at a socially formulated aim. Social and economic environment has thus not been achieved to be a fertile soil for the realization of sound and reasonable reform in science and education that is adjusted to suit the needs of the socio-economic development of Serbia. The reason for this lies in the fact that the process of reforms in education has been embarked on with little knowledge and with even less practical experience, with purely theoretical assumptions of the great philosophers. Their complete blending in the social system has brought in question their other values that enhance and maintain society and that are a factor of its progress.

Kokovic (1994): "Science and education should not sink into the social life, but they should encourage creativity and reveal the reality of the social life" (p.83).

With the weakened state, new patterns of consciousness have been imposed, coupled with the appearance of know-it-all and omnipotent individuals and non-governmental organizations and their famous veteran activists and ideologists of civil society, attested "Bologna missionaries" and persons that are allegedly worried about or concerned with the change in the prevailing mindset of the Serbian people.

Avramovic (2010): "Non-governmental organizations with segmented and strictly functional organization bring in the spirit of special interests and fragmentary knowledge and skills in Serbian education" (p.27).

New post-modernist forms: trainings, educations, consultations, courses, workshops and the similar, that are quite often organized outside the Serbian borders, and the question of the real purpose of such type education remains, just as whether it serve to undermine the results, tradition and standing of the educational institutions.

The following question arises: What does our society do today to fight the grey economy, business logic and corruption in education? Almost nothing?

The policy of equal chances has been abandoned, and changes are being limited to the internal approach (of the Universities, faculties, schools, teachers, curricula and textbooks). The biggest confusion lies in the relation between the national and the global.

Karavidic (2010) point out that "In the practice so far, rationality of goals has been sacrificed to the rationality of means" (p. 97).

Discussion about education is movement on a broader social level the end goal of which is an invitation to a new understanding of the mission, role and function of education.

3. CONCLUSION

General conclusion is as follows: it is necessary to create a vital and creative society, which is versatile and harmoniously and integrally developed, ready and qualified to face very rapid and constant developmental changes.

Education is expected to produce workforce that will not simply be the people looking for a job, but people who are capable of becoming successful entrepreneurs and jobs' creators. In this process, elimination of shortcomings in management is of utmost importance.

Changes require activities within the educational process, that is, in everything that the educational system can make more efficient and effective, while at the same time liberating it from the unnecessary waste of energy.

It is indisputable that the socio-economic development in Serbia is a precondition for reforms of education, but it can hardly be considered a political priority as well, and also that the role of education as an instrument of socio-economic development will be highly changeable over time.

"Big problems that we face cannot be resolved on the level on which we have created them". (Albert Einstein)

In order to accommodate demands that characterize modern business activities of educational institutions and their contribution to the socio-economic development, the active directing concept – the management concept - is being used, which provides for the focus on goals, flexibility and control over achievement of educational results.

ROLE AND IMPORTANCE OF MANAGEMENT IN HIGHER EDUCATION TODAY

Jelena Dakić

Higher Education Technical School of Professional Studies in Novi Sad, dakic@vtsns.edu.rs

Abstract: *The author has estimated that the best way to show the role and importance of management in higher education is to present higher schools in the past and present. The Higher Education School of Professional Studies, established by the state and quite different from other organizational types of higher education institutions, has been chosen as a model example. Differences significantly reflect on the behavior, role and importance of management. The effects of novelties arising from the implementation of the Bologna Declaration and even a draft higher education strategy have also been taken into account. The obtained results and views are the outcome of studying former advanced schools in the past and analyzing results of vocational higher education schools today.*

Keywords: management, higher education school, national strategy, standards, accreditation

1. INTRODUCTION

In our educational system, higher education institutions can be organized as universities, higher education schools of academic studies, academies of professional studies, and higher education schools of professional studies (Narodna Skupština Republike Srbije, 2005), (Komisija za akreditaciju i proveru kvaliteta i Nacionalni savet za visoko obrazovanje 2010). All of them can be private or state-founded. Some of these organizational models already exist, others do not; some truly function, others just figuratively. Attitudes on the role and importance of management in them all probably do not differ much. However, as this claim is not firmly grounded, the discussion herein will only refer to the model of the higher education school of professional studies. This higher education profile in Serbia is mostly of technical character and within the technical and technological field, so the reasoning on the issue is determined in that direction.

From the year 2000, the practice of appointing directors in higher education schools, still called advanced schools at the time, was changed, so that they were not appointed by the minister of education. There were some concerns about how this will function or malfunction. In the beginning, school steering committees, and then school councils became decision makers, and school representatives are in the majority in them. This governmental decision was accepted as part of new democracy in the higher education. After the initial enchantment, it was realized that such a move imposes a lot of responsibility with regard to good governance upon employees, i.e. the management team in particular. This became the border line between two totally different management concepts: the old one with full state control and equal care, and the new one in which the state still keeps full control and decision making, but its participation in financing reduces. In the old arrangement, directors acted like state officials as they simply transmitted decisions and funds from the ministry. The new approach requires competent managers and a well-designed management system. Considering that the application of Bologna principles started in this environment (Narodna Skupština Republike Srbije, 2005), the role and importance of management have become even greater.

2. THEN

The forerunner of today's higher education schools of professional studies is advanced schools. They were founded by the state since the 1950s. The need for the establishment, development, changes and everything else was exclusively within the jurisdiction of the state. All students were budget-funded students, and schools received funding under the Decree of the government (which is unfortunately still applied). The funds were fully received and directed as intended: salaries, equipment and maintenance. Good managers were the directors close to the source of funding and decision-making. Other criteria regarding abilities were not particularly valued. It was typical for this long period that salaries in education were not in top income bracket. A doctorate was not required for the vocational professorship, hence a

small number of vocational professors had the title as their interest in obtaining a doctorate was small. A number of schools even did not have appropriate offices for the staff so they prepared and worked mainly at home. This lethargy seemed like a closed circle, and in such a framework there was no will nor space for any serious management. There was only a director who could not even be particularly successful or unsuccessful. This condition could be compared with the present situation in primary and secondary schools.

3. NOW
